Carding.—When the moisture has spread sufficiently, the material is taken to the "breaker card," the first machine in the preparing department A certain weight of jute, termed a "dollop," is laid upon the feed cloth for each revolution of the latter. The fibre, which should be arranged on the sheet as evenly as possible, is carried up by the feed cloth and passes between the feed roller and the shell on to the large cylinder. This cylinder, which has a high surface speed, carries part of the fibre towards the workers and strippers, the surface speed of the workers being much slower than that of the cylinder The pins in the two rollers oppose each other, those of the workers being "back-set," and this arrangement, combined with the relative angle of the pins, and the difference in the surface speeds of the two rollers, results in the fibre being broken and split, and part of it carried round by the worker towards the stripper. This, as its name implies, strips the fibre off the worker, and carries it round to the cylinder. The pins of the stripper and cylinder point in the same direction, but since the surface speed of the cylinder is much greater than the surface speed of the stripper, it follows that the fibre is combed between the two, and that part is carried forward by the cylinder to be reworked. The strippers and workers are in pairs of which there may be two or more. After passing the last pair of workers and strippers the fibre is carried forward towards the doffing roller, the pins of which are back-set, and the fibre is removed from the cylinder by the doffer, from which it passes between the drawing and pressing rollers into the conductor, and finally between the delivery and pressing rollers into the sliver can. It may be mentioned that more or less breaking takes place between each pair of rollers, the pins of which are opposed, and that combing and drawing out obtains between those rollers with pins

pointing in the same direction. The ratio of the surface speeds of the drawing roller and the feed roller is termed the draft:—

$$\frac{\text{surface speed of drawing roller}}{\text{surface speed of feed roller}} = \text{draft.}$$

In this machine the draft is usually about 13.

The sliver from the can of the breaker card may be wound into balls, or it may be taken direct to the finisher card. In the latter method from eight to 15 cans are placed behind the feed rollers, and all the slivers from these cans are united before they emerge from the machine. The main difference between a breaker card and a finisher card is that the latter is fitted with finer pins, that it contains two doffing rollers, and that it usually possesses a greater number of pairs of workers and strippers—a full circular finisher card having four sets.

Drawing.—After the fibre has been thoroughly carded by the above machines, the cans containing the sliver from the finisher card are taken to the first drawing frame. A very common method is to let four slivers run into one sliver at the first drawing, then two slivers from the first drawing are run into one sliver at the second drawing frame. There are several types of drawing frames, *e.g.*, push-bar or slide, rotary, spiral, ring, open link, or chain, the spiral being generally used for the second drawing. All, however, perform the same function, viz., combing out the fibres and thus laying them parallel, and in addition drawing out the sliver. The designation of the machine indicates the particular method in which the gill pins are moved. These pins are much finer than those of the breaker and finisher cards, consequently the fibres are more thoroughly separated. The draft in the first drawing varies from three to five, while that in the second drawing is usually five to seven. It is easy to see that a certain amount of draft, or drawing out of the sliver, is necessary, otherwise the various doublings would cause the sliver to emerge thicker and thicker from each machine. The doublings play a very important part in the appearance of the ultimate rove and yarn, for the chief reason for doubling threads or slivers is to minimize irregularities of thickness and of colour in the material. In an ordinary case, the total doublings in jute from the breaker card to the end of the second drawing is 96: $12\times4\times2=96$, and if the slivers were made thinner and more of them used the ultimate result would naturally be improved.

Roving.—The final preparing process is that of roving and is conducted in the machines just mentioned. In the operation there is no doubling of the slivers, but each sliver passes separately through the machine, from the can to the spindle, is drawn out to about eight times its length, and receives a small amount of twist to strengthen it, in order that it may be successfully wound upon the roving bobbin by the flyer. The chief piece of mechanism in the roving frame is the gearing known as the "differential motion." It works in conjunction with the disk and scroll, the cones, or the expanding pulley, to impart an intermittingly variable speed to the bobbin (each layer of the bobbin has its own particular speed which is constant for the full traverse, but each change of direction of the builder is accompanied by a quick change of speed to the bobbin). It is essential that the bobbin should have such a motion, because the delivery of the sliver and the speed of the flyer are constant for a given size of rove, whereas the layers of rove on the bobbin increase in length as the bobbin fills. In the jute roving frame the bobbin is termed the "follower," because its revolutions per minute are fewer than those of the flyer. Each layer of rove increases the diameter of the material on the bobbin shank; hence, at the beginning of each layer, the speed of the bobbin must be increased, and kept at this increased speed for the whole traverse from top to bottom or vice versa.

Let R = the revolutions per second of the flyer;
r = the revolutions per second of the bobbin;
d = the diameter of bobbin shaft plus the material;
L = the length of sliver delivered per second; then
$(R-r)d\pi=L$.

In the above expression R, π and L are constant, therefore as d increases the term $(R-r)$ must decrease; this can happen only when r is increased, that is, when the bobbin revolves quicker. It is easy to see from the above expression that if the bobbin were the "leader" its speed would have to decrease as it filled.

The builder, which receives its motion from the disk and scroll, from the cones, or from the expanding pulley, has also an intermittingly variable speed. It begins at a maximum speed when the bobbin is empty, is constant for each layer, but decreases as the bobbin fills.

Spinning.—The rove yarn is now ready for the spinning frame, where a further draft of about eight is given. The principles of jute spinning are similar to those of dry spinning for flax For very heavy jute yarns the spinning frame is not used—the desired amount of twist being given at the roving frame.

Method of Counting Jute Yarns.—The count of jute yarn is based upon the weight in pounds of 14,400yd., such length receiving the name of "spyndle." The finest yarns weigh 2½lb. to 3lb. per spyndle, but the commonest kinds are 7lb, 8lb., 9lb, and 10lb. per spyndle. The sizes rise in pounds up to about 20lb then by 2lb. up to about 50lb. per spyndle, with much larger junps above this weight. It is not uncommon to find 200lb. to 300lb. rove yarn, while the weight occasionally reaches 450lb. per spyndle. The different sizes of yarn are extensively used in a large variety of fabrics, sometimes alone, sometimes in conjunction with other fibres, *e.g.*, with worsted in the various kinds of carpets, with cotton in tapestries and household cloths, with line and tow yarns for the same fabrics and for paddings, etc, and with wool for horse clothing. The yarns are capable of being dyed brilliant colours, but, unfortunately, the colours are not very fast to light. The fibre can also be prepared to imitate human hair with remarkable closeness, and advantage of this is largely taken in making stage wigs.

Finishing.—A very important branch of the jute industry is that which deals with the finishing of the cloths, after the latter leave the loom. Fig. 7 illustrates a large finishing department in the foreground of which are the croppers for removing superfluous fibres from both sides of the cloth. In the background are both calenders and mangles—both types being massive in structure—in which the different kinds of finish to the cloth are imparted.

For detailed information regarding jute, the cloths made from it and the machinery used, *see* the following works: Watts's *Dictionary of the Economic Products of India;* Royle's *Fibrous Plants of India*

JÜTERBOG or **GÜTERBOG,** a town in the Prussian province of Brandenburg, on the Nuthe 39 m. S W. of Berlin, at the junction of the main lines of railway from Berlin to Dresden and Leipzig Pop. (1925) 8,110 Jüterbog belonged in the later middle ages to the archbishopric of Magdeburg, passing to electoral Saxony in 1648, and to Prussia in 1815. The town is surrounded by a mediaeval wall, with three gateways, and the church of St Nicholas (14th century) is remarkable for its three fine aisles Jüterbog also has an old town-hall. It carries on weaving both of flax and wool and manufactures cigars. Vines are cultivated in the neighbourhood.

JUTES, the third of the Teutonic nations which invaded Britain in the 5th century, called by Bede *Iutae* or *Iuti* (*see* BRITAIN, ANGLO-SAXON). They settled in Kent and the Isle of Wight, together with the adjacent parts of Hampshire. In the latter case the national name is said to have survived until Bede's own time, in the New Forest indeed apparently very much later. In Kent, however, it seems to have soon passed out of use, though there is good reason for believing that the inhabitants of that

kingdom were of a different nationality from their neighbours (*see* KENT, KINGDOM OF). With regard to the origin of the Jutes, Bede only says that Angulus (Angel) lay between the territories of the Saxons and the Iutae—a statement which points to their identity with the Iuti or Jyder of later times, *i.e.*, the inhabitants of Jutland. Some recent writers have preferred to identify the Jutes with a tribe called Eucii mentioned in a letter from Theodberht to Justinian (*Mon Germ. Hist. Epist. iii.* p. 132 *seq.*), and settled apparently in the neighbourhood of the Franks. But these people may themselves have come from Jutland.

See Bede, *Hist. Eccles.* i. 15. iv. 16. (H. M. C.)

JUTIGALPA, capital of the Province or Department of Olancho, Honduras, and the centre of an important agricultural and potentially valuable mining section. It lies at an altitude of 2,700 ft., 50 m. N.N.E. of Tegucigalpa. The population was estimated in 1928 at about 9,000, which makes it the second city in size in Honduras, although some of the coast towns of approximate size far surpass it in business. Jutigalpa is reached by bridle trails from La Ceiba, on the Caribbean, and also from Tegucigalpa, the capital of the country. The town ships coffee, tobacco, beans, sugar, rice and cheese, and cattle for meat and draught use; there is mining on a small scale in the mountains.

JUTLAND (Danish *Gylland*), the Chersonese or Cimbric peninsula of ancient geography, a projection of northern Europe, forming the continental portion of the kingdom of Denmark and including, in its larger sense, the Prussian province of Schleswig-Holstein. Politically, Jutland ends southwards at the narrowest part of the peninsula (36 m.), in lat. 54° 50′ N., and includes several small islands. Its physical features, etc., are treated under DENMARK.

JUTLAND, BATTLE OF. Called by the Germans the battle of the Skagerrak, this battle was fought in the North Sea between the British Grand Fleet, under Admiral Sir J. R. Jellicoe, and the German High Seas Fleet, under Admiral Reinhard Scheer, on May 31, 1916. The main action took place about 75 m. from the Dutch coast in the neighbourhood of lat. 57° N. long. 6° E. The encounter is memorable as being the only occasion throughout the World War on which the rival battle fleets met, also for the fact that it left the British fleet undisputed master of the German one up to the day of the latter's surrender. As a test of modern naval material it was prolific in lessons for both sides.

I. INTRODUCTORY

The movements of the fleets and squadrons were necessarily

governed to a large extent by highly technical considerations, and the battle is not an easy one for the layman to follow without a painstaking study of its successive phases and the motives which produced them. Moreover, in order to obtain a true perspective of events it is necessary to keep in mind the following fundamental facts:—

(*a*) The Allied cause rested absolutely on the retention by Britain of that sea supremacy of which the Grand Fleet was the fulcrum.

(*b*) By the date of Jutland Germany's surface navy had already been rendered largely immobile and her mercantile marine had been swept off the seas.

(*c*) It was the definite policy of the British naval command to bring the German main fleet to action and annihilate it if possible, but there was no intention to gamble with the Allied fortunes by seeking an engagement in waters where mines, submarines and shore defences would give the enemy a definite advantage, nor under conditions where the outcome would be largely dependent on chance, such as a fleet action at night.

(*d*) It was the definite policy of the German High Command not to risk a decisive action until, by a process of attrition, the British forces might have become so weakened as to give good prospects of success.

(*e*) It was to pursue this policy of attrition that Scheer set out prior to Jutland, his object being to lure the British fleet out in the hope of falling on a section of it before it could be supported; but the last thing he intended or desired was to meet a united Grand Fleet.

The order of events can be conveniently summarised as follows:—

1. The German plan to entice the British fleet to sea while submarines were lying in wait for it, and in the hope of concentrating the High Seas Fleet on a detached part of it.
2. The sailing of the rival forces, neither realising the full significance of the coming impact
3. The first contact and battle-cruiser action on the run south to the High Seas Fleet.
4. Beatty's run north leading the High Seas Fleet up to the Grand Fleet
5. Jellicoe's main engagement with his combined Grand Fleet against the combined High Seas Fleet.
6. The German fleet's break through the British destroyer flotillas at night, and the failure to send intelligence to Jellicoe which resulted in the escape of the enemy next day

Situation Before the Battle.—Admiral Jellicoe has summarised the causes which led up to Jutland as follows —

1. The pressure of the British blockade had led to insistent calls for action by the German fleet.
2. Scheer, who had assumed command of the High Seas Fleet in Jan. 1916, was chafing under his enforced inactivity.
3. A strong protest from President Wilson had caused the withdrawal of German submarines from the trade routes and thereby rendered them available for enterprises of a military character.
4. Scheer may have been led to believe that the steps announced in England to prevent a recurrence of such episodes as the Lowestoft raid indicated that some division of the Grand Fleet was intended.

While Scheer was planning a new attack on the east coast of England, certain changes had, in fact, been made in the distribution of the British forces. Jellicoe, with the main part of the Grand Fleet, was still at Scapa Flow awaiting the completion of the outer defences of the Firth of Forth before transferring his base to the more southerly harbour, but he had detached the 5th Battle Squadron of four fast "Queen Elizabeths," "Barham," "Valiant," "Warspite" and "Malaya," to replace the 3rd Battle-Cruiser Squadron of three "Invincibles," which were at Scapa for gunnery practice, and sent them to reinforce Beatty's Battle-Cruiser Fleet at Rosyth. A third force, consisting of the 2nd Battle Squadron, 1st Cruiser Squadron and a destroyer flotilla, was based on Invergordon.

THE FORCES ENGAGED

The Grand Fleet.—Immediately prior to the battle of Jutland the distribution and composition of the British forces which took part in the action was as in table on p. 218

At Harwich were five light cruisers and about 20 torpedo craft under Commodore Tyrwhitt, and at Sheerness was the 3rd Battle Squadron consisting of the "King Edward" and the "Dreadnought" flying the flag of Admiral Bradford. These two commands, however, took no part in the battle

The High Seas Fleet.—The main German forces, in preparation for Admiral Scheer's project, had been concentrated in the Jade Basin. They were organized as in Table II.

Attached to the High Seas Fleet were sixteen U boats and ten "L" class airships, but these took no part in the action.

The Table on p. 220 is a summary of the principal armaments of the capital ships of the rival fleets

THE GERMAN PLAN

An order issued to the High Seas Fleet on May 18 ran as follows.—

> The bombardment of Sunderland by our cruisers is intended to compel the enemy to send out forces against us. For the attack on the advancing enemy the High Seas Fleet forces to be south of the Dogger Bank, and the U boats to be stationed for attack off the East Coast of England The enemy's ports of sortie will be closed by mines.

This order may be taken as defining the strategy of the enemy on the above date

In preparation for the execution of this scheme the U boats

Total Turret Guns				344	Total Turret Guns		244

To sum up: the British Fleet consisted of 37 capital ships, 8 armoured cruisers, 26 light cruisers and 80 flotilla leaders and destroyers. The German Fleet consisted of 27 capital ships, 11 light cruisers, 63 flotilla leaders and destroyers.

had already set out in order to be in their appointed stations by May 23, while some six or eight Flanders submarines had gone north to reconnoitre between Norway and the Firth of Forth From that date to June 1 was the period during which it was intended to bring off the bombardment. But the weather continued to be unfavourable for airship reconnaissance. Scheer would not risk an advance on the English coast without ample warning of

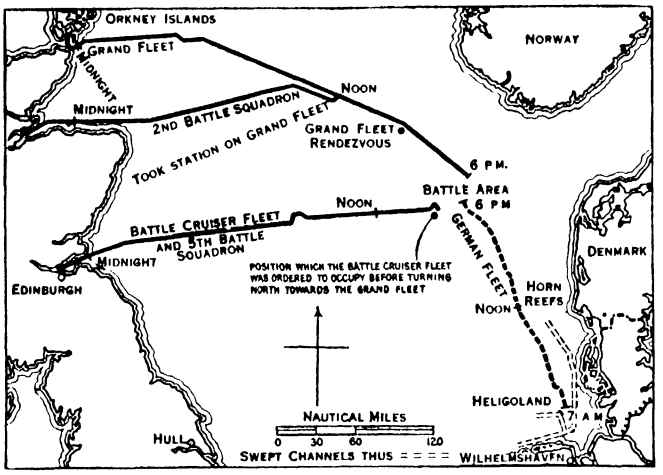

FIG. 1.—APPROACH OF RIVAL FLEETS

the approach of the British fleet; meanwhile the limit of endurance of his submarines was nearly spent.

On May 30, when he could wait no longer, he abandoned the bombarding plan and ordered Hipper, with the scouting force to sail next day and to demonstrate off the southwest coast of Norway. This he anticipated would soon be known to the British Admiralty, and he hoped, by following the scouting force with the battle fleet, but keeping out of sight until the enemy appeared, that he might fall on a detached portion of the Grand Fleet, which would probably be sent out to protect the cruiser patrol and shipping to the northward. But events turned out otherwise.

II. THE PRELIMINARY ACTIONS

The Grand Fleet Sails.—The British Naval Intelligence Dept. was already aware both of the movement of German submarines and that there was a "certain liveliness" in the Jade Roads, and Jellicoe was warned that a large operation on the part of the enemy appeared to be imminent At 5:40 P.M. on May 30 the commander-in-chief and the admiral commanding the Battle Cruiser Fleet were sent orders to proceed to the predetermined rendezvous eastward of the Long Forties (about 60 m. east of the Scottish coast) in readiness for eventualities. A warning was also sent to the Harwich Forces and 3rd Battle Squadron at the Nore. By 10 30 P M the three sections of the Grand Fleet had left their respective bases at Scapa Flow, Invergordon and Rosyth and were heading out across the North Sea. The main battle fleet made for a rendezvous in lat. 57° 45′ N. long. 4° 15′ E. where the forces under Admiral Jerram from Invergordon would meet him at 2 P.M. next day. Beatty, with the Rosyth force, was making for a point 69 m. S.S.E. of the battle fleet's position (*see* fig. 1). These dispositions would enable the battle fleet to intercept an enemy trying to attack the 10th Cruiser Squadron on the northern patrol, while the Rosyth force would guard against a raid

When the British fleet put to sea 13 hostile submarines were lying off the coast; also U-67 was south of the Dogger Bank; and U-75, having laid the mines, which afterward sank the "Hampshire" with Kitchener on board, was on her way home. The German submarines made a few ineffective attacks; but in the main the under-water craft, as usual, proved unable to prevent free movement of the fleet.

To Jellicoe the position was by no means clear when he set out. The evidence pointed to another cruiser raid being afoot, but a misleading telegram sent from the Admiralty during the forenoon of May 31 informed him that directional wireless signals placed the German fleet flagship in the Jade river, thereby leaving him with the impression that there was no reason for undue haste; he, therefore, regulated his speed so as to economise his destroyers' fuel consumption.

First Contact.—Hipper, with the scouting force left the Jade at 2 A.M. on May 31 and steamed northward, keeping well out of sight on the Danish coast. Scheer followed 50 m. astern with the battle fleet. During the early morning the German commander-in-chief received wireless reports from his U boats, but these proved vague and misleading, so much so that far from gleaning that a combined advance was being made by the British forces, he alludes to "our hope of meeting with separate enemy divisions," as being "likely to be fulfilled." (See *Germany's High Seas Fleet in the World War*, Scheer.)

At 2 P.M. Beatty, having arrived at his rendezvous, prepared to turn north in accordance with his instructions. Then followed one of those seemingly trivial events which are sometimes destined to have momentous issues. A stray merchant steamer attracted the attention of Commodore Alexander-Sinclair in the "Galatea," on the eastern wing of the light cruiser screen. He stood on to the E.S.E. to examine her. Simultaneously the "Elbing," on the west-

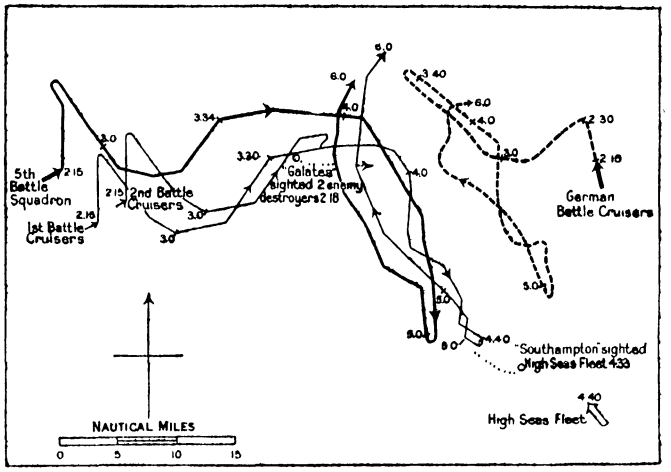

FIG. 2.—FIRST CONTACT OF OPPOSING FLEETS AND THE BATTLE CRUISER ACTION

ern wing of the German scouting force, sighted the same steamer and detached a destroyer to investigate. Another instant and the rival warships had seen each other. At 2.20, just as Beatty had turned to the northward, "Galatea" hoisted the signal "enemy in sight." (*See* fig. 2.) The result was to hasten a meeting which otherwise would, most probably, have occurred farther North and therefore nearer the British battle fleet. Beatty at once set out to cut off the line of retreat of the enemy's light cruisers towards Horn Reefs, but finding that they were apparently following the "Galatea" to the northwest, he hauled round more to the northward. He had been steering northeast for some 10 minutes when the heavy smoke of Hipper's five battle cruisers was sighted on his starboard bow, whereupon he turned back to the east.

Owing to the greater visibility to the westward, Hipper had already sighted the six British battle cruisers, and now realised that they were heading to cross his stern and cut off his line of retreat, and that he must hasten to fall back on the battle fleet. Beatty, knowing nothing of the greater forces to the south, could only regard this as a golden opportunity for getting to grips with the enemy. There followed a hot running fight to the southward between the opposing battle cruisers (*see* fig. 2). The 5th Battle Squadron under Rear-Adm. Evan-Thomas had, unfortunately, been stationed by Beatty 5 miles on the opposite bearing to that on which the enemy was sighted. A further delay in bringing this powerful force into action was caused through ineffective signalling in the "Lion." The result of this division of forces was that the British battle cruisers suffered heavily instead of the German squadron being annihilated.

THE BATTLE CRUISER ACTION

At 3.34 P.M. Beatty formed the battle cruisers into single line, increased to 25 knots and made for the enemy. About this time the "Engadine" sent up a seaplane which reported Hipper's course south. This is noteworthy as being the only occasion on which a British aircraft was used throughout the operations, and the report failed to reach the battle cruiser's flagship. At 3.45 however, the enemy could be made out distinctly from the "Lion," and Beatty formed his ships on a line bearing north-west to clear the smoke and bring their guns to bear, while he turned to E.S.E. At about 3.48 fire was opened almost simultaneously on both sides at a range of approximately 16,000 yards.

The British battle cruisers were at considerable disadvantage, for they showed up well against the western sky, while visibility to the eastward was poor for observing their fire. German accounts agree that the British firing during this part of the action was somewhat ragged, while they pay high tribute to that of the 5th Battle Squadron as it eventually got into range. The better protection of the enemy's battle cruisers and the better shell with which the heavy guns of his fleet generally were provided stood him in good stead, while confusion in the interpretation of the "Lion's" signals for distribution of fire added to the disadvantages of the British battle cruisers.

The range was rapidly decreasing as the courses of the rival forces converged. A few minutes after 4 P.M. the "Lion" was heavily hit by a shell from the "Lützow" which plunged into her midship turret and killed nearly the whole of the gun's crew But for the presence of mind and devotion to duty of Major F. J. W. Harvey, R.M.L.I (awarded a posthumous V.C.), who when mortally wounded saw to the flooding of the magazine, the flagship would doubtless have been destroyed. Up to this time, owing to a misunderstanding, the "Derfflinger" had been left unfired at, but was now engaged by the "Queen Mary." In the rear of the line the "Von der Tann" and "Indefatigable" were fighting a furious duel when a salvo of three shells from the former crashed into the vitals of the British ship; she fell out of the line sinking by the stern; at 4.06 P.M. another salvo hit her and with a rending explosion she turned over and sank with her 57 officers and 960 men Now came a moment's respite; both sides, finding the fighting too hot, decided to open the range, and soon the German shells were falling short and their fire ceased

Meanwhile Evan-Thomas, by cutting corners, had manoeuvred the 5th Battle Squadron into range, and shortly after 4 o'clock the "Barham" opened fire on the "Von der Tann" at about 19,000 yards. In spite of the poor visibility the battleships' firing was very accurate, and Hipper had to take to zig-zagging to dodge the great 15 in. salvoes. Nothing but the poor quality of the British shells, which burst without penetrating the enemy's armour, could have saved his rear ships from destruction. The van of the German line was not long out of action.

At 4.10 Hipper turned inwards two points while Beatty, having established sufficient overlap, started to press his way to the eastward again. The effect was to close the range rapidly and the engagement was fiercely renewed.

The "Lion" seems to have been still enveloped in the smoke of her burnt-out turret, and practically invisible, with the result that she was left in peace while the "Seydlitz" concentrated her guns with those of the "Derfflinger" on the "Queen Mary." The latter was fighting gallantly when at 4.26, a salvo crashed into her forward, a red flame shot up and an explosion rent her asunder. In another instant only a great pall of smoke marked the grave of the "Queen Mary" and her 57 officers and 1,209 men.

About this time a subsidiary battle was being fought between the lines. The 13th Destroyer Flotilla, having attained a suitable position, was launched to attack. At the same moment a German flotilla advanced into the arena making for the 5th Battle Squadron. The two flotillas met; the enemy destroyers fired twelve torpedoes at long range and hastily retired before the superior gun-fire of the British craft. Evan-Thomas swung his Battle Squadron away two points and safely avoided the torpedoes. Part of the British flotilla chased the fleeing enemy towards the van of the German battle cruisers, while Commander Bingham in the "Nestor," followed by the "Nicator," pursued those making for the rear. When within 5,000 yd. of the "Lützow," the two destroyers fired their torpedoes, but Hipper adopted the same dodging tactics and swung his ships away while the torpedoes ran clear or fell short of their mark The gallant pair of destroyers pressed on and fired more torpedoes at a range of only 3,500 yd. under a hail of shell from the enemy's secondary armament. The "Nicator" escaped, but the light cruiser "Regensburg" appeared suddenly from behind the battle cruisers and crippled the "Nestor" with two shots in her boiler. The "Nomad," another destroyer, was also hit and left helpless between the lines. Another small force of British destroyers had accounted for two of their opponents, "V.27" and "V.29," when at 4.43 P.M. the "Lion" ran up the destroyers' general recall. Events suddenly took a new and dramatic turn. To Hipper, sorely pressed ahead and astern, came welcome and timely relief. The German battle fleet was in sight.

German Battle Fleet in Sight.—The head of the German

battle fleet was first sighted by the "Southampton" in which was Commodore Goodenough leading his 2nd Light Cruiser Squadron about two miles ahead of the "Lion." At 4.33 he made the signal "battleships southeast." Holding boldly to his course he was soon able to identify the High Seas Battle Fleet in full array. Mindful of the extreme importance of his information, he sent a wireless message direct to Jellicoe. Within ten minutes of this signal being dispatched the commander-in-chief had quickened the pulse of his own great command with the signal "enemy battle fleet is coming north."

Goodenough stood down to within 13,000 yd. of the enemy so that he could identify him in detail before turning north under a hail of shell fire. An admirable piece of cruiser work had not only galvanised many and far distant forces into activity, but it had crystallised the whole position for the British commands. Beatty also held his course until the German battle fleet was in sight, then, at 4.40, he turned 16 points in succession and started to run north, assuming the rôle of the pursued instead of that of pursuer. To Scheer it seemed as if his opportunity to fall on a detached part of the British fleet had come, but Beatty was happy in the knowledge that if the enemy was not frightened off prematurely he would be confronted with the whole Grand Fleet.

Hipper, it so happened, was too occupied with the British destroyers' attacks to take advantage of the target presented by the British battle cruisers as they wheeled in succession round the same point. By 4.50 Beatty with his line now reduced to four ships had straightened up on a northerly course and was re-engaging his late enemy. Hipper had just resumed his southerly course, after turning away from the British destroyers, when a torpedo hit the "Seydlitz" tearing a huge hole under water and putting a 15 cm. gun out of action. The ship's stout construction saved her, however, and she kept her place in the line. By 5 P.M. Hipper, too, had turned 16 points to the northward and taken up his station ahead of the battle fleet. Meanwhile the 5th Battle Squadron could not see the "Lion's" flag signal to turn about. Evan-Thomas saw Beatty turn, but was intent on hanging to the rear of the enemy's battle cruisers, who were still on a southerly course, with the result that the two British squadrons passed each other at high speed. The "Lion" now repeated the signal to turn, direct to the 5th Battle Squadron, but before it could be obeyed, that squadron found itself under the guns of the German battle fleet.

Evan-Thomas turned 16 points at practically the same instant as Hipper, but in the process the "Barham" received a heavy shell which cost her casualties and the use of her wireless gear. The rear battleship of the line, the "Malaya," was a target for at least a whole division of enemy battle ships and suffered even more severely. ("Barham" lost 26 killed and 37 wounded, "Malaya" 63 killed and 33 wounded.) For some 20 min., she was straddled again and again and received serious damage below the waterline, but held on and eventually the whole squadron forged ahead and got clear. A plucky attempt by the destroyers "Onslow" and "Moresby" to attack the enemy battle cruisers just as they had turned north was defeated by the German light scouting group, but the "Moresby" stood on to within 8,000 yd. of the enemy's battle fleet and fired a torpedo at the third ship of the line; it did not take effect, but both destroyers escaped miraculously under a very hot fire. Scheer continued to hasten north after the apparently hard-pressed British squadrons. As he did so the motionless "Nestor" and "Nomad" came drifting down between the lines. They scorned surrender and fired their last torpedoes at the oncoming battleships but without effect. A moment later they were overwhelmed in a storm of shell. The undaunted "Nestors" gave three cheers for their sinking ship and sang a verse of "God Save the King" before the crews took to boats and Carley rafts, from which they were chivalrously rescued by enemy destroyers.

Once the 5th Battle Squadron had shaken off the German battle fleet the firing slackened. At 5.40 P.M. Hipper's squadron reappeared out of the mist and there was a temporary burst of firing from the British battle cruisers and the leading battleships, but Beatty was intent on joining his commander-in-chief and was reserving his forces for the greater issues impending.

III. THE MAIN ACTION

Meeting of the Battle Fleets.—Coming down from the north-west was Jellicoe in the "Iron Duke," at the head of a centre division of his six lines of battleships, each in single line ahead at manoeuvring distance apart. Directly ahead of him was the 4th Light Cruiser Squadron which with the destroyer flotillas was acting as an anti-submarine screen. Further ahead and spread for scouting were the 1st and 2nd Cruiser Squadrons. Twenty-one miles to the eastward were Hood's three ships of the 3rd Battle Cruiser Squadron, with two light cruisers and four destroyers.

Up to 2 45, the fleet had been steaming at economical speed, but, with the arrival of wireless messages indicating the presence of an enemy to the southward, the commander-in-chief increased to 17 knots and ten minutes later to 18 knots. Course was shaped southeast by south for Horn Reefs as previously arranged. At 3 59, as soon as he learnt that the enemy's battle cruisers had been sighted, Jellicoe increased to 20 knots and then sent Hood on to Beatty's support, so that when the report was received that the enemy's battle fleet was coming north there was nothing better to be done at the moment than to stand on as he was doing. The battle fleet was closed up in cruising formation, and it would have been useless, indeed dangerous, to deploy into line of battle until it was known on what bearing the enemy would be met. The leaders of divisions were already disposed at right angles to the most likely line of bearing on which to sight the enemy in order that they might wheel their ships into line with a minimum of delay. So the rival battle fleets approached, charging towards each other at a rate of nearly 40 knots, but as yet out of sight.

When in due course contact was made it did not come about quite as Jellicoe expected. The "Iron Duke" and "Lion" had communicated their respective positions from time to time, but zig-zagging and many other alterations of course had caused both flagships to be out in their reckoning. The "Iron Duke" was in fact some 4½ m. ahead (*i.e.*, to the southeastward) and the "Lion" 6¾ m. to the westward of their estimated positions as they approached each other. The reports of the enemy received by the commander-in-chief were therefore somewhat perplexing, and by the time it became evident that the German Battle Fleet would be met on a starboard bow bearing instead of right ahead it was too late to alter his dispositions. Hood, also, was thrown out in his calculations. Steering as he thought to join Beatty he found himself on the opposite side, *i.e.*, to eastward of the enemy. It was at this juncture that fighting broke out with renewed vigour.

At 5 40 the Battle Cruiser Fleet converging on the 1st Scouting Group, from the westward, saw the "Lützow" and her consorts emerging from the mist. Fire was opened at a range of about 14,000 yards. This apparently disconcerted Hipper, who turned away to the eastward. Hardly had he done so before he heard the guns of the 3rd Battle Cruiser Squadron engaging his 2nd Scouting Group. The trap was closing in on him, but as yet he was unaware of the far greater menace to the northward; but he seems to have sensed danger and at 6.34, hotly pursued by Beatty, he turned southeast only to see his light cruisers being attacked by four British destroyers. These latter he took to be the forerunners of the British Battle Fleet and, now thoroughly alarmed, he doubled right back to southwest to seek the cover of his own battleships. In fact what he had seen were Hood's light forces. These had been hotly engaged with Boedicker's 2nd Scouting Group. In the initial skirmish the "Chester" was badly mauled by the German light cruisers, but they in turn suddenly found themselves overwhelmed by the fire of the three "Invincibles." The "Wiesbaden" was reduced to a wreck and the "Pillau" and "Frankfurt" were badly damaged and only escaped by using their torpedoes, which forced Hood to turn away and break off the pursuit.

The destroyers which Hipper had seen were part of the 4th flotilla. Led by the "Shark," they gallantly went for the "Regensburg" and nine or ten enemy torpedo craft which seemed to be preparing to attack the 3rd Battle-Cruiser Squadron. In the

course of this encounter the "Shark" was severely battered and eventually sank, fighting to the last under her mortally wounded captain, Commander Loftus Jones. Hood avoided this attack by turning his squadron sharply to starboard; and almost at the same instant he sighted the "Lion" racing up from the westward. He turned to meet her and then swung his squadron into station ahead of the Battle Cruiser Fleet and led the line on a south-easterly course. Jellicoe was left in doubt until the very last minute as to the exact position of the enemy. Somewhere to the southward was the High Seas Fleet, but between him and his adversary were battle cruisers, cruisers and destroyers belching smoke and gun fire and obscuring his view. Beatty, hot on the heels of his own particular quarry again, had lost sight of the enemy battle fleet and at the moment could not answer the commander-in-chief's urgent enquiry. Nine minutes the latter waited, then at 6.10 repeated his question "Where is enemy's battle fleet?" The first definite information came from the "Barham," now rapidly closing with the 5th Battle Squadron from the southwest. She reported "Enemy's battle fleet S S E." At 6.14 the "Lion," having regained touch, reported it too, bearing S.S.W. from her.

The Deployment (see fig. 3.).—Within a minute of the "Lion's" report, Jellicoe had ordered the fleet to deploy on the port or easterly column The manoeuvre was a vital one and the commander-in-chief made a masterly decision. Had he followed his natural inclination to deploy to starboard, *i.e.*, on the side toward the enemy, the ships on that wing would have found themselves at grave disadvantage; the enemy would have been able to concentrate his fire on them while they would have been masking the other columns until each could turn up in rear in succession Moreover, the head of the British line would have had to make a sharp turn to port at once to prevent the enemy crossing the "T" It is not too much to say that had Jellicoe

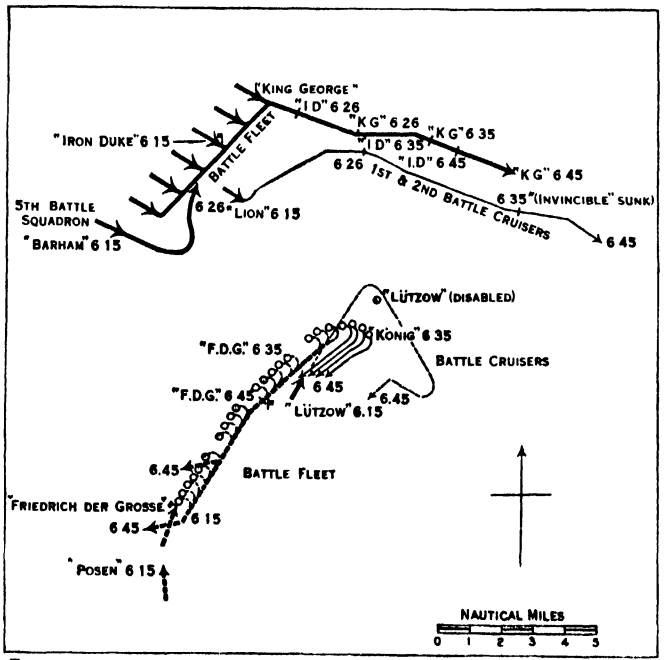

FIG. 3 —DEPLOYMENT OF BRITISH BATTLE FLEET AND FIRST RETIREMENT OF THE GERMAN FLEET

made a wrong decision at this moment irretrievable disaster might have followed. As it was the Grand Fleet was placed at the outset in a position of overwhelming tactical advantage.

The deployment, it will be seen, developed in the form of an obtuse-angled "L," one arm of which steadily lengthened to envelop the head of the enemy's line, while, during the process, the British ships could give each other the maximum of support. The battle cruisers hurried to their station at the head of the line, the 5th Battle Squadron slipped into place astern, cruisers and destroyers automatically took up their pre-arranged positions. The whole was a magnificent piece of fleet work, the culmination of fine organization and training and a clear indication of a high standard of leadership on the part of the flag officers commanding the several divisions and squadrons.

But now a tragedy occurred in the foreground of this impressive scene. Up to the moment of deployment Rear-Admiral Arbuthnot in the "Defence" with his 1st Cruiser Squadron had been scouting ahead of the battle fleet, but on contact being made, it became his duty to engage the enemy's cruisers. Boedicker's 2nd Scouting Group was faintly visible to the southward and, followed by the "Warrior," Arbuthnot turned to pursue them He was about to deliver a *coup de grâce* to the now blazing and disabled "Wiesbaden," when out of the mist came both the British and German battle cruisers hotly engaged. Holding on tenaciously, close across the bows of the "Lion," the two cruisers soon found themselves in a hurricane of fire as Hipper endeavoured to cover the stricken "Wiesbaden" Two great salvoes hit the "Defence" in quick succession and at 6 19 Arbuthnot and his flagship disappeared in a sheet of flame. The "Warrior" limped away, and was only saved for the time being by the battleship "Warspite" performing an involuntary circle round her, owing to the sudden jamming of the latter's steering gear. Clear of the fighting, the sea-plane carrier "Engadine" made a brave effort to tow her home, but the "Warrior" had to be abandoned at 7 A.M. the following morning and eventually sank.

As the cloud of smoke over the spot where the "Defence" had gone down rolled away, the full measure of his peril was revealed to Scheer. The High Seas Fleet was heading into the crook of the rapidly extending arm of the whole combined British Battle Fleet. It seemed to Jellicoe a glorious opportunity to fall on his enemy and crush him The signal was actually hoisted for the Grand Fleet to close, when the commander-in-chief realised that his line had not yet straightened out, and the battle cruisers were not yet clear of his van; to turn to S S E by subdivisions, as he wished, was not practicable at the moment He had to cancel the signal and hold on on a course which nevertheless sharply converged with that of the enemy battle fleet The Grand Fleet deployed on a course southeast at 6 15. The deployment (excluding the 5th B.S.) was completed by about 6 40. The German Battle Fleet approached on a northeasterly course. At 6 27, the "König," leading battleship, turned east, the remainder following in succession (*see* fig 3).

Now yet another misfortune befell the British. Proudly leading the long line of capital ships, was Hood in the "Invincible." Having closed to a bare 9,000 yd. she was furiously engaging the "Derfflinger," hitting her again and again with well directed salvoes, when the "Konig," leading the van of the enemy battle fleet, came to the rescue of the battle cruiser. Once again the plunging shell sought the vitals of the lightly armoured British ship; the "Invincible" was torn asunder, her stem and stern rising high out of the water before she disappeared (6 34). With her went Hood, who had so finely upheld the traditions of his historic name, and his splendid crew of over a thousand officers and men. The British battle cruisers had indeed suffered heavily. Valuable as their work had been in bringing about the main action, they were clearly unsuited for "in-fighting." From now onwards they rightly confined themselves to harassing the van of the enemy when opportunity served, leaving the battleships to take the shock of closer contact. But close contact was the last thing Scheer was seeking. He was in a trap and needed all his wits to escape impending disaster.

The possibility of such a situation had not been overlooked by the German commander-in-chief, and he had practised his command in a manoeuvre known as the *Gefechtskehrtwendung*, which was really an "emergency retirement." In this the destroyers dashed out, fired their torpedoes "into the brown," and put up a smoke screen while each big ship did a right-about turn and retreated precipitately. This manoeuvre he ordered when at 6.35 he found battleship after battleship of the Grand Fleet concentrating on the head of his line. It was not unattended with risk, but it was boldly ordered and skilfully executed. (*See* fig. 3.) In less than three minutes the evasive Germans had disappeared for the first time The destroyer attack had not been pressed home,

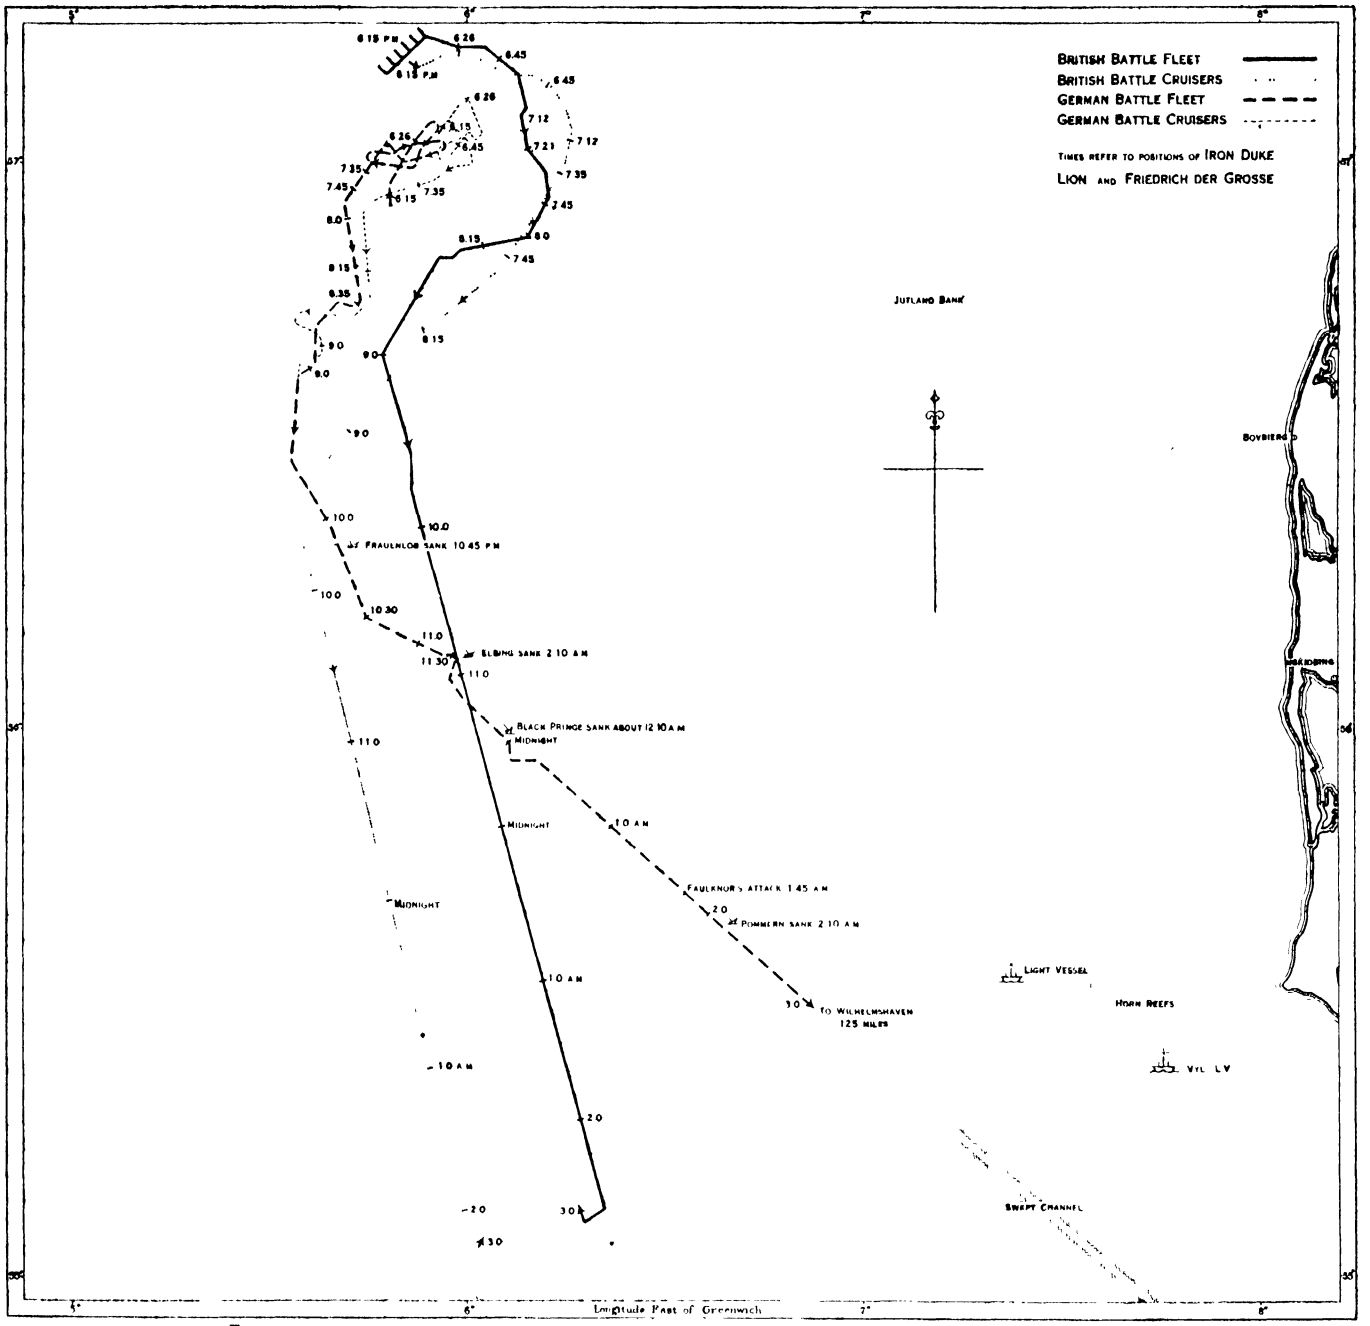

FIG. 4.—COURSE OF MAIN ACTION AND ESCAPE OF GERMAN FLEET (6.15 P.M. TO 3.00 A.M.)

and, although some of the British battleship divisions swung away momentarily to avoid the torpedoes, the course of the fleet as a whole was not deflected. Burney's flagship, the "Marlborough," was hit by a torpedo, but the damage was not so great as to force her to leave the line. The German light cruiser "Wiesbaden," now the only enemy in sight, came under a heavy fire and in ten minutes, a blazing wreck, she sank from sight.

Jellicoe, too, had foreseen the problem which now confronted him, and he had not been alone in seeking, for some time past, a satisfactory solution; it was agreed by the highest tactical authorities that to follow directly in the path of an enemy's battle fleet in a position where it could obtain the maximum advantage from torpedoes and mines, was sheer foolhardiness. He had been informed by the Naval Intelligence Dept. that the German capital ships were known to carry mines. In fact, he had already summed up the situation when he wrote "Nothing but ample time and superior speed can be an answer, and this means that unless the meeting takes place fairly early in the day, it is most difficult, if not impossible, to fight the action to a finish." In point of fact, so little was the Grand Fleet superior to the High Seas Fleet in speed that even had Jellicoe pursued it directly it is doubtful whether he would have caught up with it before nightfall. It was now 6.40. There remained little more than two hours' daylight. The enemy was out of sight somewhere to the south and west, but another advantage which the deployment to port had given was the overlap to the eastward which the Grand Fleet had secured. (*See* fig. 4.) Jellicoe was therefore in a position to work his way steadily between the High Seas Fleet and its possible lines of retreat to the German coast, and this he proceeded to do. At 6.44 he turned his divisions southeast. Simultaneously Goodenough turned south and led his Light Cruiser Squadron to look for the enemy. By 7 he was able to report the hostile battle fleet bearing S.S.W.

Five minutes before this Jellicoe had altered course to south, and now, knowing that he was again in a position of considerable tactical advantage, he ordered a turn of "3 points to starboard together" to close more rapidly. About this time a number of reports of submarines were being made to the com-

mander-in-chief. The "Lion" had just reported sighting one, the "King George V.," leading the battle fleet, sent a warning that a submarine was just ahead of the "Iron Duke," then the "Duke of Edinburgh" reported one "2 points from right ahead." It is now known that there were no submarines in the vicinity, but these reports could not well be ignored, so Jellicoe took the best course possible and turned directly towards the supposed

ron at the northward end of the line was seen to open fire. The "Marlborough's" gunnery efficiency had not been impaired by her underwater injuries, and she discharged salvo after salvo at the "König" as the head of the enemy battle fleet came into sight. The rest of the squadron took up the engagement and soon the leading German ships were smothered in shell at a range of less than 9,000 yards. At 7.13 the "Iron Duke" came

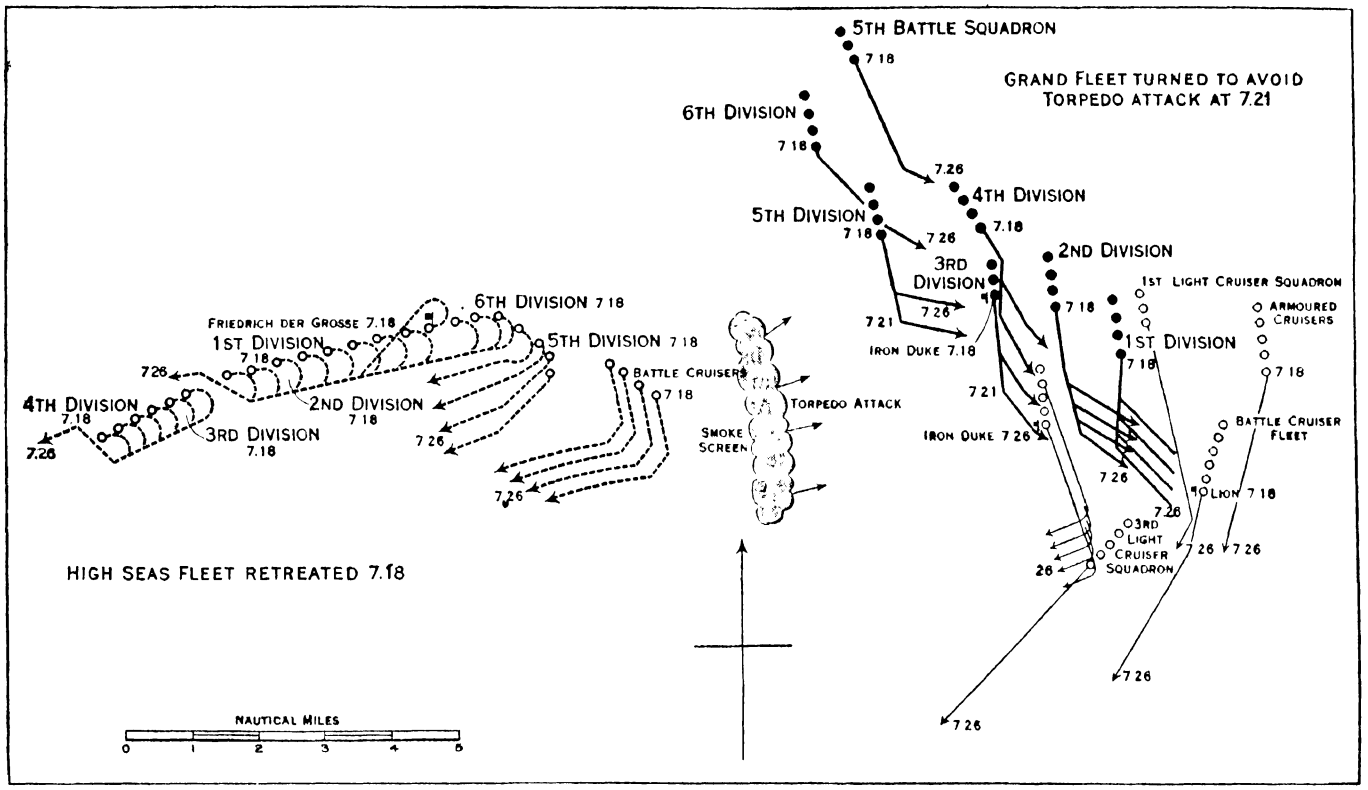

FIG. 5.—SECOND RETIREMENT OF GERMAN FLEET (7 18 P.M TO 7 26 P.M.)

menace Incidentally this brought the course of the fleet back to south and re-formed the divisions into line ahead, the leaders being disposed quarterly. Hardly was the turn completed before the enemy reappeared out of the mist.

THE BATTLE FLEETS RE-ENGAGE

Having extricated his fleet from one trap it seems incredible that Scheer should have deliberately walked into another (*see* fig. 5). In his official despatch he says: "It was as yet too early to assume night cruising order. The enemy could have compelled us to fight before dark, he could have prevented our exercising our initiative, and finally, he could have cut off our return to the German Bight." If ever there was a man who wanted to avoid decisive action it was the man who penned those words, yet in the next paragraph of his despatch he makes the illogical statement: "There was only one way of avoiding this: to deal the enemy a second blow by again advancing regardless of the consequences, and to bring all the destroyers to attack." The manner in which the High Seas Fleet renewed the action was such that its course was practically at right angles to that of the Grand Fleet, whose battleships were stretched across his bows so that they could concentrate on the leading German ships, while those in rear trailed astern out of action. The evidence goes to show that Scheer hoped to pass astern of the British line and thence make his way to the eastward, possibly engaging a detached force en route. If he had succeeded, he could then have made for home, fighting a rearguard action.

But Jellicoe had forestalled him. The British Battle Fleet was fair across his path and, in the low visibility prevailing, its commander-in-chief had not risked dividing his forces. First some enemy light cruisers appeared to the southwest of the "Iron Duke." A few minutes later, at 7.12, the 1st Battle Squad-

into action again. Once more the Grand Fleet was in a position of overwhelming tactical advantage and ship after ship joined her fire and picked out a battleship or battle-cruiser target as occasion offered. Meanwhile a small force of enemy destroyers had developed an attack which caused Sturdee to swing his 4th Division away two points to avoid their torpedoes. Directly the attack had expended itself, he turned back to the course of the fleet, approximately south, which brought him into line astern of the 3rd Division led by the "Iron Duke."

Jellicoe had been holding steadily on his course across the head of the enemy, but seeing his rear divisions in some danger of segregation he ordered them to form astern of him, while the "King George" was directed to lead the van into line ahead. And now the full fire-effect of the British battleships was rapidly developing, and Scheer saw that his leading ships were in danger of annihilation; another "right-about turn" was imperative. But the enemy seemed right on top and half round him. Drastic measures were necessary to get clear. The German battle cruisers would have to be sacrificed, if need be, to save the battle fleet. He made a signal to them which, read literally, meant "charge the enemy; ram; ships are to attack without regard to consequences." At the same time the destroyers, once again, were launched *en masse* to attack.

The "Lützow" had been completely disabled in the first contact of the main engagement, and was still ablaze and out of action. Hipper had not yet been able to get on board another battle cruiser, but Capt. Hartog, in the "Derfflinger" with the remaining three, led off gallantly on what the Germans have called a "death ride." To make matters worse, the British battle cruisers which had been working round on the outer arc of the circle, so to speak, were now coming into action again. So the enemy's 1st Scouting Group became the centre of a perfect

hurricane of fire. The "Derfflinger" had two turrets shattered to bits and was being hit again and again, the "Seydlitz," "Moltke" and "Von der Tann" were also suffering severely when the welcome signal came permitting them to withdraw. By 7.20 the German Battle Fleet had repeated its former tactics and was retreating pell-mell to the westward behind a dense smoke screen put up by its destroyers. The latter pressed on to attack with more determination this time. There was no other enemy in sight so Jellicoe was free to concentrate his attention on this one. A heavy fire was opened on the oncoming torpedo craft which made them loose their torpedoes at long range. At 7.21 the British commander-in-chief swung his ships away in two quick successive turns of two points each before the torpedoes could reach the line. The result was that this attack was completely foiled. A second and third attack were countered by Commodore Le Mesurier's 4th Light Cruiser Squadron which, crossing from its station on the disengaged bow, drove furiously at the enemy. One German destroyer, "S.35," was sunk and several badly damaged. Jellicoe was, for the time being, in complete ignorance of what his main enemy was doing, but directly the torpedo attack had spent itself he, at 7 35, swung the fleet back five points to starboard and steered S. by W. (*See* fig. 4)

Beatty had by now worked his way round to the starboard bow of the Battle Fleet and was heading southwest. At 7.40 he signalled to the commander-in-chief to say that the enemy was about 10 m. N.W. by W. But the "Lion" was quite out of sight from the fleet flagship, and her own position, as she gave it, was obviously wrong. Jellicoe, however, turned southwest, on the same course as his battle cruisers. At 7.45 Beatty again reported the position of the enemy, this time adding that the latter's course was about southwest. This signal was made to the "Minotaur" by searchlight, passed by her to the "King George V.," who passed it on to the "Iron Duke," where it did not arrive till 7 59. Jellicoe promptly turned the battle fleet west by divisions, and increased to 17 knots to regain touch with the enemy. Hardly had he done so before a wireless message came to hand from Beatty saying: "Submit van of battleships follow battle cruisers. We can then cut off whole of the enemy's battle fleet." The commander-in-chief ordered Admiral Jerram, at the head of the line, to comply with this request, but, owing to the unavoidable delay in cyphering, transmitting and decyphering the message, the "Lion" had by then lost sight of the enemy; moreover, the battle cruisers were not in sight from the "King George V." In point of fact, the battle fleet was already steering straight for the enemy.

Although he had twice butted his head into trouble and twice withdrawn it considerably battered, Scheer was loath to be forced further to the westward and away from home. So, at 7.53, he hauled round and made his way tentatively to the southward. (*See* fig. 4.) Jerram had been somewhat at a loss as to how he was to carry out his orders, but hearing gunfire on the port bow, he turned his division towards it, and at 8.21 was heading W.S.W. The firing came from Rear-Adml. Napier's 3rd Light Cruiser Squadron, which was engaging the 4th Scouting Group at the head of the High Seas Fleet. After a sharp conflict the enemy turned away and disappeared. Meanwhile, Beatty, who was also steering west, had again sighted the German battle cruisers and beyond them the pre-Dreadnought battleships steering south. He thereupon turned in succession to W.S.W. and opened fire. An attempt by hostile destroyers to attack the British battle cruisers was frustrated by Le Mesurier's Light Cruiser Squadron. Beatty held on his course and was beginning to inflict severe punishment on the sorely stricken enemy battle cruisers; but they could stand no more, and, running out of action to the westward, sought cover behind the old ships of Admiral Mauve's 2nd Battle Squadron.

Meanwhile Jellicoe had good reason to be satisfied with the situation. His battle cruisers had made contact, he was between the German fleet and its own coast, and he seemed on the point of renewing the engagement. At 8.28 he turned by divisions to southwest and stood down on a converging course expecting momentarily to meet his adversary. But Scheer foresaw the impending collision, indeed his headmost ships were already in the track of the on-coming storm. He had no intention of suffering again from its full blast, and by 8.35 he had turned hastily to the westward and disappeared before the British battle fleet came in sight. So the firing died away; and now the mists of night rolled down between the rival forces. It was past 9.00 before Jellicoe was fully informed as to the situation; then he received a message from the "Lion" reporting that at 8.40 the enemy's battle cruisers and pre-Dreadnought battleships bore from that ship N. 34° W. 10 to 11 m. and were steering southwest. Beatty at the same time made his position and gave his course also as southwest.

By this time it was an hour after sunset and growing darker every moment. The hazards of a fleet action at night were unthinkable to a wise commander. It only remained for Jellicoe to maintain his position between the enemy and the German coast until he could fight to a finish the next day. He therefore set about making his dispositions for the dark hours.

IV. EVENTS OF THE NIGHT

There were three potential lines of retreat for the High Seas Fleet. (*See* fig. 1.) The northerly one led to Horn Reefs, and thence down the swept channel inshore of the Amrun Bank minefield to the mouth of the Jade; the second would be reached by a southerly course to a swept channel which led eastward close to Heligoland; lastly, there was the swept channel which led from the vicinity of the Ems river parallel to the coast to the entrance into the Jade. (*See* fig. 1.)

Jellicoe's Dispositions.—At 9.17 Jellicoe ordered the fleet to take up night cruising stations. This meant that the battle fleet were to close up into three parallel columns with the 5th Battle Squadron, now consisting of three ships only, on the port quarter. The "Warspite" after her involuntary circle at 6.20 P.M. continued to have trouble with her steering gear. At 7 00 she withdrew from the action and at 8.50 was ordered back to Rosyth. She had been badly hit in the earlier fighting. Beatty had already anticipated his commander-in-chief's wishes and having taken station ahead and placed the 1st and 3rd Light Cruiser Squadrons to the southward and westward of him, assumed the course and speed of the fleet; this was south at 17 knots. Five miles astern of the battle fleet Jellicoe massed his destroyer flotillas. This had the following advantages:—

(*a*) It covered the rear of the fleet from attacks by hostile flotillas.

(*b*) It increased the chances of intercepting the enemy should he endeavour to make to the eastward, and of obstructing his passage by torpedo attacks.

(*c*) It kept the Grand Fleet destroyers clear of their own battleships and therefore minimised the chances of disastrous mistakes in the dark.

The value of these dispositions was to some extent diminished by the difficulty of communicating their purport to commanding officers, especially those of the innumerable destroyers, but, in effect, the British fleet ploughing through the night presented a living wall of steel barring the enemy's passage home.

Scheer's Return.—Scheer also prepared for the night. His 1st Battle Squadron led the line and was followed by the 3rd Battle Squadron; then came the older ships of the 2nd Battle Squadron and lastly the three sorely wounded battle cruisers. The "Lützow" was limping along to the northward sinking deeper and deeper by the bows. At 2 A.M. she had to be abandoned and was afterwards sunk with a torpedo. The light cruisers of the 2nd and 4th Scouting Groups were stationed near the head of the battle fleet, while in advance of all were the majority of the German destroyers groping like antennae into the darkness. About 9.30 Scheer started to feel his way to the eastward, the van of his line turning S.S.E.¼E., a course which headed for Horn Reefs. Shortly after 10.00 his advanced light cruisers came into contact with the right wing of the flotillas bringing up the rear of the Grand Fleet. A sharp fight took place in which the "Castor," leading the 11th flotilla, was severely handled. The near-by destroyers would probably have retaliated with more effect had they not been deceived by the enemy making part of the British challenge for the day. This he appears to have

picked up through indiscreet flashing signalling between the "Lion" and "Princess Royal," about half an hour previously.

The High Seas Fleet recoiled slightly after this brief encounter, but even the rival forces continued to converge and now Goodenough's light cruisers once more came into the forefront of the scene. He had been keeping in touch with the "Marlborough's" division, but owing to the under-water injuries of the flagship, the latter was lagging nearly three miles astern of its proper station. The "Castor's" engagement had put the "Southampton" and her consorts on the alert, and they were well prepared when, about 10.30, they suddenly found themselves abreast the 4th Scouting Group. A fierce contest ensued. The "Southampton" was the most vigorously assaulted. Her upper deck became a shambles and she was blazing like a haystack from cordite fires, but in the midst of this holocaust she fired a torpedo which sunk the "Frauenlob" with all hands. At the end of a quarter of an hour the enemy had had enough and drew off into the darkness. The German light cruisers had already reported the presence of enemy light forces and the order stationing the British destroyer flotillas astern had been intercepted and translated to Scheer by a shore wireless station. From these reports he probably realised that the British Battle Fleet had drawn ahead. In any case he was determined to force his way to the eastward. At 10.30 he turned back to S E.½E. heading direct for Horn Reefs Light Vessel.

The British Destroyers in Action.—The rest of the story of that night is one of sudden encounters with an enemy fighting desperately to get home while British destroyers gallantly threw themselves in his path whenever opportunity served The German fleet was frequently in a state of much confusion, the "Elbing" was rammed by the "Posen" and later had to be sunk to prevent capture. The "Rostock" was torpedoed by the 4th Flotilla and also had to be sunk. On the British side the destroyers suffered severely. About 11.30 the "Tipperary" was so badly damaged by gunfire that she sank the next morning. The "Spitfire" met the great battleship "Nassau" nearly end on, tore twenty feet from the latter's plating and carried it off on her forecastle. She was badly damaged but had done good execution with her small gun armament, putting out the big ship's searchlights and causing a number of casualties.

The shock of this conflict again caused the German fleet to waver and the leading battleships turned away nearly eight points to the westward, but Scheer was adamant in his determination to break through at all costs while darkness gave hope of escape. He forced his van back, and by 11.34 the "Westfalen" was again leading the line to the south-eastward. In another encounter a few moments later the "Broke's" steering gear was disabled and she and the "Contest" rammed the "Sparrowhawk," and the latter had to be sunk the next day. Between midnight and 12 30 A.M. the "Fortune" and "Ardent" were sunk and the "Porpoise" disabled by gunfire, and the "Turbulent" was rammed and sunk with all hands. The armoured cruiser "Black Prince," which had got separated from the fleet, was making her way to the southward when she fell in with the German battle fleet. Under the glare of their search lights she was sunk by overwhelming fire at point-blank range. Again and again the British light craft attacked, but from now onwards the enemy held his course; and the tragedy of that night was that no accurate information of the German battle fleet was vouchsafed to Admiral Jellicoe.

Admiralty Messages.—Two reports, based on intercepted wireless messages, were sent to Jellicoe by the Admiralty. One, despatched at 9.58, received in the "Iron Duke" about 10 23, but not deciphered and read until 11, gave an obviously wrong position of the rear ships of the enemy battle fleet at 9 P.M. A second message, dispatched at 10.41, received at 11.05, and read about 11.30, stated that the German battle fleet had been ordered home at 9.14, battle cruisers in rear, course S.S E.¾E., 16 knots. This latter was a summary of several intercepted signals but most unfortunately it omitted the fact that Scheer, at 9 06, had made an urgent call for airship reconnaissance off Horn Reefs at daylight, clearly indicating his intended line of retreat. The second Admiralty message referred to the enemy's movements at 9.14, but at 11.38 Goodenough's report was received saying: "Have engaged enemy cruisers at 10.15 bearing W S W.," and about the same time the "Birmingham" also reported from astern: "Battle cruisers probably hostile in sight northeast course south" (11.30). These reports came from ships which had actually sighted the enemy long after the time referred to in the Admiralty messages. They indicated that he had not yet turned home. The "Birmingham," unfortunately, sighted the German heavy ships at a moment when they had turned away from our torpedo attacks, his report therefore was misleading, but other ships might have saved the situation.

At 11.35 the "Valiant," last ship but one of the 5th Battle Squadron, noted what appeared to be "two German cruisers with at least two funnels and a crane amidships, apparently steering to the eastward at a high speed." These details make it certain that the ships were battleships and should have been recognized as such. The "Malaya," the last ship of the squadron, had a clearer view and noted at 11 40 "enemy big ships, three points abaft the starboard beam, steering the same way as ours." By the flash of an explosion the leading ship was seen to have "two masts, two funnels and a conspicuous crane (apparently "Westfalen" class)." It was obvious that the enemy's main fleet had closed in from the westward and was edging its way across the wake of the 5th Battle Squadron, yet for some inconceivable reason the captains of these two ships neglected to report what they had seen. Had they done so it would have greatly increased the chances of an overwhelming victory next day The courage and self-sacrifices of the British destroyers did not provide the one thing lacking, *i.e.,* information. Before the curtain of darkness had lifted, Scheer had hacked his way through the light forces and passed to the eastward.

Scheer was not yet out of the wood, however. About 1.45, just as a faint grey light was heralding the approaching dawn, Captain Stirling, in the "Faulkner" with his fine 34 knot 12th Flotilla, sighted large ships on his starboard bow, steering a southeasterly course. Even as he manoeuvred to attack he thought to send a wireless report to his commander-in-chief. The attack, carried out with the greatest dash and gallantry, resulted in the battleship "Pommern" being sunk without a trace. Again Captain Stirling made his wireless message, but neither of his reports reached the "Iron Duke." About 2.25 in the growing light, the "Champion" with three destroyers sighted the enemy. One of the latter, the "Moresby," broke off at once and made a plucky attack which sank the German destroyer "V4," but the "Champion" turned to the eastward and made no report.

At 2 39 A.M. Jellicoe turned north. He had been left with the impression that the enemy had been following him south and now, with daylight rapidly returning, he was anxious to get in touch with a view to renewing the engagement. It had been his intention to close Horn Reefs at dawn, but the night fighting had scattered his flotillas and he deemed it imprudent to thrust into enemy waters until he could collect a destroyer screen. A signal from the Admiralty, despatched at 1 48 A.M. but not received in the "Iron Duke" until 2 40 informed the commander-in-chief that enemy submarines were apparently coming out from German ports. The battle fleet formed single line on the northerly course so as to be ready for emergency in the early morning haze, and so, retracing his path, Jellicoe expected momentarily to fall in with his destroyer flotillas and possibly the damaged "Lützow." Tyrwhitt's Harwich Force had, at last, been ordered to sea, and by 3.50 A.M. he was under way, much too late to be of service. From 3.15 A.M. Zeppelins began to be sighted and at 3 42 A.M. the British battle fleet had turned expectantly towards the sound of guns, but found that it was only some of their own cruisers engaging one of the enemy airships. It was obvious, however, that by now the position of the British fleet must be known to the German command. The hope of meeting the enemy which had been growing fainter was finally shattered by an Admiralty message received at 4.15 A.M. saying that at 2.30 A.M. the High Seas Fleet was only 16 m. from Horn Reefs steering S E b S. at 16 knots.

Beatty was still clinging to the idea that the enemy was to the south-westward, and asked permission to sweep in that direction; but at 4 30 A.M., having re-formed into cruising formation, Jellicoe regretfully made the signal "Enemy fleet has returned to harbour." Scheer reached Horn Reefs Light Vessel about 3 A.M. There he lingered for a short space receiving reports from his airships and taking stock of the condition of his fleet. At 3.30 A.M. he was informed that the "Lützow" had had to be sunk. The rest of the 1st Scouting Group was in no condition for serious action, the battleships which had been in the van had also suffered considerably, and he had only three light cruisers serviceable; moreover the visibility was such that he could not rely on airship reconnaissance. Indeed many of the reports which he received from this source have since been proved to be very inaccurate. A policy of discretion was obviously dictated, and he gave the order for the whole fleet to return to harbour. On the way in, the battleship "Ostfriesland" struck a mine laid in the channel by the British destroyer "Abdiel" but got home.

The losses may be summarised as follows:—

Ships		
	British	German
Battleships	Nil	1
Battle cruisers	3	1
Cruisers	3	Nil
Light cruisers	Nil	4
Torpedo craft	8	5
Personnel		
	British	German
Officers (killed)	328	160
Men (killed)	5,769	2,385
Officers (prisoners)	10	Nil
Men (prisoners)	167	Nil
	6,274	2,545

On the face of them these figures would appear to leave the balance of Jutland in favour of Germany, so far as destruction of men and ships is concerned, but the value of the battle must be measured in its after effects and not in its momentary losses.

Results.—The broad effects of Jutland are a matter of history, but they may be summarised as follows:

1. The High Seas Fleet after "consistently refusing action and manoeuvring with the sole object of returning safely to its base," as Jellicoe has put it, left the Grand Fleet in undisputed possession of the arena.

2. Although the German High Command must have realised that the Grand Fleet as a "fleet in being," was the fulcrum of the whole Allied cause, the High Seas Fleet only once left the Heligoland Bight after Jutland; this was on Aug. 19 of the same year. On this occasion Scheer was warned by airship reconnaissance that the British Battle Fleet was advancing to meet him, whereupon he returned to his base.

3. In Nov. 1918 Scheer ordered the High Seas Fleet to sea "to break the blockade." It was to have been a final bid for victory, but inaction had only served to crystallise the memories of Jutland; the crews refused to weigh anchor. This mutinous outbreak at Wilhelmshaven widened the fissure which shortly afterwards engulfed the whole German cause.

4. The full fruits of Jellicoe's domination of the German Fleet at Jutland were yielded on Nov. 21, 1918, when Beatty received the surrender of the greater part of the High Seas Fleet.

JUTURNA: *see* IUTURNA.

JUVENAL (DECIMUS IUNIUS IUVENALIS) (*c.* A.D. 60–140), Roman satirist and poet, was probably born at Aquinum. Our knowledge of his life is slight, though various mediaeval mss. of his works have a *Life* of the author prefixed to them. Many of the statements they contain are improbable, and most of the rest seem to be deductions from passages in his works, and not derived from any independent source. Our material consists of 13 of these *Lives*, an inscription from Aquinum which may or may not be relevant, three poems addressed to Juvenal by Martial, and an allusion, almost certainly to him, in Sidonius Apollinaris. The most reliable of the *Lives* tells us that Juvenal was the son or ward of a wealthy freedman; it is impossible to tell if this is true or not; if it is, the rancour with which he attacks the whole class in his satires is surprising; that until middle age he practised declamation, which is not improbable; that he published his satires late in life, when they met with great success, and that an actor of the time, annoyed at a passage really aimed at Paris, Domitian's favourite, had the poet banished, under the form of a military appointment, to Egypt, where he died at the age of eighty. The only independent tradition in all this is the reference to his exile. The idea of military service, in Egypt of all places, being used as a cloak for exile does not sound particularly convincing, but the tradition is persistent The story of military service is to some extent confirmed by an inscription found at Aquinum (*C.I.L.* X., 5382), recording the dedication of an altar to Ceres by a Iunius Iuvenalis, tribune of the first cohort of Dalmatians, *duumvir quinquennialis* and *flamen Divi Vespasiani*. On the question whether this is or is not the poet, opinions differ flatly. Duff (preface to his edition of the *Satires*) is against the identification, Friedländer for it. Juvenal certainly does not write like a soldier, nor like a man who has held important offices in a country town. On the other hand it is tempting to relate his obvious interest in, and one might almost say personal acquaintance with, Britain to service with a corps which is known to have been there.

From the poems of Martial addressed to Juvenal we may conclude that Juvenal was in Rome in 92 (*Epig.* VII., 91) and 101 (XII., 18). Martial addresses Juvenal as *facundus*, into which phrase it is possible to read as little as a mere reference to the eloquence of Juvenal's verse, or as much as a definite implication that Juvenal had a forensic practice. Sidonius' reference (*Carm.* IX., 269) has no further value than to show that the tradition of his exile was prevalent in the 5th Century A.D.

The *Satires* were published at intervals, grouped in books as we have them now, but they were not necessarily written in that order, or even at about the same times. Repeatedly there are references to the life, public, literary and private, of Domitian's reign as if it belonged to the present, while the first book was certainly not published till the beginning of Trajan's reign. Juvenal would not be the only man of letters of the period who shunned publication till that tyranny was overpast.

Contents of the Satires.—The first book contains satires 1–5, and belongs to the first years of the second century. It cannot be earlier than 100, and has been dated as late as 112–116. Satire 1 is a general introduction. "Why do I write satire?" he asks; "say rather, how could I help it?" The famous lines

Quidquid agunt homines, votum, timor, ira, voluptas,
Gaudia, discursus, nostri est farrago libelli

give the key-note of all that is to follow. The third satire is a description of Rome, imitated by Johnson in his poem on London. Among the many pictures it contains of the discomforts and dangers of the capital, two incidents in Juvenal's best style stand out, a street accident and a nocturnal "hold-up." The remaining two satires are slighter; the fourth tells the story of Domitian's turbot, with a picture of the ghastly crew that surrounded him, the fifth recounts the indignities of the poor at the rich man's table.

Book two contains only the famous sixth satire, directed against the female sex. The theme is "Why marry, as long as there is still rope to hang oneself with?", illustrated by portraits of every variety of female horror from Messallina to the bluestocking. The allusion to a comet boding disaster to Parthia can be related to Trajan's Eastern campaign, and will give us 116 as a date.

The third book, Satires 7–9, seems to be dated by its opening to the accession of Hadrian (118), though the eighth satire was probably written earlier. The seventh satire hails the new reign as the dawn of better days, but laments that literature (unless one is a writer of pantomime) is still an unprofitable profession, and rhetoric is in the same plight. The eighth is on a well-worn Stoic theme, *stemmata quid faciunt?*, rely on the distinction of personal virtue, not on the fame of your ancestors.

The fourth book cannot be exactly dated. It contains the famous tenth satire, the eleventh and the twelfth. In the tenth, imitated by Johnson as the *Vanity of Human Wishes*, the various objects of ambition and desire are recounted, with examples of the disasters that have befallen those who have achieved them. The eleventh is an invitation to dinner, contrasting his simplicity with the fashionable luxury; here he states directly what the abatement of his former tremendous energy and indignation suggest, that he is growing old.

Nostra bibat vernum contracta cuticula solem.

The twelfth is a portrait of a legacy-hunter.

The fifth book, satires 13–16, can be dated 127–128. The work is now on a lower level, its tone gentler and its grip less powerful. The outstanding poem in the book is the fourteenth, on the power of parental example for good and ill. The last is unfinished.

From the change of tone discernible from the tenth satire, onwards, the increasing prolixity and tendency to abstraction, Ribbeck (*Der echte und der unechte Juvenal*, Berlin, 1865) sought to deduce a double authorship of the *Satires*. Nobody believes this now.

Juvenal had a decisive influence in the history of satire. Before him the satire in Latin literature had been true to its name, a sort of hotch-potch. The term covered equally the mixed verse and prose extravaganza of Petronius and the easy conversational *sermones* of Horace. But Juvenal was the outstanding, as he was the first, example of a truly great tragic Satirist. He carried the rhetorical form of Satire to the utmost limits of excellence. He was the first in whose work there shows no negligence, but rather an excess of elaboration. His diction is full, even to excess, of meaning, point and emphasis. Juvenal might seek to affiliate his work to Horace, but his real prototype is Lucilius; with his moralist temper, his rhetorical training and his Stoic philosophy, Juvenal turned the easy-going Latin *satura* into a fixed verse-form restricted, practically speaking, to the note of denunciation.

There is little humour in Juvenal, and what there is, is grim; there is less kindliness, though the helpless and dependent, the "homesick boy from the Sabine highlands," are sometimes treated more gently than the rest of the world. His most remarkable gift, apart from the blazing indignation with which all his work is suffused, and the terrific power and violence with which it is expressed, is his gift of presentation. The satires are studded with unforgettably vivid single sketches of various kinds: historical vignettes like that of Sejanus, characters hit off in a line or elaborately drawn, and scenes from everyday life that set the Rome of his day alive before us; perhaps one should say, the Rome of his earlier days, for in the true temper of the satirist Juvenal fails to do justice to the improvements, at any rate in public life, that followed the bad times of Domitian.

Juvenal leaves a mixed impression, both as a poet and as a man. In neither capacity is it easy to feel affection for him, or to refuse him respect. His verse is powerful and well-constructed, true Silver Age Latin in its epigrammatic force and point, if often overstrained. It is superb rhetoric nearly always; hardly ever, perhaps, true poetry. Yet Pope himself never enriched a language with so many crisp, clean-cut phrases of the sort that pass inevitably into common use: *nam quis custodiet ipsos Custodes? Mens sana in corpore sano: Nemo repente fuit turpissimus: Maxima debetur pueris reverentia: Panem et circenses:* these are but a few. As the style, so the man; he is harsh but undeniably strong. Swinburne said that Juvenal knew what he hated, and that was tyranny and democracy; but this seems unduly limited. He hated nearly everything he saw, impartially; not only the vice and cruelty of his age, but its luxury, its art, its poetry, even its philosophy. He is a sort of Cato, cut off from public life and forced to express his combative nature in literature; what seem to us his most surprising lapses of judgment, his habit, for example, of placing at the head of a list of appalling crimes what is at worst an error of taste, all this is due to his intensely Roman feeling, his hatred of any degeneration from the old Roman standard of manliness and self-respect. He could only see the evil effects of Greek influence, and they blinded him to its humanising value.

In the structure of his verse Juvenal returned to the Virgilian type of hexameter. His style shows most of the usual tendencies of the time, particularly a frequent use of the diminutive forms of words from the *sermo cotidianus*.

BIBLIOGRAPHY.—The best of the known manuscripts of Juvenal (P) is at Montpellier (125); but there are several others which cannot be neglected. Amongst these may be specially mentioned the Bodleian MS. (Canon. Lat. 41), which contains a portion of Satire vi., the existence of which was unknown until E. O. Winstedt published it in the *Classical Review* (1899), pp. 201 *seq* Another fragment in the Bibliothèque Nationale was described by C. E. Stuart in the *Classical Quarterly* (Jan. 1909). There are two classes of scholia—the older or "Pithoeana," first published by P Pithoeus, and the "Cornutus scholia" of less value. The earliest edition which need now be mentioned is that of P. Pithoeus, 1585, in which P. was first used for the text. Amongst later ones we may mention the commentaries of Ruperti (1819) and C. F. Heinrich (1839, with the old scholia), O. Jahn (1851, critical with the old scholia), A. Weidner (1889), L. Friedländer (1895, with a full verbal index). The most useful English commentaries are those of J. E. B. Mayor (a voluminous and learned commentary on thirteen of the *Satires*, ii., vi. and ix. being omitted), J. D. Lewis (1882, with a prose translation) and J. D. Duff (1898, expurgated, and ii. and ix. being omitted). There are recent critical texts conservative and chiefly based on P. by F. Buecheler (1893, with selections from the scholia) and S G. Owen (in the Oxford Series of Texts); on the other side, by A. E. Housman (1905) and by the same, but with fewer innovations, in the new *Corpus poetarum latinorum*, fasc. v. The two last-named editors alone give the newly discovered lines of Satire vi. Dryden translated i., iii., vi., x. and xvi., the others being committed to inferior hands. Other versions are Gifford's (1802), of some merit, and C Badham's (1814). English prose version by Ramsay (London, 1918). Johnson's imitations of Satires iii. and x. are well known. For the numerous articles and contributions to the criticism and elucidation of the *Satires*, reference should be made to Teuffel's *Geschichte der römischen Literatur* (Eng. trans. by Warre), § 331, and Schanz, ditto (1901, ii. § 2, §420*a*).

Scott, *The grand Style in the Satires of Juvenal* (1927). On the question of the inscription, *see* P. Knox McElderry, in *Class. Quart.* 16 (1922), arguing for a visit to Ireland in 81; Friedländer, *Sittengeschichte*, and Nettleship in *Journ. Phil.* 16, 45. (W. Y. S.; J. P. P.)

JUVENILE COURTS: *see* CHILDREN'S COURTS.

JUVENILE OFFENDERS. In modern social science the question of the proper penal treatment of juvenile (*i.e.*, non-adult) offenders has been increasingly discussed; and the reformatory principle, first applied in the case of children, has even been extended to reclaimable adult offenders (juveniles in crime, if not in age) in a way which brings them sufficiently within the same category to be noticed in this article In the old days the main idea in England was to use the same penal methods for all criminals, young and old; when the child broke the law he was sent to prison like his elders. It was only in comparatively recent times that it was realized that child criminals were too often the victims of circumstances beyond their own control. They were rather potential than actual criminals, calling for rescue and regeneration rather than vindictive reprisals. Striplings of 13 and 14 had been committed 10, 12, 16 or 17 times. Religion and moral improvement were little regarded in prisons, industrial and technical training was impossible The chief lesson learnt was an intimate and contemptuous acquaintance with the demoralizing interior of a gaol. There were at one time in London 200 "flash houses" frequented by 6,000 boys trained and proficient in thieving and depredation.

The substantial movement for reform in England dates from the first Reformatory School act in 1854. Sporadic efforts to meet the evil had indeed been made earlier. In 1756 the Marine society established a school for the reception and reform of younger criminals; in 1788 the City of London formed a similar institution, which grew much later into the farm school at Redhill. In 1838

an act of parliament created an establishment at Parkhurst for the detention and correction of juvenile offenders, to whom pardon was given conditional on their entrance into some charitable institution. Parkhurst was technically a prison, and the system combined industrial training with religious and educational instruction. These earlier efforts had, however, been quite insufficient to meet the evils, for in the years immediately preceding 1854 crime was being so constantly reinforced in its beginnings under the existing penal system, that it threatened to swamp the country. Unofficial, but more or less accurate, figures showed that between 11,000 and 12,000 juveniles passed annually through the prisons of England and Wales, a third of the whole number being contributed by London alone. In 1854 the total reached 14,000. The ages of offenders ranged from less than 12 to 17; 60% of the whole were between 14 and 17; 46% had been committed more than once; 18% four times and more.

The Reformatory School act 1854, substituted the school for the gaol, and all judicial benches were empowered to send delinquents to schools if over the age of 12 and under the age of 16 when they had been guilty of acts punishable by short imprisonment. A serious flaw in this act long survived; this was the provision that a short period of imprisonment in gaol must precede reception into the reformatory; it was upheld by well-meaning but mistaken people as essential for deterrence. But more enlightened opinion condemned the rule as inflicting an indelible prison taint and breeding contamination, even with ample and effective safeguards. Wiser legislation has followed, and an act of 1899 abolished preliminary imprisonment.

Certified Schools.—Reformatories, or "senior home office schools" as they are officially styled, in England numbered 28 in 1928. They maintain 1,861 boys and 163 girls They receive all juvenile offenders, up to the age of 16, who have been convicted of an offence punishable with penal servitude or imprisonment Industrial schools or "junior home office schools" receive children under 12 years of age who have been found guilty of an offence, or under 14 if not previously convicted To these schools may also be sent children found wandering, begging in the streets, frequenting the company of thieves, living in immoral surroundings, playing truant from school, etc. There are now 57 industrial schools (37 for boys and 20 for girls). The number of children sent to schools of either kind has greatly diminished In the year 1913 there were 18,916 inmates; in 1926 only 6,871 inmates. Whilst at one time there may have been too great a readiness to commit to certified schools, the tendency would appear now to be in the opposite direction, yet these schools were never so efficient as they are at present, nor their work so valuable. Older offenders, between 16 and 21, come within the category of juvenile adults and are dealt with differently (*see* BORSTAL SYSTEM).

The disciplinary system of the English schools is planned upon the establishment or institution system, as opposed to that of the "family" or "boarding out" systems adopted in some countries, and some controversy has been aroused as to the comparative value of the methods. The British practice has always favoured the well-governed school, with the proviso that it is kept small so that the head may know all of his charges But a compromise has been effected in large establishments by dividing the boys into "houses," each containing a small manageable total as a family under an official father or head. Under this system the idea of the home is maintained, while uniformity of treatment and discipline is secured by grouping several houses together under one general authority. The plan of "boarding out" is now being adopted very largely in the case of young children, who although technically "committed" to a particular school are in reality boarded out by the school authorities and remain under their control, becoming inmates of the school on attaining the age of 10 years. The value of the domestic training is questionable and of uncertain quality, depending entirely upon the character and fitness of the foster-parents secured. Education must be less systematic in the private home, industrial training is less easily carried out, and there can be none of that *esprit de corps* that stimulates effort in physical training as applied to athletics and the playing of games.

Under careful management and the wise inspection and supervision of the Home office, the "certified schools," both Reformatory and Industrial, have attained a very high degree of efficiency. Punishments in them have greatly decreased and a much larger measure of freedom and self-development has been secured. In nearly all schools the boys or girls go into "camp" for a summer holiday and, where conditions render it possible, also have a short holiday with parents or relations. The standard of education has been raised and the technical instruction has become really valuable in after life.

Inmates of certified schools remain after discharge under the control of the authorities; in the case of the senior schools until 19, in that of the junior until 18 years of age. This system enables the managers to give every boy and girl on leaving a good start in life in a carefully selected occupation. So efficient has it now become that some schools are able to claim 95% of successes for those discharged under control.

Certain schools specialize in nautical training, others in farm work, but nearly every trade and occupation is open to choice, the Army receiving a very large number. Exact figures are given in the Home office reports.

Special Features.—Nearly all civilized countries have provided institutions for the care and training of Juvenile Delinquents and in most instances they are conducted on lines very similar to those of the British certified schools.

Belgium has inaugurated an experiment of great interest in the establishment of "observation schools" at Molle for boys and at Namur for girls. The period of residence lasts for about three months and during this time every characteristic of the child, physical, mental, psychological and vocational, is carefully studied, so that the Court having cognizance of the particular case may be fully advised as to the best method of treatment.

Holland has not only followed Belgium in this respect but has instituted a system of special police for the control and care of children and most countries have now established Children's Courts.

The "George Junior Republic" (*q.v.*) is a remarkable institution established in 1895 at Freeville, near the centre of New York State, by Mr. William Reuben George The original features of the institution are that the motto "Nothing without labour" is rigidly enforced, and that self-government is carried to a point that, with mere children, would appear whimsical were it not a proved success. The place is, as the name implies, a miniature "republic" with laws, legislature, courts and administration of its own, all made and carried on by the "citizens" themselves. The tone and spirit of the place appeared to be excellent and there is much evidence that in many cases strong and independent character is developed in children whose antecedents have been almost hopeless.

Some time back the experiment of establishing a penal reformatory for offenders above the age hitherto committed to reformatory schools was resolved upon. This led to the foundation of the Borstal scheme, which was first formally started in October 1902 (*see* BORSTAL SYSTEM). (X.)

United States.—It is only within the century that the notion of a differentiated treatment of the youthful offender led to the establishment of separate correctional institutions for juvenile offenders under 16 years of age. The first of these houses of refuge, as they were called, was set up in the City of New York in 1825. Under the general description of reform schools, institutions of this type multiplied in the United States, some under public and some under private, religious or other benevolent auspices. These have for the most part been prisons in all but name and have done little to reform the young delinquents committed to their custody, but the last 20 years have marked a considerable improvement in the spirit and methods of their administration. The more recent tendency is to locate them in the country and to house the inmates in cottages holding from 20 to 40 each, under the immediate supervision of a house-father and mother. In this new phase of their development these institutions are commonly known as State, city or county homes or industrial schools. There are to-day (1928) 145 such institutions in the United States wholly or in part supported out of the public funds.

Commitments are made by the juvenile courts and are for an indeterminate period in the discretion of the management of the school. The boy or girl committed may be held until he or she attains the age of 21, but the usual period of residence does not exceed three years. Release is conditional on parole, subject to supervision by the parole officer of the institution who may return the delinquent for any subsequent misconduct.

As an escape from the prison there can be no doubt of the value of the reform school; but it is open to the question whether it is anything better than a makeshift—a question which raises the issue of the balance of the benefits and the detrimental effects of institutional treatment. Students of the problem in America are looking hopefully to other social agencies—probation, boys' and girls' clubs and, for the younger delinquents, foster homes—as more promising means of dealing effectively with the problem. The juvenile court is still in a state of transition; equipped with the psychiatric clinic and its staff of probation officers, it is feeling its way. It will be remembered that the juvenile court has ridded itself of the criminal law—its punitive aims, inflexible procedure and tradition of finality, replaced by a court of chancery with no aim but the protection of the child and with a procedure which is not exhausted until that end has been attained. It is from the juvenile court, therefore, rather than from houses of refuge and reformatories, that a solution of the problem of the juvenile offender is to be expected. (*See* CHILDREN'S COURTS; REFORMATORY SCHOOL; PRISONS.)

JUVENTAS (Lat. for "youth," later *Iuventus*), in Roman mythology the tutelary goddess of young men. *See* HEBE.

JUXON, WILLIAM (1582–1663), English prelate, archbishop of Canterbury, was born probably at Chichester, being educated at Merchant Taylors' School, London, and at St. John's College, Oxford. He studied law at Oxford, but took orders, and held various preferments. In 1621 he succeeded his friend, William Laud, as president of St. John's College, and in 1626 and 1627 he was vice-chancellor of the university. Juxon became chaplain-in-ordinary to Charles I. In 1627 he was made dean of Worcester and in 1632 he was nominated to the bishopric of Hereford, though he never took up his episcopal duties at Hereford, as in Oct. 1633 he was consecrated bishop of London in succession to Laud. In March 1636 Charles I. made him lord high treasurer of England. He resigned the treasurership in May 1641. During the Civil War the bishop lived undisturbed at Fulham Palace, and his advice was often sought by the king, who selected him to be with him on the scaffold and to administer to him the last consolations of religion. Juxon was deprived of his bishopric in 1649, and retired to Little Compton in Gloucestershire. At the restoration of Charles II. he became archbishop of Canterbury. He died at Lambeth on June 4, 1663. By his will the archbishop was a benefactor to St. John's College, where he was buried; he also aided the work of restoring St. Paul's Cathedral and rebuilt the great hall at Lambeth Palace.

See W. H. Marah, *Memoirs of Archbishop Juxon and his Times* (1869); and the article by W. H. Hutton in the *Dict. Nat. Biog.* (1892).

K This letter, corresponding to Semitic כ (*kaph*), Greek Κ, K (*kappa*), has changed its shape less perhaps than any other in the history of the alphabet. Early Greek forms from the island of Thera ⋊, ⋊, closely resemble the Semitic. In the Lydian alphabet the form ⋊ occurs, written from right to left, as had been the case with the Semitic form on the Moabite stone. The Chalcidic, Etruscan, and Latin forms were identical, K, and the letter has retained its shape till modern times. The minuscule form k is but a slight adaptation of the majuscule with the point of junction of the three strokes lowered and the lower transverse stroke consequently much shortened and moved to the right. The round form ĸ also appears in handwriting.

The sound represented by the letter throughout its known history until the present day has been the unvoiced velar stop. Its function in the Latin alphabet was usurped by the letter C, which, taken over as representing the voiced velar, came under Etruscan influence to represent the unvoiced sound as well Later the letter G was adapted from C to represent the voiced velar and C stood for the unvoiced only. K now fell into disuse except in official formulae or initials such as in the word *Kalendae*.

FALISCAN		> Ↄ
OSCAN		⋊
UMBRIAN		⋊ ⋊ ⋊
CLASSICAL LATIN AND ONWARDS		K

DEVELOPMENT OF THE LETTER K

In late Latin and the early Roman period the unvoiced velar, represented by C, became palatalised before front vowels, and in the 12th century K was reintroduced as a substitute for C to represent the velar before front vowels, since C did duty for both the velar and palatal in such cases and confusion was thus liable to arise. Thus the English word *cyng* for example began to be spelt *kyng*, later *king*.

In modern English orthography *k* is combined with *c* to represent the unvoiced velar, when the sound is final, e.g., *thick, stock, buck*. This is usually the case only in monosyllabic words.

(B. F. C. A.)

K_2, or MT. GODWIN-AUSTEN, the second highest mountain in the world, ranking after Mt. Everest. It is a peak of the Karakoram extension of the Muztagh range dividing Kashmir from Chinese Turkestan. The most recent determination of the height of K_2 is 28,283 ft. thus placing it higher than Kinchinjunga. K_2 was ascended for the first time by the duke of the Abruzzi in June 1909, being at that time the highest elevation on the earth's surface reached by man.

KA. The name given by the ancient Egyptians to the second self or physical double of their personality—represented in hieroglyphics by uplifted hands—which they believed survived after death together with the soul or *bai*. It was supposed to be born with the person to whom it belonged and acted as a protection during his life on earth. (*See* EGYPT and RELIGION.)

KABABISH: *see* ARABS.

KA'BAH, the sacred shrine of Islam, containing the "black stone," in the middle of the great mosque at Mecca (*q.v.*).

KABARDIN-BALKAR, autonomous area, created in 1924, a region linked administratively to the North Caucasian area of the Russian S.F.S.R. It occupies about 9,000 sq km., and lies between the territory of the Karachaevs on the west and that of the Northern Osetins and Ingushets on the east. To the south is the Svanetian district of Georgia and to the north, the Terek province of the North Caucasian area. Kabardia is mainly the plain and foothill region, while Balkaria is entirely mountainous and includes the highest portion of the Caucasus, with a series of peaks standing on a subsidiary range north of the main range, including Elburz, 18.471 ft., Janga (Dzhanga) -tau, 16,660 ft., Shkara-tau, 17,040 ft., Dykh-tau, 17,050 ft. and Koshtan-tau 16,875 ft. The Balkars live in the upper valleys of the glacier-fed streams and little is known accurately of the climate of the region; every valley varies according to its slope, aspect and height. The Balkars are a branch of the same race as the Karachaevs, and speak a Turkish dialect. They call themselves the hill people and probably settled here some five hundred years ago to escape oppression. Under the influence of the Kabardians they became Mohammedans of the Sunni sect in the 18th century, but a good deal of primitive nature-worship survives amongst them Their tiny *auls* or mountain villages are perched in almost inaccessible valleys and their stone huts are usually flat roofed, with a hole for the outlet of smoke. In their severe climate agriculture is impossible and they are mainly herders of cattle and sheep: in pre-war times they also hunted the bear and aurochs. Attempts are being made to improve the breed of sheep, on which many villages rely entirely for food and clothing. Numerically the Balkars form about 16% of the population of the area. The Kabardians are a north eastern branch of the Adighei (Cherkess; Circassians). They form 60% of the population and are an able people who formerly held an influential position among the neighbouring tribes, from many of whom they exacted tribute, including the Osetins, the Ingushets, the Abkhasians and the mountain Tatars.

The territory which they now occupy has a mild climate suitable for agriculture except in the north east, on the right bank of the Terek river, where irrigation is necessary. The rest of Kabardia-Balkaria is drained by abundant streams, flowing in a north easterly direction, and including the Malka, Baksan, Chegen, Nalchik and Cherek, all linking with the left bank of the Terek. The main crop is maize, sown in a primitive way; millet, sunflower seed; potatoes, vegetables, melons, cucumbers and vines are also cultivated to a small extent. The foothills are everywhere rich in grass, and herding is as important as cultivation. Kabardian horses are famous and draught cattle, sheep and goats are bred In 1926 the effects of the 1914–22 War and famine were still marked; the number of horses being 58·8% of the pre-war level,

cattle 86·4% and sheep and goats 66·5%. The Kabardians breed cattle for meat and for working purposes, the Balkars for dairy purposes. Balkaria still depends on nomad pasturage, but Kabardia is in a transition stage to intensive cattle rearing, with the use of winter foods; a few veterinary training centres exist.

Kabardia is well forested with beech, maple and oak, though little timber is exported. Poultry and beekeeping are common both among Kabardians and Balkars, but for local needs only. Silkworm-breeding of a primitive kind is common among the Kabardians, but has no economic importance; neither wine nor tobacco is manufactured. The only industrial undertakings are two timber-mills, a steam flour mill, and the Nalchik electric station and printing works. *Kustar* industries are widespread and include the making of homespun, felt and fur cloaks, saddlery, and wooden wares. The administrative centre is Nalchik. Of the population (1926) of 203,776, Kabardians and Balkars numbered 76·3%; the remaining people being Russians, Ukrainians, Osetins, Germans and Jews. Education is spreading among the Kabardians of the plains. In 1926–27 there were 156 primary and 4 secondary schools; a teachers' training college was established at Nalchik in 1926. A short grammar of the Kabardian language, and a Russian-Kabardian dictionary by Lopatinsky were published in 1891. In 1864 fragments of the poem "Sosyruko," some Persian tales, and the tenets of the Mohammedan religion were printed in Kabardian by Kazi Atazhukin and Shardanov. Recently Roman script has been adopted instead of the Turkish, and Kabardian is now the medium of instruction in schools; text books in that language are in use. In the hill regions and among the Balkars, the percentage of illiterates is probably over 90% and about 75% of the children are receiving no education. There is one children's and one general hospital, and the net work of medical services is extremely poor. The budget is slender, and plans to improve it involve capital expenditure on an irrigation canal between the Terek and the Sunzha, the organization of health resorts, the building of an electric power station on the Malka or the Baksan river to provide power for the timber and flour mills, and the construction of roads and bridges. Communications are poor; there is no first class road and the only railway is in the east, a part of the branch from the Trans-Caucasian to Vladikavkaz. A branch from Kotlyarevsk on this line to Nalchik was under construction in 1928.

KABBA, a province of Northern Nigeria, British West Africa. Area 10,382 sq m.; pop. (1926) 411,082. The province is riverine; in it is the junction of the Niger and Benue. A small part lies north of this junction; south of the confluence, Kabba is divided into two roughly equal portions by the Niger. Most of the province lies over 1,000 ft. above sea level. It has many fertile valleys and belts of thick forest. It includes the Idah division of the former Munshi province, added to Kabba in 1926. Idah lies east of the Niger and south of the Benue; it forms a native state, the ruling chief being styled *Attah*. West of the Niger is the Igbirra district, also under an *Attah*. These two pagan negro states, in which, however, there are strong Christian missions, with many adherents, are efficiently governed. North of Igbirra is Kabba proper. Under Fula rule the armies of Bida regularly raided Kabba for slaves and laid waste the country. Both the Idah and the Igbirra people are industrious, and cotton, tobacco, indigo and many food crops are grown. The sylvan products include palm oil, kolas, shea and rubber.

Lokoja, a town situated at the Niger-Benue confluence was the centre from which British penetration of Northern Nigeria began. The site was ceded to the British government in 1841 by the *Attah* of Idah, but the first British settlement was a failure. In 1854 MacGregor Laird sent thither W. B. Baikie, who was successful in dealing with the natives and in 1857 became the first British consul in the interior. The town of Lokoja was founded by him in 1860. In 1868 the consulate was abolished and the settlement was left wholly to commercial interests. In 1886 the Royal Niger company made Lokoja its military centre and under crown government it was the first capital (1900–1902) of Northern Nigeria. Kabba town, 30 m. W. by N. of Lokoja, is a thriving place. The trunk road systems of the northern and southern provinces of Nigeria join in Kabba province, which has also a regular passenger and goods service of steamers on the Niger.

KABBALAH (or *Kabbālah, Qabbālah,* Hebr. קַבָּלָה from קִבֵּל, he received) signifies "reception" or "doctrines received by tradition," applied originally to the Prophets and Hagiographa as opposed to the Pentateuch (*cf.* T. B. *Rōsh hash-Shānah* 19a; C. Taylor, *Sayings,* etc. Cambridge, ed. 2, 1897, pp. 106–114: G. F. Moore, *Judaism,* i. 87, 239, Cambridge, Harvard, 1927). The term sometimes included the oral traditions embodied in the *Mishnah* and was finally applied to a group of hidden doctrines dealing with the nature of the Deity and His relation to the world. A later, commoner name is חָן, the initials of חָכְמָה נִסְתָּרָה, or hidden wisdom, which form the word חֵן, or grace. The Kabbalistic system, as now known, goes back to the 11th or 12th centuries but its claims to a much greater antiquity are probably well founded. The germ of the Kabbalah of the *Geōnim* (*see* GAON) may be traced to sayings and beliefs mentioned in the Talmud and known to have existed among gnostics and followers of Pythagoras.

The purpose of the Kabbalah was to connect a finite universe with an infinite God, to account for the existence of evil and to achieve perfection in life. Kabbalism questions and even denies the *creatio ex nihilo* and declares that God, being boundless (*'ēn ṣōf,* ἄπειρος) cannot be known: He may be understood by the expedient of negative attributes. Yet Kabbalism may be described as a reaction of immanence against transcendance and, in fact, the Kabbalists attained a mystic communion which, by its occasionally exaggerated anthropomorphisms, seems at times fantastic. It was just this use of anthropomorphism that attracted mediaeval Christianity and correspondingly alarmed mediaeval Judaism. None the less the influence of Kabbalism on Judaism was great and lasting; it was not antinomian, for Joseph Caro (1488–1545), the author of the last and most generally accepted code of Canon law (*Shulḥan 'Arūkh*), was a prominent Kabbalist of Safed.

The mysteries of deity and cosmogony were linked: both were esoteric. The total restriction of these speculations and their limitation to students of mature age are discussed in *T.B. Ḥagigah* 13a (*see* p. 55 of A. W. Streane's *Chagigah,* Camb., 1891): they are clearly indicated at an earlier date in Ecclesiasticus (Hebr. iii., 21 *sqq.*) of which the recently-discovered Hebrew original bears marked resemblances to *Genesis Rabba* viii. (edit. J. Theodore, Berlin, 1903, p. 58), thus showing the connection in thought. If the etymology of Essene (*q.v.*) is to be sought in חשאי (Hebr., secret or silent), an additional source of esoteric wisdom is suggested.

Emanations.—The relation of the infinite to the finite is achieved by the Kabbalah through the means of emanations, proceeding from the Deity as rays from a luminary. The Deity being incomprehensible through His infinity and the act of creation involving finite acts, such as intention, wish and activity—all of which are finite—some voluntary action on the part of the *'ēn ṣōf* must be predicated. The desire to become known and to create is coeternal with the Deity and this produced the first and the successive emanations. These emanations are called by various terms, *Aziluth* (אֲצִילוּת, from Num. xi., 7) or *Hashpā'ah.* The former stage includes the ten *Ṣefīroth,* which are a detailed development of *Aziluth.* The etymology of *Ṣefirah* is still disputed but *σφαῖρα* is more probable than *Ṣappīr* (brilliance or sapphire) and √סָפַר (he counted). The ten *Ṣefīroth* form a unity of progressive or associated qualities and are named:—the Crown, Wisdom, Intelligence, Love, Justice, Beauty, Firmness, Splendour, Foundation and the Kingdom. As an example of hymns on the Spheres remaining in the liturgy, *cf.* אֵל אָדוֹן (S Singer's *Authorized Daily P.B.,* annotated ed., pp. 129 and cxliii.: M. Gaster, P.B. vol. i., p. 101, Oxf, 1901: on origin *see* I. Davidson, *Thesaurus,* vol. i., No. 3,320, p. 155, New York, 1924). As man is created in the Divine image, it is possible to argue from the known to the unknown.

Hence the Spheres were grouped anthropomonically and often drawn up in charts, suggesting the correspondence between man the microcosm (*Adam Qadmōn*) and the macrocosm. An illustration of such a chart is given in *Jew. Enc.* (i. 181: another one, with a more recent article, in *Enc. Jud.,* Berlin, 1927, *s v. Adam*

Kadmon). The Spheres are arranged in triads and represent the intellectual, moral and material worlds: the Spheres are not creations of the *'ēn ṣōf* as this would imply a diminution of its power but they and the *'ēn ṣōf* form a unity. They are finite and yet infinite, according to their conjunction with or absence from the *'ēn ṣōf*. A system of four different worlds was evolved, on the basis of Isa. xliii., 7, *e.g.*, *'Açilah, Beri'āh, Yeçirah* and *'Asiyyah,* or emanation, creation, formation, making. These were opposed to the negative world (*'Olam hap-Pirūdh*) or world of separation.

Kabbalistic System.—There are two main subdivisions in the Kabbalistic system, theoretical or *'Iyyūnith,* and practical *Ma'asith.* The chief points can only be enumerated briefly:—(1) Permutations of letters and combinations of numbers, partly Pythagorean—the generic Jewish term, *Gematria* (see *Jew. Enc.* s.v.) or *Grammatia* is foreign—and partly Jewish. Biblical examples are not unknown, *e.g.*, בבל-ששך and כשרים-לב-קמי (Jer., xxv., 26: li., 1) and many examples occur in the Talmud. The *Ṣēfer Yeçirah* is based on the alphabet. It must be remembered that the numerical value of letters was obvious and striking when no ciphers for figures existed: a combination of consonants would automatically suggest either a word or a total and a connection between the two would not seem so far-fetched as it does to-day. (2) Classes of angels and demiurges, partly due to gnosticism. Reaction against angelology is seen in the Midrash, whenever angels are felt to be too near the Godhead; *e.g*, the denial to the angels of any part in the Creation is emphatic and frequent. The Kabbalistic angels facilitate man's approach to the Deity: they are subordinate, even Meṭaṭron (*Metator* or *μετα θρόνον*). (3) *Qelippōth* and *Ṣōdh haz-Ziwug, i e*, "Scales" and syzygies, dualism in nature, the Scales being the impure side in a universe wherein everything has a mate and where light and darkness are contrasted throughout. (4) The "Chariot" (*Merkābah*) of Ezek. i., by which man can ascend to the *Hekhalōth* or halls of God. (5) Limitation (צימצום) God's self-withdrawal, to enable the finite universe to be created. (6) *Adam Kadmon,* primordial, sexless man, intermediate between the *'ēn ṣōf* and the spheres: *cf.* St. Paul's idea of a heavenly and earthly Adam (1 Cor. xv., 45–50). (7) *Gilgūlim* or metempsychosis, a doctrine adopted by the Kabbalists in defiance of Jewish philosophers

Works.—The chief books of the Kabbalists are (1) *Ṣēfer Yeçirah,* dealing with permutations and letters: source of the spheres. Date, probably 6th century. (2) *Ṣēfer hab-Bāhir,* probably by Isaac the Blind (13th century), mystic commentary on Genesis; a precursor of the *Zohar:* originally attributed to Neḥunya haq-Qāna. (3) *Hekhāloth,* mystic writings on the *Merkābah,* of the Geonic age. (4) The *Zohar,* the most important of all Kabbalistic works, attributed to Simon ben Yoḥai, the mystic Tanna (*q.v.*) of Galilee, in the 2nd century A D. by Moses de Leon in the 13th century, later stated to be the invention of Moses de Leon himself. It is now held that Moses was not a mere forger, that he had a considerable basis of ancient material before him and that he may sincerely have believed the work which he was giving the world to have been a copy of a Midrash of Simon. The *Zohar* is composed in Aramaic: it is a mystical commentary on the Pentateuch. Other books of note are the *Raziel,* the *Shi'ur Qōmah* and the mystical-ethical works such as the *Roqēah* of Eleazar of Worms.

Prominent Kabbalists.—The course of Kabbalism may be briefly traced. As in the Midrash, so in Philo are evidences of Kabbalistic exegesis. In Egypt Kabbalism was in existence in the time of *Ṣa'adya* (892–942), the philosopher and bible-translator, who composed a commentary to the *Ṣēfer Yeçirah.* About this time it is held that Kabbalah came to Europe, sponsored by Aaron b. Samuel, who migrated to Italy from Babylonia. From this developed the French, German and Spanish schools. Judah ben Samuel *Ḥasīdh* (the Saint), the Kalonymides, and Eleazar of Worms were the chief German Kabbalists. Judah, who founded the Regensburg academy, died in 1217. Among other famous mystics were Abraham ben Samuel Abulafia (1240–91), founder of the Spanish Kabbalistic school; Joseph ben Abraham Giqatilla (1248–1305), author of *Ginnath 'Egōz* and *Sha'arē Çèdeq;* Isaac ibn Latif (d. 1290), a Spanish physician and philosopher, to whom precision in Kabbalistic terminology is largely due; 'Azriel ben Menaḥem (1160–1238), who maintained the theory of negative attributes and denied the *creatio ex nihilo;* Isaac the Blind of Posquières; Isaac Arāma (1420–94); Menaḥem ben Benjamin Recanati, Italian Kabbalist of the 13th century, one of whose mystic bible commentaries was translated into Latin by Pico di Mirandola; Isaac Lurya Ashkenazi (Ari) (1534–72), founder of modern Kabbalah, with his disciples Cordovero, al-Qabeç, Joseph Caro, Hagiz and Vital. He brought Kabbalah into the prayerbook and daily life. His liturgy is saturated with mysticism: every rite and every prayer, almost every word, is invested with a *Ṣōdh* or hidden meaning, often of rare beauty of thought. The Kabbalah of Lurya has remained orthodox, whereas a later development, that of the *Ḥaṣidim* under Israel b. Eliezer *Ba'al Shem Ṭōbh* (*Besht*) (1700–1760), and Baer Dob of Meseritz (1710–62), became sectarian.

Estimates of the Kabbalah.—In the Kabbalah, as in all mystic systems, excesses and extravagances sometimes arose. Hence modern scholars such as Graetz, influenced ultimately by the rationalism of Maimonides which had no patience with the emotions, have looked askance at Kabbalah and decried it. The trend of the last century was almost unmitigated disapproval But latterly a more temperate verdict has succeeded to the one-sided judgment of the past. The Kabbalah is being studied instead of being condemned. The library catalogues of the last generation were content to label Kabbalist works as "collectanea": the present age is identifying, classifying and seeking to interpret them. Interest is being devoted to Kabbalah and, especially in Jerusalem and in Germany, much useful work is being done: manuscripts are being collected and critical texts are being produced. Two of the leaders in the new movement are R. Eisler and G. Scholem and a new aspect of Kabbalah is in process of being revealed. The reader is cautioned against accepting many of the categorical statements of the past century without reference to present-day views.

Bibliography.—The reader is referred to the various articles, main and subsidiary, in the *Jewish Encyclopaedia;* Hasting's *E R.E.; Encyclopaedia Judaica* (*Adam Kadmon*); and C D. Ginzburg's original article in the *Encyclopædia Britannica,* 11th edition, expanded and printed in book form, publ. 1865; bibliographies in the above. In addition to the foregoing G Scholem has published a most valuable annotated bibliography, *Bibliographica Kabbalistica,* Leipzig, 1927, giving a list of all available material Unfortunately most of Scholem's other works, which are indispensable to the serious student are in Hebrew and therefore unavailable for the general reader in mysticism particularly important is his refutation of the alleged forging of the *Zohar* by Moses de Leon (in מורע היהרות I, Jerusalem, 1926). The edition of the *Bahir* is No. I. of *Quellen und Forschungen zur Gesch. d. Jud. Mystik,* Leipzig *See* also I. Abraham's article on Cordovero in *Studies,* ii, xvi, Camb, 1924: on Pico di Mirandola in *Heb. Union Coll. Jub. Volume* (Cincinnati, 1925, pp. 317–333); S. A. Hirsch, *The Cabbalists* (1922).

KABINDA, a Portuguese possession on the west coast of Africa north of the mouth of the Congo. On the west it borders the Atlantic, north and north-east French Equatorial Africa, south and south-east Belgian Congo. It has a coast-line of 93 m., extends inland, at its greatest breadth, 70 m., and has an area of about 3,000 sq.m. In its physical features, flora, fauna and inhabitants, it resembles the coast region of French Equatorial Africa (*q.v.*). The only considerable river is the Chiloango, which in part forms the boundary between Portuguese and Belgian territory, and in its lower course divides Kabinda into two fairly equal portions. The mouth of the river is in 5° 12′ S, 12° 5′ E. The chief town, named Kabinda, is a seaport finely situated on the right bank of the small river Bele, in 5° 33′ S., 12° 10′ E.; pop. about 10,000. The harbour is sheltered and commodious, with anchorage in four fathoms. Kabinda was formerly a noted slave mart. There is a considerable trade in palm oil, ground nuts and other jungle produce. For administrative purposes Kabinda forms a division of the Congo district of Angola (*q.v.*). The inhabitants are Bantu negroes who are called Kabindas. They are an intelligent, energetic and enterprising people, daring sailors and active traders.

KABIRPANTHIS. Kabir, the weaver, a remarkable man who lived in the latter part of the 15th century, is claimed by both Hindus and Muslims. Kabir's activity lay in the direction of a

compromise between the Hindu and the Mohammedan creeds, the religious practices of both of which he criticized with equal severity. His followers, the Kabir Panthis ("those following Kabir's path") neither worship the gods of the pantheon, nor observe the rites and ceremonial of the Hindus but are in close touch with the Vaishnava sects, especially the Ramavats, and generally worship Rama as the supreme deity. Whilst very numerous, the mendicants of this creed, however, never actually solicit alms; and, indeed, "the quaker-like spirit of the sect, their abhorrence of all violence, their regard for truth and the inobtrusiveness of their opinions render them very inoffensive members of the state" (H. H. Wilson).

The peculiar conciliatory tendencies of Kabir were carried on with even greater zeal from the latter part of the 15th century by one of his followers, Nanak Shah, the promulgator of the creed of the *Nanak Shahis* or *Sikhs—i.e.,* (Sanskrit) *sishya,* disciples, whose *guru,* or teacher, he called himself—a peaceful sect at first, until, in consequence of Mohammedan persecution, a martial spirit was infused into it by the tenth, and last, *guru,* Govind Shah, changing it into a political organization. (*See* SIKHS.)

KABRE, a warlike people, in physical and social characters resembling their neighbours the Bariba; who live among, and south of, the Atakora mountains in northern Togo, and speak a language akin to Bariba. They are cultivators and cattle-raisers and animist in religion.

KABUL (kah'bool), capital of Afghanistan, at an elevation of 6,900 ft. above the sea in 34° 32′ N. and 69° 14′ E. Estimated pop. 150,000. Lying at the foot of the bare and rocky mountains forming the western boundary of the Kabul valley, just below the gorge made by the Kabul river, the city extends a mile and a half east to west and one mile north to south and is hemmed in by the mountains except to the north. Kabul has been a city of vast importance for countless ages commanding all the passes which here debouch from the north through the Hindu Kush, and from the west through Kandahar; and through it passed successive invasions of India by Alexander the Great, Mahmud of Ghazni, Jenghiz Khan, Baber, Nadir Shah and Ahmad Shah. Indeed from the time of Baber to that of Nadir Shah (1526–1738) Kabul was part of the empire of Delhi. It is now some 160 m. from the British frontier post of Jamrud near Peshawar.

Kabul was formerly walled; and the city itself is a huddle of narrow and dirty streets, with the Bala Hissar or fort forming the south-east angle, and rising about 150 ft. above the plain. The Amir's palace is situated outside the town about midway between it and the Sherpur cantonment which lies about a mile to the north-east. Formerly the greatest ornament of the city was the arcaded and roofed bazaar called *Chihâr Châtâ,* ascribed to Ali Mardan Khan, a noble of the 17th century, who has left behind him many monuments of his munificent public spirit both in Kabul and in Hindustan. Its four arms had an aggregate length of about 600 ft., with a breadth of 30. This edifice was destroyed by Sir G. Pollock on evacuating Kabul in 1842 as a record of the treachery of the city.

The tomb of the Sultan Baber stands on a slope about a mile to the west of the city in a charming spot. Near him lie several of his wives and children; the garden was formerly enclosed by a marble wall; a clear stream waters the flower-beds. From the hill that rises behind the tomb there is a noble prospect of his beloved city, and of the all-fruitful plain to the north of it.

After the accession of Abdur Rahman in 1880 the city underwent great changes. The Bala Hissar was destroyed and has never since been entirely rebuilt, and a fortified cantonment at Sherpur (one side of which was represented by the historic Bemaru ridge) had taken the place of the old earthworks of the British occupation of 1842 which were constructed on nearly the same site. The city streets were as narrow and evil-smelling, the surrounding gardens as picturesque and attractive, and the wealth of fruit was as great, as they had been fifty years previously. The amir, however, effected many improvements. Kabul is now connected by well-planned and metalled roads with Afghan Turkestan on the west, with the Oxus and Bokhara on the north, and with India on the east. The road to India was first made by British and is now maintained by Afghan engineers. Improvements were continued under the Amir Habibullah, and the road from Kabul to Ghazni was surfaced for motors. A good road from Jalalabad runs now to Kafiristan via Asmar. The city ways have been improved until it has become possible for wheeled vehicles to pass, and the various roads connecting the suburbs and the city are efficiently maintained. A purely local railway has also been introduced, to assist in transporting building material. The buildings erected by Abdur Rahman included a new palace and a durbar hall, a bridge across the river and embankment, a pavilion and garden laid out around the site of Baber's tomb overlooking the Chardeh valley; and many other buildings of public utility connected with stud arrangements, the manufacture of small arms and ammunition, and the requirements of what may be termed a wholesale shop under European direction, besides hospitals, dispensaries, bazaars, etc. The new palace is within an entrenchment just outside the city. It is enclosed in a fine garden, well planted with trees, where the harem serai (or ladies' apartments) occupies a considerable space. But the arrangement of terraced gardens and the lightly constructed pavilion which graces the western slopes of the hills overlooking Chardeh are the most attractive of these innovations. Here, on a summer's day, with the scent of roses pervading the heated air, the cool refreshment of the passing breezes and of splashing fountains may be enjoyed by the officials of the Kabul court, whilst they look across the beauty of the thickly planted plains of Chardeh to the rugged outlines of Paghman and the snows of the Hindu Kush. The artistic taste of the landscape gardening is excellent, and the mountain scenery is not unworthy of Kashmir.

Kabul was invaded by the Arabs in the thirty-fifth year of the Hegira, but it was long before the Mohammedans effected any lasting settlement. Kabul first became a capital when Baber made himself master of it in 1504, and here he reigned for fifteen years before his invasion of Hindustan. In modern times it became a capital again, under Timur Shah (*see* AFGHANISTAN), and so has continued both to the end of the Durani dynasty, and under the Barakzais, who now reign It was occupied by Sir John Keane in 1839, General Pollock in 1842, and again by Sir Frederick, afterwards Lord Roberts, in 1879.

Kabul is also the name of the province including the whole of the plains called Koh Daman and Beghram, etc., to the Hindu Kush northward, with the Kohistan or hill country adjoining. Eastward it extends to the border of Jalalabad at Jagdalak; southward it includes the Logar district, and extends to the border of Ghazni; north-westward it includes the Paghman hills, and the valley of the upper Kabul river, and so to the Koh-i-Baba. Roughly it embraces a territory of about 100 m. square, chiefly mountainous. Wheat and barley are the staple products of the arable tracts. Artificial grasses are also much cultivated, and fruits largely, especially in the Koh Daman. A considerable part of the population spends the summer in tents. The villages are not enclosed by fortifications, but contain small private castles or fortalices.

It is pleasant to record that the graveyard of those officers who fell in the Kabul campaign of 1879–1880, which lies at the northern end of the Bemaru ridge, is not uncared for. Since the World War the number of Europeans (non-British) in Kabul has greatly increased, and European engineers have developed electricity by water power, and made the main roads fit for motor traffic. King Amanullah soon after his succession started a new royal suburb at Dar-es-Salaam a few miles from the city and much modernized the environs of Kabul.

See C. Yate, *Northern Afghanistan* (1888); J. A. Gray, *At the Court of the Amir* (1895); Sir T. H. H. Holdich, *The Indian Borderland* (1901). (T. H. H.)

KABUL RIVER, Afghanistan, is 300 miles in length. The Kabul (ancient *Kophes*), which is the most important river in Afghanistan, rises at the foot of the Unai pass leading over the Sanglakh range, an offshoot of the Hindu Kush towards Bamian and Afghan Turkestan. Its basin forms the province of Kabul, which includes all northern Afghanistan between the Hindu Kush and the Safed Koh ranges. From its source to the city of Kabul

the course of the river is only 45 m., and this part of it is often exhausted in summer for purposes of irrigation. Half a mile east of Kabul it is joined by the Logar, a much larger river, which rises beyond Ghazni among the slopes of the Gul Koh (14,200 ft.), and drains the rich and picturesque valleys of Logar and Wardak. Below the confluence the Kabul becomes a rapid stream with a great volume of water and gradually absorbs the whole drainage of the Hindu Kush. About 40 m. below Kabul the Panjshir river joins it; 15 m. farther the Tagao; 20 m. from the Tagao junction the united streams of Alingar and Alishang (rivers of Kafiristan); and 20 m. below that, at Balabagh, the Surkhab from the Safed Koh. Two or three miles below Jalalabad it is joined by the Kunar, the river of Chitral. Thenceforward it passes by deep gorges through the Mohmand hills, curving northward until it emerges into the Peshawar plain at Michni. Soon afterwards it receives the Swat river from the north and the Bara river from the south, and after a further course of 40 m. falls into the Indus at Attock. From Jalalabad downwards the river is navigable by boats or rafts of inflated skins, and is considerably used for purposes of commerce.

KABYLES or KABAIL, a confederation of tribes in Algeria, Tunisia, and a few oases of the Sahara, who form a branch of the great Berber race. Their name (Arabic *gabilat*, pl. *gabāil*), was at first indiscriminately applied by the Arabs to all Berber peoples. There are two divisions—Great Kabylia and Lesser Kabylia, the former being also known as the Kabylia of the Jurjura (also called Adrar Budfel, "Mountain of Snow"). Physically many Kabyles resemble the Arabs of Algeria. Both Kabyle and Arab are white at birth, but rapidly grow brown through exposure to air and sunshine. Both have in general brown eyes and wavy hair of coarse quality, varying from dark brown to jet black. The Kabyle appears to be of heavier build and more muscular. Both are clearly long-headed. Some, however, of the purer type of Kabyles in Kabylia proper have fair skins, ruddy complexions and blue or grey eyes In fact there are two distinct types of Kabyles: those which by much admixture have approximated to Arab and negroid types, and those which preserve Libyan features. Active, energetic and enterprising, the Kabyle is found as a soldier in the French army, as a workman in the towns, as a field labourer, or as a pedlar or trader earning the means of purchasing his bit of ground in his native village. The Kabyles are Mohammedans of the Sunnite branch and the Malikite rite, looking to Morocco as the nearer centre of their religion. Some retain their vernacular speech. The best known of the Kabyle dialects is Zouave (which gave its name to the Zouave regiments) or Agawawa, spoken on the northern side of the Jurjura at least from the time of Ibn Khaldun. The Kabyles have no alphabet, and their literature, of historical pieces, proverbial couplets and quatrains, dancing songs, etc., is preserved by professional writers.

Liorel, *Races berbères: les Kabyles* (1893); MacIver and Wilkin, *Libyan Notes* (1901).

KACHARI, a more or less Hinduized tribe in Assam belonging to the Bodo group (*q.v.*); divided into clans, formerly exogamous and, perhaps, originally totemistic, which include that of Swarga-aroi ("Heaven-folk") as the socially superior clan and the Basumati-aroi ("earth-folk") as another. The sons inherit their fathers' clans and the daughters those of their mothers. The religion, generally animistic, includes traces of phallicism, Menhirs and Y-shaped posts being erected, at any rate up to a recent date, while the *euphorbia*, a cactus-like tree exuding a milky juice, is reverenced as a sacred tree. Bachelor's houses are built for the young men, and this institution, under Hindu influence, becomes the village *nāmghar* or prayer-house. Both burial and cremation are practised.

See Soppitt, *Account of the Kachari Tribe*, etc. (1901); Endle, *The Kacharis* (1911).

KACH GANDAVA or **KACHHI** (Kach, Kej, Kiz), a low-lying flat region in Baluchistan separating the Bugti hills from those of Kalat. It is driven, like a wedge, into the frontier mountain system and extends for 150 m. from Jacobabad to Sibi, with nearly as great a breadth at its base on the Sind frontier. Area, 5,310 sq.m.; pop. (1921) 75,153. The Mula pass, which connects it with the Kalat highlands, was once (when the ancient city of Kandabel was the capital of Gandava) a much trodden trade highway, and is still a practicable route though no longer a popular one. The soil is fertile wherever it can be irrigated by the floods brought down from the surrounding hills; but much of the central portion is sandy waste. It is traversed by the North-Western railway. The climate is unhealthy in summer, when pestilential hot winds are sometimes destructive to life. The annual rainfall averages only 3 in. Kachhi, though subject to the khan of Kalat, is administered under the tribal system. There are no schools, dispensaries or gaols

See *Baluchistan District Gazetteer.*

KACHIN, a tribe in northern Burma of Tibeto-Burmese language and affinities and probably related to the Kuki tribes (*q.v.*). They are also known as Kakhyen, Chingpaw and Singpho. They are governed generally by hereditary chiefs called Duwas, and live in small communities practising the cultivation of dry rather than irrigated rice. They are exogamous and organized in patronymic clans, but appear to be restricted in matrimonial choice by involved genealogical regulations which cause much dispute among themselves. Earlier records state that there were five clans, each taking its wives from a specified clan, thus depending on a definite mode of cousin marriage, that with the maternal uncle's daughter. They bury their dead (except in the Hukong valley where they burn them) and erect a conical thatched cover over the grave and surround it with a trench. Special modes of burial are used in cases of unnatural death. Land seems to belong to the free members of the community. Slaves are obtained by raiding. They use daos, spears, guns and crossbows, and take the heads of their enemies apparently merely as proof of having killed them. The men wear rings below the knee, the women round the waist. Traces of phallicism exist. They believe in a separable soul which departs after death to rejoin the souls of its ancestors, by a path over mountain tops which include a "Sandy Pass" (*cf.* KAREN). They believe in a Supreme Being and in large numbers of *nats* who need to be propitiated, and with whom communication is held by means of shamanistic mediums, called *Myihtoi.*

BIBLIOGRAPHY—J. H. Hertz, *A Grammar of the Kachin or Chingpaw language;* Hanson, *The Kachins* (1913); Enriquez, *A Burmese Arcady* (1923).

KACHIN HILLS. The Kachins have been the object of many police operations and several regular expeditions:—(1) Expedition of 1892. It was essential to pacify the trade routes through the mountains, which lay between the Chinese frontier and the Irrawaddi, inhabited by Kachins. In the winter of 1891–92 two military columns operated in the hills. The larger column, after establishing a post at Sadon, moved north into "the triangle" between the N'Markha and N'Malikha branches of the Irrawaddi During its absence Sadon was attacked by Chinese and Kachins and besieged for 14 days, but was eventually relieved and the country pacified. (2) Expedition of 1892–93. Bhamo was occupied by the British on Dec. 28, 1885, and almost immediately trouble began. Constant punitive measures were carried on by the military police; but in Dec. 1892 a police column proceeding to establish a post at Sima was heavily attacked, and simultaneously the town of Myitkyina was raided by Kachins. A force of 1,200 troops was sent to put down the rising. The enemy received their final blow at Palap, but not before three officers were killed, three wounded, and 102 sepoys and followers killed and wounded. (3) Expedition of 1895–96. The continued misconduct of the Sana Kachins from beyond the administrative border rendered punitive measures necessary. They had remained unpunished since the attack on Myitkyina in Dec. 1892. Two columns

were sent up, one of 250 rifles from Myitkyina, the other of 200 rifles from Mogaung, marching in Dec. 1895. The resistance was insignificant, and the operations were completely successful. A strong force of military police is stationed at Myitkyina, with several outposts in the Kachin hills, and the country is never wholly free from crimes of violence committed by the Kachins.

KADU, a Burmanized tribe of Katha and the Upper Chindwin districts, probably of mixed origin from Burman, Shan, Kachin and Chin elements, speaking a dialect of their own. They are Buddhists, but worship spirits also, in particular the Great *Nat* of Maingthon Mountain. They live on spurs above their cultivated valleys, growing rice, tea, etc., on communal land. They are hard-working, elect their own headmen, are divided into several exogamous groups and blacken their teeth. *See* Scott and Hardiman, *Gazetter of Upper Burma* (1900); Clayton, *Katha Settlement Report* (1906).

KADUR, a district of Mysore state, in southern India, with an area of 2,788 sq m. Pop. (1921) 333,538. The larger portion of the district consists of the Malnad or hill country, which contains some of the wildest mountain scenery in southern India. The western frontier is formed by the chain of the Ghats, of which the highest peaks are the Kudremukh (6,215 ft.) and the Meruti Gudda (5,451 ft.). The centre is occupied by the horse-shoe range of the Baba Budans, containing the loftiest mountain in Mysore, Mulaingiri (6,317 ft.). The Maidan or plain country lying beneath the amphitheatre formed by the Baba Budan hills is a fertile, well-watered region, with the famous "black cotton soil." The principal rivers are the Tunga and Bhadra, which rise near each other in the Ghats, and unite to form the Tungabhadra, a tributary of the Kistna. The eastern region is watered by the Vedavati. From all the rivers water is drawn off into irrigation channels by means of anicuts or weirs. The chief natural wealth of Kadur is in its forests, which contain large supplies of the finest timber, especially teak, and also furnish shelter for the coffee plantations Iron is found and smelted, and corundum exists in certain localities.

The headquarters are at Chikmagalur (pop 10,207). The staple crop is rice, chiefly grown on the hill slopes, where the natural rainfall is sufficient, or in the river valley, where the fields can be irrigated. The district is served by the Madras and Southern Mahratta railway.

KAEMPFER, ENGELBRECHT (1651–1716), German traveller and physician, was born on Sept. 16, 1651 at Lemgo in Lippe-Detmold, Westphalia, where his father was a pastor. He studied at Hameln, Lüneburg, Hamburg, Lubeck and Danzig, and after graduating Ph D. at Cracow, spent four years at Königsberg in Prussia, studying medicine and natural science. In 1681 he visited Uppsala in Sweden, and became secretary to the embassy which Charles XI. sent through Russia to Persia in 1683. He reached Persia by way of Moscow, Kazan and Astrakhan, landing at Nizabad in Daghestan after a voyage in the Caspian; from Shemakha in Shirvan he made an expedition to the Baku peninsula In 1684 he arrived in Isfahan, then the Persian capital.

When after a stay of more than a year the Swedish embassy prepared to return, Kaempfer joined the fleet of the Dutch East India company in the Persian gulf as chief surgeon, and in spite of fever caught at Bander Abbasi he saw something of Arabia and of many of the western coast-lands of India. In September 1689 he reached Batavia; spent the following winter in studying Javanese natural history; and in May 1690 set out for Japan as physician to the embassy sent yearly to that country by the Dutch. The ship in which he sailed touched at Siam, whose capital he visited; and in September 1690 he arrived at Nagasaki, the only Japanese port then open to foreigners. Kaempfer stayed two years in Japan, during which he twice visited Tōkyō. In 1693 he returned to his native city where he died on Nov. 2, 1716.

Kaempfer's *Amoenitatum exoticarum politico-physico-medicarum fasciculi* V. (Lemgo, 1712), contains invaluable observations in Georgia, Persia and Japan. At his death the unpublished mss. were purchased by Sir Hans Sloane. Among them was a *History of Japan*, translated from the manuscript into English by J. G Scheuchzer (London, 2 vols., 1727). This book contains a description of the political, social and physical state of Japan in the 17th century. For upwards of a hundred years it remained the chief source of information for the general reader, and is still not wholly obsolete. A life of the author is prefixed to the *History*. Another work was *Icones selectae Plantarum, quas in Japonia collegit* (1791).

KAFFA, a district in the south-west part of the Great Abyssinian plateau, lying roughly within 6° to 9° N. and 35° to 37° E. It is a beautiful country, consisting of broken table-land deeply scored by mountain torrents and densely wooded. The general elevation is about 8,000 ft., while several peaks are over 10,000 ft. From the western slopes of the plateau descend headstreams of the Sobat. The principal river however is the Omo, the chief feeder of Lake Rudolf. Kaffa proper is the native home of the coffee plant (whence the name), which grows in profusion on the mountain sides. The present official capital is Sherada to which the Abyssinians transferred their headquarters from Anderacha, the former capital which still remains a great trading centre, especially for coffee.

Kaffa proper was until recently an independent kingdom; the Abyssinians had penetrated into it and partly Christianized it some centuries ago, and it was later overrun by the Mohammedan invaders under Mohammed Gran in the early 16th century. The last independent king was taken prisoner by the Abyssinians in 1897 when Menelik conquered the country and devastated it, two-thirds of the population being killed or transported, the remainder being reduced to a state of serfdom. The natives of Kaffa are known as Kafecho, a branch of the Harmatic race, copper in colour, and speaking a language of their own differing widely from Amharic or Galla They are in part pagan and in part profess a debased form of Christianity. (C. F. R.)

KAFFIR BREAD, in botany, the popular name for a species of *Encephalartos* (*E. caffra*), one of the Cycadaceae (*see* GYMNOSPERMS), a native of South Africa, so called from the farinaceous food-stuff which is found at the apex of the stem. It is a tree reaching nearly 20 ft in height, with very stiff, spreading pinnate leaves 3 to 4 ft. long and recurving at the tip. The species of *Encephalartos*, which are natives of tropical and South Africa, form handsome greenhouse and conservatory plants.

KAFFRARIA, the descriptive name given to the E. part of the Cape province, South Africa. Kaffraria, *i.e.*, the land of the Kafirs, is no longer an official designation. It used to comprise the districts now known as King William's Town and East London, which formed British Kaffraria, annexed to Cape Colony in 1865, and the territory between the Drakensberg and the coast, from the Kei river to the borders of Natal, known as Kaffraria proper. As a geographical term it is still used to indicate the Transkeian territories of the Cape provinces comprising the four administrative divisions of Transkei, Pondoland, Tembuland and Griqualand East, incorporated into Cape Colony at various periods between 1879 and 1894 They have a total area of 18,310 sq m. (*See* UNION OF SOUTH AFRICA and CAPE COLONY.) Much of the land is held by the natives under tribal tenure.

Towns, Communication and Administration.—The chief town is Kokstad (*q.v.*), pop : 1,150 Europeans, and 2,150 non-Europeans, the capital of Griqualand East. Umtata (2,100 ft. above the sea, pop., white, 1,639), on the river of the same name, capital of Tembuland, is the residence of an assistant chief magistrate, and seat of the Anglican bishopric of Kaffraria Port St John is the chief town in Pondoland, and the only harbour of the country. Butterworth is the chief town in Transkei. A railway, the first link in the direct Cape-Natal line, runs through Indwe to Maclear, an agricultural centre in Griqualand East. Another railway parallel but south of that described also traverses Kaffraria. Starting from Amabele, a station on the main line from East London to the north, it goes via Butterworth (132 m. from East London) to Umtata (234 m.).

The Cape administrative and judicial system is in force, save as modified by special enactments of the Cape parliament. A "Native Territories Penal Code" which came into operation on the 1st of January 1887 governs the relations of the natives, who are under the jurisdiction of a chief magistrate (resident at Cape Town) with subordinate magistrates in the Territories. In civil affairs the tribal organization and native laws are maintained. No chief, however, exercises criminal jurisdiction. Since 1898 certain provisions of the Glen Grey Act have been applied to

Kaffraria. (*See* GLEN GREY.) The franchise laws are the same as in the Cape proper. Though the Kaffirs outnumber the whites by fifty to one, white men form the bulk of the electorate.

Purely native affairs are dealt with by the Transkeian Territories General Council. District Councils were established in 1895 in the districts of Butterworth, Indutywa, Nqamakwe and Tsomo, and the four were united into the Transkeian General Council. A district council consists of a Resident Magistrate, and six members, two nominated by the Governor-General and four either nominated or elected by local headmen or tax payers. Each District Council nominates two of its members to the General Council. The Governor-General nominates a third, and these members from each district, together with the white magistrates, form the Transkeian Territories General Council, which meets annually in the autumn, the session lasting about a fortnight. The General and District Councils are advisory bodies, and allow the people to express their views on local affairs. Among the subjects discussed are native marriage and inheritance laws, education, stock diseases, etc. The responsibility for action rests with the white magistrates and the higher authorities. The District Councils are also executive organs of the General Council, and are made responsible for road maintenance, cattle dipping, etc. The General Council's revenue is derived from all quit-rents collected in the districts, and from a local tax of 10/– payable in respect of every hut, according to the number of wives. The system has been gradually extended to other districts as the natives have progressed and become able to profit by it. Nineteen districts are now included, and comprise the whole of the Transkei and Tembuland, and the whole of East Griqualand, except the Mount Currie district.

Religion.—Numbers of Protestant missionary societies have churches and educational establishments in Kaffraria, but, except in Fingoland, the bulk of the Kaffirs are heathen. The Griquas profess Christianity and have their own churches and ministers. The Anglican diocese of St. John's, Kaffraria, was founded in 1873.

Particulars concerning each of the four divisions of Kaffraria follow.

Griqualand East (area, 7,594 sq.m.) (*q.v.*).

Tembuland (area, 4,122 sq.m.), which lies S.W. of Griqualand East and comprises the districts of Tembuland Proper, Emigrant Tembuland and Bomvanaland, takes its name from the Tembu nation, called sometimes Tambookies, one of the most powerful of the Kaffir groups. The chief town is Umtata.

Transkei (area, 2,552 sq m.) comprises the districts of Fingoland, the Idutywa Reserve and Gcalekaland, this last being named from the Gcaleka nation, who claim to be the senior branch of the Xosa family, the principal royal line of the Kaffir tribes. They still form the chief element of the population. Here are some prosperous missionary stations, where the natives are taught agriculture, mechanical industries and a knowledge of letters. Even more advanced in all social respects are the Fingo, who give their name to the district of Fingoland, and also form the bulk of the population in the Idutywa Reserve. The majority profess Christianity. The industrial institution of Blythswood, about 20 m. N.W. of Butterworth, is a branch of Lovedale (*q.v.*), and is largely supported by the Fingo.

Pondoland (area, 4,040 sq.m.; is bounded E. by the sea, N. by Natal, W. by Griqualand East, and S. by Tembuland. In Pondoland the primitive organization of the natives has been little altered and the influence of the chiefs is very great. Land is held almost wholly in tribal tenure, though a number of whites possess farms acquired before the annexation of the country. The Pondo have shown some appreciation of the benefits of education.

See G. McCall Theal's *History of South Africa* and other works cited under CAPE COLONY; also *The Native or Transkeian Territories*, by C. C. Henkel (Hamburg, 1903), a useful handbook by an ex-official in the Transkeian Territories.

KAFIRISTAN, a province of Afghanistan. Very little of this country was known with accuracy and nothing at first hand until Lockhart headed a mission to examine the passes of the Hindu Kush range in 1885–1886. He penetrated into the upper Bashgal valley, but after a few days was compelled to return. In 1889 Robertson was sent to Kafiristan. He only remained a few days, but a year later he revisited the country, staying amongst the Kafirs for nearly a year, and was able to study the people. His observations are the most trustworthy foundations of our knowledge.

Kafiristan is the name given to the tract between Chitral and Afghan territory. Its pagan mountaineers maintained independence until 1895, when they were finally subdued by Abdur Rahman, the amir of Kabul, who also compelled them to accept the religion of Islam. The territory is included between 34° 30′ and 36° N., and from about 70° to 71° 30′ E. Its greatest extent is from east to west at 35° 10′ N.; its greatest breadth is probably about 71° E. The total area approximates to 5,000 sq m. Along the north the boundary is the province of Badakshan, on the north-east the Lutkho valley of Chitral. Chitral and lower Chitral enclose it to the east, and the Kunar valley on the south-east. Afghanistan proper supplies the south limit. The ranges above the Nijrao and Pansher valleys of Afghanistan wall it in upon the west. The northern frontier is split by the narrow Minjan valley of Badakshan, which seems to rise in the very heart of Kafiristan.

The mountain ranges of metamorphic rock, which separate the main drainage valleys, are all high, rugged and difficult. During the winter Kafiristan becomes a number of isolated communities, with few means of intercommunication. In the whole land there is probably nothing in the shape of a plain. Every variety of mountain scenery can be found: silent peaks, mighty pine forests, wooded slopes and grazing grounds; or wild vine and pomegranate thickets bordering sparkling streams. The lower hill-sides are covered with the wild olive and evergreen oaks. Many kinds of fruit trees—walnuts, mulberries, apricots and apples—grow near the villages or by the wayside, as well as splendid horse-chestnuts and other shade trees. Higher in elevation, and from 4,000 to 8,000 ft., are the dense pine and cedar forests. Above this altitude the slopes become dreary, the juniper, cedar and wild rhubarb gradually giving place to scanty willow patches, tamarisk and stunted birches. Over 13,000 ft. there are merely mosses and rough grass. Familiar wildflowers blossom at different heights. The rivers teem with fish. Immense numbers of red-legged partridges live in the lower valleys, as well as pigeons and doves. Gorgeously plumaged pheasants are plentiful. Of wild animals the chief are the *markhor* (a goat) and the *oorial* (a sheep). In the winter the former are recklessly slaughtered by hunters, being either brought to bay by trained hounds, or trapped in pits, or caught floundering in the snow-drifts; but in the summer immense herds move on the higher slopes. The *ibex* is very rare. Bears and leopards are fairly common, as well as the smaller hill creatures.

History.—Yule thought the present Kafiristan was part of that pagan country stretching between Kashmir and Kabul which mediaeval Asiatics referred to vaguely as *Bilaur,* a name to be found in Marco Polo as *Bolor.* The first distinct mention of the Kafirs as a separate people appears in the history of Timur. On his march to the invasion of India the people at Andarab appealed to Timur for help against the Kator and the Siah-Posh Kafirs, to which he endeavoured to respond. He caused an inscription to be carved in the defiles of Kator to commemorate his invasion and to explain its route. Inside the Kafir country on the Najil or Alishang river there is a fort still called Timur's castle, and in the Kalam fort there is said to be a stone engraved to report that as the farthest point of his advance. In the *Memoirs* of Baber there is mention of the Kafirs raiding into Panjhir and of their taste for drinking, every man having a leathern wine-bottle slung round his neck. The *Ain-i-Akbari* makes occasional mention of the Kafirs, probably on the authority of the famous *Memoirs.*

After Robertson's sojourn in the country and the visit of several Kafirs to India with him in 1892 an increasing intimacy continued, especially with the people of the eastern valleys, until 1895, when by the terms of an agreement entered into between the government of India and the ruler of Afghanistan the whole of the Kafir territory was recognized so far as Great Britain was concerned as

within the Afghan sphere. The amir Abdur Rahman at once set about enforcing his authority, and the conversion of the population to Islam, amid scenes of cruel and fierce fighting. Since then the converted Kafirs have been a common sight in Kabul while in the high valley the old people have bitterly cherished their lost religion.

See Sir G. S. Robertson, *Kafirs of the Hindu-Kush* (1896).

KAFIRS: *see* XOSA.

KAGERA, a river of east equatorial Africa, the most remote headstream of the Nile. The sources of its principal upper branch, the Nyavarongo, rise in the hill country immediately east of Lake Kivu. After a course of over 400 m. the Kagera enters Victoria Nyanza on its western shore in 0° 58′ S. It is navigable by steamers for 70 m. from its mouth, being obstructed by rapids above that point. The river was first seen (by white men) by J. H. Speke (Jan. 16, 1862) on his journey to discover the Nile source. By him the stream was called "Kitangülé," *kagera* being given as equivalent to "river." The exploration of the Kagera has been largely the work of German travellers.

See NILE; also J. H. Speke, *Discovery of the Source of the Nile* (Edinburgh, 1863); R. Kandt, *Caput Nili* (Berlin, 1904); and map by P. Sprigade and M. Moisel in *Grosser deutscher Kolonialatlas,* No. 16 (Berlin, 1906).

KAGU (*Rhinochetus jubatus*), a bird inhabiting New Caledonia, about the size of a bittern, grey above, white below, with a loose crest on the head. Its nearest allies seem to be the sun-bitterns (*q.v.*) of America and the cranes (*q.v.*), but its exact affinities are very uncertain. It forms a family of its own, the *Rhinochetidae.*

KAHLUR or Bilaspur, an Indian hill state, within the Punjab, under British protection since 1846. The Gurkhas overran the country in the early 19th century, and expelled the raja, who was, however, reinstated by the British in 1815. Area, 448 sq. miles. Pop. (1921) 98,000; estimated gross revenue, £22,000; tribute £530. The town of Bilaspur on the Sutlej is 1,465 ft. above sea-level.

KAHN, GUSTAVE (1859–), French poet, was born at Metz on Dec. 21, 1859. He was educated in Paris at the École des Chartes and the École des langues orientales, and began to contribute to obscure Parisian reviews. After four years spent in Africa he returned to Paris in 1885, and founded in 1886 a weekly review, *La Vogue,* in which many of his early poems appeared. In the autumn of the same year he founded, with Jean Moréas and Paul Adam, a short-lived periodical *Le Symboliste,* in which they preached the doctrine of Stéphane Mallarmé; and in 1888 he became one of the editors of the *Revue indépendante.* He contributed poetry and criticism to the French and Belgian reviews favourable to the extreme symbolists, and, with Catulle Mendès, he arranged at the Odéon, the Théâtre Antoine and the Théâtre Sarah Bernhardt, matinées for the production of the plays of the younger poets. He claimed to be the earliest writer of *vers libre,* and explained his methods and the history of the movement in a preface to his *Premiers poèmes* (1897). Whether he can justly be said to be the first *vers libriste* or not, he broke quite definitely with the dominating tradition of the Alexandrine and sought to make rhythm dependent on the movement of the poet's thought, rather than on accepted rules of prosody. He was the leader of the revolt against the Pamassiaus. Later books are *Le Livre d'images* (1897); *Les Fleurs de la passion* (1900); some novels, a good example of which is *L'adultère Sentimentale* (1902); and a valuable contribution to the history of modern French verse in *Symbolistes et décadents* (1902).

KAIANIA: *see* SEISTAN.

KAI-FÊNG, one of the most historic cities of China and the capital of Honan province. It is situated on the western borders of the Plain of North China a little beyond the point where the Hwang-ho emerges on to it from the Tung-kwan Gorge. It thus guards the eastern end of the long corridor by which China was most easily approached from the West. Kai-fêng was one of the most important of the early settlement sites and a great node of routes leading eastwards towards the Shantung Highlands and southwards towards the Yang-tze along the drier western margin of the Plain. It lay within the zone of early Imperial capitals and was itself a capital city in the period of the Five Dynasties (A.D. 907–960) and the early part of the succeeding Sung Dynasty. Under the Ming and Manchu Dynasties it was made the centre of important road systems. Its significance as a "gate" city for influences from the west is shown by the large Muslim element in its population and the continuance almost down to the present time of a distinct Jewish colony, whose advent is recorded on some famous inscribed stones still preserved. Kai-fêng is the centre of a densely-populated rural area, producing good crops of wheat, millet, sorghum and also cotton which is locally manufactured. The rearing of horses, mules, swine and sheep is also very important. But both the city and the country of which it is the market are often menaced by the floods of the Hwang-ho which runs a few miles to the north. Kai-fêng is linked by the transverse Lung-Hai railway with both the great north-south trunk lines (Peking-Hankow and Tientsin-Pukow) but transport facilities are still very inadequate. The population of the city is about 200,000.

KAILAS, a mountain in Tibet; the highest point of a range lying to the north of Lake Manasorawar, with an altitude of about 22,000 feet. It is famous in Sanskrit literature as Siva's paradise, and is a favourite place of pilgrimage with Hindus. A track encircles the base of the mountain, and it takes the pilgrim three weeks to complete the round, prostrating himself all the way.

KAILYARD SCHOOL OF FICTION, THE, was a name applied to a group of Scottish novelists which, flourishing during the last two decades of the 19th century, included J. M. Barrie, "Ian Maclaren" (the Rev. John Watson) and S. R. Crockett. Its tendencies were towards the sentimental, the humorous and the "pawky"; dialect was freely used, and the harsher verities of Scots rural life were kept in the background —an evasion of reality which drew from George Douglas Brown his grim counterblast, *The House with the Green Shutters* (1900). The term "Kailyard" is believed to have been the invention of the late J. H. Millar, who, reviewing the movement in *The New Age* for April, 1895, borrowed the epithet from the opening line of the Jacobite song, "There grows a bonnie brier bush in our kailyard," from which line "Ian Maclaren" had already derived the title of his characteristic and very popular *Beside the Bonnie Brier Bush* (1894). There are, however, those who hold that the phrase was inserted in Millar's critique by W. E. Henley, then editor of the periodical in which it appeared.

KAIOCHOW BAY: *see* TSINGTAO.

KAIRA, a town and district of British India, in the northern division of Bombay. The town is 20 m. S.W. of Ahmedabad and 7 m. from Mehmadabad railway station. Pop. (1921), 8,277. Its antiquity is proved by the evidence of copperplate grants to have been known as early as the 5th century. Early in the 18th century it passed to the Babi family, with whom it remained till 1763, when it was taken by the Mahrattas; it was finally handed over to the British in 1803.

The DISTRICT OF KAIRA has an area of 1,608 sq m.; pop. (1921), 710,982. Except a small corner of hilly ground near its northern boundary and in the south-east and south, where the land along the Mahi is furrowed into deep ravines, the district forms one unbroken plain, sloping gently towards the south-west. The north and north-east portions are dotted with patches of rich rice-land, broken by untilled tracts of low brushwood. The centre of the district is very fertile and highly cultivated, with clusters of trees. To the west this belt of rich vegetation passes into a bare though well-cultivated tract of rice-land, growing more barren and open till it reaches the maritime belt, along the Gulf of Cambay. Antelope, gazelle and many game-birds are common. The chief rivers are the Mahi on the south-east and south, and the Sabarmati on the western boundary. The Mahi, owing to its deeply cut bed and sandbanks, is impracticable for either navigation or irrigation; but the waters of the Sabarmati are largely utilized for the latter purpose, as are those of a smaller stream, the Khari. The principal crops are cotton, millets, rice and pulse; the industries are cotton,

printing, dyeing and glass manufacture. Bauxite is worked. The chief centre of trade is Nadiad, on the railway, with a cotton-mill and leather works. A special article of export is *ghi*, or clarified butter. The Bombay and Baroda railway runs through the district.

KAIRWAN: *see* QAIRWAN.

KAISER, GEORG (1878–), German dramatist, was born at Magdeburg on Nov. 25, 1878, the son of a merchant. Educated in his native city, he became a merchant and joined the staff of the Deutsch-Ueberseeische Elektrizitäts-Gesellschaft, Buenos Aires. After three years he was forced to return to Germany owing to ill-health. He lived for some time at Magdeburg, Berlin and Weimar, later at Tutzine on the Starnberger See. In 1903 he published his first drama and from that time onwards wrote numerous plays, at first mostly farcical, but later approaching social and ethical problems in an increasingly serious and successful fashion which secured him recognition as a leader of the expressionist school. In 1921 he was prosecuted for embezzlement and sentenced to a term of imprisonment. His play *Von Morgen bis Mitternacht* was produced in English as *From Morn to Midnight* at the Regent Theatre, London, in 1926.

His works include: *Rektor Kleist* (1905); *Die jüdische Witwe* (1911); *Konig Hahnrei* (1913); *Die Bürger von Calais* (1914); *Von Morgen bis Mitternacht* (1916); *Die Sorina* (1917); *Die Versuchung* (1917); *Gas* (1918 and 1920); *Die Koralle* (1918); *Der Brand im Opernhaus* (1918); *Hölle, Weg, Erde* (1919); *Die Flucht nach Venedig* (1923); *Nebeneinander* (1923); *Kolportage* (1924); *Zweimal Oliver* (1927),

See G. Landauer, *Das Werk Kaisers* (1918).

KAISERSLAUTERN, town in the Bavarian palatinate, on the Waldlauter, in the district of Westrich, 41 m. by rail W. of Mannheim. Pop. (1925) 59,336. Kaiserslautern takes its name from the emperor (Kaiser) Frederick I, who built a castle here about 1152, although it appears to have been a royal residence in Carolingian times. It was an imperial city until 1357, when it passed to the palatinate. It was one of the early stations of the Reformation, and in 1849 was the centre of the revolutionary spirit in the palatinate. The house of correction occupies the site of Frederick Barbarossa's castle, which was demolished by the French in 1713. Kaiserslautern is one of the most important industrial towns in the palatinate. Its industries include cotton and wool spinning and weaving, iron-founding, and the manufacture of beer, tobacco, sugar, boots and furniture.

KAISERSWERTH, town in the Prussian Rhine province, on the right bank of the Rhine, 6 m. below Düsseldorf Pop. (1925) 2,972. It possesses a Romanesque Roman Catholic church of the 12th or 13th century, with a shrine, said to contain the bones of St. Suitbert. The Roman Catholic hospital occupies the former Franciscan convent. The population is engaged in small industries.

In 710 Bishop Suitbert built the Benedictine monastery round which the town gradually formed. Until 1214 Kaiserswerth lay on an island, but in that year the Count of Berg, who was besieging it, dammed up effectually one arm of the Rhine. About the beginning of the 14th century Kaiserswerth, then an imperial city, came to the archbishopric of Cologne. It finally passed into the possession of the princes of the palatinate, whose rights, long disputed by the elector of Cologne, were legally settled in 1772.

KAITHAL or KYTHAL, an ancient town of British India, Karnal district, Punjab. Pop. (1921), 15,477. It is said to have been founded by the mythical hero Yudisthira, and is connected by tradition with the monkey-god Hanuman. In 1767 it fell into the hands of the Sikh chieftain, Bhai Desu Singh, whose descendants, the bhais of Kaithal, ranked among the most powerful Cis-Sutlej chiefs. Their territories lapsed to the British in 1843.

KAIZAK. The Kaizak are a Turki people living in the eastern and northern part of the Aral Caspian basin, and in the Orenburg Steppes. They are divided into three hordes, and claim to be the kinsfolk of the Usbegs, although they undoubtedly have a very close connection with the Mongols, being, like them, nomads, keeping horses and cattle. The Karakalpak of Amu Daria, Kokand and Khiva also probably belong to the same group.

KAJANUS, ROBERT (1856–), Finnish conductor and composer, was born at Helsingfors on Dec. 2, 1856. He studied at Leipzig and later in Paris under Svensden. His great achievement has been the founding of the municipal orchestra at Helsingfors, which has stimulated the musical life of the city and, by its concert tours, has introduced the works of Finnish composers into other countries. Kajanus has also done pioneer work in the discovery of Finnish folk music, drawing largely on it himself for inspiration in his compositions and opening up a rich field for others. His works include two "Finnish Rhapsodies" and a symphony, *Aino*.

KAKAPO, the Maori name for a bird often called the "ground-parrot" or "owl-parrot." This bird (*Strigops habroptilus*) is a flightless parrot inhabiting New Zealand. Nocturnal in habit, it feeds on twigs, leaves, roots and fruits. It is about the size of a raven, of a green colour, barred and freckled with dark brown and light yellow. The powerful beak and the elongated face-feathers give it the appearance of an owl. The keel of the sternum is much reduced.

KAKAR, a Pathan group on the Zhob valley frontier of Baluchistan. They are divided into many distinct tribes who have no connexion beyond the common name of Kakar. There is no chief of the Kakars, or general *jirgah* (or council) of the whole tribe.

See *Census of India*, 1911, vol. iv.

KAKWA: *see* BARI.

KALA-AZAR. In 1881 a malaria-like fever, with great enlargement of the spleen, was found to be causing serious mortality at the foot of the Garo hills in Assam, from whence it spread slowly eastward during the next two decades over some 200m. of the Brahmaputra valley, carrying off about one-third of the inhabitants

Causation and History of Parasite.—It was attributed by successive investigators to hookworm disease, epidemic malaria, and Malta fever respectively, until in 1903 Leishman and Donovan independently discovered its cause in a new minute protozoal parasite, *Leishmania donovani*, found in the spleen. In the following year L. Rogers developed a flagellate stage of the organism in cultures, and suggested a biting insect, probably the bedbug, as its carrier, a supposition which was supported by Patton demonstrating the flagellate stage of the parasite in bedbugs fed on the blood of kala-azar patients in 1905. But in 1925 Knowles and Napier, of the Calcutta School of Tropical Medicine, appear to have solved the difficult problem by incriminating a sand fly, *Phlebotomus argentipes*, as the true agent in transmitting the disease; this minute insect, together with kala-azar cases, being far more prevalent in areas of Calcutta with much vegetation than in the more crowded Indian quarter. After the discovery of the causative parasite in 1903 it was soon found that what had for a century been called malarial cachexia in Bengal was nothing but a widely distributed sporadic form of the Assam epidemic kala-azar, the virulence of the latter being due to its invasion of an area previously free from the disease. The disease is now recognized as being very prevalent over all Bengal, Behar, the eastern part of the United provinces and in Madras, but the comparatively dry Punjab and north-west frontier are practically free from the disease, a certain degree of humidity being necessary for it. A form of kala-azar especially affecting children is also prevalent all round the Mediterranean basin and in Egypt and the Sudan.

Symptoms.—Kala-azar is characterized by very prolonged fever, often typhoid-like in the early stages, and frequently showing two or three rises and falls in 24 hours, the characteristic double remittent fever, but with long intervals of low continued or intermittent fever, the total duration being seldom less than seven months and often extending, with periods of freedom from fever, over several years; accompanied by extreme wasting, very great enlargement of the spleen, and later of the liver, some anaemia and extreme reduction of the white corpuscles of the blood, which lowers the resisting power of the patients to secondary infections with septic diseases, pneumonia, dysentery and phthisis, which are far more frequently the ultimate cause of death than the original disease, the case mortality having been until recently from 80 to 96%.

Prophylaxis and Treatment.—As the result of his Assam researches of 1897, L. Rogers established a house and site infec-

tion of kala-azar and worked out a system of moving the sites of the villages and tea garden coolie lines, whereby the further progress of the epidemic up the Assam valley was checked for many years. J. Dodds Price successfully applied the same plan to stamping out the disease from a number of badly infected tea estates, thereby saving the industry in the Nowgong district. The debilitating effects of the 1918 influenza pandemic led to a recrudescence of kala-azar in the Assam valley, including the more eastern and little infected area. Fortunately by this time an effective treatment had been discovered in intravenous injection of tartar emetic and other antimony preparations, which now enables some 90% of the cases to be cured; a greater saving of life perhaps than has been effected in any such fatal illness by modern medical research, with the result that many thousand cases have been treated successfully each year in Assam and Bengal. Given adequate funds and organization, this, the most terrible of tropical fevers, might be nearly stamped out of the large areas which it has decimated for centuries past and further epidemics prevented.

See L. E. Napier and E. Muir, *Kala-Azar* (1923). (L. R.)

KALACH, also known as Donskaya, a village of south-east Russia in the province of Stalingrad, in lat. 48° 43′ N. and long. 43° 30′ E., a summer river port on the Don at the point where that river approaches the bend of the Volga on which Stalingrad (Tsaritsyn) is situated. Its population (in 1926, 45,182) is much greater during the navigation period, when fish, petroleum, cereals and timber brought up the Volga from the Caspian are unloaded at Stalingrad and sent by rail across the 45 m. between the Volga and Don on the way to the Sea of Azov or to south central Russia.

Also a village in lat. 50° 22′ N, 41° 0′ E, in the province of Voronezh, pop. (1926) 14,833. It is the terminus of a branch line running south through Buturlinovka and has six annual fairs, dealing mainly in cattle and hides.

KALAHANDI (formerly KAROND), one of the Orissa Feudatory States, Behar and Orissa, India, which was transferred from the Central Provinces in 1905. A range of the Eastern Ghats runs from north-east to south-west through the State, with open undulating country to the north. Area 3,745 sq m.; pop. (1921), 415,827. The inhabitants mostly belong to the aboriginal race of Khonds. The chief has the title of raja. The capital is Bhawani-Patna (pop. 6,376).

KALAHARI DESERT, a region of South Africa, lying mainly between 20° and 28° S. and 19° and 24° E., and covering fully 120,000 sq.m. The greater part of this territory forms the western portion of the (British) Bechuanaland protectorate, but it extends south into that part of Bechuanaland annexed to the Cape and west into German South-West Africa. The Orange river marks its southern limit; westward it reaches to the foot of the Nama and Damara hills, eastward to the cultivable parts of Bechuanaland, northward and north-westward to the valley of the Okavango and the bed of Lake Ngami. The Kalahari, part of the immense inner table-land of South Africa, has an average elevation of over 3,000 ft. with a general slope from east to west and a dip northward to Ngami. The surface soil is mainly red sand. On the eastern border long tongues of sand project into the veld, while the veld in places penetrates far into the desert. There are also, and especially along the river beds, extensive mud flats. After heavy rain these become pans or lakes. A tough, sun-bleached grass, growing knee-high in tufts at spaces of about 15 in., covers the dunes and gives the general colour of the landscape. Considerable parts of the Kalahari, chiefly in the west and north, are however covered with dense scrub and there are occasional patches of forest. Next to the lack of water the chief characteristics of the desert are the tuberous and herbaceous plants and the large numbers of big game found in it.

In the south the drainage is towards the Orange. The Molopo and the Kuruman, which in their upper course in eastern Bechuanaland are perennial streams, lose their water by evaporation and percolation on their way westward through the Kalahari. The Molopo, a very imposing river on the map, is dry in its lower stretches. (*See* BECHUANALAND.)

The Kalahari was first crossed to Lake Ngami by David Livingstone, accompanied by William C. Oswell, in 1849. In 1878–1879 a party of Boers, with about three hundred wagons, trekked from the Transvaal across the Kalahari to Ngami and thence to the hinterland of Angola. Many of the party, men, women and children, perished of thirst during the journey. Survivors stated that in all some 250 people and 9,000 cattle died.

See BECHUANALAND. *Die Kalahari,* by Dr. Siegfried Passarge (Berlin, 1904), is a valuable treatise on the geology, topography, hydrography, climate and flora of the desert, with maps and bibliography. The author spent two years (1896–98) in the Kalahari. *See* also *Missionary Travels and Researches in South Africa,* etc., by David Livingstone (1857) and the *South African Year Book.*

KALAKH (Calah, modern Nimrud), an Assyrian city situated in the angle formed by the confluence of the Tigris and the upper Zab 19 m south of Mosul. The city was the artificial creation of Shalmaneser I, as Agade to the south was of Sargon. It was later abandoned for many centuries and subsequently occupied by Assur-nasir-pal. The city was the headquarters of the army in Assyria and as such played an important part in the military revolts which at various times upset the empire. The excavations which have been made on this site, although mostly carried on before the time of scientific archaeology, have produced particularly valuable results in the way of statues and inscriptions although comparatively few tablets have been found, apparently because many of these were transferred in ancient times to Nineveh. The most important objects from the site are the winged lions now in the British Museum, the black obelisk of Shalmaneser, in the same collection and a series of great winged bulls. The most important buildings fall into six groups. First, south of the stage tower lies the north-west palace, originally built by Assur-nasir-pal, and restored by Sargon. It is a wonderfully complete Assyrian building measuring about 350 feet square and including a central court, 129×90 feet, surrounded as in most oriental buildings by a series of large rooms. Secondly, in the interior of the mound, towards its southern end, the palace of Shalmaneser II. rebuilt by Tiglath-Pileser III. there was found together with several other things a series of slabs showing the victorious passages of arms of the rebuilder of the palace. In the south-west corner of the platform an uncompleted building of Esarhaddon was found. This was made from the material taken from Tiglath-Pileser's buildings. Between this building and the north-west palace there was a small palace dating from about sixty years after the time of Assur-nasir-pal. The south-east palace was built by Assur-etil-ilanion; it dates from the end of the seventh century B.C. and was probably used as was the other building as a harem. A temple called E-zida, dedicated to Nebo, was found near the south-east palace, while two small temples of Assur-nasir-pal were found opposite this on the north-west corner. There were other buildings on the east side but these were all found to be ruined because the mound had been used as a cemetery and in later times as an underground granary. Kalakh was never a city of first rate importance. All the cities of Assyria lay within a day's journey of one another, and were overshadowed by Nineveh, but Kalakh owed its importance partly to the action of Shalmaneser and later simply to its official position as the military headquarters of a military power.

BIBLIOGRAPHY.—Layard, A. H., *Nineveh and Its Remains* (London, 1849) (an account of the original excavations); *Cambridge Ancient History,* vol. i., 1923, contains a bibliography of all subsequent work on the site.

KALAMATA (officially Καλάμαι, from an ancient town near the site), chief town of the modern Greek nomarchy of Messenia on the Nedon, about 1 m. from the sea, seat of a court of justice and of an archbishop. Population (1928) 28,955. On a hill behind the town is a mediaeval castle, but no ancient remains have been discovered; some identify the site with classical Pharae. During the middle ages it was for a time a fief of the Villehardouins; in 1685 it was captured by the Venetians; in 1770, and again in 1821, it was the revolutionary headquarters in the Morea; in 1825 it was sacked by Ibrahim Pasha. The harbour, though recently improved, offers little shelter; vessels are served by lighters; in the winter months the fishing craft take shelter in the haven of Armyro. The silk industry was formerly important; the local olives are noted; and the Messenian plain produces

currants and other fruit crops.

KALAMAZOO, a city of south-western Michigan, U.S.A., between Detroit and Chicago, on the Kalamazoo river; the county seat of Kalamazoo county. It is on federal highways 12 and 131; has a municipal airport; and is served by the Chicago, Kalamazoo and Saginaw, the Grank Trunk, the Michigan Central, the New York Central, and the Pennsylvania railways, and by electric interurban railways, motor coach and motor truck lines in every direction. The population was 48,487 in 1920 (83·5% native white) and was estimated locally at 68,000 in 1928, with an additional 10,000 in the contiguous suburbs. Beautiful wooded hills encircle the city, and there are many lakes in the vicinity. The region is famous for its celery, peppermint and fruits, especially grapes. Kalamazoo has a large wholesale and retail trade, and a large number of diversified and exceptionally stable manufacturing industries. Paper of many kinds is the outstanding product, ten large plants making 3,000,000 lb. daily. The total factory output is valued at $72,000,000 annually. Bank debits in 1927 amounted to $305,475,996. The assessed valuation of property was $78,115,900. Since 1918 the city has operated under a commission-manager form of government. Under the "pay-as-you-go" policy the bonded indebtedness was reduced in nine years to $101,250. Kalamazoo is the seat of Kalamazoo college (Baptist), established in 1833 as a "literary institute"; the Western State Teachers college (1903); a State hospital for the insane (1859); and a private home for the feeble-minded. The city was founded in 1829 by Titus Bronson, and was called Bronson until 1836. It was incorporated as a village in 1838 and chartered as a city in 1883. The site was an Indian rendezvous and trading post, and the name is said to mean "a pot of boiling water."

KALAMEIN, in architecture, a type of window and door construction in which a core of wood of exactly the shape of the finished article desired is covered completely with steel or other sheet metal, so arranged as to conceal the seams. Kalamein doors and windows are very nearly fireproof and used frequently in fireproof construction as they are the least expensive form of finished metal-covered doors and windows.

KALAT, the capital of Baluchistan, situated in 29° 2′ N. and 66° 35′ E., about 6,780 ft. above sea-level, 88 m. from Quetta. The town gives its name also to a native state with an area, including Makran and Kharan, of 71,593 m. and a population (1921), 328,281. Kalat is the most picturesque fortress in the Baluch highlands. It crowns a low hill, round the base of which clusters the closely built mass of flat-roofed mud houses which form the insignificant town. A *miri* or citadel, having an imposing appearance, dominates the town, and contains within its walls the palace of the khan. It was in an upper room of this residence that Mehrab Khan, ruler of Baluchistan, was killed during the storming of the town and citadel by the British troops at the close of the first Afghan War in 1839. The valleys immediately surrounding the fortress are well cultivated and thickly inhabited, in spite of their elevation and the extremes of temperature to which they are exposed. Recent surveys of Baluchistan have determined the position of Hozdar or Khozdar, the former capital (27° 48′ N., 66° 38′ E.), to be about 50 m S. of Kalat. In spite of the rugged and barren nature of the mountain districts of the Kalat highlands, the main routes through them (concentrating on Khozdar rather than on Kalat) are comparatively easy. The old *Pathan vat*, the trade highway between Kalat and Karachi by the Hab valley, passes through Khozdar. From Khozdar another route strikes a little west of south to Wad, and then passes easily into Las Bela. This is the *Kohan vat*. A third route runs to Nal, and leads to the head of the Kolwa valley (meeting with no great physical obstruction), and then strikes into the open high road to Persia. Some of the valleys about Kalat are wide and fertile, full of thriving villages and strikingly picturesque, in spite of the great preponderance of mountain wilderness (often, however, the pasturage of sheep) existing in the Sarawan lowlands almost equally with the Jalawan highlands which explains the importance of the province, anciently called Turan (or Tubaran), in the eyes of mediaeval Arab geographers (*see* BALUCHISTAN). The khans of Kalat are now believed to be of Arabic origin, rather than Brahuic extraction. They belong to the Ahmadzai branch of the Mirwari clan, which originally emigrated from Oman to the Kolwa valley of Mekran. The khan of Kalat is the leading chieftain in the Baluch Confederacy. The revenue of the khan is estimated at nearly £60,000, including subsidies from the British government; and an accrued surplus of £240,000 has been invested in Indian securities.

See G. P. Tate, *Kalat* (Calcutta, 1896); *Baluchistan District Gazetteer.* (T. H. H.)

KALAT-I-GHILZAI, a fort in Afghanistan. It is situated on an isolated rocky eminence 5,543 ft. above sea-level and 200 ft. above the plain, on the right bank of the river Tarnak, on the road between Kabul and Kandahar, 87 m. from Kandahar and 229 m. from Kabul. It is celebrated for its gallant defence by Captain Craigie and a sepoy garrison against the Afghans in the first Afghan War of 1842.

KALB, JOHANN ("BARON DE KALB") (1721–1780), German soldier in the American Revolution, was born in Hüttendorf, near Bayreuth, on June 29, 1721. He was of peasant parentage, and left home when he was 16 to become a butler. In 1743 he was a lieutenant in a German regiment in the French service, calling himself at this time Jean de Kalb. He served with the French in the War of the Austrian Succession, becoming captain in 1747 and major in 1756; in the Seven Years' War he was in the corps of the comte de Broglie, rendering great assistance to the French after Rossbach (Nov. 1757) and showing great bravery at Bergen (April 1759). As secret agent, appointed by Choiseul, he visited America in 1768–69 to enquire into the feeling of the colonists toward Great Britain. Late in 1775 he received permission to volunteer in the army of the American colonies, in which the rank of major-general was promised to him by Silas Deane. After many delays he sailed with 11 other officers on the ship fitted out by Lafayette, and arrived at Philadelphia in July 1777. His commission from Deane was disallowed, but the Continental Congress granted him the rank of major-general (dating from Sept. 15, 1777), and in October he joined the army, where his growing admiration for Washington soon led him to view with disfavour de Broglie's scheme for putting a European officer in chief command. Early in 1778, as second in command to Lafayette for the proposed expedition against Canada, he accompanied Lafayette to Albany before the expedition was abandoned. In April 1780 he was sent from Morristown, N.J., to relieve Charleston, but on arriving at Petersburg, Va., he learned that Charleston had already fallen. In his camp at Buffalo Ford and Deep river, Gen. Horatio Gates joined him on July 25; and next day Gates led the army by the short and desolate road directly towards Camden, S.C. On Aug. 11–13, when Kalb advised an immediate attack on Lord Rawdon, Gates hesitated, and it was not until after Cornwallis had occupied Camden (on Aug. 14) that he decided upon action. In the battle, which took place near Camden early in the morning of Aug. 16, the American left and centre gave way in disorder and Gates fled from the field, but Kalb, unhorsed and fighting fiercely at the head of his right wing, was wounded 11 times before he was taken prisoner. He was sent to Camden, where he received the kindest attention, but died on Aug. 19, 1780. Here, in 1825, Lafayette laid the corner-stone of a monument to him. In 1887 a statue of him by Ephraim Keyser was dedicated in Annapolis, Md.

See Friedrich Kapp, *Leben des amerikanischen Generals Johann Kalb* (Stuttgart, 1862; English version, privately printed, New York, 1870), which is summarized in G. W. Greene's *The German Element in the War of American Independence* (New York, 1876); and "Letters of Maj.-gen. Johann Kalb," in *American Historical Review,* vol. xv., pp. 562–567 (1910).

KALCKREUTH, LEOPOLD, COUNT VON (1855–1928), German painter, was born at Düsseldorf, received his training at Weimar from his father, the landscape painter Count Stanislaus von Kalckreuth (1820–94), and subsequently studied at the academies of Weimar and Munich. Although he painted some portraits remarkable for their power of expression, he devoted himself principally to depicting with relentless realism the monotonous life of fishing folk and peasants. His palette is joyless, and almost melancholy, and in his technique he is strongly influenced by the impressionists. He was one of the founders of the seces-

sionist movement. From 1885 to 1890 Count von Kalckreuth was professor at the Weimar art school. In 1890 he retired to his estate of Höckricht in Silesia, where he painted subjects drawn from the life of the country-folk. In 1895 he became a professor at the art school at Karlsruhe. From 1900 to 1905 he was director of the art school at Stuttgart. In 1903 he was elected first president of the German "Künstterbund." He is represented in most German public galleries. The Neue Staats gallery in Munich has his "Rainbow" and the Dresden gallery his "Old Age." Among his chief works are the "Funeral at Dachau," "Homewards," "Wedding Procession in the Carpathian Mountains," "The Gleaners," "Old Age," "Before the Fish Auction," "Summer," and "Going to School." He was also an etcher and lithographer, and he illustrated several books. He died Dec. 1, 1928.

KALE, a cultivated variety of cabbage (*Brassica oleracea* var. *acephala*), which includes several forms. Common or Scotch and Buda kale are amongst the hardiest of the esculents. The plant consists of a stout central stem, which grows to a height of about 2 ft., the large thick-set leaves used for edible purposes being purplish or light red in colour. *See* CABBAGE.

KALEDIN, ALEXEI (1861–1918), Russian general, was born in 1861, and entered the army in 1882. For some years he served in the artillery and in 1889 was appointed on the general staff. When the World War broke out in 1914 he was at the head of the 12th Cavalry Division, with which he distinguished himself in the Galician campaigns of 1914–15. Later in 1915 he commanded the XII. Corps, and in the beginning of 1916 the VIII. Army. With this army, in 1916, he carried out the great offensive campaign of Lutsk. In May 1917, being out of sympathy with the policy of the Provisional Government, he resigned his post as an army commander and later in the same year was elected Ataman of the Don. His popularity among the Cossacks survived the conflict between Kornilov and Kerensky. After the seizure of power by the Bolsheviks, the influence he exercised over the Cossacks kept them at first from supporting the Revolution. But when all means of saving them from Bolshevism were exhausted, Kaledin shot himself on Feb. 11, 1918.

KALEIDOSCOPE, an instrument which produces a symmetrical set of images, by the to and fro reflections in a pair of plane mirrors meeting one another at an angle, which is an even submultiple of 360°. It was invented by Sir David Brewster, and patented by him in 1817. An attempt was made to discount the invention as being merely the same as the multiple mirrors of Kircher, Harris, Wood, Bradley and others; but none of these writers had described an arrangement that produced the beautifully symmetrical patterns that resulted from Brewster's design.

Essentially the instrument consists of two flat pieces of glass, with the edge of one surface meeting the other surface in a clean line; and with their planes inclined to one another at some such angle as $30° \left(\frac{360}{12}\right)$, or $22\frac{1}{2}° \left(\frac{360}{16}\right)$. The eye of the observer is applied at one end, close to the line of intersection of these glasses, and near the opposite end is placed any suitable object in the angular space between the mirrors. The backs of the glasses are blacked to cut off any reflection from them; or, preferably, the inner surfaces of the glasses may be silvered, or metal mirrors may be substituted. The mirrors are usually mounted in a tube, and they are cut somewhat tapering at the eye end, so that their line of intersection may conveniently be brought towards the centre of the tube, and the eye thus be able to look through an aperture central with the tube. The objects usually supplied are a number of pieces of coloured glass, mounted in a cell between a disc of clear glass, which is close to the end of the mirrors, and an outer disc of ground glass. On rotating this cell the pieces of glass fall about and form an infinite variety of patterns. Much more delightful effects are produced by a further device of Brewster. He mounted a convex lens of short focal length (two or three inches) in a sliding tube, which could then be adjusted to throw the image of any natural object in the plane of the ends of the mirrors.

The field of view is limited by the edges of the mirrors opposite to the eye. If, as is usually the case, the object is at a little distance from the end, unless the eye can be placed absolutely in the plane of the mirror, the edge of the mirror will cut the object and the image in different lines, and they will not appear to be perfectly symmetrical. A plane object, *e.g.*, a drawing, which is placed close against the far edges of the mirrors, or a solid object which is placed actually within the angle of the mirrors, and nearer the eye than the ends of the mirrors, will form a symmetrical pattern, independently of the position of the eye. Or if the eye could be placed in the line of intersection of the mirrors, so that it is in the plane of both mirrors, the pattern would always be symmetrical, even if the object is beyond the far end of the mirrors. In actual practice, the eye is arranged to be placed as close as possible to the angle of the mirrors, and the objects are also kept close to the ends of the mirrors. The pattern will then not be quite perfect, but will be sufficiently symmetrical to satisfy an ordinary observer, whose attention has not been specially directed to the want of symmetry.

From the remarks in the last paragraph, it is obvious that it is possible to form a perfectly symmetrical picture of a solid object, which can be seen in relief by the two eyes simultaneously. It is only necessary that the object shall be placed within the far ends of the mirrors, and if the latter are of sufficient size, it can be viewed by both eyes and appear symmetrical, even though the eyes are not close to the angle of the mirrors. A bunched-up handkerchief, or a coloured piece of silk, lighted strongly from one side, yields most beautiful designs, which look like exquisite exotic flowers.

The kaleidoscope is frequently used by designers to enable them to realise the effects that can be produced by symmetrical designs. In this case the mirrors are usually set up in a vertical plane, and supported a little above a table, on which any object can be placed.

Attempts have often been made to project kaleidoscopic patterns, but usually with indifferent success. If a pair of mirrors are merely interposed between the condenser and the projecting lens, it will be found impossible to illuminate the images formed by the successive reflections A piece of ground glass placed immediately after the condenser will help to make the lighting more even, but at a great sacrifice of light. As many beams of light as there are reflected images are required, one beam being focussed upon each of the images of the projecting lens. This can be obtained by interposing a second pair of mirrors between the arc and the condenser, these mirrors making the same angle with one another as the front pair. The lines of intersection of each pair of mirrors and the axis of the condenser should all be coincident. A group of images of the arc arranged round a circle, will then be formed, and the condenser should focus these on the centres of the set of images of the projecting lens. (R. S. CL.)

KALERGIS, DIMITRI (DEMETRIOS) (1803–1867), Greek statesman, a Cretan by birth, studied medicine at Paris and on the outbreak of the War of Greek Independence went to the Morea and joined the insurgents. He fought under Karaiskakis, and was taken prisoner by the Turks before Athens; later he acted as aide de camp to the French philhellene Colonel Fabvier and to Count Capo d'Istria, president of Greece. In 1843, as commander of a cavalry division, he was the prime mover in the insurrection which forced King Otto to dismiss his Bavarian ministers. He was appointed military commandant of Athens and aide de camp to the king, but after the fall of the Mavrocordato ministry in 1845 was forced to go into exile, and spent several years in London, where he became an intimate of Prince Louis Napoleon. In 1848 he descended on the Greek coast, in the hope of revolutionizing the kingdom. He was captured, but soon released and, after a stay in the island of Zante, went to Paris (1853). At the instance of the Western Powers he was recalled on the outbreak of the Crimean War and appointed minister of war in the reconstituted Mavrocordato cabinet (1854). He was, however, disliked by King Otto and his consort, and in October 1855 was forced to resign. In 1861 he was appointed minister plenipotentiary in Paris, in which capacity he took an important part in the negotiations which followed the fall of the Bavarian dynasty and led to the accession of Prince George of Denmark

to the Greek throne.

KALEVALA or KALEWALA, the name of the Finnish national epos. It takes its name from the three sons of Kalewa (or Finland), viz., the ancient Väinämöinen, the inventor of the sacred harp Kantele; the cunning art-smith, Ilmarinen; and the gallant Lemminkainen, who is a sort of Arctic Don Juan. The adventures of these three heroes are wound about a plot for securing in marriage the hand of the daughter of Louhi, a hero from Pohjola, a land of the cold north. Ilmarinen is set to construct a magic mill, the Sampo, which grinds out meal, salt and gold, and as this has fallen into the hands of the folk of Pohjola, it is needful to recover it. The poem actually opens, however, with a very poetical theory of the origin of the world. The virgin daughter of the atmosphere, Ilmatar, wanders for seven hundred years in space, until she bethinks her to invoke Ukko, the modern Zeus, who sends his eagle to her; this bird makes its nest on the knees of Ilmatar and lays in it seven eggs. Out of the substance of these eggs the visible world is made. But it is empty and sterile until Väinämöinen descends upon it and woos the exquisite Aino. She disappears into space, and it is to recover from his loss and to find another bride that Väinämöinen makes his series of epical adventures in the dismal country of Pohjola. Various episodes of great strangeness and beauty accompany the lengthy recital of the struggle to acquire the magical Sampo, which gives prosperity to whoever possesses it. In the midst of a battle the Sampo is broken and falls into the sea, but one fragment floats on the waves, and, being stranded on the shores of Finland, secures eternal felicity for that country. At the very close of the poem a virgin, Mariatta, brings forth a king who drives Väinämöinen out of the country, and this is understood to refer to the ultimate conquest of Paganism by Christianity.

The poem is written in eight-syllabled trochaic verse, and an idea of its style may be obtained from Longfellow's *Hiawatha,* which is a pretty true imitation of the Finnish epic. Longfellow in fact borrowed his metre from a German translation of the *Kalevala* in the original metre.

Until the 19th century the *Kalewala* existed only in fragments in the memories and on the lips of the peasants. A collection of a few of these scattered songs was published in 1822 by Dr. Zacharius Topelius, but it was not until 1835 that anything like a complete and systematically arranged collection was given to the world by Dr. Elias Lönnrot. For years Dr. Lönnrot wandered from place to place in the most remote districts, living with the peasantry, and taking down from their lips all that they knew of their popular songs. Some of the most valuable were discovered in the governments of Archangel and Olonetz. After unwearied diligence Lönnrot was successful in collecting 12,000 lines. These he arranged as methodically as he could into thirty-two runes or cantos, which he published exactly as he heard them sung or chanted. Continuing his researches, Dr. Lönnrot published in 1849 a new edition of 22,793 verses in fifty runes. A still more complete text was published by A. V. Forsman in 1887. The importance of this indigenous epic was at once recognized in Europe, and translations were made into Swedish, German and French. Several translations into English exist, the latest being that by W. J. Kirby in 1907. The best foreign editions issued are those of Castren in Swedish (1844), Leouzon le Duc in French (1845 and 1868), Schiefner in German (1852).

KALGAN, an important depôt and gate-town, as its Mongolian name (halga = gate) signifies, on the Sino-Mongolian border. (40° 53′ N. and 114° 50′ E.). The city lies at an altitude of 2,800 ft. on the extremity of a rich loess plain (Hsuan-Hua) within the belt of high scarps which separate the apex of the North China plain from the Mongolian plateau. It is situated at the point where the easiest and most frequented route from Peking to Urga, utilising the Nankow pass, penetrates the outer of the two sections into which the Great Wall of China is divided in this critical region. Hence it is called "The Gate to Mongolia" and "The Gateway of North China." Under the Ming and Manchu dynasties Kalgan was a centre of great commercial and military importance and until recently was included within the metropolitan province of Chih-li. It has now been made the capital of the newly-constituted administrative district or provisional province of Chahar and is the chief entrepôt of the trade of inner Mongolia. It is served by the Peking-Suiyuan railway which was opened to traffic as far as Kalgan in 1911. There is also a motor-car service for trade and postal purposes between Kalgan and Urga, the capital of outer Mongolia, but camels remain the chief carriers of freight. As many as 100,000 camels used to be employed in carrying tea from Kalgan to Siberia and 1,200,000 camels and 300,000 bullock wagons were used on the inland caravan trade. Kalgan has long been the chief collecting and distributing centre for Mongolian wool destined for foreign export. It is also the focus for the fur trade and has over 20 fur-dressing factories. Skins are brought there to be cleaned, sorted and sewn together, before being sent down to Tientsin. The import in 1923 of goat-skin, sheep-skin, cow-hide, horse-hide and camel wool from Mongolia was valued at $32,000,000. Under the new administrative régime Chahar is being closely linked with Shansi and an extensive scheme of village development and road improvements on the lines associated with that province is proposed.

KALGOORLIE, a town of Western Australia some 380 miles E. by N. of Perth. Kalgoorlie, Coolgardie, Boulder, Kanowna and some others form a group of mining towns fairly typical of south-western Australian conditions. The climate is arid (av. ann. temps.: 77·5°–51° F; av. ann. rainfall *c.* 9 in.). Gold began to be discovered from about 1888 onwards and settlements rapidly sprang up and swelled to great dimensions (Kalgoorlie pop. [1900] *c.* 30,000). Water shortage was a difficulty and led to the construction of the Goldfield Water Supply system, one of the greatest in existence, by which water is piped (since 1903) from the Darling Ranges (capacity 5,000,000 gal. per diem; distance *c.* 1,500 miles in all). The Goldfields had a most meteoric career.

The output of the East Coolgardie and of the Boulder mines alone totals some 34·65 million fine oz. (*c.* £137,000,000) (*see* also AUSTRALIA: Minerals and Mining), but the output has now greatly declined (Kalgoorlie—with Boulder—pop. [1926] 11,200), the place of mining being to some extent filled by agricultural and pastoral pursuits (wheat and sheep). The Trans-Australian railway now passes through Kalgoorlie, and the line from Esperance (*q.v.*) via Norseman to Boulder—which will, it is hoped, open up extensive (*c.* 8,000,000 ac.) new wheat areas—was approaching completion in 1928.

KĀLĪ, "dark" or Kālī Mai, "dark mother," in the late Epic Hindu mythology a cult-title of Durga, wife of Siva. The origin of her worship is obscure and her attributes enigmatical. Usually regarded as a goddess of death and destruction, she is depicted as black, four-armed, with red palms and eyes, her tongue, face and breasts blood-stained, matted hair and fang-like teeth. She wears a necklace of skulls, corpses as earrings, and a girdle of snakes. She was also incarnate as Chamunda (Skt. Chhinnamastaka, "headless"), a type of those who lay down their life for a cause. One of her shrines was Kālīkshetra, near Kālīghat (now Calcutta). There goats are slain as vicarious sacrifices to Kālī, at the Kālī-pūja, on the darkest night of November.

See Hastings' *E.R.E.* (Edinburgh, 1914, 7); *s.v.* Kalighat.

KĀLIDĀSA, the most illustrious name among the writers of the second epoch of Sanskrit literature, which, as contrasted with the age of the Vedic hymns, may be characterized as the period of artificial poetry. The extremely corrupt form of the Prākrit or popular dialects spoken by the women and the subordinate characters in his plays, as compared with the Prākrit in inscriptions of ascertained age, led Weber and Lassen to agree in fixing on the 3rd century A.D. as the approximate period of the writings of Kālidāsa.

He was one of the "nine gems" at the court of King Vikramaditya or Vikrama, at Ujjain, and the tendency is now to regard the latter as having flourished about A.D. 375; others, however, place him as late as the 6th century. Kālidāsa is in the first rank of Oriental poets. Kālidāsa's fame rests chiefly on his several dramas, but he is also distinguished as an epic as well as a lyric poet.

He wrote three plays, the most famous of which is *Sakuntalā*. There are two recensions of the text in India, the Bengalī and the Devanāgarī, the latter being generally considered older and purer. *Sakuntalā* was first translated into English by Sir William Jones (Calcutta, 1789), who used the Bengalī recension. It was soon after translated into German by G. Forster (1791; new ed. Leipzig, 1879). An edition of the Sanskrit original, with French translation, was published by A. L. Chézy at Paris in 1830. This formed the basis of a translation by B. Hirzel (Zürich, 1830); later trans. by L. Fritze (Chemnitz, 1876). Other editions of the Bengalī recension were published by Prema Chandra (Calcutta, 1860) for the use of European students and by R. Pischel (2nd ed., Kiel, 1886). The Devanāgarī recension was first edited by O. Böhtlingk (Bonn, 1842), with a German translation. On this were based the successive German translations of E. Meier (Tübingen, 1851) and E. Lobedanz (8th ed., Leipzig, 1892). The same recension has been edited by Dr. C. Burkhard with a Sanskrit-Latin vocabulary and short Prākrit grammar (Breslau, 1872) and by Professor Monier Williams (Oxford, 2nd ed. 1876), who translated the drama (5th ed., 1887). There is another translation by P. N. Patankar (Poona, 1888). There are also a South Indian and a Cashmir recension.

The *Vikramorvasī*, or *Urvasī won by Valour*, abounds with fine lyrical passages, and is of all Indian dramas second only to *Sakuntalā* in poetic beauty. It was edited by R. Lenz (Berlin, 1833) and translated into German by C. G. A. Höfer (Berlin, 1837), by B. Hirzel (1838), by E. Lobedanz (Leipzig, 1861) and F Bollensen (Petersburg, 1845). There is also an English edition by Monier Williams, a metrical and prose version by Professor H. H. Wilson, and a literal prose translation by Professor E. B. Cowell (1851). The latest editions are by S. P. Pandit (Bombay, 1879) and K. B. Paranjpe (*ibid.* 1898).

The third play, entitled *Mālavikāgnimitra*, has considerable poetical and dramatic merit, but is confessedly inferior to the other two. It possesses the advantage, however, that its hero Agnimitra and its heroine Mālavikā are more ordinary and human characters than those of the other plays. It is edited by O. F. Tullberg (Bonn, 1840), by Shankar P. Pandit, with English notes (1869), and S. S. Ayyar (Poona, 1896); translated into German by A. Weber (1856), and into English by C. H. Tawney (2nd ed., Calcutta, 1898).

Two epic poems are also attributed to Kālidāsa. The longer of these is entitled *Raghuvamsa*, the subject of which is the same as that of the *Rāmāyana*, viz., the history of Rāma, but beginning with a long account of his ancestors, the ancient rulers of Ayodhya (ed. by A. F. Stenzler, London, 1832; and with Eng. trans. and notes by Gopal Raghunath Nandargikar, Poona, 1897, verse trans. by P. de Lacy Johnstone, 1902). The other epic is the *Kumārasambhava*, the theme of which is the birth of Kumāra, otherwise called Kārttikeya or Skanda, god of war (ed. by Stenzler, London, 1838; K. M. Banerjea, 3rd ed. Calcutta, 1872; Parvanikara and Parab, Bombay, 1893; and M. R. Kale and S. R. Dharadhara, ibid. 1907; Eng. trans. by R. T. Griffith, 1879). Though containing many fine passages, it is tame as a whole.

His lyrical poems are the *Meghadūta* and the *Ritusamhāra*. The *Meghadūta*, or the Cloud-Messenger, describes the complaint of an exiled lover, and the message he sends to his wife by a cloud. It is full of deep feeling, and abounds with fine descriptions of the beauties of nature. It was edited with free English translation by H. H. Wilson (Calcutta, 1813), and by J. Gildemeister (Bonn, 1841); a German adaptation by M. Müller appeared at Königsberg (1847), and one by C. Schütz at Bielefeld (1859). It was edited by F. Johnson, with vocabulary and Wilson's metrical translation (London, 1867); later editions by K. P. Parab (Bombay, 1891) and K. B. Pathak (Poona, 1894). The *Ritusamhāra*, or Collection of the Seasons, is a short poem, of less importance, on the six seasons of the year. There is an edition by P. von Bohlen, with prose Latin and metrical German translation (Leipzig, 1840); Eng. trans. by C. S. Sitaram Ayyar (Bombay, 1897).

Another poem, entitled the *Nalodaya*, or Rise of Nala, edited by F. Benary (Berlin, 1830), W. Yates (Calcutta, 1844) and Vidyasagara (Calcutta, 1873), is a treatment of the story of Nala and Damayanti, but describes especially the restoration of Nala to prosperity and power. It has been ascribed to the celebrated Kālidāsa, but was probably written by another poet of the same name. It is full of most absurd verbal conceits and metrical extravagances.

So many poems, partly of a very different stamp, are attributed to Kālidāsa that it is scarcely possible to avoid the necessity of assuming the existence of more authors than one of that name. It is by no means improbable that there were three poets thus named; indeed modern native astronomers are so convinced of the existence of a triad of authors of this name that they apply the term Kālidāsa to designate the number three.

On Kālidāsa generally, *see* A. A. Macdonell's *History of Sanskrit Literature* (1900), and on his date, G. Huth, *Die Zeit des K.* (Berlin, 1890). (A. A. Ma.)

KALIMPONG, a subdivisional town of British India, in the Darjeeling district of Bengal, 3,933 ft. above sea-level. It is a hill sanatorium in an early stage of development and also a frontier market to which wool and mules are brought from Tibet. An important agricultural fair is held in November. In 1900 Kalimpong was chosen by the Church of Scotland as the site of cottage homes, known as St. Andrew's Colonial Homes, for the education and training of poor European and Eurasian children.

KALININ, MICHAEL IVANOVITCH (1875–), Russian statesman, son of a peasant of Tver province, was born in 1875. He went to a village elementary school, and was apprenticed in a munition factory, afterwards at the age of 16 going to St. Petersburg to work in the Putilovsk factory. In 1898 he joined the social-democratic party, was arrested 12 months later, and spent ten months in prison. After being transferred from town to town, he was again arrested in 1903 and sent to Siberia in 1904. He returned in 1905, working in St. Petersburg and Moscow, and in 1908 was banished from St. Petersburg. Like many another peasant-worker, during all these years he remained in touch with his home village, and kept his small-holding in cultivation. In 1913 he was again arrested and sentenced to exile in Eastern Siberia, but he escaped and remained illegally in St. Petersburg until the February revolution of 1917. He took active part in the October Revolution; in 1919 he was elected a member of the central committee of the Russian communist party, and in the same year became president of the central executive committee of the Soviet Government. A peasant himself, he was regarded as the peasants' representative in the Soviet Government, and any peasant could obtain a personal interview with him.

KALINJAR, a town and hill fort of British India in the Banda district of the United Provinces. The fort stands on an isolated rock, the termination of the Vindhya range, at an elevation of 1,203 ft., overlooking the plains of Bundelkhand. Kalinjar is the most characteristic specimen of the hill-fortresses, originally hill-shrines, of central India. Its antiquity is proved by its mention in the *Mahābhārata*. It was besieged by Mahmud of Ghazni in 1023, and here the Afghan emperor Sher Shah met his death in 1545. Both the fort and the town, which stands at the foot of the hill, are of interest to the antiquary on account of their remains of temples, sculptures, inscriptions and caves.

KALIR (QALIR), ELEAZER, Hebrew liturgical poet, whose hymns (*piyyutim*) are among the festival prayers of the German synagogal rite. He is said by some authorities to have lived in the 6th, by others in the 10th century.

Some beautiful renderings of Kalir's poems may be found in the volumes of Davis & Adler's edition of the German Festival Prayers entitled *Service of the Synagogue*.

KALISCH, ISIDOR (1816–1886), Jewish divine, was born at Krotoschin in Prussia on Nov. 15, 1816, and was educated at Berlin, Breslau and Prague. In 1848 he came to London, but passed on in 1849 to America, where he ministered as rabbi in various cities. At Newark from 1875 he gave himself entirely to literary work, and exercised a strong influence as leader of the radical and reforming Jewish party.

Among his works are *Wegweisen für rationelle Forschungen in den biblischen Schriften* (1853).

KALISCH, MARCUS (or MAURICE) (1828–1885), Jewish scholar, was born in Pomerania in 1828, and died in England in 1885. He was one of the pioneers of the critical study of the Old Testament in England. At one time secretary to the Chief Rabbi, he became tutor in the Rothschild family in 1853 and enjoyed leisure to produce his commentaries and other works. The first instalment of his commentary on the Pentawuch was *Exodus* (1855); this was followed by *Genesis* (1858) and *Leviticus* in two parts (1867–1872). Kalisch wrote before the publication of Wellhausen's works, and anticipated him in some important points. Besides these works, Kalisch published in 1877–1878 two volumes of Bible studies (on *Balaam* and *Jonah*). He was also author of a once popular Hebrew grammar in two volumes (1862–1863). In 1880 he published *Path and Goal,* a brilliant discussion of human destiny. His commentaries are of permanent value, not only because of the author's originality, but also because of his erudition. No other works in English contain such full citations of earlier literature. (I. A.)

KALISPELL (Kăl-ĭs-pĕl'), a city of north-western Montana, in the beautiful valley of the Flathead river, at an altitude of 2,950 ft., 10 m. N.W. of Flathead lake, and 35 m. from the western entrance to Glacier national park. It is on Federal highways 2 and 93 and the Great Northern railway, and has a municipal airport. The population was 5,147 in 1920, and was estimated locally at 7,000 in 1928. There are many lakes in the vicinity, and to the east is the beautiful Mission range. Kalispell is an important jobbing and trading centre and has elevators, flour mills, creameries, lumber and planing mills. The city was settled about 1892 and incorporated in 1893.

KALISZ, a town of Poland in the province of Lodz, situated 147 m. by rail W.S.W. of Warsaw, on the river Prosna. The population in 1921 was 44,613. It is one of the oldest and finest cities of Poland, is the seat of a Roman Catholic bishop, and possesses a castle and a large public park. The industrial establishments comprise a brewery, tanneries and factories for ribbons, cloth and sugar. It has been identified with the Galisia of Ptolemy, and its antiquity is indicated by the abundance of coins discovered on the site, as well as by the numerous burial mounds existing in the vicinity. It was the scene of a decisive Polish victory over the Swedes in 1706.

KÁLLAY, BENJAMIN VON (1839–1903), Austro-Hungarian statesman, was born at Budapest on Dec. 22, 1839, of an ancient Magyar family. At an early age Kállay manifested a deep interest in politics, and especially in the Eastern Question. He travelled in Russia, European Turkey and Asia Minor, gaining a thorough knowledge of Greek, Turkish and several Slavonic languages. He became as proficient in Serbian as in his native tongue. In 1867 he entered the Hungarian diet and in 1869 was appointed consul-general at Belgrade. Leaving Belgrade in 1875 he resumed his seat in the diet, and shortly afterwards founded the journal *Kélet Nepe* (Eastern Folk) in which he defended Andrássy's policy, which he had himself largely inspired. In 1878 he went to Philippopolis as Austro-Hungarian envoy extraordinary on the International Eastern Rumelian Commission. In 1879 he became second, and soon afterwards first, departmental chief at the foreign office in Vienna. In 1882 he was appointed Imperial minister of finance and administrator of Bosnia and Herzegovina, a post which he filled for 21 years. He governed on the whole with administrative ability and political skill. He did much for the economic development of the provinces. Politically he began by an attempt to create a special Bosnian nationality and language and to win the Muslim population for this idea. He was driven however, into gradually increasing opposition to the Orthodox Sects, which resulted in a slow rapprochement with the Croats. Kállay died on July 13, 1903 He was an author of talent, translated J. S. Mill, and other writings into Magyar and wrote two valuable writings which have been translated into German (*Geschichte der Serben* and *Die Orientpolitik Russlands*).

KALLIÓ, KJOSTI (1873–), Finnish statesman, was originally a farmer and became a member of the Diet in 1904 and a senator in 1917. From 1919–22 he was minister of agriculture; from 1922–24 prime minister and minister of communications in 1925. On Dec. 31, 1925, Kallio formed a Coalition Government representing the Agrarian and the Finnish Coalition Party. It was conservative in tendency and based mainly on the determination to maintain the existing organization of society; it fell on Nov. 23, 1926, and was succeeded by a Socialist Government.

KALMAR, a seaport of Sweden on the Baltic coast, chief town of the district (*län*) of Kalmar, 250 m. S.S.W. of Stockholm by rail. Pop. (1928) 18,875. It lies opposite the island of Öland, mainly on two small islands, but partly on the mainland. Most of the houses are of wood, but the principal buildings are of limestone from Öland, including the 17th century cathedral. Kalmar, a town of great antiquity, was formerly strongly fortified. There remains the island-fortress of Kalmarnahus, dating partly from the 12th century, but mainly from the 16th and 17th, and containing the beautiful chamber of King Eric XIV. (d. 1577). The town gives name to the treaty (Kalmar Union) by which Sweden, Norway and Denmark were united into one kingdom in 1397. Kalmar has an artificial harbour, with a depth from 15 to 22 feet. There are match factories, the produce of which, with timber and oils, is exported. Shipbuilding is carried on.

KALMUCK, an autonomous area, a district of the Russian S.F.S.R., extending from the right bank of the Volga to the Manich depression on the south-west, and the Dagestan A.S.S.R. on the south-east, and from the Ergeni hills on the west to the Caspian Sea on the east. It was created in 1920 from the former Kalmuck reservation of the province of Astrakhan. A tongue of the area thrusts westwards from long. 43° 5′ E. to about 41° 5′ E., to include the Manich lakes and the settlement of Bashanta. A tiny patch on the left bank of the Volga, in lat. 47° N. also belongs to the Kalmuck Area. Much of the Kalmuck steppe was formerly part of the Aral-Caspian sea, and is a plain 30–40 ft. below sea-level, sloping gently to the south-east. Large areas of moving sands exist near Enotayevsk, where high dunes or *barkhans* have been formed. A narrow tract of land along the coast of the Caspian, "the hillocks of Baer," is covered with hillocks elongated from west to east, perpendicularly to the coast-line, the spaces between them being filled with water or overgrown with thickets of reeds, various willows, elms and almond trees. An archipelago of little islands is thus formed close to the shore by these mounds, which are backed on the north and north-west by strings of partly desiccated salt lakes. The escarpments of the Ergeni Hills represent the former shore-line of the Caspian. The hills are Tertiary, belonging to the Sarmatian division of the Miocene period and are covered with loess and black earth; the remainder of the region is salty, clayey or sandy soil, with islands of chestnut and light brown soils, favourable to agriculture if irrigated.

The water supply is poor. Streams from the eastern slopes of the Ergeni Hills lose themselves in the sand, while those on the western slopes flow in spring only. Water on the steppe is obtainable from wells where sunk, but from no other source. About 50% of the steppe cannot be cultivated. Of the land available, 40% is pasture, 20% salt pasture, and ploughed land is less than 5%. This lies in the Ergeni region, where wheat, rye, barley, millet, oats, maize, sunflower seed, mustard and a few grapes are grown. The rainfall is 4 to 8 in. per annum; winter is severe, with an average temperature much below freezing point; summer temperatures average 85° F. Dust spouts and fierce winds are common, and the air is very dry and the sky cloudless. The chief occupation is nomad stock-raising; sheep are the most numerous, draught cattle, goats, horses and camels are also bred, and there is some fishing. There are no towns; agricultural villages exist in the west, but the Kalmucks are mainly tent-dwelling nomads. The administrative offices are in the city of Astrakhan at present (1928). The Kalmucks, however, are in a semi-dying condition. Their region was an active centre during the civil war following the 1917 revolution, and their flocks and horses were requisitioned. Upon this followed the terrible Volga famine, when fugitives from other areas added to the starvation and distress consequent on the previous heavy depletion of their flocks. In 1909 only 3% of the nomads were without cattle; in 1924–25, 36% had none, while only 10% had the minimum number necessary for produc-

tive stock raising.

The Kalmucks are a Mongol race, and are Buddhists. In the 16th century, under the name of *Oirat* (confederation), four tribes occupied a vast region in Central Asia, between the Altai and Tian-Shan, and the Desert of Gobi and Lake Balkhash. Internecine quarrels led to the migration of the western Kalmucks through the Kirghiz steppe into Russian territory. In 1636 they crossed the Emba river and settled in the Trans-Volga steppe, from which they raided the Russian colonies. By 1646, however, they had submitted to Russia, though retaining their own Khan and their own tribal methods of government. They furnished troops for the Russian army, which proved a valuable fighting asset in Peter the Great's campaign against the Persians. In the 18th century, the pressure of the increasing agricultural settlements limited the range of their nomad herders and attempts were made to convert them to Christianity. During the troubled sixties of the 18th century, discontent among the peasants and native tribes of the Volga came to a height, and the Kalmucks, alarmed by rumours of further oppression, and of sterner efforts to suppress their religion, determined to leave the Volga region and return to China. The Emperor of China and the Dalai Lama of Thibet encouraged the conspirators, and the scheme was so successfully initiated that the first stages were taken before the Russians were aware of their decision. A vast horde of Kalmucks, men, women and children, taking their flocks and herds and *kibitkas* or felt tents with them, assembled on the east bank of the Volga on January 5th, 1771, after having destroyed all their villages in a general conflagration. By some accident, still unexplained, the Kalmucks of the western Volga were unable to join their brethren, and it is their descendants who still inhabit the western steppes. The hardships endured in this unprecedented exodus of a whole nation form one of the great tragedies of history. Thousands succumbed to the bitter frosts of the steppe and desert winter journey, and to the heat and drought of the southern deserts which they reached five months later. In addition, their sworn enemies, the Bashkirs and Kirghiz, pursued them throughout their journey, perpetually harrowing their rear, and they were attacked by the tribes of the countries they passed *en route;* for many years their path could be traced through the desert and steppe by the skeletons of the fallen. Barely a third of the 300,000 who started crossed the frontier into China, where the Chinese came to their help and drove off their Bashkir and Kirghiz persecutors. The survivors were settled in the fertile Ili basin of Chinese Turkistan. *See* MONGOLS.

BIBLIOGRAPHY.—I. V. Mushketov, *Geological Researches in the Kalmuk Steppe in 1884–85* (in Russian) (1894). For other Russian sources *see* Semenov's *Geogr. Dict. and Russ. Encycl. Dict.; Atlas of the U.S.S.R.* (1928) (in Russian); De Quincey, *Revolt of the Tartars; or Flight of the Kalmuck Khan and his people from the Russian territories to the frontiers of China* (1854).

KALNÓKY, GUSTAV SIEGMUND, COUNT (1832–1898), Austro-Hungarian statesman, was born at Lettowitz, Moravia, on Dec. 29, 1832, of an old Transylvanian family. After spending some years in a hussar regiment, in 1854 he entered the diplomatic service without giving up his connection with the army, in which he reached the rank of general in 1879. He was secretary of embassy at London (1860–70), served next in Rome and Copenhagen, became ambassador at St. Petersburg (Leningrad) 1880 and Austro-Hungarian minister of foreign affairs, 1881–95. Essentially a diplomatist, Kalnóky confined his activities almost wholly to foreign affairs. His advice was generally conservative and somewhat unimaginative, but not unsuccessful, especially in the Balkans. He confirmed and renewed Austria's alliance with Germany, co-operated with Bismarck to secure Italy's adherence, followed by that of Rumania's (1883) and the secret treaty with King Milan of Serbia, whom he saved from disaster after Serbia's defeat by Bulgaria at Slivnitza (1885). At the same time he prevented Bulgaria from falling wholly under the influence of Russia, with whom he tried to improve Austria's relations, notably at the meeting of the three emperors at Skiernevice (Sept. 1884). A convinced Catholic, Kalnóky once caused some friction with Italy by stating in a speech to the delegations (1891) that the question of the pope was still unsettled, and his resignation in 1895 was due to Hungarian suspicion of his ultra-montane tendencies. He died at Prödlitz, Moravia, soon after (Feb. 13, 1898).

KALOCSA, a Hungarian town on the left bank of the Danube in the county of Pest-Pilis-Solt-Kis-Kun. Surrounded by marshy but fertile land, much of which is communal, its interests are mainly agricultural. Flax, hemp, cereals, fruit and vines are cultivated and supplemented by fishing and fowling. The town is one of the oldest in Hungary but has lost its former greatness, having suffered much from Turkish attacks in the 16th century and from fire in 1875. As the see of a Roman Catholic archbishop it still retains ecclesiastical importance and has in addition interesting educational institutions, *e.g.*, an observatory and training colleges for priests and teachers. The archbishopric, founded about 1135, is a development of a bishopric said to have been founded in the year 1000 by King Stephen the Saint. It suffered much during the XVI. century from hordes of OHomans who ravaged the country. Pop. (1920), 12,332.

KALONG, the name applied in the East Indies to fruit-eating bats of the genus *Pteropus*. (*See* FLYING FOX, CHIROPTERA.)

KALPI, a town of British India, in the Jalaun district of the United Provinces, on the right bank of the Jumna, 45 m. S.W of Cawnpore. Pop. (1921), 10,037. It was founded, according to tradition, by Vasudeva, at the end of the 4th century A.D. In 1196 it fell to Kutab-ud-din, the viceroy of Mohammed Ghori, and during the subsequent Mohammedan period it played a large part in the annals of this part of India. About the middle of the 18th century it passed into the hands of the Mahrattas. It was captured by the British in 1803, and since 1806 has remained in British possession In May 1858 Sir Hugh Rose (Lord Strathnairn) defeated here a force of about 10,000 rebels under the rani of Jhansi. The old town, which is beside the river, has ruins of a fort, and several temples of interest, while in the neighbourhood are many ancient tombs. There is a lofty modern tower ornamented with representations of the battles of the *Ramayana*. The new town lies away from the river to the south-east, and is a centre of local trade (principally in grain, *ghi* and cotton).

KALUGA, a province of the Russian S.F.S.R., surrounded by those of Moscow, Smolensk, Briansk, Orel and Tula, and not coinciding exactly with the pre-1917 province of the same name. Area 25,687 sq km. Pop. (1926) 1,151,656. Its surface is an undulating plain (800–900 ft.), deeply entrenched by rivers, the town of Kaluga lying at the junction of the valleys of the Ugra and the Oka. The province is mainly built up of Carboniferous deposits, with patches of soft Jurassic clays and limestones which formerly covered the whole region. Coal is mined along the railway running from Kaluga to the Oka River, but is smoky and not of very high calorific value; iron is mined in the south-west. Boulder clay covers the north, which is strewn with boulders brought from Finland and Olonets during the glacial period; in the centre are flint boulders, and to the south patches of loess. The soils are mainly of the grey forest type in the north, merging into black earth with a somewhat low humus content in the south. The climate is extreme, winter frost lasting for five months, and summer temperatures averaging 66° F; the rainfall, about 20 inches per annum, is adequate in view of temperature conditions. These soil and climate conditions are not ideal for agriculture, but are more favourable than in some provinces of Central Russia, and ploughed land here occupies about three times the area under meadow and grassland. Forest and shrub occupy 27.3% of the province, coniferous in the north and deciduous, with birch, ash and oak in the south.

The chief crops are rye (44·4%), oats (21·5%), and potatoes (8·2%). Grass, barley, buckwheat, flax and a little hemp are grown, and along the Oka river cucumbers, cabbages, onions and apples are cultivated. Flax, which demands much labour, is raised in greater quantity than in the Moscow province, where linen factories create a market for it, because there is more labour available, since there are fewer factories to draw off surplus hands. Stock raising includes sheep, working and milch cattle, horses and pigs; dairying is not much developed. In accordance with the better agricultural conditions of the loess area, peasant industries

are less important than in the provinces of poorer agricultural opportunities. They include the making of wooden articles (69%), leather (20%), cement, and chemicals in the Medynsk district. Fireclay, china-clay, chalk, grindstone, pure quartz sand, phosphorite and copper are extracted by peasant artels, and Medyn has a match factory. The province has a comparatively good railway net, and steam navigation is possible on 60% of its rivers.

Kaluga is the chief town of the province, situated on the left bank of the Oka, in 54° 33′ N., 36° 15′ E. Pop. (1926) 49,159. Its industries include saw-milling, smelting, brewing, sausage-manufacture, brick-making and the making of leather goods. It is a good trading centre, on a navigable river, and has railways, roads and telegraph lines radiating from it. The first historical mention of Kaluga occurs in 1389; its incorporation with the principality of Moscow took place in 1518. In 1607 it was held by the second false Demetrius and vainly besieged for four months by the forces of Shuisky. In 1619 Kaluga fell into the hands of the *hetman* or chief of the Zaporozhian Cossacks. Later two-thirds of its inhabitants were carried off by a plague; and in 1622 the whole place was laid waste by a conflagration. It recovered, however, in spite of several other conflagrations (especially in 1742 and 1754). On several occasions Kaluga was the residence of political prisoners; among others Shamyl, the Lesghian chief, spent his exile there (1859–1870).

KALYAN, a town of British India, in the Thana district of Bombay, situated where the two main lines of the Great Indian Peninsula railway diverge 33 m. N.E. of Bombay city. The population (17,829 in 1921) is increasing, owing to the proximity of the town to Bombay. The chief industries are rice husking and brick and tile making, and there are stone quarries in the neighbourhood. Kalyan is known to have been the capital of a kingdom and a centre of sea-borne commerce in the early centuries of the Christian era.

KĀMA or **KĀMADEVA,** in the Vedic Hindu mythology, "desire," the first seed of the mind. From it emanate the gods in the *Rig-Veda.* But in the *Atharva-Veda* Kāma is one of the titles of the Creator, who fulfils all desires. In post-Vedic writings he is the god of love.

See E. W. Hopkins, *Epic Mythology* (Strasbourg, 1915).

KAMAKURA, a coast village of Japan 12 m. S of Yokohama. It was founded in the 7th century and was formerly the established capital of the Shogunate. It is of great natural beauty and contains the famous bronze image of the Buddha or *Dai-Butsu. See* JAPAN.

KĀMĀLA, a red powder formerly used in medicine as an anthelmintic and employed in India as a yellow dye. It is obtained from *Mallotus philippinensis,* Müll., a euphorbiaceous tree from 20 to 45ft. in height, distributed from southern Arabia in the west to north Australia and the Philippines in the east. In India kāmalā has several ancient Sanskrit names, one of which, kapila, signifies dusky or tawny red.

KAMCHATKA (kahm-chăt'ka), a province of the Far Eastern area, Russian S.F.S.R., including the peninsula of Kamchatka, and also that part of the mainland lying north of Cape Viligin (north of the town of Tumansk in 60° 40′ N., 156° 50′ E.), and east of a line going along the crest of the mountain range, and then across the ridge into the valley leading to Chaun Bay, west of the Pala river. The Arctic Ocean washes its northern shores from Chaun Bay eastwards, the Bering Strait, the Bering Sea and the Pacific Ocean its eastern shores, and the sea of Okhotsk its western shores.

Geography.—The peninsula of Kamchatka stretches south from the Koryak territory of the Anadir district for about 750 m. to the long, low, undulating Cape Lopatka. It varies in width from 80 to 300 m. (51° to 62° N. and 156° to 163° E.), and has an area of 104,260 sq.m. Its southern point is 7 m. from the northernmost point of the Kuril islands, belonging to Japan. The greater part of the peninsula is mountainous; the ranges have a general south-west and north-east trend. The tundra-covered plateau of Parapolski Dol separates them from the Stanovoi mountains, and they reappear to the north-east as the Polpol mountains of the Anadir region.

The two main ranges are the Central and the Eastern. The Central range (3,000 ft.), slopes sharply on the east to the upper Kamchatka river valley, but runs down to the sea on the west in long, low spurs. The Eastern or Miakovski range (4,000 to 4,800 ft.), a rugged mass containing many isolated volcanic peaks, is merged with the Central range around Lake Palanskoe north of the sources of the Tigil river in a confused mountain mass nearer to the west than the east coast, and from this point the Tigil Spur branches off from the Central range. North of the Lyesnaya river at the neck of the peninsula, the single range dies down, with the tundra covered plateau of the Parapolski to the north-west, and gentle slopes to the south-east. The Kamchatka river after flowing north for some distance between the Central and the Eastern chains turns eastward through a gap in the Eastern range. The Central and Eastern ranges towards the south approach one another, being separated by the Ganal tundra (1,200–1,300 ft.). South of this is a valley, with the Bistraya river flowing westward through it to join the Bolshaya river and south of this the peninsula is wild and rugged, with many volcanic peaks, and, as in the region farther north, a gentler slope westwards than eastwards.

The most striking feature of the peninsula is, however, the series of towering volcanoes which stretches on the east from Cape Lopatka to the neighbourhood of Syedanka, forming part of the Pacific ring of volcanic activity extending from Java and the Philippines, through Japan, the Kuril islands, Kamchatka and the Aleutian islands to North America. Forty volcanoes, 14 active and 26 extinct, have been located in Kamchatka, and more may be discovered when the peninsula has been completely surveyed. Signs of former volcanic activity are known to exist elsewhere; *e.g.,* the Lyesnaya district. Volcanic activity is spasmodic and peaks believed to be extinct suddenly break out again; *e.g.,* the violent eruption of Koryatskaya (alt. 11,522 ft.) north of Petropavlovsk in 1895. Kluchevskaya (alt. 16,130 ft.) is the highest peak in Siberia and the highest active volcano in the old world. It is surrounded by several rows of terraces and lesser peaks and the circumference of its base measures about 200 m. It is in a state of continuous activity, and notable eruptions occurred in 1729, 1737, 1841, 1853–54, 1896–97. In 1853 its lava outflow reached the Kamchatka river. Other volcanic peaks are Kronotskaya (alt. 10,808 ft.), Shiveluch (alt. 10,519 ft.), in the Yelovka district and Krestovskaya (alt. 9,392 ft.). In the north the mountains consist chiefly of Tertiary sandstones and interbedded volcanic rocks, thick Tertiary deposits, probably Miocene, overlie the middle portions of the west coast. The southern parts of the peninsula are mainly granites, syenites, crystalline slates and recent volcanic deposits. Extensive layers of melaphyre and andesite, with conglomerates and volcanic tuffs, cover the middle portions. In 1899 glaciers were discovered on the Byelaya and Utkinskaya mountains (15,400 ft.).

Hot springs are found all over the peninsula, and 8 m. above the village of Paratunka, on the Paratunka river, is the confluence of a deep river, formed by hot springs, which is navigable for canoes for 2 m. It rises among hot lakes, one of which is 200 yd. long and 14 yd. wide, and is much resorted to by the natives for its medicinal qualities.

The Komandorski islands, Bering and Myedni, form part of the province and are long and mountainous (2,600 ft.). They are the centre of a cod-fishing industry in the hands of Americans, who salt the fish for the Chinese and Japanese markets.

Their main industry in the past was the hunting of the fur seal (*Otaria ursina*); the male seals arrive at the end of May or in early June, and the females in mid-June for breeding. The pups are black at birth, but get a fresh coat of grey fur in August. The promiscuous killing of fur seals in calf in the open sea greatly diminished their numbers and led to protracted disputes. In 1890, 55,435 reached the market, but in 1911 only 200. Hunting these animals in the open sea was forbidden by the Washington International Commission for 15 years and 1912–17 was observed as a close season in the islands themselves; the industry is slowly recovering. There are also reindeer and arctic foxes.

The islands have been inhabited for about a century by Aleuts. The chief settlement is Nikolski, on Bering island, where a wire-

less station is projected, and which has a steamer link in summer with Petropavlovsk. Karaginski island, opposite the Karaga river, also belongs to the province, from which it is separated by a channel 30 to 50 m. in breadth. Its mountains (2,000 ft.) form precipices off the north coast.

The Kamchatka River.—The chief river of the peninsula is the Kamchatka about 350 m. long, and its longitudinal valley, before it pierces the volcanic chain, is the least unfavourable region for agriculture. Carrots, potatoes and cabbages do well in the small vegetable gardens, and clover and flax crops ripen. But rye, sown in May, frequently fails to mature by August, and the crop is rarely successful, so that the country depends on imported grain. Dairy cattle and horses could be bred, but, though a few are kept for local needs, attempts to introduce a dairy industry for export have failed up to the present. The Kamchatka river rises in two streams, one in the Ganal tundra, and the other in a lake in the Central range; it discharges into the Kamchatka gulf over a low tundra, after receiving the overflow of Nerpiche lake. Where the broad river meets the sea there is a maelstrom and motor boats visiting the river during the short summer season frequently capsize, so that to effect a landing is a precarious undertaking. The Russian village of Ust-Kamchatsk is situated to the south of the river, while in the north are the Russo-Japanese fish canneries of Ust-Kamchatsk, which afford employment to 2,000 Japanese in the summer. About 10 m. south of the river are the Japanese "Nichiro" canneries, also employing 2,000 summer hands. Both canneries are idle in winter. A powerful wireless station on the north bank of the river communicates with the wireless station at Petropavlovsk.

For 20 m. or more from the mouth of the river, extends a swampy tundra, intersected by the countless arms of the river, with stunted willows and osier beds in places. The mouth freezes over towards the end of November, and thaws between April and the end of June; the upper course thaws in March and floods result. Of the numerous short streams running east and west the more important are:—the Tigil, 250 m., but navigable only in the tidal area, the Bolshaya, both on the west, and the Avacha, the Goligino, famous for its pearls, and the Oblukovino, which has gold in its upper reaches, on the east.

Climate.—Though much of the peninsula is situated in the same latitude as the British Isles, its climate is extremely severe. The short June to August summer is cooler than on the mainland of Siberia, particularly on the east, where the effect of the open ocean is emphasised by a cold current. Monsoonal rain is heavy at this season, and Bergman noted heavy snowdrifts lying in the south of the peninsula in the second week in June, 1920. Winter snowstorms are frequent and of such violence that travel in them is impossible. Coastal fogs are prevalent in summer. Winter temperatures are not so low as on the mainland. At Petropavlovsk the average January temperature is 13·8° F, July 58·3° F, while in the upper Kamchatka valley they are January 16° F, July 58°–64° F. The average annual precipitation is 40 in. or more and is excessive in view of the lack of evaporation. The rivers are frozen for 6 months or more.

Fauna and Flora.—Much of Kamchatka is tundra-covered; mosquitoes are a terrible plague in summer. In other places is the dense Alschovnik (*Alnus maximowiczi*) jungle coming quite close to the settlements, and notably to Petropavlovsk, often 7 ft. high in summer and difficult to penetrate even with an axe. The Kamchatkan bear makes tracks of which the natives avail themselves through this dense undergrowth, especially along the course of the Upper Kamchatka river. The slopes of the mountains are well wooded with alder, willow, birch, larch, poplar, Siberian fir and "cedar" and a species of mountain-ash. Crake, whortle and other berries are plentiful. Hunting and trapping in winter and fishing in summer are the main occupations of the natives, who rely mainly on fish for their diet and that of their dogs.

The principal kinds of salmon that visit the rivers are:—*Chavucha* (*S. orientalis*), weighing about 15–20 lb. and supplying good caviare, *Goltsi* (*S. collaris*), a kind of sea trout, *Keta* (*Onchorhynchus lagocephalus*), or dog salmon, commonest of all except in South Kamchatka, where the chavucha prevails, *Gorbusha* (*O. proteus*), the humpbacked or Alaskan pink salmon, *Krasnaya* (*O. lycoodon*), a red salmon which salts well, and *Kizhucha* (*O. sanguinolentus*). The keta weighs about 9 lb., and its skin gives the natives food, sails, clothes and boots, while its pale pink caviare is now much in demand. Herring and cod are numerous, but are not used by the natives except in Gizhiga and Penzhina bays, when salmon are scarce. Other fish, not much used by the natives, are *Mikiska* (*Salmo purpurateus*), *Korzhuka*, a kind of smelt, and *Uiki* (*S. socialis*). Crabs and lobsters are also found.

The two main fishing seasons are spring and mid-June. There are about 148 fishing stations in West Kamchatka and 61 in East Kamchatka. *Jukkola*, or sun-dried salmon, is the main winter food of many natives, especially in western Kamchatka; in eastern Kamchatka diet is more varied. The sledge dogs are fed entirely on *jukkola* through the winter. Canning under Japanese direction, with up-to-date machinery, has been successfully started; salmon caviare is prepared and over 2,000 tons per annum exported. A fish preserve called *balyk* is exported to Vladivostok and San Francisco. The chief markets for Kamchatka fish products are China and Japan, though tinned salmon finds a wider market,

Of fur-bearing animals the sable (*Mustela zibelliana*) is the most important for the Kamchatkan hunter. Other animals hunted are the fox, especially by the Koryaks (the blue fox is only found on Komandorski islands), the brown or Kamchatkan bear (*Ursus beringianus*), otters, marmots, hares, wolves, wolverines, chamois, the mountain horned sheep (*Ovis nivicola*), and the wild reindeer. Great precautions against forest fires are taken all over the peninsula in view of the dependence of the people upon hunting products. The Kamchadals remove the lemming's winter store of grain and roots and replace it by caviare and fish remains.

Bird life is abundant and varied and includes ptarmigan, capercailzie, swans, ducks, mallards, red-breasted merganser, pine grosbeak, nuthatches, woodpeckers, waxwings, coal-tits in the spruce forests, eagles, ravens, hawks, hawk owl, sea gulls and northern divers. In the tundra the snowy owl and gerfalcon are numerous, and carrion crows and magpies frequent the villages in winter.

Reindeer are bred in the north and the Koryaks rely on their reindeer herds for food, clothing and transport. Their birch bark reindeer sledges are held together by strips of undressed reindeer skin. The Lamuts keep reindeer, but also rely on hunting, and some Lamuts keep dogs for sledge purposes. Neither tribe milks the reindeer. Both these tribes are nomadic, the mosquitoes making the tundra unbearable for the reindeer in summer, so that they migrate north, often leaving the women and children behind.

The Population in 1926 was reckoned to be about 20 to 25 thousand, but the difficulties of estimating numbers of a nomad population in the climatic conditions of the peninsula are great.

The Koryak tribe extends from the Stanovoi mountains to the sea; and on the west side of Kamchatka as far south as 55° N. The Koryaks are closely related by race and language to the Chukchi, and are divided into the Reindeer Koryaks of Gizhiga and Petropavlovsk districts, and the Maritime Koryaks of the west; the former intermarry with the Chukchi, the latter with the Kamchadals. Jochelson describes the Koryaks as below average height, but square and muscular, with black hair, narrow eyes, bronze skin, broad cheekbones and with little facial hair. Their wood, ivory, whalebone and horn carvings are artistic and they make decorated basketwork and reindeer skin rugs. The reindeer Koryaks camp in tents and have four main annual migrations: (1) in October they remain in the river valleys under the protection of high banks among poplar and aspen groves (2) at the end of March, before the fawning, they descend to the open tundra (3) in July they climb the mountains to the sources of the rivers (4) in autumn, at the time of the fawn festival, they return from the ridges to the tundras and river valleys.

The Maritime Koryaks have underground or semi-underground dwellings. They use kayaks (one man boats) and in Northern Kamchatka, dugouts. In the intervals between famines and epidemics of syphilis, arctic hysteria, smallpox and measles, the population increases. But the absence of medical help, the smug-

gling of spirits and the use of fly-agaric as an intoxicant and their low standard of sanitation are great drawbacks to them.

They are, however, more prosperous than the Lamuts, a branch of the Tungus, who depend on the Koryaks for a supply of reindeer meat in time of famine. They appear to be dying out more rapidly than the Koryaks. The Kamchadals (*Itelmen; Konchalo*) are mainly half breeds between aborigines of a Mongolian type and Siberian emigrants or escaped convicts; their language, except near Penzhina bay, has been replaced by Russian and their numbers have been much diminished by drink and syphilis.

Of incoming races, the Russians, descendants of the Cossacks settled there from the Lena, before the Amur region was conquered, some colonists settled in later times; groups of religious exiles and escaped convicts form the larger proportion. There are also numerous Chinese and Koreans. The Japanese summer population for the fish canning numbers 4,000 to 5,000. Petropavlovsk (*q.v.*) is the chief town and its population has increased from 398 in 1897 to 1,670 in 1926. The development of the fishing industry has increased coastal communications; the season for steamer connections opens earlier and there are several sailings direct to Petropavlovsk, and others to various east and west Kamchatkan centres. It has also helped to raise the standard of living, and the east coast inhabitants especially have a better and more varied diet, since there are more vessels to bring grain. There are no railways and no roads. Dog sledges are the chief means of transport, but the dogs are wild and ill trained and tracks are difficult to find in the heavy winter snows. The installation of wireless and telegraphic communications is already spreading news among the natives and lessening their isolation.

The North.—The remainder of the province is little explored, and much of it lies within the Arctic circle. The Chukchi peninsula lies north of the line that would connect Chaun bay on the Arctic ocean with Kresta (Holy Cross) bay on the Anadir gulf. It is apparently mountainous, sloping more gradually to the north than to the south, but no reliance should be placed on maps of the inland district, as it has not all been topographically surveyed (1928). Vilkitski's exploring expedition in the steamship "Tobol" in 1915 opened up fresh ground. Seals, walrus, lemmings and foxes are found and fishing is good in the rivers and coast lagoons.

The population consists of Chukchi and Eskimos, the latter having crossed from Alaska, and settled along Bering strait. The Chukchi belong to the aboriginal Palaeo-Siberian group. The number of Chukchi in the Chukchi peninsula was estimated at 2,000 in 1926, but the Chukchi have spread beyond Chaun bay and through the Anadir region to Kamchatka, and their total number is probably 10 to 12 thousand. Their name means rich in reindeer, and they are mainly nomad reindeer breeders; some hunt the wild reindeer, when the latter cross from the Polpol mountains over the Anadir river to the north in June and return south in July. Wolves, bears and foxes are also trapped. The maritime Chukchi are mainly seal hunters, but also catch walrus and whale. They use walrus skin boats and harpoons or guns. Reindeer breeding is more profitable than fishing and the evidence seems to point to the development of the reindeer Chukchi at a later date from the original maritime Chukchi. The maritime Chukchi are gradually transferring themselves to reindeer breeding. In view of the importance of the reindeer, a veterinary station was established in the Chukchi peninsula near Cape Dezhnev in 1927, and a boarding school and hospital for the natives is planned for 1928. At present Uelen is the nearest boarding centre to the station.

The trading centres of the Chukchi peninsula are mainly in Bering strait; whalebone, walrus tusks, skins and fur boots are the main exports. Coal, graphite and silver exist, but the remoteness of the district and the severity of the climate prevent their exploitation. There is a wireless station near Cape Dezhnev (East cape). The Anadir river, south of the Arctic circle, has a drainage area of about 330,000 sq.m. It is frozen from the middle of October to June, and at Novo-Mariinsk often to mid-July. It is navigable for 200 m. up to Markovo during the summer and is rich in fish. The inhabitants of Markovo secure red salmon, in addition to whitefish, and stores of dried fish "onkolo" form their own and their dogs' winter food. In the Gulf of Anadir, pike, grayling, dorse and malma are fished and exported to Japan and Vladivostok, in addition to the supply for local needs. Gold mines were working at Volshaya until 1907 and the gravels contained 240 grains of ore per ton. The region is rich in coniferous forests, and coal exists, but distance and climate prevent exploitation at present, though plans are being considered. There is no telegraph and only two steamers visit the Anadir per annum. There is a wireless station in 64° 34′ N. and 175° 35′ E.

The native tribes are Chukchi, Lamuts, Yukaghir and Chuvanzi. The Yukaghir and Chuvanzi are branches of a Palaeo-Siberian race, short, dark-haired, dark-eyed, yellow to brown in skin colour and have hairless faces; their eyes are not Mongolian in type. They are rapidly dying out, partly through drink and syphilis and partly through the limitation of their hunting of the wild reindeer by the increasing activities of the Chukchi. Markovo, at the centre of winter routes to Gizhiga, Kolima river, Chukchi peninsula and Novo-Mariinsk, is the chief settlement. There are a few horses, long-haired cows and pigs, but fishing is the chief occupation. There is a wireless station here, and at Novo-Mariinsk.

The country along the Pacific coast between the Polpol mountains and the Kerek villages to the south is altogether unknown and uninhabited. Dr. Bogoras crossed it in 1900. Mineral wealth reported from the Kamchatka province, in addition to that mentioned previously, includes lignite coal in Gizhiga and Penzhina bays and at Baron Korfa gulf, wolfram near Klyuchevskaya, and iron, copper, iridium, palladium and osmium.

History.—In 1648 the Cossack Dezhnev, after whom East cape has been re-named Dezhnev, sailed round the Arctic coast and south to Anadir gulf, thus discovering Bering strait 80 years before Bering re-discovered it. Other Cossacks crossed from the Kolima river by land along the Anyui and over the watershed and joined him in the Anadir region. But quarrels ensued and Dezhnev remained a wanderer in the region until his disappearance about 1654.

In 1696 Vladimir Atlasov penetrated from the Anadir to Cape Lopatka, and established a fort at Verkhni-Kamchatka. His successors Kobelev and Zinovev further extended the Russian discoveries and a settlement was made at Nijni-Kamchatka. The natives burned the settlements and drove the Russians from the country in 1706, but Atlasov, who had been imprisoned, was released and returned to Kamchatka in 1707 and restored the Russian forts. The authorities at Yakutsk sent out expeditions in 1714 to find a shorter route to Kamchatka than that via Anadir and discovered the Aldan-Maya-Okhotsk route; this opened up quicker communication and ensured Russian rule in Kamchatka.

In 1720 a survey of the peninsula was undertaken; Bering's expedition visited it in 1725–30 and Krasheninnikov and Steller in 1733–45. From 1760 Kamchatka was governed by a naval officer from Okhotsk. In 1799 the Russian-American trading firm began to develop the district, and in 1803 it became a separate province. Nijni-Kamchatka was the first administrative centre, Bolsheretsk succeeded it for a time, but in 1850 Petropavlovsk, with its fine harbour, became the centre of the Russian Pacific naval squadron.

In 1855 the French and English were defeated in an attack on the town, and in 1860 the squadron was transferred to Nikolaievsk and in 1872 to Vladivostok. Attempts at colonization, including the settlement of Cossacks from the Lena, were made during the period before the acquisition of the Amur region. They were not successful, and with the loss of the strategic importance of Kamchatka, the attempts were discontinued. Trading activities are reviving and the increased communications by sea will probably result in further development. The population of the whole province was estimated at 32,000 in 1926.

KAME (a form of Scandinavian *comb*, hill), a more or less rounded hill or short ridge of sand and gravel which occurs associated with glacial deposits. Kames frequently occur in the outwash plain of a glacier and at the mouths of en-glacial streams and are formed by the deposition of the sediments carried by these streams. Kames are often situated directly behind a terminal moraine. They are common in the glaciated portions of the lower Scottish valleys. (*See* GLACIER.)

KAMENETS PODOLSKIY or **PODOLIAN KAMENETS,** a town in the Ukrainian S.S.R., in 48° 43′ N., 26° 35′ E., on a high, rocky bluff of the Smotrich, a left hand tributary of the Dniester. It is on the Bessarabian frontier, opposite to the castle of Khotin. The town (Polish *Kamieniec*), is sharing in the industrial development of the Ukraine and is the terminus of a branch railway from the north. In 1926 it had smelting works, makhorka tobacco factories and a brewing industry; there is a municipal electric plant. A Workers' Scientific institute has been established recently. Its history and the present variety of racial types reflect its border position. The Roman Catholic cathedral of St. Peter and St. Paul, built in 1361, was used as a mosque by the Turks (1672–99). The Greek cathedral of John the Baptist dates from the 16th century, but up to 1798 belonged to the Basilian monastery. Other buildings are the Orthodox Greek monastery of the Trinity, and the Catholic Armenian church (founded, 1398), possessing a 14th century missal and an image of the Virgin Mary that saw the Mongol invasion of 1239–42. Kamenets was laid waste by the Mongol leader Batu in 1240. In 1434 it was made the chief town of the province of Podolia. In the 15th and 16th centuries it suffered frequently from the invasions of Tatars, Moldavians and Turks; and in 1672 the hetman of the Cossacks, Doroshenko, assisted by Sultan Mohammed IV. of Turkey, made himself master of the place. Restored to Poland by the peace of Karlowitz (1699), it passed with Podolia to Russia in 1795. Here the Turks were defeated by the Poles in 1633, and here 20 years later peace was concluded between the same antagonists.

KAMENEV, LEO BORISOVICH (ROSENFELD), (1883–), Russian politician, born in 1883, son of an engineer, received a technical education, but in 1901 joined the Russian social-democratic party, and became a "professional revolutionary." While still a student in 1902 he was imprisoned for participation in a political demonstration. From 1903 he was a member of the Bolshevik section of the R.S.D.P., devoting himself to organising, lecturing and writing on their behalf. In 1908 he was interdicted from living in St. Petersburg, and went to Paris. At the beginning of 1914 he was sent back to Russia by the Bolshevik party central committee, and as their representative in St. Petersburg directed all the party activities in Russia. He adhered to Lenin's revolutionary policy on the war question, and (1915) was arrested and sent to perpetual banishment in Siberia. He returned at the outbreak of the February 1917 revolution, and from March to October 1917 was a member of the praesidium of the Petrograd Soviet. In October he, with Zinoviev and others, was in opposition to Lenin on the question of the Bolshevik revolution, and also in his advocacy of a coalition government formed from all the socialist parties, and temporarily resigned his membership of the Bolshevik central committee. From 1918 he was president of the Moscow soviet, and in 1922 was elected vice-chairman of the soviet of people's commissars. On the death of Lenin in 1924 he was elected chairman of the council of labour and defence. On the development of the Trotskyist opposition in 1923 Kamenev was at first violently anti-Trotsky, but in 1926 he with Zinoviev and others went over to the opposition platform, being expelled from the communist party and losing his official positions in December 1927 for his anti-party and opposition activities. He was readmitted to membership of the party in June 1928.

KAMENZ, a town in the republic of Saxony, on the Black Elster, 21 m. N.E. of Dresden, on a branch line of railway from Bischofswerda. Pop. (1925) 11,165. Built about 1200, Kamenz, was known by the name Dreikretcham until the 16th century In 1318 it passed to the mark of Brandenburg; in 1319 to Bohemia; and in 1635, after suffering much in the Hussite and Thirty Years' wars, it came into the possession of Saxony. In 1706 and 1842 it was almost entirely burnt. The hospital is dedicated to the memory of Lessing, who was born here. The industries of Kamenz include wool-spinning, tanning and the manufacture of cloth, glass, crockery and stoneware.

KAMERUN: *see* CAMEROONS.

KAMES, HENRY HOME, LORD (1696–1782), Scottish lawyer and philosopher, was born at Kames, Berwickshire. Called to the bar in 1724, he employed his leisure in the compilation of *Remarkable Decisions in the Court of Session from 1716 to 1728* (1728). In 1752 he was appointed a judge in the court of session under the title of Lord Kames, and in 1763 he was made a lord of justiciary. He died at Edinburgh on Dec. 27, 1782.

In 1751 Lord Kames published *Essays on the Principles of Morality and Natural Religion,* in which he supported the doctrine of innate ideas, and conceded to man only apparent freedom of the will. The latter doctrine so alarmed certain clergymen of the Church of Scotland that it was withdrawn and man's delusive sense of freedom attributed not to a conviction implanted by God, but to the influence of the passions. His other works are *An Introduction to the Art of Thinking* (1761), *Elements of Criticism* (1762), *Sketches of the History of Man* (1774), and *The Gentleman Farmer,* a work on agriculture.

See *Life of Lord Kames,* by A. F. Tytler, Lord Woodhouselee (2 vols., 1807.)

KAMIMURA, HIKONOJO, BARON (1849–1919), Japanese admiral, was born in Satsuma. He commanded the second squadron in the Russo-Japanese war and defeated the Russian Vladivostok squadron in Aug. 1904. His squadron also fought the battle of Tsushima under the command of Admiral Togo. He was created baron in 1907.

KAMINISTIKWIA, a river of Ontario in Canada, rising in Lake Nipigon, flowing south and east and entering Lake Superior at Thunder Bay. The Kakabeka Falls on its course supply power to the twin cities of Fort William and Port Arthur and the deep water at its mouth makes it the great shipping port for western wheat. *See* ONTARIO.

KAMLOOPS, chief town of the valley of the same name, British Columbia, Canada, situated at the junction of the north and south branches of the Thompson river. Pop. (1921), 4,501. Kamloops is the supply centre for a large mining, grazing and fruit-growing district, and is noted for its healthy climate. It is within the dry area of the southern interior of the province, having a mean annual rainfall of 11 inches. Its physical conditions have been compared with those of Bukhārā in central Asia, and in this connection it is notable that Karakul sheep have been introduced from that country. Kamloops is on the Canadian Pacific and Canadian Northern railways. Among industries are brewing, cigar-making, brick making, founding, and fruit-canning.

KAMMIN or **CAMMIN,** a town in the Prussian province of Pomerania, 2½ m. from the Baltic, on the Kamminsche Bodden, a lake connected with the sea by the Dievenow. Pop. (1925) 5,640. Kammin is of Wendish origin, and obtained municipal privileges in 1274. From about 1200 till 1628 it was the seat of a bishopric, which at the latter date became a secular principality, being incorporated with Brandenburg in 1648. Machine and cement manufacture and brewing are carried on in the town, which has also some fishing and shipping. There is steamer communication with Stettin, about 40 m. S.S.W.

KAMPEN, a town in the province of Overysel, Holland, on the Ysel, 4 m. above its mouth, and a terminal railway station 8 m. N.W. of Zwolle. It has steamboat communication with Zwolle, Deventer, Amsterdam and Enkhuizen. Pop. (1926) 19,755. The four turreted gateways furnish excellent examples of 16th and 17th

century architecture. The very fine Bovenkerk ("upper church"), or church of St. Nicholas, begun in 1369, has double aisles, ambulatory and radiating chapels, and contains some good carved woodwork. The Roman Catholic Buitenkerk ("outer church") is a 14th century building as is the town-hall, which was partly restored after a fire in 1543. The old council-chamber is wainscoted in black oak, and contains a sculptured chimney-piece (1545). The town-hall contains the municipal library, collections of tapestry, portraits and antiquities. The municipality derives revenues from the fertile delta-land, the Kampeneiland, which is always being built up at the mouth of the Ysel. There is a trade in hay and dairy produce.

KAMPTEE or **KAMTHI,** a town of British India in the Nagpur district of the Central Provinces on the Kanhan river, 10 m. from Nagpur. It was founded in 1821, as a military cantonment in the neighbourhood of the then Mahratta capital of Nagpur, and became an important centre of trade, being the entrepôt for all produce coming from Seoni and Chhattisgarh. The town has suffered from visitations of plague and since the extension of railways and the reduction of the cantonment most of its export trade has been diverted to Nagpur or transferred to the producing areas. The population has progressively dwindled from 51,000 in 1881 to 20,226 in 1921.

KAMRUP, a district of British India, in the Brahmaputra valley division of Assam. The headquarters are at Gauhati. Area, 3,863 sq.m.; pop. (1921), 761,671. In the immediate neighbourhood of the Brahmaputra, where the land is low and exposed to annual inundation, reeds and canes flourish luxuriantly, and the only cultivation is that of rice. Away from the river banks the ground begins to rise in undulating knolls towards the mountains of Bhutan on the north, and towards the Khasi hills on the south. The hills south of the Brahmaputra in some parts reach the height of 800 ft. The Brahmaputra, which divides the district into two nearly equal portions, receives several tributaries. The chief of these are the Manas, Chaul Khoya and Barnadi on the north, and the Kulsi and Dibru on the south bank. Government reserved forests cover 300 sq.m. The population is mostly rural, the only town with upwards of 5,000 inhabitants being Gauhati (16,480), near which the temples of Hajo and Kamākhya attract many pilgrims from all quarters. The staple crop of the district is rice.

KAMYSHIN, a town of Russia, in the province of Saratov, on the right bank of the Volga, at its junction with the Kamyshin river. Pop. (1926) 18,375. Being the terminus of the railway to Tambov, Moscow and the Baltic ports, it is a port for the export of cereals and salt from the Volga, and it imports timber and wooden wares. It has an electric plant, a grain elevator and a radio station, and also timber and flour mills. It is famous for its water-melons. It was at first a settlement on the left bank of the river, much exposed to raids from the steppe, but in 1668 the inhabitants moved to the right bank.

KANAKA, a Polynesian word meaning "man," used by Polynesians to describe themselves, and by the French to describe all South Sea islanders, whether black or brown.

KANARA, the name of two adjoining districts, British India: North Kanara in the presidency of Bombay, South Kanara in that of Madras. Both are on the western coast.

North Kanara District forms part of the southern division of Bombay. The administrative headquarters are at Karwar, which is also the chief seaport. Area 3,946 sq.m.; pop. (1921), 401,727. Along the coast rice is the chief crop, and coco-nut palms are grown. In the upland there are valuable gardens of areca palms, cardamoms and pepper. Teak is the chief product, sandalwood-carving, stone-quarrying and salt manufacture are carried on and manganese is worked. The range of the Western Ghats, running from north to south, divides the district into two parts, a lowland or coast strip (Payanghat), and an upland plateau (Balaghat). The coast-line is only broken by the Karwar headland in the north, and by the estuaries of four rivers and the mouths of many smaller streams, through which the salt water finds an entrance into numerous lagoons winding several miles inland. The breadth of the lowlands varies from 5 to 15 miles. From this narrow belt rise a few smooth, flat-topped hills; and at places it is crossed by lofty, rugged, densely wooded spurs, which, starting from the main range, maintain almost to the coast a height of not less than 1,000 ft. Among these hills lie well-tilled valleys of garden and rice land. The plateau of the Balaghat is irregular, varying from 1,500 to 2,000 ft. in height. In some parts the country rises into well-wooded knolls, in others it is studded by small, isolated, steep hills. Except on the banks of streams and in the more open glades, the whole is one broad waste of woodland and forest. Of the rivers flowing eastward from the watershed of the Sahyadri hills the only one of importance is the Wardha or Varada, a tributary of the Tungabhadra. Of those that flow westwards, the four principal ones, proceeding from north to south, are the Kali, Gungawali, Tadri and Sharavati. The last of these forms the famous Gersoppa falls. Extensive forests clothe the hills, and are conserved by the forest department.

South Kanara District has its headquarters at Mangalore. Area 4,021 sq.m. Pop. (1921), 1,247,368. The district is intersected by rivers, none of which exceeds 100 miles in length, They all take their rise in the Western Ghats, and many are navigable during the fair weather for from 15 to 25 miles from the coast. Numerous groves of coco-nut palms extend along the coast, and green rice-fields are seen in every valley. The Western Ghats, rising to a height of 3,000 to 6,000 ft., fringe the eastern boundary. The forests are valuable and extensive. Pepper, ginger, spices, nuts, etc., are characteristic products. Coffee is the chief export, followed by areca nuts. The staple crop is rice. There are a number of tile factories and coffee works and saw and oil mills. Fishing and fish-curing are carried on. The Azhikal-Mangalore line of the Madras railway serves the district.

KANARESE, a language of the Dravidian family, spoken chiefly in Mysore, Hyderabad, and the adjoining districts of Madras and Bombay. It has an ancient literature, written in an alphabet closely resembling that employed for Telugu. The irregular forms in the alphabet are nearly the same as in Telugu, but it is closely related to Tamil

BIBLIOGRAPHY.—Bishop Caldwell, *Comparative Grammar of the Dravidian Languages* (1875); *Linguistic Survey of India,* vol. iv. (1906) (with full bibliography).

KANARIS (or CANARIS), **CONSTANTINE** (1790–1877), Greek patriot, born on the little island of Psara, to the north-west of Chio. He first became prominent as the leader of the signal vengeance taken by the Greeks for the massacre at Chio in April 1822 by the Turkish Capitan Pasha. The commander sent to assail the Turkish fleet was the navarch Miaoulis, but it was Kanaris who executed the attack with the fireships on the flagship of the Capitan Pasha on June 18, 1822. Owing to the celebration of a religious festival by the Turks, Kanaris, at the head of a volunteer party, succeeded in attaching his fireships to the Turkish flagship, and escaping with his party. He repeated the feat at Tenedos in November of 1822, and his successful attacks at Samos and Mytilene in 1824 caused panic in the Turkish navy. His efforts to destroy the ships of Mehemet Ali at Alexandria in 1825 were defeated by contrary winds. When the Greeks tried to organize a regular navy he was appointed captain of the frigate "Hellas" (1826). In politics he was a follower of Capo d'Istria. He helped to upset the government of King Otho and to establish his successor, was prime minister in 1864–1865, came back from retirement to preside over the ministry formed during the crisis of the Russo-Turkish war, and died in office on Sept. 15, 1877. Kanaris is described as of small stature, simple in appearance, somewhat shy and melancholy. He is justly remembered as an honorable and clever leader.

KANAUJ, an ancient city of British India, in Farukhabad district, United Provinces, near the left bank of the Ganges. Pop. (1921), 18,258. Kanauj in early times formed the capital of a great Hindu kingdom, and its splendour culminated about the 6th century A.D. under Harsha. In 1019 it fell before Mahmud of Ghazni, and again in 1194 before Mohammed Ghori. The existing ruins occupy a semicircle fully 4 m. in diameter and have not yet been systematically excavated. Kanauj, which is traditionally said to be derived from *Kanyakubja* (=the crooked maiden), has given its name to an important division of Brahmans in north-

ern India. Hinduism in Lower Bengal also dates its origin from a Brahman migration southwards from this city, about 800 or 900. Kanauj is now noted for the distilling of scents.

KANAVINO, a town of Russia in the Nizhegorod province in 56° 20′ N., 43° 59′ E., on the navigable Oka river. It was given town status in 1925 and its population in 1926 was 64,877. It has sprung into importance with the development of peat fuel electric power. It has sawmills and forges, silicate works, fat extracting works, and manufactures machinery and linen and woollen goods. Its close proximity to Nizhniy-Novgorod provides a ready market for its products.

KANDAHAR, the largest city in Afghanistan, situated in 31° 37′ N. and 65° 43′ E., 3,400 ft. above sea, 370 m. N.W. from Herat. The Indian railway system extends to New Chaman, within some 80 m. of Kandahar. Immediately round the city is a plain, highly cultivated and well populated to the south and west; but on the north-west barren, and bounded by a double line of hills, rising to about 1,000 ft. above its general level. To the north-west these hills form the watershed between the valleys of the Arghandab and the Tarnak, until they are lost in the mountain masses of the Hazarajat. On the south-west they lose themselves in the sandy desert of Registan. Between Kandahar and India the road is comparatively open, and would be available for railway communication should modern conditions overcome the intense exclusiveness of the Afghans. To the north-west, and parallel to the long ridges of the Tarnak watershed, stretches the great road to Kabul. The best known road from Kandahar to India leads to the foot of the Kwaja Amran (Khojak) range, on the far side of which from Kandahar lies the valley of Peshin. The passage of the Kwaja Amran involves a rise and fall of some 2,300 ft., but the range has been tunnelled and a railway now connects the frontier post of New Chaman with Quetta. Several roads to India have been developed through Baluchistan, all dominated from Kandahar.

Kandahar is approximately square-built, with a wall of about 3¼ m. circuit, and from 25 to 30 ft. high, and 15 ft. broad. Outside the wall is a ditch 10 ft. deep. The city and its defences are entirely mud-built. The four main streets cross each other nearly at right angles, the central *chouk* being covered with a dome. These streets are wide and bordered with trees, and are flanked by shops with open fronts and verandas. There are no buildings of any great pretension in Kandahar, a few wealthy Hindus occupying the best houses. The tomb of Ahmad Shah is the only attempt at monumental architecture. This, with its rather handsome cupola, and the twelve minor tombs of Ahmad Shah's children grouped around, contains a few good specimens of fretwork and of inlaid inscriptions. The four streets of the city divide it into convenient quarters for the accommodation of its mixed population of Duranis, Ghilzais, Parsiwans and Kakars, numbering in all some 30,000 souls. Of these the greater proportion are the Parsiwans.

There are 1,600 shops and 182 mosques in the city. The mullahs of these mosques generally have considerable power. The walls are pierced by the four principal gates of "Kabul," "Shikarpur," "Herat" and the "Idgah," opposite the four main streets, with two minor gates, called the Top Khana and the Bardurani respectively, in the western half of the city. The Idgah gate passes through the citadel, a square-built enclosure with sides about 260 yd. long. The flank defences of the main wall are insufficient; indeed there is no pretence at scientific structure about any part of the defences; but the site of the city is well chosen for defence, and the water supply (drawn by canals from the Arghandab or derived from wells) is good.

About 4 m. W. of the present city, stretched along the slopes of a rocky ridge, and extending into the plains at its foot, are the ruins of the old city of Kandahar, sacked and plundered by Nadir Shah in 1738. From the top of the ridge a small citadel overlooks the half-buried ruins. On the north-east face of the hill forty steps, cut out of solid limestone, lead upward to a small, dome-roofed recess, which contains some interesting Persian inscriptions cut in relief on the rock, recording particulars of the history of Kandahar, and defining the vast extent of the kingdom of the emperor Baber.

Kandahar is the most important trade centre in Afghanistan. No manufactures or industries are peculiar to Kandahar, but the long lines of bazaars display goods from England, Russia, Hindustan, Persia and Turkestan. The customs and town dues together amount to a sum equal to the land revenue of the Kandahar province, which is of considerable extent, stretching to Pul-i-Sangin, 10 m. south of Kalat-i-Ghilzai on the Kabul side, to the Helmund on the west, and to the Hazara country on the north. Although Farah has been governed from Kandahar since 1863, its revenues are not reckoned as a part of those of the province. The land revenue proper is assessed in grain, the salaries of government officials, pay of soldiers, etc., being disbursed by *barats* or orders for grain at rates fixed by government. The greater part of the English goods sold at Herat are imported by Karachi and Kandahar in view of the facility of the British railway to Chaman, and a very large trade in fresh fruit now comes to India and is specially catered for by special refrigerator trains. The imports consist chiefly of English goods, indigo, cloth, boots, leather, sugar, salt, iron and copper, from Hindustan, and of shawls, carpets, *barak* (native woollen cloth), postins (coats made of skins), shoes, silks, opium and carpets from Meshed, Herat and Turkestan. The exports are wool, cotton, madder, cummin seed, asafoetida, fruit, silk and horses.

Immediately south and west of Kandahar is well-irrigated and highly cultivated country, but the valley of the Arghandab is the most fertile in the district, with luxuriant orchards and vineyards. The pomegranates of Kandahar, with its *sirdar* melons and grapes, are famous. Vines are grown on artificial banks, probably for want of the necessary wood to trellis them—the grapes being largely exported in a semi-dried state. The art of irrigation is so well understood that the water supply is at times exhausted, no river water being allowed to run to waste. The plains about Kandahar are chiefly watered by canals drawn from the Arghandab near Baba-wali, and conducted through the same gap in the hills which admits the Herat road. The amount of irrigation and the number of water channels form a considerable impediment to the movements of troops. Irrigation by *karez* is also largely resorted to. The *karez* is a system of underground channelling which usually taps a sub-surface water supply at the foot of the rugged and apparently waterless hills. The water is carried over long distances by an underground channel or drain, constructed by sinking shafts at intervals along the required course and connecting the shafts by tunnelling. The general agricultural products of the country are wheat, barley, pulse, fruit, madder, asafoetida, lucerne, clover and tobacco.

History.—Kandahar has a stormy history. Sultan Mahmud of Ghazni took it in the 11th century from the Afghans who then held it. In the beginning of the 13th century it was taken by Jenghiz Khan, and in the 14th by Timur. In 1507 it was captured by the emperor Baber, but shortly afterwards it fell again into Afghan hands, to be retaken by Baber in 1521. Baber's son, Humayun, agreed to cede Kandahar to Persia, but failed to keep his word, and the Persians besieged the place unsuccessfully. Thus it remained in the possession of the Moguls till 1625, when it was taken by Shah Abbas. Aurangzeb tried to take it in 1649 with 5,000 men, but failed Another attempt in 1652 was equally unsuccessful. It remained in Persian possession till 1709, when it was taken by the Afghans, but was retaken after a two years' siege by Nadir Shah. Nadir Shah was assassinated in 1749, and immediately on hearing the news of his death Ahmad Shah (Abdali) seized Nadir Shah's treasure at Kandahar, and proclaimed himself king, with the consent, not only of the Afghans, but, strange to say, of the Hazaras and Baluchis as well. He at once changed the site of the city to its present position, and thus founded the Afghan kingdom, with modern Kandahar as its capital. Ahmed Shah died in 1773, and was succeeded by his son Timur, who died in 1793, and left the throne to his son Zaman Shah. This prince was deposed by his half-brother Mahmud, who was in his turn deposed by Shah Shuja, the full brother of Zaman Shah. After a short reign Shah Shuja was compelled to abdicate from his inability to repress the rising power of Fateh Khan, a Barakzai chief, and he took refuge first with Ranjit Singh, who then ruled the Punjab, and finally secured the protection of

British power. Afghanistan was now practically dismembered. Mahmud was reinstated by Fateh Khan, whom he appointed his vizier, and whose nephews, Dost Mahommed Khan and Kohn dil Khan, he placed respectively in the governments of Kabul and Kandahar. Fateh Khan was barbarously murdered by Kamran (Mahmud's son) near Ghazni in 1818; and in retaliation Mahmud himself was driven from power, and the Barakzai clan secured the sovereignty of Afghanistan. While Dost Mahommed held Kabul, Kandahar became temporarily a sort of independent chiefship under two or three of his brothers. In 1839 the cause of Shah Shuja was actively supported by the British. Kandahar was occupied, and Shah Shuja reinstated on the throne of his ancestors. Dost Mahommed was defeated near Kabul, and after surrender to the British force, was deported into Hindustan. The British army of occupation in southern Afghanistan continued to occupy Kandahar from 1839 till the autumn of 1842, when General Nott marched on Kabul to meet Pollock's advance from Jalalabad. The cantonments near the city, built by Nott's division, were repaired and again occupied by the British army in 1879, when Shere Ali was driven from power by the invasion of Afghanistan; nor were they finally evacuated till the spring of 1881.

KANDERSTEG (3,937 ft.), a town in the canton of Berne, Switzerland, in the centre of the Oberland. It is the highest station on the important railway line from Berne to Brig. It is a health resort and a centre for winter sports at the foot of the Blümlisalp. The place has a population of 3,554, German-speaking and, the majority, Protestant.

KANDY, a town near the centre of Ceylon, 75 m. from Colombo by rail, formerly the capital of a kingdom of the same name, situated 1,718 ft. above sea-level. Pop. (1921) 32,562. It was occupied by the Portuguese in the 16th century and by the Dutch in 1763; but the native kings maintained their independence. In 1814–15 the British got control. It lies round the margin of an artificial lake constructed by the last king of Kandy in 1806. There are Buddhist and Brahman temples, that of Dalada Malagawa being best known. The Royal Botanic Gardens are situated at Peradeniya, 3 m. distant, and the district is renowned for its beauty. Various missions are active in educational work.

KANE, ELISHA KENT (1820–1857), American scientist and explorer, was born in Philadelphia on February 3, 1820. In 1842 he received the degree of M.D. from the University of Virginia, and in the following year entered the U S. Navy as surgeon. In 1850 Kane was made surgeon and naturalist under Lieutenant de Haven, who commanded the ships "Advance" and "Rescue" in the first Grinnell expedition. After an absence of 16 months Kane returned in feeble health, but produced an account of the expedition in 1853, under the title of *The U.S. Grinnell Expedition in Search of Sir John Franklin.* He was determined not to give up the search for Franklin, but travelled the States, lecturing to obtain funds. The second expedition, financed by Henry Grinnell, set out in 1853 in the little brig "Advance," commanded by Kane. She passed up Smith sound at the head of Baffin bay and advanced into the enclosed sea which now bears the name of Kane basin, thus establishing the Polar route of many future Arctic expeditions Here the expedition passed two winters, accomplishing much useful geographical as well as scientific work, including the attainment of what was to remain for 16 years the highest northern lat., 80° 35′ N. (June 1854). After enduring the greatest hardships, it was resolved to abandon the ship, Upernivik being reached on Aug. 5, 1855. From there a relief expedition brought the explorers home. Dr. Kane published *The Second Grinnell Expedition* in 1856. He died at Havana on Feb. 16, 1857.

See *Biography of E. K. Kane,* by William Elder (1858); *Life of E. K. Kane and other American Explorers,* by S. M. Smucker (1859); *The Love-Life of Dr. Kane, containing the Correspondence and a History of the Engagement and Secret Marriage between E. K. Kane and Margaret Fox* (1866); "Discoveries of Dr. Kane," in *Jour. of the Roy. Geog. Soc.,* vol. xxviii. (reprinted in *R.G.S. Arctic Papers* of 1875).

KANE, a borough of McKean county, Pa., U.S.A., in the north-western part of the State, in the midst of the Allegheny National Forest. It is on Federal highways 6 and 219, and is served by the Baltimore and Ohio, the Kane and Elk, and the Pennsylvania railways. The population was 7,283 in 1920 (85% native white) and was estimated locally at 8,000 in 1928. It has an elevation of 2,200ft. above the sea, in a region producing oil, gas, lumber and silica. There are railroad repair shops in the borough, and its manufactures include glass, wood chemical products, screen doors, silk and silk garments, brush heads and handles, gun-cabinets, silver-ware, toys, brick and tile. Kane was settled in 1859 and incorporated as a borough in 1887. It was named after its founder, Gen. Thomas L. Kane (1822–83).

KANGAROO, an Australian pouched mammal (marsupial) with the hind limbs enlarged for hopping and a long thick tail. The enlarged median lower incisors point forward and are used in snipping grass and other vegetation, which is cut up by the sharp cross-crests of the molar teeth. The kangaroo (a native Australian word) was described in 1773 by Captain Cook, who saw some in what is now north Queensland.

The kangaroos belong to the order Marsupialia, one of whose characters is the possession of a pouch in which the young remain for a considerable time after birth. They belong in the suborder Diprotodontia or that group of marsupials having the two median lower incisor teeth enlarged and inclined forward. The nearest living relatives of the kangaroos are the phalangers, which inhabit the same region. The kangaroos differ, however, from the phalangers, which are slow-moving, arboreal forms, in that they are adapted to rapid progression on the ground by hopping on the enlarged hind limbs.

The largest living kangaroos have a head the size of that of a sheep and stand about 8ft. high. The largest extinct form had a head as large as that of a Shetland pony and stood 10ft. or more. *Hypsiprymnodon,* the tiny musk kangaroo, has a head smaller than that of a rabbit. The foot is greatly elongated and very narrow. The first toe or hallux is wanting (except in *Hypsiprymnodon*); the second and third toes are exceedingly slender and joined throughout their length by skin. These syndactylous digits have no function in locomotion but are of use in scratching and cleaning the fur. The straight, long fourth digit forms the principal part of the foot and is provided with a heavy claw. The fifth digit also takes part in locomotion; its metatarsal is closely appressed to that of the fourth digit but the toe diverges.

The tail is long, tapering and very heavy. It is used for balancing during rapid progression and when the animal moves slowly with its forefeet on the ground, the tail and forefoot together act as supports while the hind feet are moved forward. In standing and sitting with body erect and forefeet off the ground, the tail acts as a prop.

Except in *Hypsiprymnodon* the stomach is usually sacculated. The mouth opening is small and partly hidden by the lips. The dark brown eyes are of moderate size. The rounded ears are rather large and capable of being turned back and forth. The fur is soft and somewhat woolly in most large forms. In some rat kangaroos the pelage consists of stiff hairs and soft under fur.

BY COURTESY OF THE N.Y. ZOO. SOCIETY

THE GREAT GREY KANGAROO

In all kangaroos the pouch is well developed, opens forward and contains the four teats. As a rule there is but one young born at a time. In the colder parts of Australia the young are usually born at the beginning of the cold season. For an account of the birth of the young kangaroo, *see* MARSUPIALIA.

Among living mammals no other group affords a more striking example of the principle of adaptive radiation that do the *Macropodidae* or kangaroo family. The living kangaroos form an almost unbroken series illustrating the structural stages in the evolution of its members from the small forest-living type to the giant of the plains, to the hare-like forms of thickets and the secondarily arboreal forms of the tropical forests.

On the damp floor of the tropical rain forest of north Queensland lives the musk kangaroo (*Hypsiprymnodon moschatus*). This

form, the most primitive and generalized member of the *Macropodidae,* has a number of characters in common with the phalangers and stands near to the primitive diprotodonts from which both were derived. It also resembles the phalangers in its general arboreal heritage. From its peculiar characters *Hypsiprymnodon* is considered a distinct subfamily in which is included the somewhat larger Pleistocene *Propleopus.*

The bulky, heavy-jawed, short-headed and rather short-footed kangaroos of the Australian Pleistocene have been grouped together in the genus *Sthenurus.* All the short-footed kangaroos of the present time are forest-living animals; it is therefore assumed that the species of *Sthenurus* also lived largely in forests.

The New Guinean genus *Dorcopsis* is represented by many species, all living in tropical rain forest and none larger than a fox terrier. These are short-footed forms with rather short, partly naked tails, long heads and exceptionally long sectorial premolars. They are most closely allied to the tree-climbing kangaroos (*Dendrolagus*) of the rain forests of New Guinea and north-eastern Queensland. The tree kangaroos are about the same size as *Dorcopsis* but have shorter ears than any other kangaroos and longer, thinner tails and less disproportion between the fore and hind limbs, the toes of which are all provided with sharp, curved claws. The soles of the feet are broad and underlaid by a heavy pad of fat, modifications for climbing.

The pademelons (*Thylogale*) are stocky little animals resembling *Dorcopsis* except in their much shorter head. The sectorial teeth are also much smaller than in *Dorcopsis* and *Dendrolagus* and the third upper incisor tooth is grooved at the posterior edge. They range from New Britain, New Ireland, New Guinea and the Aru islands to eastern Australia, Tasmania and south-western Australia in places where there is suitable forest.

The next group (*Protemnodon*), sometimes referred to as the large wallabies, contains numerous species, most of which are primarily grass-land forms but others transitional in habitat, feeding at night in the open grass-lands and resting during the day in dense scrubs. They resemble the true kangaroos in their proportions and many of the species are commonly called kangaroo rather than wallaby, the name by which most of the smaller forms are known. *Protemnodon* is characterized by a long, tapering tail, moderately long feet, large ears, cheek and hip stripes, palatal vacuities and a groove on the external face of the third upper incisor that divides the tooth into anterior and posterior halves. Some fossil species are larger than any living kangaroos.

The typical kangaroos of the genus *Macropus* are all large forms with long, narrow hind feet. The best known are the great gray kangaroo of the grassy plains of the open Eucalyptus forests, the wallaroo, whose build is more robust and who prefers grass-covered, stony ridges, while the red kangaroo inhabits the interior of the continent where most of the terrain is level and the vegetation sparse. The rock wallabies (*Petrogale* and *Peradorcas*), which are as specialized in foot structure as the large kangaroos, usually spend their days among the crevices of rocks on ridges and beside gullies, as a rule near water-courses. They feed on grass, much of which they obtain at night. The nail-tailed wallabies (*Onychogale*) are among the most beautiful of the kangaroos. These small, graceful creatures of the semi-arid country are highly specialized in tooth and foot structure and have a peculiar, horny growth on the end of the tail resembling a nail. *Palorchestes,* the Pleistocene giant kangaroo, probably weighed as much as a small horse and to judge by its dentition also resembled a horse in feeding habits.

Branching off in another direction from a primitive type somewhat similar to *Hypsiprymnodon* there developed several genera of small size popularly known as rat-kangaroos. The most primitive of these is the potoroo (*Potorous*), about the size of *Hypsiprymnodon.* It has, however, lost its great toe or hallux. Apart from *Hypsiprymnodon* it is the only member of the family with the primitive plantar pads. The three more specialized genera (*Caloprymnus, Bettongia* and *Aepyprymnus*) inhabit more open country but still may be called thicket-living. The banded wallaby (*Lagostrophus*) and the hare wallaby (*Lagorchestes*) avail themselves of much the same sort of habitat as do the kangaroos. They hop about on the open plains and take refuge among bushes.

Thus the family *Macropodidae* may be divided into four subfamilies, the first and most generalized being the Hypsiprymnodontinae, including the genera *Hypsiprymnodon* and *Propleopus;* the second, the Potoroinae, including *Potorous, Bettongia, Caloprymnus* and *Aepyprymnus;* the third, by far the largest, the Macropodinae, including *Dorcopsis, Dendrolagus, Thylogale, Petrogale, Peradorcas, Protemnodon, Macropus* and *Onychogale;* the fourth, Sthenurinae, comprising *Sthenurus* and *Palorchestes.*

All the evidence indicates that the ancestors of the kangaroos were forest animals with an arboreal heritage. The members of the family now show various stages of specialization for terrestrial bipedal locomotion and for a vegetable diet. There is also a definite correlation between the foot and tooth structure of the animals and the type of habitat they occupy. The first two subfamilies feed principally on berries, roots, and fallen fruits in the forest or thickets and all have low-cusped molar teeth. The members of the third sub-family either browse on leaves of vines and saplings in the forest, in which case they have crested, short-crowned molars, or graze in the open grass-lands, in which case they have crested, long-crowned molar teeth; the crested molars being better adapted to grinding than the low-cusped type. The more specialized members of the Potorinae inhabit thickets in more open country and correlated with this is an elongation of the hind feet; thus these forms are exceedingly swift.

As recently revised the family of kangaroos comprises 21 genera, in which are included 158 species and subspecies; of these, five genera and 29 species are known only as Pleistocene fossils.

BIBLIOGRAPHY.—Writings of Oldfield Thomas, especially the *Catalogue Marsupialia and Monotremata in the British Museum* (1888); R. Owen, *Fossil Mammals of Australia* (1877); H. C. Raven, *American Museum Novitiates* (1928). (H. C. R.)

KANGAROO-RAT, a name applied to two widely different groups of mammals. In Australia it is used to denote the small kangaroo-like marsupials technically known as *Potoroinae* and also called rat-kangaroos (*see* MARSUPIALIA and KANGAROO). In North America it is employed for certain small jumping rat-like rodents belonging to the family *Geomyidae.* Kangaroo-rats in this latter series are represented by three North American genera, of which *Dipodomys phillipsi, Cricetodipus agilis* and *Microdipodops megacephalus* may respectively be taken as examples. Resembling pocket-gophers in the possession of cheek-pouches, kangaroo-rats, together with pocket-mice, are distinguished by their elongated hind-limbs and tails, large eyes, well-developed ears, and general jerboa-like appearance and habits. They inhabit sandy districts, where they burrow beneath rocks, and hop about like jerboas; their food consists of grasses and other plants.

KANGAVAR, a small district of Persia lying between Hamadan and Kermanshah and since 1902 included in the latter province. It is very fertile and comprises 35 villages of which the largest is Kangavar which is also the headquarters of the district. It is situated on the high road from Kermanshah to Hamadan, 60 miles from the former and 54 from the latter, and has an elevation of 6,000 ft. Tradition connects the village, which is built on some extensive natural or artificial mounds, with the great queen, Semiramis, who is supposed to have erected a temple to Artemis on the site where the village now lies. Kangavar has a population of about 5,000 and enjoys the amenities of a post and telegraph office.

KANGRA, a town and district of British India, in the Punjab. The town, sometimes called Nagarkot, is situated 2,409 ft. above the sea. The Katoch rajas had a stronghold there, with a fort and rich temples. Mahmud of Ghazni took the fort in 1009 and from one of the temples carried off a vast treasure. In 1360 Kangra was again plundered by Feroz Shah. The temple of Devi was one of the oldest and wealthiest in northern India. It was destroyed, together with the fort and the town, by an earthquake on the 4th of April 1905 (when 1,339 lives were lost in this place alone, and about 20,000 elsewhere) but has since been restored. In 1855 the headquarters of the district were removed to the sanitarium of Dharmsala.

The district of Kangra besides some Rajput states, annexed

after the Sikh wars, includes Lahul, Spiti and Kulu, which are essentially Tibetan. Area, 9,978 sq.m. Pop. (1921), 766,065. Tea cultivation was introduced into Kangra about 1850. The Palampur fair, established by government with a view to fostering commerce with central Asia, attracts a small concourse of Yarkandi merchants. Rice, tea, potatoes, spices, wool and honey are the chief exports.

KANG YU-WEI (1857–1927), Chinese scholar and writer. Born in Kwangtung he passed his literary examinations with high honours at an early age. He attained notoriety by his lectures and leaflets advocating reforms, and in 1898 was introduced to the Emperor Kwang Hsu by the Imperial Tutor Weng Tung-ho. The famous Reform Edicts of that year were due to his powerful influence over the young Emperor, and as a result, he incurred the displeasure of the Empress Dowager. Kang was proscribed and his execution ordered. He, however, succeeded in escaping, and for sixteen years resided abroad, travelling extensively in Europe and America. An ardent monarchist, he advocated the adoption of Confucianism as the State religion, but in neither aspiration made any headway. Upon his return to China, after the establishment of the Republic, he supported the unsuccessful attempt of General Chang Hsun to bring about the restoration of the Emperor Hsuan Tung, and accepted the office of Vice Minister of the Interior in the short-lived Cabinet formed in 1917. The administration lasted only a few weeks, and, after some fighting, the monarchist group were easily disarmed. Kang sought refuge in the Legation Quarter, and eventually retired to Shanghai. His fame as a scholar attained for him freedom from further molestation, and he spent the concluding ten years of his life in comparative affluence, lecturing throughout the country, and forming a collection of antique pottery and ancient Chinese porcelain.

KANISHKA, king of Kabul, Kashmir, and north-western India in the 2nd century A.D., was a Tatar of the Kushan tribe, one of the five into which the Yue-chi Tatars were divided. His dominions extended as far down into India as Madurā, and probably as far to the north-west as Bukhāra. Private inscriptions found in the Punjab and Sind, in the Yusufzai district and at Madurā, and referred by European scholars to his reign, are dated in the years five to twenty-eight of an unknown era. References by Chinese historians to the Yue-chi tribes before their incursion into India, together with conclusions drawn from the history of art and literature in his reign, render the date given the most probable. Kanishka's predecessors on the throne were pagans; but shortly after his accession he professed himself a Buddhist. He spent vast sums in the construction of Buddhist monuments; and under his auspices the fourth Buddhist council, the council of Jālandhara (Jullunder) was convened under the presidency of Vasumitra.

At this council three treatises, commentaries on the Canon, one on each of the three baskets into which it is divided, were composed. King Kanishka had these treatises when completed and revised by Aśvaghosha written out on copper plates, and enclosed the latter in stone boxes, which he placed in a memorial mound. For some centuries afterwards these works survived in India; but they exist now only in Chinese translations or adaptations. We are not told in what language they were written. It was probably Sanskrit (not Pali, the language of the Canon). This change in the medium of literary intercourse was partly the cause, partly the effect, of a complete revulsion in the intellectual life of India. The reign of Kanishka was certainly the turning-point in this remarkable change. It has been suggested that the wide extent of his domains facilitated the incursion into India of Western modes of thought; and thus led in the first place to the corruption and gradual decline of Buddhism, and secondly to the gradual rise of Hinduism.

KANKAKEE (Kăng-kạ-kē'), city, Illinois, U.S.A., 56m. S. of Chicago, on the Kankakee river; county seat of Kankakee county. It is on Federal highway 45, and five State highways, and is served by the Illinois Central and the New York Central railways. The population was 16,753 in 1920 (86% native white) and was estimated locally at 19,500 in 1928. The city has important manufactures, including furniture, agricultural implements, stoves, incubators, metal beds, hosiery, overalls, radio cabinets, foundry products and office supplies, with an aggregate output in 1927 valued at more than $10,000,000. It is also a shipping point for corn, oats, wheat and live stock. There are large limestone quarries and coal deposits near by. The Kankakee State Hospital for the Insane (1879) and a State armoury are situated here. At Bourbonnais, 3m. N., one of the oldest French settlements in the middle west, is St. Viator college (Roman Catholic, 1868). Kankakee was settled in 1832; platted in 1853, as the town of Bourbonnais; and chartered as the city of Kankakee in 1855.

KANKER, a feudatory State of India within the Central Provinces. Area 1,431 sq.m.; pop. (1921) 124,928. It is a hilly tract lying between the Raipur district and the Bastar State, containing the head waters of the Mahanadi river. The residence of the raja, who comes of an old Rajput family, though his subjects are mostly Gonds, is at Kanker (population 4,536), 40 miles south of Dhamtari station on the branch line from Raipur. It is the only State in the C.P. which pays no tribute. The chief crops are rice and small millets, and the forests produce good timber.

KANNSTATT, a town of Germany in the republic of Württemberg, situated on both banks of the Neckar, 2½ m. from Stuttgart, with which it has been incorporated since 1904. Pop. (1925) 21,276.

Kannstatt is mentioned early in the 8th century as the place where a great court was held by Charlemagne for the trial of the rebellious dukes of the Alamanni and the Bavarians. From the emperor Louis the Bavarian it received the same rights and privileges as were enjoyed by the town of Esslingen, and until the middle of the 14th century it was the capital of the county of Württemberg. The town is famous for its mineral springs, known since Roman times. Railway supplies, automobiles and machinery are manufactured; spinning and weaving are carried on; and there are chemical works. Fruit and vines are largely cultivated in the neighbourhood. Near the town are the palaces of Rosenstein and Wilhelma.

KANO, the name of a city and province of Northern Nigeria, British West Africa. Area of the province, 17,644 sq.m.; pop. (1926) 2,299,682. The people are Hausa, with a considerable admixture of Fula. Situated roughly midway between the Niger and Lake Chad, it is mainly undulating plains, park-like in aspect. Nearly all the province drains to Lake Chad, and through it flows from west to north-east the Hadejia (or Challowa) river. In the north, towards the border of the French Nigèr colony, semi-arid conditions prevail. The greater part of the province is highly cultivated "and the hedged or fenced roads and fields give an impression of civilization and ordered industry which is almost unparalleled in tropical Africa." (From the official report for 1926.) This description applies particularly to the Kano emirate, which forms the greater part of the province and has a population of 153 per square mile. The province also includes four small emirates, grouped as the Northern division. Katsina emirate and Katagum emirate were transferred respectively to the Zaria and Bauchi provinces in 1926.

Kano was one of the original seven Hausa States. Written annals carry the record of its kings back to about A.D. 900. Legendary history goes back much further. It was conquered by the Songhoi (Songhay) in the early part of the 16th century, and more than once appears to have made at least partial submission to Bornu. Mohammedanism was introduced not later than the 14th century; probably as early as the 12th century. The Hausa system of government and taxation was adopted by the Fula when, in the early part of the 19th century, they overran the Hausa States (*see* SOKOTO).

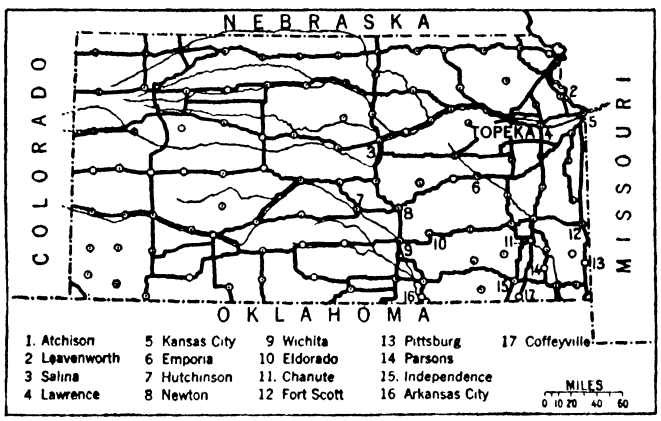
The capital is the city of KANO situated in 12° N. and 8° 20′ E., 500 m. N.E. of Lagos, in a direct line, and 705 m. by railway.

Pop. (1921) 49,938. It is built on an open plain, and is encompassed by a wall 11 m. in perimeter and pierced by 13 gates. The wall is from 30 to 50 ft. high and about 40 ft. thick at the base. Round the wall is a deep double ditch, a dwarf wall running along its centre. The gates are simply cow-hide, but are set in massive entrance towers. Only about a third of the area (7¼ sq.m.) enclosed by the walls is inhabited, the intention of the

BY COURTESY OF THE PHELPS-STOKES FUND

OUTSIDE ONE OF THE GATES OF KANO, SHOWING PART OF THE MUD WALL BUILT AROUND THE CITY SEVERAL HUNDRED YEARS AGO

founders of the city being to wall in ground sufficient to grow food for the inhabitants during a siege. Within the walls are two steep hills, one, Dala, on the north-west, about 120 ft. high, being the most ancient quarter of the town. To its east was a great pond, the Jakara, 1½ m. long, and by its north-east shore is the market of the Arab merchants. Here also was the slave market. The palace of the emir, in front of which is a large open space, consists of a number of buildings covering 33 ac. and surrounded by a wall 20 to 30 ft. high. The houses of Kano are built of clay with (generally) flat roofs impervious to fire. Traces of Moorish influence are evident and the horseshoe arch is common. The audience hall of the emir's palace—25 ft. square and 18 ft. high—is decorated with designs in black, white, green and yellow, the yellow designs (formed of micaceous sand) glistening like gold. The dome-shaped roof is supported by 20 arches.



Kano is the greatest commercial city in the west-central Sudan and is pre-eminent as a manufacturing centre. The chief industry is the weaving and embroidery of cloth from native grown cotton. Leather goods of all kinds are also manufactured, and from Kano come most of the "morocco leather" goods on the European markets. Dyeing is another large trade, as is the preparation of indigo. In Kano itself is a great market for livestock; camels, horses, oxen, asses and goats being on sale. The trade with the south received a great impetus on the opening of the railway in 1911. About 1½ m. E. of Kano is Nassawara. Formerly the emir's suburban residence, it is now the headquarters of the British resident.

The city of Kano appears on the map of the Arab geographer, Idrisi, A.D. 1145, and the hill of Dala is mentioned in the earliest records as the original site of Kano. Barth, however, concluded that the present town does not date earlier than the second half of the 16th century, and that before the rise of the Fula power (*c.* 1800) scarcely any great Arab merchant ever visited Kano. The present town may be the successor of an older town occupying a position of similar pre-eminence. Kano submitted to the Fula without much resistance, and under them, in the first half of the 19th century, flourished greatly. It was visited by Hugh Clapperton, an English officer, in 1824, and in it Barth lived some time in 1851 and again in 1854. Barth's description of the wealth and importance of the city attracted great attention in Europe, and Kano was subsequently visited by several travellers, missionaries, and students of Hausa, but none was permitted to live permanently in the city. In the closing years of the century, Kano became the centre of resistance to British influence, and the emir, Alieu, was the most inveterate of Fula slave raiders. In Feb. 1903 the city was captured by a British force under Col. T. L. N. Morland, and a new emir, Abbas, a brother of Alieu, installed. Abbas was succeeded, in 1919, by Usuman dan Abdullahi, who was one of the great chiefs to receive the prince of Wales on his visit to Kano in 1925. In 1926 Usuman died, and the council of chiefs chose as emir Abdullahi Chiroma Baiyero, a son of the ex-emir Abbas.

Temple, *Notes on the Tribes, Provinces, Emirates and States of the Northern Provinces of Nigeria* (1922); H. F. Backwell (ed.), *The Occupation of Hausaland* (Lagos, 1927).

KANSAS, popularly known as the "Sunflower State," is the central commonwealth of the United States, lying between 37° and 40° N. and 94° 38′ and 102° 1′ 34″ W. It is bounded on the north by Nebraska, on the east by Missouri, on the south by Oklahoma, and on the west by Colorado. The State is nearly rectangular in shape, with a breadth of about 210m. from north to south and a length of about 410m. from east to west; the total area is 82,158 sq m., 384 of which are water surface.

Physical Features.—Three physiographic regions may be distinguished within the State—the first, a small portion of the Ozark uplift in the extreme south-east corner; the second, the Prairie plains, covering approximately the eastern third of the State; the third, the Great plains, covering the remaining area. Between the latter two there is only the most gradual transition. The entire State is indeed practically an undulating plain, gently sloping from west to east at an average of about 7ft. per mile. There is also an inclination in the eastern half from north to south, as indicated by the course of the rivers, most of which flow south-easterly (the Kansas, with its general easterly course, is the principal exception), the north-west corner being the highest portion of the State. The lowest point in the State, in its south-east part, in Montgomery county, is 700ft. above sea-level. The maximum elevation, 4,135ft., is attained on the western boundary in Greeley and Wallace counties. The mean elevation for the State is nearly 2,000ft., but somewhat more than half the total area is below that elevation. The gently rolling prairie surface is diversified by an endless succession of broad plains, isolated hills and ridges and moderate valleys. In places there are terraced uplands, and in others the undulating plain is cut by erosion into low escarpments. The bluffs on the Missouri are in places 200ft. high, and the valley of the Cimarron, in the south-west, has deep cuts, almost gorges. The west central portion has considerable irregularities of contour, and the north-west is distinctively hilly. In the south-west, below the Arkansas river, is an area of sand-hills, and the Ozark plateau region, as above stated, extends into the south-

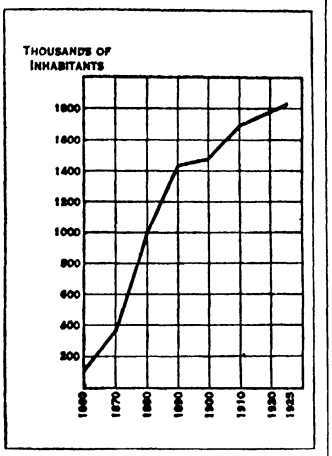
MAP OF MAIN ROADS OF KANSAS

east corner, though not there much elevated. The great central valley is traversed by the Kansas (or Kaw) river, which, inclusive of the Smoky Hill branch, extends the entire length of the State, with lateral valleys on the north. Another broad valley is formed in the south half of the State by the Arkansas river, with lateral valleys on the north and south. The south-east portion contains the Neosho and smaller valleys. In the extreme south-west is the valley of the Cimarron, and along the south boundary is a network of the south tributaries of the Arkansas. Numerous small affluents of the Missouri enrich and diversify the north-east quar-

ter. The streams of Kansas are usually fed by perennial springs, and, as a rule, the east and middle portions of the State are well watered. Most of the streams maintain a good flow of water in the driest seasons, and in case of heavy rains many of them "underflow" the adjacent bottom lands, saturating the permeable substratum of the country with the surplus water, which in time drains out and feeds the subsiding streams. This feature is particularly true of the Saline, Solomon and Smoky Hill rivers. The west part is more elevated and water is less abundant.

The soil of the upland prairies is generally a deep rich clay loam of a dark colour. The bottom lands near the streams are a black, sandy loam; and the intermediate lands, or "second bottoms," are a rich and deep black loam, containing little sand. These soils are very easily cultivated, free from stones, and exceedingly productive. There are exceptional spots on the upland prairies composed of stiff clay not as easily cultivated, but highly productive when properly managed and enriched. The southwest section is distinctively sandy.

Climate.—The climate of Kansas is exceptionally salubrious. Extremes of heat and cold occur, but as a rule the winters are dry and mild, while the summer heats are tempered by the perpetual prairie breezes, and the summer nights are usually cool and refreshing. The average annual temperature of the State for a period of years was 54·3°, the warmest mean being 56·0°, the coldest mean 52·6°. The absolute extremes were 116° and −34°. The dryness of the air tempers exceedingly to the senses the cold of winter and the heat of summer. The temperature over the State is much more uniform than is the precipitation, which diminishes somewhat regularly westward. In the above period of years the yearly means in the west part of the State varied from 11·93 to 29·21in. (av. 19·21), in the middle from 18·58 to 34·30in. (av. 26·68), in the east from 26·00 to 45·71in. (av. 34·78); the mean for the State ranging from 20·12 to 35·50 (av. 27·12). The precipitation in the west is not sufficient for confident agriculture in any series of years, since agriculture is practically dependent upon the mean fall; a fact that has been and is of profound importance in the history of the State. The line of 20in. fall (about the limit of certain agriculture) approximately bisects the State in dry years. The precipitation is very largely in the growing season. Freshets and droughts at times work havoc. Freshets signalized the years 1844 and 1858, and droughts 1860, 1874 and 1894. Tornadoes are also a not infrequent infliction, least common in the west. There are 150 to 175 "growing days" for crops between the frosts of spring and autumn, and eight in ten days are bright with sunshine—half of them without a cloud.



Government.—Kansas, in 1927, was still governed by her original constitution, which was adopted at Wyandotte in July 1859, was ratified by the people on Oct. 4, 1859, and came into effect on Jan. 29, 1861. Twenty-eight amendments have been added since that time. An amendment may be proposed by either branch of the legislature, and, if approved by two-thirds of the members elected to each house, as well as by a majority of the electors voting on it at a general election, it is adopted. A constitutional convention to revise or amend the constitution may be called in the same manner. Kansas was the first State to grant women municipal suffrage as well as the right to hold municipal offices (1887). Full suffrage was extended to women in 1912, and under pressure of the World War the suffrage was limited in 1918 to citizens of the United States. General elections to State, county and township offices are biennial, in even-numbered years, and take place on the first Tuesday after the first Monday in November. The State executive officers are a governor, lieutenant-governor, secretary of State, auditor, treasurer, attorney general, superintendent of public instruction, superintendent of insurance, and State printer, all elected for a term of two years. The governor appoints, with the approval of the senate, certain administrative boards; he may veto any bill from the legislature, and the bill cannot thereafter become a law unless approved by two-thirds of the members of each house.

The legislature, consisting of a senate and a house of representatives, meets in regular session at Topeka, the capital, on the second Tuesday of January in odd-numbered years. The membership of the senate is limited to 40, and that of the house of representatives to 125. Senators are elected for four years, and representatives for two years. The judicial power is vested in one supreme court, 39 district courts, one probate court and a juvenile court for each county and two or more justices of the peace for each township. All justices are elected: those of the supreme court, seven in number, for six years, two or three of them every two years; those of the district courts for four years; and those of the probate courts and the justices of the peace for two years. An act of 1913 provides for the nomination and election of judges by separate ballots without party designation.

The more important affairs of each county are managed by a board of three commissioners, who are elected by districts for four years, but each county elects also a clerk, a treasurer, a probate judge, a register of deeds, a sheriff, a superintendent of public instruction, an assessor, a coroner, an attorney, a clerk of the district court and a surveyor, for terms of two years. A county auditor is appointed by the district court for each county having a population in excess of 45,000. The township officers, all elected for two years, are a trustee, a clerk, a treasurer, two or more justices of the peace, two constables and one road overseer for each road district. Cities are divided into three classes according to size, and the government is different for each class. Those having a population of more than 15,000 constitute the first class; those having a population of more than 2,000 but not more than 15,000 constitute the second class; and those having a population not exceeding 2,000 constitute the third class. Municipal elections are far removed from those of the State, being held in odd-numbered years in April. A great number of municipalities have abandoned the old city-council form of government. An act passed in 1907 and amended in 1909 and 1913 authorized the adoption of a commission form of government in cities of the first and second class. Until 1917 54 cities reorganized under this law. In 1917 the legislature authorized the city-manager plan. All cities that have reorganized since then have adopted this plan. In 1908 a direct primary law was passed, applicable to all nominations except for presidential electors, school district officers, and officers in cities of fewer than 5,000 inhabitants; like public elections, the primaries are made a public charge; nomination is by petition, signed by a certain percentage of the party vote. Since 1910 the administration of the State has become centralized to a high degree. The first step was taken in 1913 in reference to the various educational institutions. In 1916, during the administration of Governor Capper, all of the State educational, charitable and penal institutions were brought under a single board called the board of administration, and in 1925 all the higher educational institutions were put under the control of a single board called a board of regents, consisting of nine members appointed by the governor for terms of four years and electing their own chairman. A provision that part of the board retire annually is intended to give it permanence and remove it from political control. An attempt, made by Governor Capper in 1917 and renewed by Governor Allen in 1921, to consolidate on a similar plan the various bureaux that composed the State board of agriculture, did not succeed. In 1911 the State board of railroad commissioners was superseded by a public utilities commission, modelled on the commissions already established in New York and Wisconsin, to which was given supervision of all public utilities in the State. The legislature in 1920 created a court of industrial relations, consisting of three members. The act declared the manufacture of food and clothing, the mining of fuel and transport to be essential industries and "affected with a public interest" to such a degree as to justify public control. The right of collective bargaining was recognized, but strikes were prohibited, and the court was given authority, either on its own initiative or on complaint, to investigate and to issue orders regulating limitation of production, hours and conditions of labour and rates of wages. Originally the public utilities commission was merged in the industrial court, but in 1921 the public utilities commission was re-established as a separate body, and the labour bureau and the industrial commission were merged in the industrial commission. Finally, in 1924, the tax commission, the public utilities

commission and court of industrial relations, including the department of labour, were consolidated in a single board of five members called the public service commission. The power of the court to fix wages was annulled by the courts, but in other respects the court was allowed to function satisfactorily, operating with the bureau of labour as a department of the public service commission.

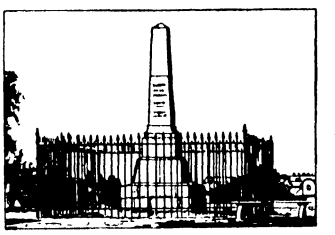
Population.—In population, Kansas ranked, in 1900 and 1910, 22nd in the Union; in 1920, twenty-fourth; the U.S. census estimate on July 1, 1927, was 1,828,000. In the ten years from 1915 to 1925 the rural population increased only 5,000, while the urban population increased 135,000. In 1920, there were 14 cities with a population of 10,000 or more. The population of the four largest cities in 1920 and 1925: Kansas City, 108,851, 116,053; Wichita, 72,217, 88,367; Topeka, 50,022, 55,411; Hutchinson, 23,298, 25,970.

GRAPH SHOWING GROWTH OF POPULATION 1860–1925

The negro population, 3·3% of the total, somewhat large for a northern and western State, is largely the result of an exodus of coloured people from the South in 1878–80 at a time when their condition was an unusually hard one; an exodus which turned mainly toward Kansas. The white population was 93·5% American-born in 1920. The west third of the State has a comparatively scant population, because of its aridity. In the '70s, after a succession of wet seasons, and again in the '80s, settlement was pushed far westward, beyond the limits of safe agriculture, but hundreds of settlers—and indeed many entire communities—were literally starved out by the recurrence of droughts. Irrigation has made a surer future for limited areas, however, and the introduction of drought-resisting crops and the substitution of dairy and livestock interests in the place of agriculture have brightened the outlook in the western counties and created additional possibilities of progress.

Finances.—The chief source of revenue is a general property tax. An amendment permitting the classification of property for the purpose of taxation was rejected by the people in 1914 and 1920, but finally was carried in a somewhat altered form in 1923. Under the new classification, the assessment for the year 1925 was $3,481,626,270 as tangible and $148,667,608 as intangible property. The revenue from a levy of 2·6 *mills* was $7,156,454 for general purposes and $2,236,249 for the soldiers' bonus fund. Other important sources of revenue were the motor vehicle licence fees and a gasolene tax of two cents per gallon. There was practically no State debt until the issuance of $29,500,000 of soldiers' bonus bonds between July 1, 1923, and Oct. 1, 1924. By June 30, 1926, this bonded indebtedness had been brought down to $27,500,000. A State budget system was established by an act of the legislature in 1917.

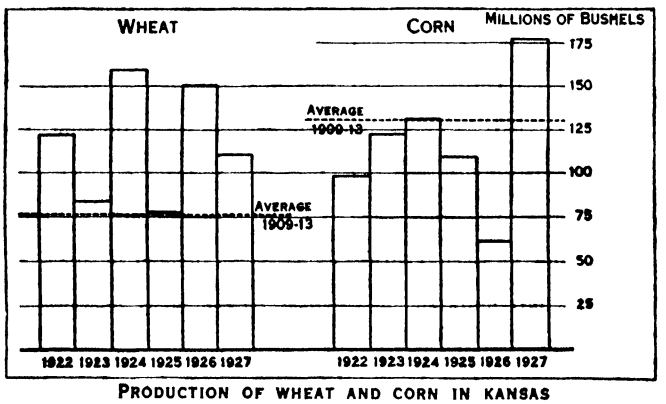
Education.—Kansas ranks very high among the States in its small percentage of illiteracy (inability to write). In 1920 only 1·6% of persons at least ten years of age were illiterate; and the percentages of illiteracy for native whites, foreign whites and negroes were respectively 1·3%, 8·5% and 22·3%. The public school system has as its head a superintendent of public instruction; the schools of each county are under a county superintendent; and each district has a board of directors known as a school board. In rural districts the school board consists of three members; in cities it has six members.



The total population in 1924 between the ages of five and 17 years, inclusive, was 470,415. Of this number, 424,501, or 90·2%, were enrolled in the public schools. For the same year there were 22,762 pupils enrolled in private and parochial schools. The distribution of the public school enrolment was 349,051 in the kindergarten and elementary grades and 75,450 in secondary schools. The average number of days attended per pupil enrolled had increased from 119·5 in 1910 to 150 in 1924. The per capita expenditure, based on population from the ages of five to 17, inclusive, increased from $56.71 in 1920 to $75.01 in 1924. The total expenditure for the year 1923–24 was $35,286,000.

Of higher educational institutions, the State supports the University of Kansas at Lawrence (1866); an agricultural college at Manhattan (1863, aided by the U.S. Government), to which are attached agricultural experiment stations at Hays, Garden City, Colby and Tribune; State teachers' colleges at Emporia (1875), Hays (1902), and Pittsburg (1903); Western university, for negroes, at Kansas City; and the Kansas vocational school at Topeka. In 1899 the State university established a school of medicine in Kansas City.

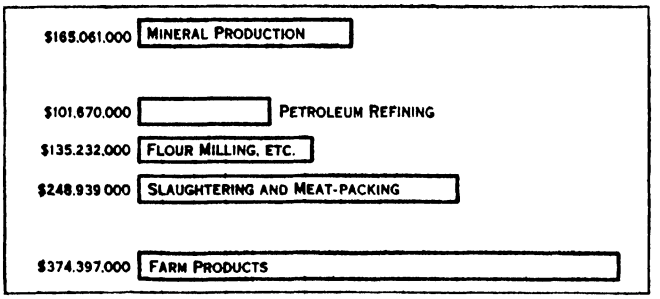
In addition to the State schools, various flourishing private or denominational institutions are maintained. Those institutions recognized by the U.S. bureau of education as universities or colleges, in 1927, were: Kansas Wesleyan university at Salina; Baker university at Baldwin; Washburn college at Topeka; Southwestern college at Winfield; College of Emporia at Emporia; Bethany college at Lindsborg; St. Marys college at St. Marys; Ottawa university at Ottawa; Kansas City university at Kansas City; St. Benedict's college at Atchison; McPherson college at McPherson; Bethel college at Newton; Friends university at Wichita; and the Municipal university of Wichita at Wichita. There are also ten junior colleges, chiefly operated as parts of public school systems, and a number of small business and professional schools. Haskell institute (1884), near Lawrence, is maintained by the United States Government as a school for Indians which is very successful.



Charities and Houses of Correction.—State charitable and penal institutions are under the supervision of a State board of administration. Hospitals for the insane are maintained at Topeka, Larned and Osawatomie, and a hospital for epileptics at Parsons. Other State institutions are the school for feeble-minded youths at Winfield; the State tubercular sanatorium at Norton; the State orphans' home at Atchison; the State soldiers' home at Ft. Dodge; Mother Bickerdyke home at Ellsworth; a school for the blind at Kansas City; a school for the deaf at Olathe; an industrial school for girls at Beloit, and a similar school for boys at Topeka; an industrial farm for women at Lansing; a reformatory for young criminals at Hutchinson; and the State penitentiary at Lansing. The State also contributes to many institutions on a private basis. Most of the counties maintain Poor farms and administer outdoor relief.

Industry, Trade and Transportation.—Kansas is pre-eminently rural, and agriculture is one of the chief industries. The U.S. census of agriculture in 1925 showed that 43,729,129ac., or 83·6% of the total area, were in farms, and that 54·6% of the farm acreage was crop land. The total farm acreage, however, showed a decrease from the 45,425,179ac. in 1920. The number of farms decreased from 177,841 in 1910 to 165,149 in 1925. Of the total number of farms in 1925, 95,149 were operated by owners and 70,000 by tenants. The total farm population in 1925 was 701,768; 697,135 white and 4,633 coloured. The value of all farm property had decreased from $3,302,806,187 in 1920 to $2,504,320,108 in 1925, when the average value per farm was $15,097. The total value of all crops, exclusive of live stock, was $301,655,000 in 1925, and $329,882,000 in 1926. The crop value in 1926 gave the State the rank of fifth among the States of the Union. Wheat is by far the most important agricultural product. In 1926, for instance, a wheat acreage of 10,147,000ac. produced 150,084,000bus., valued at $178,599,000. This was more than twice that of any other State. Winter wheat constituted almost the entire crop. The hard varieties rank in the flour market

OGDEN MONUMENT AT FORT RILEY, KANSAS, THE GEOGRAPHICAL CENTRE OF THE UNITED STATES



with the finest Minnesota wheat. The principal wheat belt crosses the State from north to south in its central third. Second in importance is Indian corn. In 1926, 5,563,000ac. devoted to it produced 57,299,000bus., worth $40,109,300. The corn crop is variable in both acreage and yield; the yield in 1926 having been 10·3 bus. per acre, compared with an average of 20·3 bus. for the years 1920–25. The Indian corn belt is mainly in the eastern third of the State. The cereal next in importance is oats, 35,122,000bus. having been the product for 1926. In the western third, irrigation has been tried unsuccessfully; in all Kansas, in 1920, there were 504 farms irrigated, or only ·3% of the total number of farms. These enterprises were found chiefly along the Arkansas river. In this western part of the State the rainfall is insufficient for Indian corn; but Kaffir corn and other drought-resisting sorghums furnish an abundance of grain. In 1926, there were 1,078,000ac. planted in sorghums of all varieties; the grain yield was 19,404,000bus., worth about $11,642,400. Alfalfa, because of its drought-resisting quality, is planted extensively throughout the State. The hay crop in 1926 was 2,707,000 tons, and had an approximate value of $35,191,000. Other crops of economic value were potatoes, barley, flax and broom corn. Sugar-beet culture, tried with indifferent success since 1890, is of minor importance. Fruits grow well in Kansas where the rainfall is sufficient; but with the exception of apples none has more than local commercial value. Alfalfa, soy-beans and the wheat fields—which furnish the finest of pasture in the early spring and ordinarily well into the winter season—are the principal elements of a prosperous dairy business. Western Kansas is the dairy country. Its great ranges, whose insufficient rainfall makes impossible the certain, and therefore the profitable, cultivation of cereals or other settled agriculture, lend themselves to stock and dairy farming. Stock raising and dairy farming have, for that reason, demanded constantly increasing attention. Dairy products in 1924 were worth $26,103,314.

In mineral production Kansas ranked 12th among the States of the Union in 1925; the product being 2·87% of the total of the United States. The chief products in the order of their values were: petroleum, zinc, coal, cement and natural gas. The total value for all minerals was, in 1925, $142,944,214. Petroleum was discovered about 1865 in Miami and Bourbon counties, and about 1892 in Neodesha, Wilson county. There was only slight commercial exploitation before 1900. In 1914 the production was only 3,000,000 barrels, but by 1918 it had jumped to 45,500,000 barrels. A decline then set in which was not checked until new pools were discovered in Cowley and Russell counties in 1924. The production rose from 28,836,000 barrels in 1924 to 41,427,000 barrels in 1926. The chief producing area is confined to the 27

south-eastern counties. Iola, Allen county, is the centre of an important gas field, and the gas yields heat, light and a cheap fuel for smelters, cement works and other manufacturing plants throughout a large area. Zinc and lead were produced in Cherokee county, an overlapping of the Joplin field of Missouri. While the field approaches exhaustion on the Missouri side, there is a strong production in Kansas; the State's output of zinc in 1925 gave it the rank of second among the States. Coal, which comprised about one-sixth of all the mining enterprises in the State and was the third most important mineral industry, was produced in six eastern and south-eastern counties—the mines of Cherokee and Crawford counties were most important. Kansas, in 1926, ranked fourth among the States in the production of salt. The beds are found in Hutchinson, Ellsworth, Harper, Rice and Kingman counties. Some was produced by the lime process, while the remainder was mined as rock salt. Building stone of good quality

VALUE OF A YEAR'S PRODUCTION IN FARM CROPS (1924), THE THREE PRINCIPAL GROUPS OF MANUFACTURING INDUSTRIES (1925) AND MINERALS (1926)

is found in the central part of the State, and the supply of material for cement seems inexhaustible.

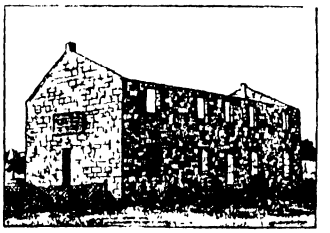
The chief products and their quantities and values for 1925 are given in the following table:

Product	Quantity	Value
Petroleum	38,357,000 bbls.	$74,410,000
Zinc	118,778 short tons	18,054,256
Coal	4,524,251 „ „	13,013,000
Cement	6,513,297 bbls.	10,861,506
Natural gas	26,917,000 M. cu. ft.	9,991,000
Clay products	.	4,345,971
Lead	22,775 short tons	3,962,850
Salt	812,540 „ „	2,494,423
Natural gas gasolene	19,592,000 gals.	2,223,000
Sand and gravel	2,198,870 short tons	1,303,060
Gypsum	166,952 „ „	1,009,510.

The larger manufacturing interests of Kansas are based upon the products of the farm. The largest is the slaughtering and packing of meat, which in 1925 had a product valued at $248,939,792—approximately one-tenth of the total output of the United States. The industry next in importance was the milling of flour, which is widely distributed over the State. The flour and grist mill industry in 1925 gave employment to 2,494 persons and had a product valued at $135,232,063. In the same year, the 20 petroleum refineries operating within the State had an output valued at $101,670,342. Lesser manufacturing interests in 1925 were railway shop repair and construction ($27,969,284); the manufacture of butter, cheese and condensed milk ($25,511,829); printing and publishing newspapers and periodicals ($13,648,944); foundry and machine shop products ($13,085,044); cement ($11,452,430); and bakery products ($10,056,631). Kansas had, according to the 1925 census of manufactures, 1,878 industries giving employment to 46,659 persons and a product valued at $706,249,994. Kansas City, the centre of the meat-packing industry, is by far the chief industrial centre of the State. In 1925 its 156 industrial establishments produced 40·85% of the State's manufactured products.

Kansas is exceedingly well supplied with steam railway facilities, with an aggregate mileage in 1924 of 9,489. The most important systems are the Atchison, Topeka and Santa Fe; the Missouri Pacific; the Chicago, Rock Island and Pacific; the Union Pacific; the Missouri, Kansas and Texas; the Chicago, Burlington and Quincy; and the St. Louis and San Francisco. These roads give excellent connections with Chicago, the Gulf of Mexico and the Pacific. The first train entered Kansas on the Union Pacific in 1860. In 1923 there were 13 electric inter-urban and street railways, operating 582m. of track within the State. With the building

of hard-surfaced roads, motor-bus lines are superseding electric railways. The State highway department controlled 7,887m. of roads at the end of 1926. Of this total 1,338·5m. were surfaced. The mileage of new surfacing placed during 1926 was 403·5. The total motor vehicle registration for 1925 was 459,047. There were 409,968 passenger cars, buses and taxi-cabs and 47,065 trucks and road tractors.



History.—The territory now included in Kansas was first visited by Europeans in 1541, when Francisco de Coronado led his Spaniards from New Mexico across the buffalo plains in search of the wealth of "Quivira," a region located, by Bandelier and other authorities, in Kansas north-east of the Great Bend of the Arkansas. Thereafter, save for a brief French occupation, 1719–25, and possibly slight explorations equally inconsequential, Kansas remained in undisturbed possession of the Indians until, in 1803, it passed to the United States (all save the part west of 100° long. and south of the Arkansas river) as part of the Louisiana Purchase. The explorations for the United States of Z. M. Pike (1807) and S. H. Long (1819) tended to confirm old ideas of sandy wastes west of the Mississippi. But with the establishment of prairie commerce to Santa Fé (New Mexico), the waves of emigration to the Mormon land and to California, the growth of traffic to Salt Lake, and the explorations for a transcontinental railway, Kansas became well known and was taken out of that mythical "Great American Desert" in which, thanks especially to Pike and to Washington Irving, it had been supposed to lie. The trade with Santa Fé began about 1804, although regular caravans were begun only about 1825. This trade is one of the most picturesque chapters in border history; and picturesque in retrospect, too, is the army of emigrants crossing the continent in "prairie schooners" to California or Utah, of whom almost all went through Kansas.

But this movement of hunters, trappers, traders, Mormons, miners and home-seekers left nothing to show of settlement in Kansas. Before 1854 Kansas was an Indian land, although on its Indian reservations (created in its east part for eastern tribes removed thither after 1830) some few whites resided—missionaries, blacksmiths, agents, farmers supposed to teach the Indians agriculture, and land "squatters"—possibly 800 in all. Ft. Leavenworth was established in 1827, Ft. Scott in 1842, Ft. Riley in 1853. Methodist (1829), Baptist, Quaker, Catholic and Presbyterian missions were active by 1837. Importunities to Congress to institute a territorial government began in 1852. This was realized by the Kansas-Nebraska Act of 1854.

By that act Kansas, which from 1854 to 1861 included a large part of Colorado, became, for almost a decade, the storm centre of national political passion, and her history of prime significance in the unfolding prologue of the Civil War. Despite the Missouri Compromise, which had prohibited slavery in the Louisiana Purchase north of 36° 30′ N. lat. (except in Missouri), slaves were living at the missions and elsewhere, among Indians and whites, in 1854. The "popular sovereignty" principle of the Kansas-Nebraska Act involved a sectional struggle for the new territory. Time showed that the winning of Kansas was a question of the lightest-footed immigrant. Slave-holders were not foot-loose; they had all to lose if they should carry their blacks into Kansas and should nevertheless fail to make it a slave State. Thus the South had to establish slavery by other than actual slave-holders, unless Missouri should act for her to establish it. Although Missouri did not move her slaves, her proximity encouraged border partisans to seek such establishment even without residence—by intimidation, election frauds and outrage. This determined the nature and outcome of the Kansas struggle.

In the summer of 1854, Missouri "squatters" began to post claims to border lands and warn away intending anti-slavery settlers. The immigration of anti-slavery people from the North was fostered in every way, notably through the New England Emigrant Aid company (*see* LAWRENCE, A. A.), whose example was widely imitated. Lawrence (Wakarusa) and Topeka, free-State centres, and Leavenworth, Lecompton and Atchison, pro-slavery towns, were among those settled in 1854.

At the first election (Nov. 1854), held for a delegate to Congress, about 1,700 armed Missourians invaded Kansas and stuffed the ballot boxes; and this intimidation and fraud was practised on a much larger scale in the election of a territorial legislature in March 1855. The resultant legislature (at Pawnee, later at Shawnee Mission) adopted the laws of Missouri almost *en bloc*, made it a felony to utter a word against slavery, made extreme pro-slavery views a qualification for office, declared death the penalty for aiding a slave to escape, and in general repudiated liberty for its opponents. The radical free-State men thereupon began the importation of rifles. Furthermore, a free-State "government" was set up, the "bogus" legislature at Shawnee being "repudiated." Perfecting their organization in a series of popular conventions, they adopted (Dec. 1855) the Topeka constitution—which declared the exclusion of negroes from Kansas—elected State officials, and sent a contestant delegate to Congress. The Topeka "government" was simply a craftily impressive organization, a standing protest. It met now and then, and directed sentiment, being twice dispersed by U.S. troops; but it passed no laws, and did nothing that conflicted with the territorial Government countenanced by Congress. On the other hand, the laws of the "bogus" legislature were generally ignored by the free-State partisans.

THE FIRST CAPITOL OF KANSAS, ERECTED AT PAWNEE IN 1855

The "Border War."—In the almost bloodless "Wakarusa war" that now began, Lawrence was threatened by an armed force from Missouri, but was saved by the intervention of Governor Shannon. Up to this time, the initiative and the bulk of outrages lay assuredly heavily on the pro-slavery side; thereafter they became increasingly common and more evenly divided. In May 1856 another Missouri force entered Lawrence without resistance, destroyed its printing offices, wrecked buildings and pillaged generally. These outrages fired Northern passion and determination. In Kansas they were a stimulus to the most radical elements. Immediately after the sack of Lawrence, John Brown (*q.v.*), and a small band murdered and mutilated five pro-slavery men, on Pottawatomie creek; a horrible deed, showing a new spirit on the free-State side, and of ghastly consequence—for it contributed powerfully to widen further the licence of highway robbery, pillage and arson, the ruin of homes, the driving off of settlers, and all sorts of outrages that made the following months a welter of lawlessness and crime, until Governor Geary—by putting himself above all partisanship, repudiating Missouri, and using Federal troops—put an end to them late in 1856. In the isolated south-eastern counties, however, they continued through 1856–58, mainly to the advantage of the "jay-hawkers" of free-State Kansas and to the terror of Missouri.

The struggle now passed into another phase, in which questions of State predominate. But something may be remarked in passing of the leaders in the period of turbulence. John Brown wished to deal a blow against slavery, but did nothing to aid any conservative political organization to that end. James H. Lane was another radical, and always favoured force. He assuredly did much for the free-State cause; meek politics was not alone sufficient in those years in Kansas. The leader of the conservative free-soilers was Charles Robinson (1818–94), who in 1854 had come to Kansas as an agent of the Emigrant Aid company. He was the author of the Topeka "government" idea, or at least was its moving spirit, serving throughout as the "governor" under it; though averse to force, he would use it if necessary, and was first in command in the "Wakarusa war." His partisans say that he saved Kansas, and regard Lane as a fomenter of trouble who accomplished nothing. Andrew H. Reeder (1807–64), who showed himself a pro-slavery sympathizer as first territorial governor, was removed from office for favouring the free-State party; he became a leader in the free-State cause. Reeder and Shannon fled the territory in fear of assassination by the pro-slavery party, with which at first they had had most sympathy. Among the pro-slavery leaders was David Rice Atchison (1807–86), U.S. Senator

in 1843–55, who accompanied both expeditions against Lawrence.

In June 1857 delegates were elected to a constitutional convention. The election act did not provide for any popular vote upon the constitution they should form, and was passed over Governor John W. Geary's veto. A census, miserably deficient (largely because of free-State abstention and obstruction), was the basis of apportionment of delegates. The free-State party demanded a popular vote on the constitution. On the justice of this, Governor Robert J. Walker and President Buchanan were at first unequivocally agreed, and the governor promised fair play. Nevertheless, only pro-slavery men voted, and the convention was thus pro-slavery. The document it framed is known as the Lecompton Constitution. Before the convention met, the free-State party, abandoning its policy of political inaction, captured the territorial legislature. On the constitutional convention rested, then, all hope of saving Kansas for slavery; and that would be impossible if they should submit their handiwork to the people. The convention declared slave property to be "before and higher than any constitutional sanction" and forbade amendments affecting it; but it provided for a popular vote on the alternatives, the "constitution with slavery" or the "constitution with no slavery." If the "constitution with no slavery" should be adopted, slavery should cease "except" that the right to property in slaves in the territory should not be interfered with. The free-State men regarded this as including the right to property in offspring of slaves, and therefore as pure fraud. Governor Walker stood firmly against this iniquitous scheme. But President Buchanan, under Southern influence, repudiated his former assurances. He abandoned Walker, who left Kansas; and he dismissed Acting-Governor Frederick P. Stanton for convoking the (now free-State) legislature. This body promptly ordered a vote on the third alternative, "Against the Constitution."

The free-State men ignored the alternatives set by the Lecompton Convention; but they participated, nevertheless, in the provisional election for officers under the Lecompton Government, capturing all offices, and then, the same day, voted overwhelmingly against the constitution (Jan. 4, 1858).

Nevertheless, Buchanan, against the urgent counsel of Governor Denver, urged on Congress (Feb. 2) the admission of Kansas under the Lecompton Constitution. He was opposed by Senator Stephen A. Douglas, the leader of the Northern Democracy. The senate upheld the president; the house of representatives voted down his policy;and finally both houses accepted the English bill,[1] by which Kansas was virtually offered some millions of acres of public lands if she should accept the Lecompton Constitution[1]. On Aug. 21, 1858, by a vote of 11,300 to 1,788, Kansas resisted this temptation. The plan of the Administration thus effectually miscarried, and its final result was a profound split in the Democratic Party.

The free-State men framed an anti-slavery constitution at Leavenworth in March–April 1858, but the origins of the convention were illegal. On July 29, 1859, still another constitution was therefore framed at Wyandotte, and on Oct. 4 it was ratified by the people. On Jan. 29, 1861, Kansas was admitted to the Union under the Wyandotte Constitution. The United States census of 1860 gave her a population of 107,206 inhabitants. The struggle in Kansas was of paramount importance in the breaking up of the Whig Party, the first establishment of an uncompromising anti-slavery party, the sectionalization of the democracy, and the general preparation of the country for the Civil War

Drought and famine came in 1860, and then upon the impoverished State came the strain of the Civil War. Nevertheless, Kansas furnished proportionally a very large quota of men to the Union armies. Military operations within her own borders were largely confined to a guerrilla warfare, carrying on the bitter neighbourhood strife between Kansas and Missouri. The Confederate officers began by repressing predatory plundering from Missouri; but after James H. Lane, with an undisciplined brigade, had crossed the border, sacking, burning and killing in his progress, Missouri "bushrangers" retaliated in kind. Freebooters trained in territorial licence had a free hand on both sides. William C. Quantrell, after sacking various small Kansas towns along the Missouri river (1862–63), in Aug. 1863 took Lawrence (*q.v.*) and put it mercilessly to fire and sword—the most ghastly episode in border history. In the autumn of 1864, the Confederate general, Sterling Price, aiming to enter Kansas from Missouri, but defeated by Gen. Pleasanton's cavalry, retreated southward, zigzagging on both sides of the Missouri-Kansas line. This ended for Kansas the border raids and the war. Indian raids and wars troubled the State from 1864 to 1878. The tribes domiciled in Kansas were rapidly moved to Indian territory after 1868.

After the Civil War, the Republicans held uninterrupted supremacy in national elections, and almost as complete control in the State Government, until 1892. From about 1870 onward, however, elements of reform and of discontent were embodied in a succession of radical parties of protest. The movement of the Patrons of Industry (1874), growing into the Grange, Farmers' Alliance, and finally into the People's (Populist) Party (*see* FARMERS' MOVEMENT) was perhaps of greatest importance. In conjunction with the Democrats, the Populists controlled the State Government in 1892–94 and 1896–98. These two parties decidedly outnumbered the Republicans at the polls from 1890 to 1898, but they could win only by fusion. In 1892–93, when the Populists elected the governor and the senate, and the Republicans (as the courts eventually determined) the house of representatives, political passion was so high as to threaten armed conflicts in the capital.

Legislation.—The manufacture and sale of intoxicating liquors except for medical, scientific and mechanical needs were prohibited by a constitutional amendment in 1880. The Murray liquor law of 1881, for the enforcement of the amendment, was declared constitutional by the State supreme court in 1883. At many sessions of the legislature its enemies vainly attempted its repeal. The enforcement of the law varied enormously according to the locality. In 1906–7 a fresh crusade to enforce the law was begun by the attorney general, who brought ouster suits against the mayors of Wichita, Junction city, Pittsburg and Leavenworth for not enforcing the law and for replacing it with the "fine" system, which was merely an irregular licence. In 1907 the attorney general's office turned its attention to outside brewing companies doing business in the State, and secured injunctions against the continuance of such operations within the State and the appointment of receivers of their property. The provisions of the law permitting the sale of whisky for medicinal, scientific or mechanical purposes were repealed by a law of 1909 prohibiting the sale, manufacture or barter of spirituous, malt, vinous or any other intoxicating liquors within the State. The severity of this law was ascribed to efforts of the liquor interests to render it objectionable; however, State prohibition continued to exist until strengthened by the 18th (Prohibition) amendment to the Federal Constitution.

An eight-hour labour law was passed in 1891, and was upheld by the State supreme court. In 1909 a law was passed requiring that any corporation acting as a common carrier in the State must receive the permission of the State board of railway commissioners for the issue of stocks, bonds or other evidences of indebtedness. An exception to the general trend of legislation at that time was the "blue sky" law for the regulation of investment companies, passed in 1911 and amended in detail in 1913 and 1915. It prohibited the sale in the State of stock not approved by a board consisting of the secretary of State, the attorney general and the State bank commissioner, and thus prevented the floating of worthless securities. It has been extensively copied by other States. In 1919 a general strike in the coalfields suspended production and threatened a coal famine in the midst of an exceptionally severe winter. Governor Allen took

[1]The English bill was not a bribe to the degree that it has usually been considered to be, inasmuch as it "reduced the grant of land demanded by the Lecompton ordinance from 23,500,000ac. to 3,500,000ac., and offered only the normal cession to new States." But this grant of 3,500,000ac. was conditioned on the acceptance of the Lecompton Constitution, and Congress made no promise of any grant if that constitution were not adopted. The bill was introduced by William Hayden English (1822–96), a Democratic representative in Congress in 1853–61.

over the coal mines, and began their operation by means of volunteer recruits, chiefly from among the students in the educational institutions, and called the legislature in special session to provide against the recurrence of such conditions. The result was the passage in 1920 of an act which created a court of industrial relations. Kansas, on the whole, is Republican in politics; however, the Democratic candidate (Wilson) succeeded in getting the State's electoral vote in both 1912 and 1916.

BIBLIOGRAPHY.—The best bibliography is *A List of Books Indispensable to a Knowledge of Kansas History and Literature* (1916), published by the Kansas State Historical society. For history *see* W. E. Connelly, *A Standard History of Kansas and Kansans* (1918); L. W. Spring, *Kansas* (1885, rev. ed., 1907); C. R. Green, *Early Days in Kansas* (Olathe, Kan., 1912–13); A. T. Andreas, *History of Kansas* (1883, compiled mainly by J. C. Hebbard); D. W. KANSAS CITY, the largest city of Kansas, U.S.A., and the county seat of Wyandotte county, on the eastern boundary of the State, at the confluence of the Kansas (Kaw) river with the Missouri, adjoining Kansas City, Mo., from which it is separated only by the State line. It is on Federal highways 40, 50, 71 and 73E; has a well-equipped commercial airport; and is served by the Chicago Great Western, the Missouri Pacific, the Rock Island, the Sante Fe and the Union Pacific railways, and by several interurban electric and motor-bus lines. The population in 1925 (State census) was 116,053, of whom 19,376 were negroes. A local survey indicated over 128,000 at the beginning of 1928. The city occupies 22 sq.m., in rectangular shape (about 3m. by 7m.), rising from the level bottom-land between the two rivers (altitude 720ft.) to bluffs 947ft. above sea-level, where the principal residential districts are located. It has a waterfront of 8 5m., and is the western terminus of the present programme of improvements on the inland waterways system. The stock-yards, which are the centre of its economic life, lie on the State line, with about 62% of their area on the Kansas side. A massive steel and concrete toll viaduct, 1¼m. long, spans the Kaw valley, connecting the bluffs of the two cities. There are 300ac. in the public parks; 25m. of connecting boulevards, and 50m. more planned; and 24 small playgrounds scattered through the city. A fine court-house of limestone, with a Greek portico upheld by columns over 7ft. in diameter and 48ft. high, was completed in 1927. The municipal memorial building, a tribute to the men who have lost their lives in the wars of the country, contains an auditorium seating 4,000, a chapel, a memorial hall, a banquet hall and a kitchen, and is so arranged that a parade can pass through the auditorium. In 1924 the city adopted a comprehensive city plan and zoning ordinance, prepared by a volunteer commission, which will shape its development for 40 years. Building permits in the seven years 1920–26 represented values aggregating $24,486,146. The assessed valuation of property for 1927 was $139,500,000.

There are five industrial districts of distinctive character in different parts of the city, each one flanked by residential sections. The Armourdale district, a level stretch extending west from the Missouri State line and served by five railways, contains many of the large industries, including the stock-yards, packing plants, soap factories, foundries, flour mills and lumber mills. A district under development along the Sante Fe, in the south-western part of the city and extending several miles into the country, has grain elevators, steel plants, ice factories and car shops. In the Fairfax district, on a bend in the Missouri river, at the north-eastern boundary of the city, is the Fairfax airport of 125ac. only 2m. from the post office. Natural gas from the Kansas fields has been available since 1906.

The public school system has 51 elementary, three junior and five senior high schools, an Americanization school and a continuation (evening) school with an enrolment of 1,900. There are also 17 parochial schools. The school of medicine of the University of Kansas (established 1899) has been located in Kansas City (except for the work of the first year and a half of the four year course, which is still given at Lawrence) since 1905, when three older medical colleges were merged with it. Among the other institutions of higher education are the Kansas City university (United Brethren); the Kansas City Baptist theological seminary (1902) and Woman's training school (which prepares for missionary work); and two training schools for nurses, in connection with two of the six hospitals. The State school for the blind is here. There are two mineral springs in the city, one of which is used for the treatment of rheumatism. The private charitable agencies of the city are financed through a joint "community chest." The principal daily paper, the *Kansan,* is one of 26 in the State which are owned by Senator Arthur Capper. Since 1909 the city has operated under a commission form of government.

Kansas City is the principal industrial centre of the State, and ranks 20th among the cities of the United States in the value of its manufactured products (1925), though 67th in population (1920). The output of the 156 establishments included in the Federal census of manufactures in 1925 was valued at $288,544,917. Slaughtering and meat-packing, in which Kansas City stands second only to Chicago, overshadows all other industries, contributing 73% of the total value of factory products. Next in importance are flour and grain milling, foundry and machine-shop products and railroad cars. In the manufacture of hog serum and of black walnut lumber Kansas City ranks first in the country; in the manufacture of soap and flour, third; and in the capacity of its grain elevators, fifth. The stock-yards handle nearly 10,000,000 head annually, and the market for stock and feed cattle and stock hogs is the largest in the country. Bank debits to individual accounts amounted in 1926 to $244,679,000.

The site of Kansas City was the starting point for many early explorations westward, including that of Lewis and Clark. The first permanent settlement, Wyandotte, was made in 1843 by the Wyandotte Indians from Ohio. In 1855 they sold their lands to the Federal Government, stipulating that their burial-ground, now in the heart of the city, should be preserved, as it has been. Wyandotte was plotted and settled by whites in 1857, and in 1858 was incorporated as a city, with a population of 1,259. The convention that drafted the first constitution of the State of Kansas met here in July 1859. Wyandotte was a pro-slavery town. Quindaro, a free State settlement a few miles up the Missouri, of which nothing remains but ruins, was its commercial rival until after the Civil War. In 1869 a town called Kansas City was founded on the bottom-lands between the Kansas river and the Missouri State line; in 1872 Rosedale was plotted on the southern boundary of the county; in 1880 Argentine was laid out (a smelting town; the name derived from the Latin word *argentum*) on the south bank of the Kansas, and Armourdale on the north bank. Meanwhile, a small community called Armstrong had grown up on the hills south of Wyandotte. The modern Kansas City was formed in 1886 by the consolidation of Wyandotte, Armourdale, Armstrong and the original Kansas City. Argentine was annexed in 1910; Rosedale in 1922. The population was 38,316 in 1890; 51,418 in 1900; 82,331 in 1910. In the next ten years it increased 22·9%, and in the five years 1920–25, 14·7%. The foundation of the packing industry was laid in 1867, and the first large packing plant was established by Armour and company in 1871. In June 1903, a great flood, the highest since 1844, swept away 12 of the 13

bridges spanning the Kaw, and did much damage to other property. The entire area affected is now thoroughly protected by concrete dikes.

KANSAS CITY, a city of Jackson county, Missouri, U.S.A., on the Missouri river, at the mouth of the Kansas (locally called the "Kaw"), adjoining Kansas City, Kan.; a port of entry and the second city of the State in size and importance. It is on Federal highways 24, 40, 50, 69 and 71; is a station on the air-mail route from Chicago to Dallas; and is served by the Burlington, the Chicago and Alton, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Frisco, the Kansas City Southern, the Missouri-Kansas-Texas, the Missouri Pacific, the Quincy, Omaha and Kansas City, the Rock Island, the Santa Fe, the Union Pacific and the Wabash railways, and by inter-urban motor bus and electric trolley lines in every direction. The Kansas City Terminal Railway company operates the Union station and passenger and freight terminals, serving all the steam roads entering the city over a system of depressed tracks; and the Kansas City Connecting railroad transfers live stock between all the roads and the stock-yards. The population was 324,410 in 1920, of whom 30,718 were negroes and 27,320 were foreign-born white; and was estimated by the census bureau at 391,000 in 1928. "Greater Kansas City," including both cities of that name and their immediate suburbs, was estimated locally to have a population of over 600,000 in 1928.

Near the geographical centre of the United States, "the gateway to the south-west," Kansas City is one of the great markets and transportation centres of the country. Over 7,000,000 passengers enter and leave the city annually by the steam and electric railways, which handle over 40,000,000 tons of freight and 5,000,000 express packages. The Union Passenger station, built in 1914 at a cost of $6,000,000, is the largest in the United States, outside of New York and Chicago, and one of the best appointed for the comfort of travellers. The main building is 510 x 150 ft. in area; the grand lobby has a ceiling 90ft. high; the main waiting room, 410ft. long, is built over 32 tracks, by which 300 trains arrive and leave daily. Facing the station, across a plaza to the south, stands the Liberty Memorial, completed in 1925, the cost of which ($2,500,000) was raised in one week by popular subscription. A column 280ft. high, with a fire burning continuously at the top, is flanked by two low buildings in classic style, one of which is a hall of records and the other a meeting-place for the veterans. Through the centre of the city extends from north to south for 8·5m. the Paseo Parkway, 250ft. wide, and adjoining it is the Parade, the principal playground. There are over 3,470ac. in public parks (including Swope park, of 1,354ac. lying south of the city limits), all connected by a boulevard system of 105 miles. The diversified character of the terrain has made possible drives commanding panoramas of unusual beauty and interest, notably Cliff drive, 3·5m. long. The business section of the city was occupied originally by high bluffs and deep ravines, which were graded down and filled up to the present level. South and west of this high land, along the Kansas river, is a low, level tract, occupied chiefly by railway yards, stock-yards, wholesale houses and manufacturing establishments. North and east is the Missouri river bottomland, which has more railway yards and factories, and also grain elevators and districts of wage-earners homes. Much high and dry "made" land has been reclaimed from the river flood-plain. Three great railway bridges cross the Missouri, and in 1927 the city and Clay county (on the other side of the river) jointly bought a highway bridge and opened it free to the public. Across the valley of the Kaw, from bluff to bluff, extends a great inter-State viaduct, also free of toll charges. The area within the corporate limits of the city is 57·75 sq.m., and the assessed valuation of property for 1927 was $500,879,177. A city plan was adopted in 1922, and a comprehensive zoning ordinance was enacted in 1923.

By the provisions of the present charter (the fifth it has had), adopted in 1926 by a vote of more than 4 to 1, the city is under a council-manager form of government. A council of 9 members (including the mayor) is elected on a non-partisan ballot. The council appoints the auditor and the city clerk, and a city-manager, who is responsible for the administrative departments of the government. The mayor appoints the board of park commissioners, the city-plan commission, and the municipal art commission. The police department is under a board of two members appointed by the governor of the State, with the mayor as chairman *ex officio*. A new water-supply system was completed in 1928, at an expense of $11,000,000. The water comes from the north side of the Missouri river, above the mouth of the Kaw, and is brought in to the city through two parallel tunnels 6·5ft. in diameter, through solid rock under the bed of the river. The water plant has been owned by the city since 1895, but all other public utilities are under private ownership. Coal comes from fields in Missouri, Kansas, Iowa, Arkansas and Illinois, fuel oil from the mid-continent field not 200m. away, and natural gas from Kansas has been available since 1906. The public-school system includes 92 elementary, 8 senior high and 4 junior high schools, a teachers college, a junior college, 2 trade schools and a part-time school. There are also 22 parochial and 6 private schools, and several institutions for professional training. The public library in 1927 had 425,000 volumes, and maintained 15 branch stations. There are 400 churches. The Nelson Gallery of Art has an endowment of $15,000,000. The charitable agencies are financed jointly through a community chest which has an annual budget of over $1,000,000.

Kansas City is the seat of the Federal Reserve Bank of the tenth district. Debits to individual accounts in the local banking institutions in 1926 aggregated $4,632,785,000. Though primarily a commercial centre, Kansas City has become also an important manufacturing city. Its economic life is closely bound up with that of its neighbour across the State line (*see* KANSAS CITY, Kansas). Greater Kansas City has a wholesale trade which amounted to $771,781,928 in 1926, and a factory output valued at $673,855,722, of which 38% was represented by packing-house products. It is the largest market in the country for hay, stock hogs and stock and feed cattle; it also ranks first in distribution of agricultural implements, lumber, seeds, kaffir corn and milo maize, and as a primary winter wheat market; ranks second in meat-packing, and as a horse and mule and live stock market, in receipt and distribution of fruits and vegetables, and in volume of discount paper; third in distribution of butter, eggs and poultry, in production of flour and soap, and as a general grain market; and fifth in capacity of grain elevators. The Missouri city, ranking 19th in population (1920), stood sixth in postal receipts and tenth in bank clearings in 1926. Manufacturing was increased after the World War by the establishment of branch plants by many eastern firms, by the making of open-hearth steel for local consumption, and by a great development in the oil-refining and the milling industries. By 1926 the grain elevators had a capacity of 37,532,500 bu.; receipts of grain totalled 112,528,800 bu.; the output of the flour mills was 6,161,000bbl.; and receipts of live stock 7,183,164 heads. The American Royal Live Stock Show, held annually in November, is one of the largest horse and live stock exhibitions in the United States. Its pavilion, erected in 1922, is a two-story building of reinforced concrete, containing over 7ac. of floor-space. The Kansas City Live Stock Exchange and the Board of Trade building (the grain market) are the largest buildings in the country devoted exclusively to their respective purposes.

Because of its central position Kansas City is an advantageous meeting place for national conferences. The hotels have 12,000 guest rooms. In the heart of the city is Convention hall, 314ft. long by 198ft. wide, covered by a steel-frame roof without a column for its support, and containing 35,000 sq.ft. of floor space and a large roof garden. It was built within three months for the National Democratic convention of 1900, to replace one that had been destroyed by fire; and in 1928 it was the scene of the National Republican convention.

The first permanent settlement within the present limits of Kansas City was established by French fur-traders about 1821. Westport—now a fashionable residential district of Kansas City—was a rival of Independence in the Santa Fe trade, and succeeded to most of it after the great Missouri flood of 1844 destroyed the

landing used by Independence. Meanwhile Westport Landing, on the river, increased in importance and overshadowed Westport. In 1838 lots were surveyed and the name Town of Kansas (from the Kansas river) was adopted. It was incorporated as a town in 1850, chartered under its present name in 1853, rechartered in 1875, and adopted new charters under its power of home rule in 1889, 1908 and 1925. Before 1850 it was practically the exclusive eastern terminus on the river for the Santa Fe trade, and a great outfitting point for emigrants to California. Whiskey, groceries, prints and notions were staples sent to Santa Fe. Wool, buffalo robes and dried buffalo meat, Mexican silver coin, gold and silver dust and ore came in return. In 1860 the trade employed 3,000 wagons and 7,000 men, and amounted to millions of dollars. During the Civil War both Independence and Westport were the scene of battles. There was no fighting at Kansas City, but her trade went to Leavenworth, where it had the protection of an army post and a quiet frontier. After the war the railways took away the traffic to Santa Fe, and other cities, farther up the Missouri, took over the trade to the upper river valley. In 1866 the first railway reached Kansas City from Saint Louis; in 1867 the packing industry had its beginning; and in 1869 a railway bridge across the Missouri assured Kansas City predominance over Leavenworth and Saint Joseph. The population grew from 4,418 in 1860 to 32,260 in 1870, and by 1880 it had reached 55,785. Between 1880 and 1900 it increased threefold, and between 1900 and 1920 it doubled.

KANSK, a town in the Siberian Area of the Russian S.F.S.R. on the trans-Siberian railway 151 m. E. of Krasnoyarsk, in 56° 20′ N., and 95° 37′ E. Pop. (1926) 19,235. It is subject to floods from the Kan river, a tributary of the Yenisei, on which it stands; the Kan is not navigable. It is situated near gold, coal and iron fields and has an iron foundry, an electric plant, distilleries and leather factories. It was founded in 1628 by Dubensky, the *voivoda* of Krasnoyarsk, but remained a mere village until the coming of the railway.

KANSU, the most north-westerly province of China. In shape it constitutes a long wedge thrust forward between Tibet on the south and Mongolia on the north. Its south-eastern border, adjoining Shensi province, is 900 miles inland from Shanghai. The greater part of it is drained by the Hwang-ho, part of whose upper course runs through the province from south-west to north-east. With the exception of a few sandy plains mainly in the north, Kansu is dominated by high mountains, rising to 10,000 feet or more in many of the ranges. Those in the north-west are known collectively as the Nan-shan and represent the prolongation of the northern loop of the Kun-lun ranges of Tibet, which in the south of the province are directly continued from west to east in the Sik'ing-shan and Min-shan. For the most part, especially in the east, the province is characterised by rich loess terraces, deeply dissected by the Wei-ho river-system. The climate naturally shows great extremes. In winter, intensely dry cold winds blow from the tableland of Mongolia while in summer, which is the rainy season, the temperature sometimes rises above 100° F. The southern part of the province is at all times milder and wetter than the northern, but Kansu as a whole, because of its isolation, severe climate, and rugged topography, is one of the wildest regions of China.

Kansu in its present form as a province has only been recently constituted, but as a corridor region between China and the West its history probably dates back to the beginnings of Chinese civilization. From earliest times the Chinese have had contact with Turkestan by way of the natural passage afforded by the Wei-ho valley and the corridor along the northern base of the Nan-shan mountains, the alignment and continuity of these two sections of the route being preserved by intermediate tributary valleys of the Hwang-ho.

From the third century B.C. when China, consolidated under the Chin Dynasty, organised a defensive scheme against the steppeland nomads the function of the Kansu corridor as the key to the defence of the Western borderland becomes increasingly conspicuous. Under the strong dynasties, notably those of the Han and the Tang, the corridor was kept open and military colonies placed at strategic points along it. At such times too new influences from the West such as Buddhism and Nestorian Christianity reached China by this avenue of entry and overland trade with the West flowed through it, particularly under the Yuan (Mongol) Dynasty. But during times of disintegration and weakness in China, numerous Tartar invasions penetrated along the route, and Lanchow-fu, the only early bridge-point on the Upper Hwang-ho, was an important base for further conquest in North China. As a separate province Kansu dates only from 1911. Prior to that it had for some years been united with Shensi, the two provinces being known as Shên-kan, and before 1882 it had been administered with Sinkiang as one province. The inclusion in the new Kansu of the long arm to the north-west was intended to secure the critical lowland approach to China from the Tarim Basin. In the middle of the nineteenth century Kansu was richer and more populous than it is to-day. It suffered severely from the great Muslim rebellions of that period and particularly from the revolt of 1861–77.

The population in 1923, according to the Post Office estimate, was a little less than six millions in an area of over 125,000 square miles, giving a density of 47 persons to the square mile. Thus, while it is the third Chinese province in point of size, it is the most thinly peopled. It is also the least Chinese in the composition of its population One-third of the inhabitants are Muslims, in the main ethnically distinct from the Chinese and still retaining their own customs. The north-western districts and the area around Ningsia-fu, on the borders of the Ordos, are mainly Mongol in character. Along the western border there are many Tanguts and here too has occured an overflow from north-east Tibet. In the mountains to the north-east of Sining-fu are some 50,000 "aborigines" speaking tribal dialects. The largest single element in the population, however, is Chinese and there has been immigration in recent years from Szechwan. Corresponding to the diversity of racial elements is the great variety of languages in Kansu, especially in the west and north-west but Mandarin is spoken throughout the greater part of the province.

The mountainous character of Kansu and the precarious nature of the rainfall seriously handicap agriculture, but in the limited sandy plains, where irrigation is possible, abundant crops of millet, sorghum and Indian corn, as well as fruits, are grown. For years Kansu has been one of the chief opium-producing provinces of China; the poppy is everywhere grown save in the Mohammedan western sections. Animal husbandry is dominant on the dry grassland, unsuited for cultivation, giving rise to the export of pastoral products such as hides, furs and wool, and the direct manufacture of coarse woollens and cloths. Leather-tanning and the woollen industry show great promise of future development. Lanchow-fu, the capital city, is the only notable centre of industry and the chief market for provincial produce. Large deposits of precious minerals (of which gold and quicksilver are exported), iron-ore, petroleum and coal are known to exist; coal is especially extensive in the neighbourhood of Kungchang-fu.

The inaccessibility of the province together with internal difficulties of transport and communication have proved the greatest drawback to the development of its considerable mining and agricultural potentialities, but the comparatively early extension of the Lung-hai railway line to Sian-fu and thence to Lanchow-fu is projected and should greatly facilitate the development of Kansu by bringing its products into the world markets. The present railway terminus (Lingpao) in western Honan is a 25 days' journey from Lanchow-fu, but a postal courier line (the longest in the world) runs via Sian-fu, Lanchow-fu and Ansi-chow to Kashgar.

KANT, IMMANUEL (1724–1804), German philosopher, was born at Königsberg on April 22, 1724. His grandfather was an emigrant from Scotland. His father was a master-saddler in Königsberg, then a stronghold of Pietism, to the strong influence of which Kant was subjected in his early years. In his tenth year he was entered at the Collegium Fredericianum with the definite view of studying theology. His inclination at this time was towards classics, and he was recognized, with his school-fellow, David Ruhnken, as among the most promising classical scholars of the

college. His taste for the greater Latin authors, particularly Lucretius, was never lost, and he acquired at school an unusual facility in Latin composition. With Greek authors he does not appear to have been equally familiar. During his university course, which began in 1740, Kant was principally attracted towards mathematics and physics. Though he attended courses on theology, and even preached on one or two occasions, he appears to have given up the intention of entering the church. His father died in 1746, and for nine years he earned his own living as a private tutor.

In 1755 Kant became tutor in the family of Count Kayserling. By the kindness of a friend named Richter, he was enabled to resume his university career, and in the autumn of that year he graduated as doctor and qualified as *Privatdozent*. For 15 years he remained a *Privatdozent*, his fame as writer and lecturer steadily increasing. Though twice he failed to obtain a professorship at Königsberg, he steadily refused appointments elsewhere. The only academic preferment received by him during the lengthy probation was the post of under-librarian (1766). His lectures, at first mainly upon physics, gradually expanded until nearly all descriptions of philosophy were included under them.

In 1770 he obtained the chair of logic and metaphysics at Königsberg, and delivered as his inaugural address the dissertation *De mundi sensibilis et intelligibilis forma et principiis*. Eleven years later appeared the *Kritik der reinen Vernunft* (1781; 2nd enl. ed. 1787), the work towards which he had been steadily advancing, and of which all his later writings are developments. In 1783 he published the *Prolegomena*, intended as an introduction to the *Kritik*, which had been found to stand in need of some explanatory comment.

In spite of its frequent obscurity, its novel terminology, and its declared opposition to prevailing systems, the Kantian philosophy made rapid progress in Germany. In the course of 10 or 12 years from the publication of the *Kritik der reinen Vernunft*, it was expounded in all the leading universities, and it even penetrated into the schools of the Church of Rome. J. Schulz in Königsberg, J. G. Kiesewetter in Berlin, Jakob in Halle, Born and A. L. Heydenreich in Leipzig, K. L. Reinhold and E. Schmid in Jena, Buhle in Göttingen, Tennemann in Marburg, and Snell in Giessen, with many others, made it the basis of their philosophical teaching, while the theologians Tieftrunk, Stäudlin, and Ammon eagerly applied it to Christian doctrine and morality. Young men flocked to Königsberg as to a shrine of philosophy. The Prussian Government even undertook the expense of their support. Kant was hailed by some as a second Messiah. He was consulted as an oracle on all questions of casuistry—as, for example, on the lawfulness of inoculation for the small-pox. This universal homage for a long time left Kant unaffected; it was only in his later years that he spoke of his system as the limit of philosophy, and resented all further progress. He still pursued his quiet round of lecturing and authorship, and contributed from time to time papers to the literary journals. Of these, among the most remarkable was his review of Herder's *Philosophy of History*, which greatly exasperated that author, and led to a violent act of retaliation some years after in his *Metakritik der reinen Vernunft*. Schiller at this period in vain sought to engage Kant upon his *Horen*.

In 1792 Kant, in the full height of his reputation, was involved in a collision with the Government on the question of his religious doctrines. Naturally his philosophy had excited the declared opposition of all adherents of historical Christianity, since its plain tendency was towards a moral rationalism, and it could not be reconciled to the literal doctrines of the Lutheran Church. After the first part of his book, *Die Religion innerhalb der Grenzen der blossen Vernunft*, had appeared in the *Berlin Journal*, the publication of the remainder, which treats in a more rationalizing style of Christianity, was forbidden. Kant, thus shut out from Berlin, availed himself of his local privilege, and, with the sanction of the theological faculty of his own university, published the full work in Königsberg (1793). The Government, probably influenced as much by hatred and fear of the French Revolution, of which Kant was supposed to be a partisan, as by love of orthodoxy, resented the act; and a secret cabinet order was received by him intimating the displeasure of the king, Frederick William II., and exacting a pledge not to lecture or write at all on religious subjects in future. With this mandate Kant, after a struggle, complied, and kept his engagement till 1797, when the death of the king, according to his construction of his promise, set him free. The incident depressed his spirits. He withdrew in 1794 from society; next year he gave up all his classes but one public lecture on logic or metaphysics; and in 1797, before the removal of the interdict on his theological teaching, he ceased his public lectures, after an academic course of 42 years. In that year he had finished his treatises *Die Metaphysik der Ethik*, which, with his *Anthropologie*, completed in 1798, were the last considerable works that he revised with his own hand. His lectures on logic, on physical geography, on paedagogics, were edited during his lifetime by his friends and pupils. By way of asserting his right to resume theological disquisition, he also issued in 1798 his *Streit der Fakultäten*, in which all the strongest points of his work on religion were urged afresh.

From the date of his retirement from the chair Kant declined in strength, and gave tokens of intellectual decay. His memory began to fail, and a large work at which he wrought night and day, on the connection between physics and metaphysics, was found to be only a repetition of his already published doctrines. After 1802, finding himself attacked with a weakness in the limbs attended with frequent fits of falling, he mitigated the Spartan severity of his life, and consented to receive medical advice. A constant restlessness oppressed him; his sight gave way; his conversation became an extraordinary mixture of metaphors; and it was only at intervals that gleams of his former power broke out, especially when some old chord of association was struck in natural science or physical geography. A few days before his decease, with a great effort he thanked his medical attendant for his visits in the words, "I have not yet lost my feeling for humanity." On Feb. 12, 1804, he died, having almost completed his 80th year. His stature was small, and his appearance feeble. He was little more than five feet high; his breast was almost concave, and, like Schleiermacher, he was deformed in the right shoulder. His senses were quick and delicate, and, though of weak constitution, he escaped by strict regimen all serious illness.

His life was arranged with mechanical regularity; and, as he never married, he kept the habits of his studious youth to old age. His man-servant, who awoke him summer and winter at five o'clock, testified that he had not once failed in 30 years to respond to the call. After rising he studied for two hours, then lectured two hours, and spent the rest of the forenoon, till one, at his desk. He then dined at a restaurant, which he frequently changed, to avoid the influx of strangers, who crowded to see and hear him. This was his only regular meal; and he often prolonged the conversation till late in the afternoon. He then walked out for at least an hour in all weathers, and spent the evening in lighter reading, except an hour or two devoted to the preparation of his next day's lectures, after which he retired between nine and ten to rest. In his earlier years he often spent his evenings in general society, where his knowledge and conversational talents made him the life of every party. His social circle included J. G. Hamann, the friend of Herder and Jacobi, who was thus a mediator between Kant and these philosophical adversaries.

Kant cared comparatively little for the history of speculation, but his acquaintance with books of science, general history, travels and *belles lettres* was boundless. He was well versed in English literature, chiefly of the age of Queen Anne, and had read English philosophy from Locke to Hume, and the Scottish school. He was at home in Voltaire and Rousseau, but had little or no acquaintance with the French sensational philosophy. He was familiar with all German literature up to the date of his *Kritik*, but ceased to follow it in its great development by Goethe and Schiller. It was his habit to obtain books in sheets from his publishers Kanter and Nicolovius; and he read over for many years all the new works in their catalogue, in order to keep abreast of universal knowledge.

As a lecturer, Kant avoided altogether that rigid style in which his books were written. He sat behind a low desk, with a few jottings on slips of paper, or textbooks marked on the margin, before him, and delivered an extemporaneous address, opening up the subject by partial glimpses, and with many anecdotes or

familiar illustrations, till a complete idea of it was presented. His voice was extremely weak, but sometimes rose into eloquence, and always commanded perfect silence. Though kind to his students, he refused to remit their fees, as this, he thought, would discourage independence. It was another principle that his chief exertions should be bestowed on the intermediate class of talent, as the geniuses would help themselves, and the dunces were beyond remedy.

Simple, honourable, truthful, kind-hearted and high-minded as Kant was in all moral respects, he had little sentiment. He had no enthusiasm for the beauties of nature, and indeed never sailed out into the Baltic, or travelled more than 40 miles from Königsberg. Music he disregarded, and all poetry that was more than sententious prose. His ethics have been reproached with some justice as setting up too low an ideal for the female sex. Though a faithful friend, he could not bear to visit his friends in sickness, and after their death he repressed all allusion to their memory.

On Feb. 12, 1904, the 100th anniversary of Kant's death, a Kantian society (*Kantgesellschaft*) was formed at Halle under the leadership of H. Vaihinger to promote Kantian studies; it supports the periodical *Kantstudien* (founded 1896).

KANTARA: *see* QANTARA.

KANTIAN PHILOSOPHY, the philosophy of Immanuel Kant (*q.v.*).

Pre-critical.—In any complete account of the Kantian system it is necessary that there should be constant reference, on the one hand, to the peculiar character of the preceding 18th-century philosophy, and, on the other hand, to the problems left for renewed treatment to more modern thought. Fortunately the development of the Kantian system itself furnishes such treatment as is necessary of the former reference. For the critical philosophy was a work of slow growth. In the early writings of Kant we are able to trace with great definiteness the successive stages through which he passed from the notions of the preceding philosophy to the new and comprehensive method which gives its special character to the critical work. Scarcely any great mind, it has been said with justice, ever matured so slowly. In the early essays we find the principles of the current philosophies, those of Leibniz and English empiricism, applied in various directions to those problems which serve as tests of their truth and completeness; we note the appearance of the difficulties or contradictions which manifest the one-sidedness or imperfection of the principle applied; and we can trace the gradual growth of the new conceptions which were destined, in the completed system, to take the place of the earlier method. To understand the Kantian work it is indispensable to trace the history of its growth in the mind of its author.

Of the two preceding stages of modern philosophy, only the second, that of Locke and Leibniz, seems to have influenced practically the course of Kant's speculation. With the Cartesian movement as a whole he shows little acquaintance and no sympathy, and his own philosophic conception is never brought into relation with the systematic treatment of metaphysical problems characteristic of the Cartesian method. The fundamental question for philosophic reflection presented itself to him in the form which it had assumed in the hands of Locke and his successors in England, of Leibniz and the Leibnizian school in Germany. The transition from the Cartesian movement to this second stage of modern thought had doubtless been natural and indeed necessary. Nevertheless the full bearings of the philosophic question were somewhat obscured by the comparatively limited fashion in which it was then regarded. The tendency towards what may be technically called subjectivism, a tendency which differentiates the modern from the ancient method of speculation, is expressed in Locke and Leibniz in a definite and peculiar fashion. However widely the two systems differ in details, they are at one in a certain fundamental conception which dominates the whole course of their philosophic construction. They are throughout individualist, *i.e.*, they accept as given fact the existence of the concrete, thinking subject, and endeavour to show how this subject, as an individual conscious being, is related to the wider universe of which he forms part.

In dealing with such a problem, there are evidently two lines along which investigation may proceed. It may be asked how the individual mind comes to know himself and the system of things with which he is connected, how the varied contents of his experience are to be accounted for, and what certainty attaches to his subjective consciousness of things. Regarded from the individualist point of view, this line of inquiry becomes purely psychological, and the answer may be presented, as it was presented by Locke, in the fashion of a natural history of the growth of conscious experience in the mind of the subject. Or, it may be further asked, how is the individual really connected with the system of things apparently disclosed to him in conscious experience? what is the precise significance of the existence which he ascribes both to himself and to the objects of experience? what is the nature of the relation between himself as one part of the system, and the system as a whole? This second inquiry is specifically metaphysical in bearing, and the kind of answer furnished to it by Leibniz on the one hand, by Berkeley on the other, is in fact prescribed or determined beforehand by the fundamental conception of the individualist method with which both begin their investigations. So soon as we make clear to ourselves the essential nature of this method, we are able to discern the specific difficulties arising in the attempt to carry it out systematically, and thus to note with precision the special problems presented to Kant at the outset of his philosophic reflections.

Consider, first, the application of the method on its psychological side, as it appears in Locke. Starting with the assumption of conscious experience as the content of the individual mind, Locke proceeds to explain its genesis and nature by reference to the real universe of things and its mechanical operation upon the mind. The result of the interaction of mind, *i.e.*, the individual mind, and the system of things, is conscious experience, consisting of ideas, which may be variously compounded, divided, compared, or dealt with by the subjective faculties with which the entity, mind, is supposed to be endowed. Matter of fact and matter of knowledge are thus at a stroke dissevered. The very notion of relation between mind and things leads at once to the counter notion of the absolute restriction of mind to its own subjective nature. That Locke was unable to reconcile these opposed notions is not surprising; that the difficulties and obscurities of the *Essay* arise from the impossibility of reconciling them is evident on the slightest consideration of the main positions of that work. Of these difficulties the philosophies of Berkeley and Hume are systematic treatments. In Berkeley we find the resolute determination to accept only the one notion, that of mind as restricted to its own experience, and to attempt by this means to explain the nature of the external reality to which obscure reference is made. Any success in the attempt is due only to the fact that Berkeley introduces alongside of his individualist notion a totally new conception, that of mind itself as capable of reflection upon the whole of experience and of reference to the supreme mind as the ground of all reality.

It is only in Hume that we have definitely and completely the evolution of the individualist notion as groundwork of a theory of knowledge; and it is in his writings, therefore, that we may expect to find the fundamental difficulty of that notion clearly apparent. It is not a little remarkable that we should find in Hume, not only the sceptical dissolution of all fixity of cognition, which is the inevitable result of the individualist method, but also the clearest consciousness of the very root of the difficulty. The systematic application of the doctrine that conscious experience consists only of isolated objects of knowledge, impressions or ideas, leads Hume to distinguish between truths reached by analysis and truths which involve real connection of the objects of knowledge. The first he is willing to accept without further inquiry, though it is an error to suppose, as Kant seems to have supposed, that he regarded mathematical propositions as coming under this head (*see* HUME); with respect to the second, he finds himself hopelessly at fault. No real connections between isolated objects of experience are perceived by us. No single matter of fact necessarily implies the existence of any other. In short, if the difficulty be put in its ultimate form, no existence can transcend itself,

or imply relation to any other existence. If the parts of conscious experience are regarded as distinct things, there is no possibility of connecting them other than contingently, if at all. If the individual mind be really thought of as individual, it is impossible to explain how it should have knowledge at all. "In short," says Hume, "there are two principles which I cannot render consistent, nor is it in my power to renounce either of them, viz., *that all our distinct perceptions are distinct existences,* and *that the mind never perceives any real connection among distinct existences.* Did our perceptions either inhere in something simple or individual, or did the mind perceive some real connection among them, there would be no difficulty in the case" (App. to *Treatise of Human Nature*).

Thus, on the one hand, the individualist conception leads to the total negation of all real cognition. If the real system of things, to which conscious experience has reference, be regarded as standing in casual relation to this experience there is no conceivable ground for the extension to reality of the notions which somehow are involved in thought. The same result is apparent, on the other hand, when we consider the theory of knowledge implied in the Leibnizian individualism. The metaphysical conception of the monads, each of which is the universe *in nuce,* presents insuperable difficulties when the connection of the monads is in question, and these difficulties obtrude themselves when the attempt is made to work out a consistent doctrine of cognition. For the whole mass of cognizable fact is contained *impliciter* in each monad, and the several modes of apprehension can only be regarded as so many stages in the developing monad. Sense and understanding, real connection of facts and analysis of notions, therefore, differ only in degree. The same fundamental axioms, the logical principles of identity and sufficient reason, are applicable in explanation of all given propositions. It is true that Leibniz himself did not work out any complete doctrine of knowledge, but in the hands of his successors the theory took definite shape in the principle that the whole work of cognition is in essence analytical. The process of analysis might be complete or incomplete. For finite intelligences there was an inevitable incompleteness so far as knowledge of matters of fact was concerned. In respect to them, the final result was found in a series of irreducible notions or categories, the analysis and elucidation of which was specifically the business of philosophy.

It will be observed that, in the Leibnizian as in the empirical individualism, the fundamental notion is still that of the abstract separation of the thinking subject from the materials of conscious experience. From this separation arise all the difficulties in the effort to develop the notion systematically, and in tracing the history of Kant's philosophical progress we are able to discern the gradual perception on his part that here was to be found the ultimate cause of the perplexities which became apparent in considering the subordinate doctrines of the system. The successive essays composing Kant's precritical work are not so many imperfect sketches of the doctrines of the *Kritik.* They are essentially tentative, and exhibit the manner in which the difficulties of a received theory force on a more comprehensive view.

Logical and Real Ground.—The particular problem which gave the occasion to the first of the precritical writings is the question to which the *Kritik* is an answer. What is the nature of the distinction between knowledge gained by analysis of notions and knowledge of matters of fact? Kant seems never to have been satisfied with the Wolffian identification of logical axioms and of the principle of sufficient reason. The tract on the *False Subtlety of the Four Syllogistic Figures,* in which the view of thought as analytic is clearly expressed, closes with the significant division of judgments into those which rest upon the logical axioms of identity and contradiction and those for which no logical ground can be shown. Such immediate judgments, it is said, abound in our experience. They are the foundations for all judgments regarding real existence. It was impossible that the question regarding their nature and legitimacy and their distinction from analytic judgments should not present itself to him. The three tracts belonging to the years 1763–64 bring forward the essential opposition between the two classes of judgments. In the *Essay on Negative Quantities,* the fundamental thought is the total distinction in kind between logical opposition and real opposition. For the one adequate explanation is found in the logical axiom of analytical thinking; for the other no such explanation is to be had. Logical ground and real ground are distinct. "I can understand perfectly well," says Kant, "how a consequence follows from its reason according to the law of identity, since it is discoverable by mere analysis of the notion contained in it. . . . But how something follows from another thing and not according to the law of identity, this I should gladly have made clear to me. . . . How shall I comprehend that, since something is, something else should be?" Real things, in short, are distinct existences and not necessarily connected in thought.

The prize essay *On the Principles of Natural Theology and Morals* brings forward the same fundamental opposition. Here, for the first time, appears definitely the distinction between synthesis and analysis, and in the distinction is found the reason for the superior certainty and clearness of mathematics as opposed to philosophy. Mathematics proceeds synthetically, for in it the notions are constructed. Metaphysics is analytical in method; in it the notions are given, and by analysis they are cleared up. Kant does not, in this place, raise the question as to the reason for assuming that the arbitrary synthesis of mathematical construction has any reference to reality. The deeper significance of synthesis has not yet become apparent.

In the *Only Possible Ground of Proof for the Existence of God,* the argument, though largely Leibnizian, advances one step farther towards the ultimate inquiry. For there Kant states precisely his fundamental doctrine that real existence is not a predicate to be added in thought to the conception of a possible subject. So far as thought is concerned, possibility, not real existence, is contained in judgment.

The year 1765 was marked by the publication of Leibniz's posthumous *Nouveaux Essais,* in which his theory of knowledge is more fully stated than in any of his previous tracts. Kant gave some attention to this work, though no reference to it occurs in his writings, and it may have assisted to give additional precision to his doctrine. In the essay, *Dreams of a Clairvoyant,* published 1766, he emphasizes his previous conclusion that connections of real fact are mediated in our thought by ultimate notions, but adds that the warrant for such notions can be furnished only by experience. He is inclined, therefore, to regard as the function of metaphysics the complete statement of these ultimate, indemonstrable notions, and therefore the determination of the limits to knowledge by their means. Even at this point, the difficulty raised by Hume does not occur to him. He still appears to think that experience does warrant the employment of such notions, and when there is taken into account his correspondence with Lambert during the next few years, one would be inclined to say that the *Architektonik* of the latter represents most completely Kant's idea of philosophy.

On another side Kant had been shaking himself free from the principles of the Leibnizian philosophy. According to Leibniz, space resulted from the relations of monads to one another. But Kant began to see that such a conception did not accord with the manner in which we determine directions or positions in space. In the essay, *On the Ground of distinguishing Particular Divisions in Space,* he pointed out that the idea of space as a whole is not deducible from the experience of particular spaces, or particular relations of objects in space, that we only cognize relations in space by reference to space as a whole, and finally that definite positions involve reference to space as a given whole.

Sense and Understanding.—The whole development of Kant's thought up to this point is intelligible when regarded from the Leibnizian point of view, with which he started. Even in the *Dissertation* of 1770 the really critical question is not involved. Sense and understanding, according to the *Dissertation,* are the two sources of knowledge. The objects of the one are things of sense or *phenomena;* the objects of the other are *noumena.* These are absolutely distinct, and are not to be regarded as differing only in degree. In *phenomena* we distinguish *matter,* which is given by sense, and *form,* which is the law of the order of sensations.

Such form is twofold—the order of space and time. Sensations formed by space and time compose the world of appearance, and this when treated by the understanding, according to logical rules, is *experience*. But the logical use of the understanding is not its only use. Much more important is the *real* use, by which are produced the pure notions whereby we think things as they are. These pure notions are the laws of the operation of the intellect; they are *leges intellectus*.

Apart, then, from the expanded treatment of space and time as subjective forms, we find in the *Dissertation* little more than the very precise and definite formulation of the slowly growing opposition to the Leibnizian doctrines. That the pure intellectual notions should be defended as springing from the nature of intellect is not out of harmony with the statement of the *Träume eines Geistersehers*, for there the pure notions were allowed to exist, but were not held to have validity for actual things except on grounds of experience. Here they are supposed to exist, dissevered from experience, and are allowed validity as determinations of things in themselves.

The stage which Kant had now reached in his philosophical development was one of great significance. The doctrine of knowledge expressed in the *Dissertation* was the final form which the Wolffian rationalism could assume for him, and, though many of the elements of the *Kritik* are contained therein, it was not really in advance of the Wolffian theory. The doctrine of space and time as forms of sense-perception, the reference of both space and time and the pure intellectual notions to the laws of the activity of mind itself, the distinction between sense and understanding as one of kind, not of degree, with the correlative distinction between phenomena and noumena,—all of these reappear, though changed and modified, in the *Kritik*. But the real import of Hume's sceptical problem had not yet dawned upon Kant.

Up to the stage indicated by the *Dissertation* he had been attempting, in various ways, to unite two radically divergent modes of explaining cognition—that which would account for the content of experience by reference to affection from things without us, and that which viewed the intellect itself as somehow furnished with the means of pure, rational cognition. He now discovered that Hume's sceptical analysis of the notion of cause was really the treatment of one typical instance of the much more general problem. If experience, says Hume, consists solely of states of mind somehow given to us, each of which exists as an effect, and therefore as distinct from others, with what right do we make the common assumption that parts of experience are necessarily connected? The only possible answer, drawn from the premises laid down, must be that there is no warrant for such an assumption. Necessity for thought implies something more than is given in experience—for that which is given is contingent—and rests upon an *a priori* or pure notion. But *a priori* notions, did they exist, could have no claim to regulate experience. Hume, therefore, for his part, rejected entirely the notion of cause as being fictitious and delusive, and professed to account for the habit of regarding experience as necessarily connected by reference to arbitrarily formed custom of thinking. Experience, as given contingent material, had a certain uniformity, and recurring uniformities generated in us the habit of regarding things as necessarily connected.

The Critique of Pure Reason.—The dogmatic or individualist conception of experience had thus proved itself inadequate to the solution of Hume's difficulty regarding the notion of cause. The perception of its inadequacy in this respect, and the consequent generalization of Hume's problem, are the essential features of the new critical method. For Kant was now prepared to formulate his general inquiry in a definite fashion. His reflection on the Wolffian doctrine of knowledge had made clear to him that synthetic connection, the essence of real cognition, was not contained in the products of thinking as a formal activity of mind operating on material otherwise supplied. On the other hand, Hume's analysis enabled him to see that synthetic connection was not contained in experience regarded as given material. Thus neither the formal nor the material aspect of experience, supplied any foundation for real knowledge, whether *a priori* or empirical. An absolutely new conception of experience was necessary, if the fact of cognition was to be explained at all, and the various modes in which Kant expresses the business of his critical philosophy were merely different fashions of stating the one ultimate problem. How is it possible for the individual thinking subject to connect together the parts of his experience in the mode we call cognition?

The problem of the critical philosophy is, therefore, the complete analysis of experience from the point of view of the conditions under which such experience is possible for the conscious subject. The central ideas are thus self-consciousness, as the supreme condition under which experience is subjectively possible, and the manifold details of experience as a varied and complex whole. The solution of the problem demanded the utmost care in keeping the due balance between these ideas; and it can hardly be said that Kant was perfectly successful.

In any detailed exposition of the critical system it would be requisite in the first place to state with some fullness the precise nature of the problems immediately before Kant, and in the second place to follow with some closeness the successive stages of the system as presented in the three main works, the *Critique of Pure Reason*, the *Critique of Practical Reason* and the *Critique of Judgment*, with the more important of the minor works, the *Metaphysic of Nature* and the *Metaphysic of Ethics*. It would be necessary, also, in any such expanded treatment, to bring out clearly the Kantian classification of the philosophical sciences, and to indicate the relation between the critical or transcendental investigation of the several faculties and the more developed sciences to which that investigation serves as introduction. As any detailed statement of the critical system, however compressed, would be beyond the limits of the present article, it is proposed here to select only the more salient doctrines, and to point out in connection with them what advance had been effected by Kant, and what remained for subsequent efforts at full solution of the problems raised by him.

The doctrine from which Kant starts in his critical or transcendental investigation of knowledge is that to which the slow development of his thought had led him. The essence of cognition or knowledge was a synthetic act, an act of combining in thought the detached elements of experience. Now synthesis was explicable neither by reference to pure thought, the logical or elaborative faculty, which in Kant's view remained analytic in function, nor by reference to the effects of external real things upon our faculties of cognition. For, on the one hand, analysis or logical treatment applied only to objects of knowledge as already given in synthetic forms, and, on the other hand, real things could yield only isolated effects and not the combination of these effects in the forms of cognitive experience. If experience is to be matter of knowledge for the conscious subject, it must be regarded as the conjoint product of given material and synthetic combination. Form and matter may indeed be dealt with in isolation for purposes of critical inquiry, but in experience they are inseparably united. The problem of the *Kritik* thus becomes the complete statement of the elements necessarily involved in synthesis, and of the processes by which these elements are realized in individual consciousness. He is not asking, with Locke, whence the details of experience arise; but he is endeavouring to state exhaustively what conditions are necessarily involved in knowledge, *i.e.*, in any synthetic combination of parts of experience by the conscious subject.

So far as the elements necessarily involved in conscious experience are concerned, these may be enumerated briefly thus:—given data of sense, inner or outer: the forms of perception, *i.e.*, space and time; the forms of thought, *i.e.*, the categories; the ultimate condition of knowledge, the identity of the pure ego or self. The self is the central unity in reference to which alone is any part of experience cognizable. But the consciousness of self is the foundation of knowledge only when related to given material. The ego has not in itself the element of difference, and the essence of knowledge is the consciousness of unity in difference. For knowledge, therefore, it is necessary that difference should be *given* to the ego. The modes under which the isolated data can be synthetically combined so as to form a cognizable whole make up the form of cognition, and upon this form rests the possibility of any *a priori* or rational knowledge.

Data of sense-affection do not contain in themselves synthetic combination. The first conditions of such combination are found by Kant in the universal forms under which alone sense-phenomena manifest themselves in experience. These universal forms of perception, space and time, are necessary, *a priori*, and in characteristic features resembling intuitions, not notions. They occupy, therefore, a peculiar position, and one section of the *Kritik*, the *Aesthetik*, is entirely devoted to the consideration of them. It is only through *a priori* character of these perceptive forms that rational science of nature is at all possible. Kant is here able to resume, with fresh insight, his previous discussions regarding the synthetic character of mathematical propositions. In his early essays he had rightly drawn the distinction between mathematical demonstration and philosophic proof, referring the certainty of the first to the fact that the constructions were synthetic in character and entirely determined by the action of constructive imagination. It had not then occurred to him to ask, With what right do we assume that the conclusions arrived at from arbitrary constructions in mathematical matter have applicability to objects of experience? Might not mathematics be a purely imaginary science? To this question he is now enabled to return an answer. Space and time, the two essential conditions of sense-perception, are not data given by things, but universal forms of intellect into which all data of sense must be received. Hence, whatever is true of space and time regarded by imagination as objects, *i.e.*, quantitative constructions, must be true of the objects making up our sense-experience. The same forms and the same constructive activity of imagination are involved in mathematical synthesis and in the constitution of objects of sense-experience. The foundation for pure or rational mathematics, there being included under this the pure science of movement, is thus laid in the critical doctrine of space and time.

The *Aesthetik* isolates sense-perception, and considers its forms as though it were an independent, complete faculty. A certain confusion, arising from this, is noticeable in the *Analytik* when the necessity for justifying the position of the categories is under discussion, but the real difficulty in which Kant was involved by his doctrine of space and time has its roots even deeper than the erroneous isolation of sensibility. He has not in any way "deduced" space and time, but, proceeding from the ordinary current view of sense-experience, has found these remaining as residuum after analysis. The relation in which they stand to the categories or pure notions is ambiguous; and, when Kant has to consider the fashion in which category and data of sense are to be brought together, he merely places side by side as *a priori* elements the pure connective notions and the pure forms of perception, and finds it, apparently, only a matter of contingent convenience that they should harmonize with one another and so render cognition possible. To this point Fichte was the first to call attention.

Affection of sense, even when received into the pure forms of perception, is not matter of knowledge. For cognition there is requisite synthetic combination, and the intellectual function through which such combination takes place. The forms of intellectual function Kant proceeds to enumerate with the aid of the commonly received logical doctrines. For this reference to logic he has been severely blamed, but the precise nature of the debt due to the commonly accepted logical classification is very generally misconceived. Synthetic combination, Kant points out, is formally expressed in a judgment, which is the act of uniting representations. At the foundation of the judgments which express the types of synthetic combination, through which knowledge is possible, lie the pure general notions, the abstract aspect of the conditions under which objects are cognizable in experience. General logic has also to deal with the union of representations, though its unity is analytic merely, not synthetic. But the same intellectual function which serves to give unity in the analytic judgments of formal logic serves to give unity to the synthetic combinations of real perception. It appeared evident, then, to Kant that in the forms of judgment, as they are stated in the common logic, there must be found the analogues of the types of judgment which are involved in transcendental logic, or in the theory of real cognition. His view of the ordinary logic was wide and comprehensive, though in his restriction of the science to pure form one can trace the influence of his earlier training, and it is no small part of the value of the critical philosophy that it has revived the study of logic and prepared the way for a more thorough consideration of logical doctrines. The position assigned to logic by Kant is not, in all probability, one which can be defended; indeed, it is hard to see how Kant himself, in consistency with the critical doctrine of knowledge, could have retained many of the older logical theorems, but the precision with which the position was stated, and the sharpness with which logic was marked off from cognate philosophic disciplines, prepared the way for the more thoughtful treatment of the whole question. (*See* LOGIC, HISTORY OF.)

Categories.—Formal logic thus yields to Kant the list of the general notions, pure intellectual predicates, or categories, through which alone experience is possible for a conscious subject. (*See* CATEGORIES.) It has already been noted how serious was the error involved in the description of these as notions, without further attempt to clear up their precise significance. Kant, indeed, was mainly influenced by his strong opposition to the Leibnizian rationalism, and therefore assigns the categories to understanding, the logical faculty, without consideration of the question—which might have been suggested by the previous statements of the *Dissertation*—what relation these categories held to the empirical notions formed by comparison, abstraction and generalization when directed upon representations of objects. But when the categories are described as notions, *i.e.*, formed products of thought, there rises of necessity the problem which had presented itself to Kant at every stage of his pre-critical thinking—with what right can we assume that these notions apply to objects of experience? The answer which he proceeds to give altogether explodes the definition of the categories as formed products of thought, and enables us to see more clearly the nature of the new conception of experience which lies in the background of all the critical work.

The unity of the ego, as an element entering into the synthesis of cognition, is a unity of a quite distinct and peculiar kind. That the ego to which different parts of experience are presented must be the same ego, if there is to be cognition at all, is analytically evident; but the peculiarity is that the ego must be conscious of its own unity and identity, and this unity of self-consciousness is only possible in relation to difference not contained in the ego but given to it. The unity of apperception, then, as Kant calls it, is only possible in relation to synthetic unity of experience itself, and the forms of this synthetic unity, the categories, are, therefore, on the one hand, necessary as forms in which self-consciousness is realized, and, on the other hand, restricted in their application and validity to the data of given sense, or the particular element of experience. Thus experience presents itself as the organic combination of the particular of sense with the individual unity of the ego through the universal forms of the categories. Reference of representations to the unity of the object, synthetic unity of apperception, and subsumption of data of sense under the categories, are thus three sides or aspects of the one fundamental fact.

In this deduction of the categories there appears for the first time an endeavour to connect together into one organic whole the several elements entering into experience. It is evident, however, that much was wanting before this essential task could be regarded as complete. Kant has certainly brought together self-consciousness, the system of the categories and data of sense. He has shown that the conditions of self-consciousness are the conditions of possible experience. But he has not shown, nor did he attempt to show, how it was that the conditions of self-consciousness are the very categories arrived at by consideration of the system of logical judgments. He does endeavour to show, but with small success, how the junction of category and data of sense is brought about, for according to his scheme these stood, to a certain extent at least, apart from and independent of one another.

Kantian Imperfections.—The mode in which Kant endeavours to show how the several portions of cognition are subjectively realized brings into the clearest light the inconsistencies and imperfections of his doctrine. Sense had been assumed as furnishing the particular of knowledge, understanding as furnishing the universal; and it had been expressly declared that the particular was

cognizable only in and through the universal. Still, each was conceived as somehow in itself complete and finished. Sense and understanding had distinct functions, and there was wanting some common term, some intermediary which should bring them into conjunction. Data of sense as purely particular could have nothing in common with the categories as purely universal. But data of sense had at least one universal aspect—their aspect as the particular of the general forms, space and time. Categories were in themselves abstract and valueless, serviceable only when restricted to possible objects of experience. There was thus a common ground on which category and intuition were united in one, and an intermediate process whereby the universal of the category might be so far individualized as to comprehend the particular of sense. This intermediate process—which is really the junction of understanding and sense—Kant calls productive imagination, and it is only through productive imagination that knowledge or experience is actually realized in our subjective consciousness. The specific forms of productive imagination are called *Schemata,* and upon the nature of the schema Kant gives much that has proved of extreme value for subsequent thought.

Productive imagination is thus the concrete element of knowledge, and its general modes are the abstract expression of the *a priori* laws of all possible experience. The categories are restricted in their applicability to the schema, *i.e.,* to the pure forms of conjunction of the manifold in time, and in the modes of combination of schemata and categories we have the foundation for the rational sciences of mathematics and physics. Perception or real cognition is thus conceived as a complex fact, involving data of sense and pure perceptive forms, determined by the category and realized through productive imagination in the schema. The system of principles which may be deduced from the consideration of the mode in which understanding and sense are united by productive imagination is the positive result of the critical theory of knowledge, and some of its features are remarkable enough to deserve attention. According to his usual plan, Kant arranges these principles in conformity with the table of the categories, dividing the four classes, however, into two main groups, the mathematical and the dynamical.

The mathematical principles are the abstract expression of the necessary mode in which data of sense are determined by the category in the form of intuitions or representations of objects; the dynamical are the abstract expression of the modes in which the existence of objects of intuition is determined. The mathematical principles are constitutive, *i.e* , express determinations of the objects themselves; the dynamical are regulative, *i e.,* express the conditions under which objects can form parts of real experience. Under the mathematical principles come the general rules which furnish the ground for the application of quantitative reasoning to real facts of experience. For as data of sense are only possible objects when received in the forms of space and time, and as space and time are only cognized when determined in definite fashion by the understanding through the schema of number (quantity) or degree (quality), all intuitions are extensive quantities and contain a real element, that of sense, which has degree.

Under the dynamical principles, the general modes in which the existence of objects are determined, fall the analogies of experience, or general rules according to which the existence of objects in relation to one another can be determined, and the postulates of experience, the general rules according to which the existence of objects for us or our own subjective existence can be determined. The analogies of experience rest upon the order of perceptions in time, *i.e.,* their permanence, succession or coexistence, and the principles are respectively those of substance, causality and reciprocity. Kant in the expression of these analogies reaches the final solution of the difficulty as to the relation of the pure connective notions to experience. These notions are not directly applicable to experience, nor do we find in experience anything corresponding to the pure intellectual notions of substance, cause and reciprocity. But experience is for us the combination of data of sense in the forms of productive imagination, forms determined by the pure intellectual notions, and accordingly experience is possible for us only as in modes corresponding to the notions. The permanent in time is substance in any possible experience, and no experience is possible save through the determination of all changes as in relation to a permanent in time. Determined sequence is the causal relation in any possible experience, and no experience is possible save through the determination of perceived changes as in relation to a determined order in time. So with coexistence and reciprocity.

The postulates of experience are general expressions of the significance of existence in the experience of a conscious subject. The element of reality in such experience must always be given by intuition, and, so far as determination of existence is assumed, external intuition is a necessary condition of inner intuition. The existence of external things is as certain as the existence of the concrete subject, and the subject cannot cognize himself as existing save in relation to the world of facts of external perception. Inner and outer reality are strictly correlative elements in the experience of the conscious subject.

Throughout the positive portion of his theory of cognition, Kant has been beset by the doctrine that the categories, as finished, complete notions, have an import or significance transcending the bounds of possible experience. Moreover, the manner in which space and time had been treated made it possible for him to regard these as contingent forms, necessary for intelligences like ours, but not to be viewed as absolutely necessary. The real meaning of these peculiarities is hardly ever expressed by him, though it is clear that the solution of the matter is to be found in the inadequacy of the positive theory to meet the demands of reason for completed explanation. But the conclusion to which he was led was one of the greatest importance for the after development of his system. Cognition is necessarily limited. The categories are restricted in their application to elements of possible experience to that which is presented in intuition, and all intuition is for the ego contingent. But to assert that cognition is limited and its matter contingent is to form the idea of an intelligence for whom cognition would not be limited and for whom the data of intuition would not be given, contingent facts, but necessarily produced along with the pure categories. This idea of an intuitive understanding is the definite expression for the complete explanation which reason demands, and it involves the conception of a realm of objects for such an understanding, a realm of objects which, in opposition to the *phenomena* of our relative and limited experience, may be called *noumena* or things-in-themselves. The *noumenon,* therefore, is in one way the object of a non-sensuous intuition, but more correctly is the expression of the limited and partial character of our knowledge. The idea of a noumenon is thus a limiting notion.

Assuredly, the difficult section of the *Kritik,* on the ground of the distinction between phenomena and noumena, would not have led to so much misconception as it has done, had Kant then brought forward what lies at the root of the distinction, his doctrine of reason and its functions. Understanding, as has been seen, is the faculty of cognition strictly so called; and within its realm, that of space, time and matter, positive knowledge is attainable. But the ultimate conception of understanding, that of the world of objects, quantitatively determined, and standing in relation of mutual reciprocity to one another, is not a final ground of explanation. We are still able and necessitated to reflect upon the whole world of phenomena as thus cognized, and driven to inquire after its significance. In our reflection we necessarily treat the objects, not as phenomena, as matters of positive, scientific knowledge, but as things-in-themselves, as noumena. The distinction between phenomena and noumena is, therefore, nothing but the expression of the distinction between understanding and reason, a distinction which, according to Kant, is merely subjective.

The specific function of reason is the effort after completed explanation of the experience presented in cognition. But in such effort there are no notions to be employed other than the categories, and these, as has already been seen, have validity only in reference to objects of possible experience. We may expect, then, to find the transcendent employment of the categories leading into various difficulties and inconsistencies. The criticism of reason in its specific aspect throws fresh light on the limits to human knowledge and the significance of experience.

Experience has presented itself as the complex result of relation between the ego or subject and the world of phenomena. Reason may therefore attempt a completed explanation either of the ego or of the world of phenomena or of the total relation between them. The three inquiries correspond to the subjects of the three ancient metaphysical sciences, rational psychology, rational cosmology, rational theology. It is readily seen, in regard to the first of them, that all attempts to determine the nature of the ego as a simple, perdurable, immaterial substance rest upon a confusion between the ego as pure logical unity and the ego as object of intuition, and involve a transcendent use of the categories of experience. It profits not to apply such categories to the soul, for no intuition corresponding to them is or can be given. The idea of the soul must be regarded as transcendent. So too when we endeavour, with the help of the categories of quantity, quality, relation and modality, to determine the nature and relation of parts of the world, we find that reason is landed in a peculiar difficulty. Any solution that can be given is too narrow for the demands of reason and too wide for the restrictions of understanding. The transcendent employment of the categories leads to antinomy, or equally balanced statements of apparently contradictory results. Due attention to the relation between understanding and reason enables us to solve the antinomies and to discover their precise origin and significance. Finally, the endeavour to find in the conception of God, as the supreme reality, the explanation of experience, is seen to lead to no valid conclusion. There is not any intuition given whereby we might show the reality of our idea of a Supreme Being. So far as knowledge is concerned, God remains a transcendental ideal. (*See* TRANSCENDENTALISM; RATIONALISM; KNOWLEDGE, THEORY OF.)

The Critique of Practical Reason.—The criticism of the transcendental ideas, which is also the examination of the claims of metaphysic to rank as a science, yields a definite and intelligible result. These ideas, the expression of the various modes in which unity of reason may be sought, have no objects corresponding to them in the sphere of cognition. They have not, therefore, like the categories, any *constitutive* value, and all attempts at metaphysical construction with the notions or categories of science must be resigned as of necessity hopeless. But the ideas are not, on that account, destitute of all value. They are supremely significant, as indicating the very essence of the function of reason. The limits of scientific cognition become intelligible, only when the sphere of understanding is subjected to critical reflection and compared with the possible sphere of reason, that is, the sphere of rationally complete cognition. The ideas, therefore, in relation to knowledge strictly so called, have *regulative* value, for they furnish the general precepts for extension and completion of knowledge, and, at the same time, since they spring from reason itself, they have a real value in relation to reason as the very inmost nature of intelligence. Self-consciousness cannot be regarded as merely a mechanically determined result. Free reflection upon the whole system of knowledge is sufficient to indicate that the sphere of intuition, with its rational principles, does not exhaust conscious experience. There still remains, over and above the realm of nature, the realm of free, self-conscious spirit; and, within this sphere, it may be anticipated that the ideas will acquire a significance richer and deeper than the merely regulative import which they possess in reference to cognition

Where, then, are we to look for this realm of free self-consciousness? Not in the sphere of cognition, where objects are mechanically determined, but in that of will or of reason as practical. That reason is practical or prescribes ends for itself is sufficiently manifest from the mere fact of the existence of the conception of morality or duty, a conception which can have no corresponding object within the sphere of intuition, and which is theoretically, or in accordance with the categories of understanding, incognizable. The presence of this conception is the datum upon which may be founded a special investigation of the conditions of reason as practical, a *Kritik* of pure practical reason, and the analysis of it yields the statement of the formal prescripts of morality.

The realization of duty is impossible for any being which is not thought as free, *i.e.*, capable of self-determination. Freedom, it is true, is theoretically not an object of cognition, but its impossibility is not thereby demonstrated. The theoretical proof rather serves as useful aid towards the more exact determination of the nature and province of self-determination, and of its relation to the whole concrete nature of humanity. For in man self-determination and mechanical determination by empirical motives coexist, and only in so far as he belongs and is conscious of belonging both to the sphere of sense and to the sphere of reason does moral obligation become possible for him. The supreme end prescribed by reason in its practical aspect, namely, the complete subordination of the empirical side of nature to the prescripts of morality, demands, as conditions of its possible realization, the permanence of ethical progress in the moral agent, the certainty of freedom in self-determination, and the necessary harmonizing of the spheres of sense and reason through the intelligent author or ground of both. These conditions, the postulates of practical reason, are the concrete expressions of the three transcendental ideas, and in them we have the full significance of the ideas for reason. Immortality of the soul, positive freedom of will, and the existence of an intelligent ground of things are speculative ideas practically warranted, though theoretically neither demonstrable nor comprehensible (*See* ETHICS, HISTORY OF.)

The Critique of Judgment.—Thus reason as self-determining supplies notions of freedom; reason as determined supplies categories of understanding. Union between the two spheres, which seem at first sight disparate, is found in the necessary postulate that reason shall be realized, for its realization is only possible in the sphere of sense. But such a union, when regarded *in abstracto,* rests upon, or involves, a notion of quite a new order, that of the adaptation of nature to reason, or, as it may be expressed, that of end in nature. Understanding and reason thus coalesce in the faculty of *judgment,* which mediates between, or brings together, the universal and particular elements in conscious experience. Judgment is here merely *reflective;* that is to say, the particular element is given, so determined as to be possible material of knowledge, while the universal, not necessary for cognition, is supplied by reason itself. The empirical details of nature, which are not determined by the categories of understanding, are judged as being arranged or ordered by intelligence, for in no other fashion could nature, in its particular, contingent aspect be thought as forming a complete, consistent, intelligible whole.

The investigation of the conditions under which adaptation of nature to intelligence is conceivable and possible makes up the subject of the third great *Critique*, the *Critique of Judgment* The general principle of the adaptation of nature to our faculties of cognition has two specific applications, with the second of which it is more closely connected than with the first. In the first place, the adaptation may be merely *subjective,* when the empirical condition for the exercise of judgment is furnished by the feeling of pleasure or pain; such adaptation is aesthetic. In the second place, the adaptation may be objective or logical, when empirical facts are given of such a kind that their possibility can be conceived only through the notion of the end realized in them; such adaptation is teleological, and the empirical facts in question are organisms.

Aesthetics, or the scientific consideration of the judgments resting on the feelings of pleasure and pain arising from the harmony or want of harmony between the particular of experience and the laws of understanding, is the special subject of the *Critique of Judgment,* but the doctrine of teleology there unfolded is the more important for the complete view of the critical system. For the analysis of the teleological judgment and of the consequences flowing from it leads to the final statement of the nature of experience as conceived by Kant. The phenomena of organic production furnish data for a special kind of judgment, which, however, involves or rests upon a quite general principle, that of the contingency of the particular element in nature and its subjectively necessary adaptation to our faculty of cognition. The notion of contingency arises, according to Kant, from the fact that understanding and sense are distinct, that understanding does not determine the particular of sense, and, consequently, that the principle of the adaptation of the particular to our understanding is merely supplied by

reason on account of the peculiarity or limited character of understanding. End in nature, therefore, is a subjective or problematic conception, implying the limits of understanding, and consequently resting upon the idea of an understanding constituted unlike ours—of an intuitive understanding in which particular and universal should be given together. The idea of such an understanding is, for cognition, transcendent, for no corresponding fact of intuition is furnished, but it is realized with practical certainty in relation to reason as practical. For we are, from practical grounds, compelled with at least practical necessity to ascribe a certain aim or end to this supreme understanding. The moral law, or reason as practical, prescribes the realization of the highest good, and such realization implies a higher order than that of nature. We must, therefore, regard the supreme cause as a moral cause, and nature as so ordered that realization of the moral end is in it possible. The final conception of the Kantian philosophy is, therefore, that of ethical teleology.

BIBLIOGRAPHY.—For books up to 1887 *see* Erich Adickes in *Philosophical Review* (Boston, 1892 foll.); for 1890–94 R. Reicke's *Kant Bibliographie* (1895). *See* also in general the latest edition of Ueberweg's *Grundriss der Geschichte der Philosophie*, and *Kantstudien* 1896 onwards.

EDITIONS.—Complete editions of Kant's works are as follows: (1) G. Hartenstein (Leipzig, 1838–39, 10 vols.); (2) K. Rosenkranz and F. W. Schubert (Leipzig, 1838–40, 12 vols., the 12th containing a history of the Kantian school); (3) G. Hartenstein, "in chronological order" (Leipzig, 1867–69, 8 vols.); (4) Kirchmann (in the "Philosophische Bibliothek," Berlin, 1868–73, 8 vols. and supplement); (5) E. Cassirer (10 vols., 1912–22); (6) under the auspices of the Königliche Preussische Akademie der Wissenschaften a new collected edition was begun in 1900 in charge of a number of editors. Seventeen of the 21 projected volumes had appeared in 1927. There are also useful editions of the three *Kritiks* by Kehrbach, and critical editions of the *Prolegomena* and *Kritik der reinen Vernunft* by B. Erdmann.

TRANSLATIONS.—There are translations in all the principal languages. The chief English translators are J. P. Mahaffy, W. Hastie, T. K. Abbott, J. H. Bernard, Belfort Bax, Meikeljohn and Max Müller.

BIOGRAPHICAL.—Schubert in the 11th vol. of Rosenkranz's edition; Borowski, *Darstellung des Lebens und Charakters Kants* (Königsberg, 1804); Wasianski, *Kant in seinen letzten Lebensjahren* (Königsberg, 1804); Stuckenberg, *The Life of Immanuel Kant* (1882); Rudolf Reicke, *Kants Briefwechsel* (1900). *See* also several of the critical works below. On Kant's portraits *see* D. Minden, *Ueber Portraits und Abbildungen Imm. Kants* (1868) and *cf.* frontispieces of *Kantstudien* (as above).

KANURI or **BERIBERI,** an African tribe of mixed origin, the dominant race of Bornu. They are large-boned and coarse-featured, with a strain of Fula blood. Beriberi (or Berberi) is the name given them by the Hausa.

See C. K. Meek, *Northern Nigeria* (1925).

KAOLINITE. A hydrated aluminium silicate having the formula $Al_2O_3{\cdot}2SiO_2{\cdot}2H_2O$. This mineral was so named, by S. W. Johnson and T. M. Blake, in 1867 from Kaolin (*see* under CHINA CLAY) of which it is the principal ingredient. It occurs in scales which are crystalline but too minute for identification under the microscope. The silvery-white powder, found at Almwich in Anglesea, is described by A. Dick as consisting of minute hexagonal plates, with perfect basal cleavage, which belong to the monoclinic system. Kaolinite is a decomposition product of many aluminium silicates (*e.g.*, albite, orthoclase, leucite, scapolite, beryl and topaz); but all large deposits of china clay are due to the decomposition of orthoclase felspar in granite. Ball clay, or potters' clay and common clay are also mixtures of kaolinite, or lithomarge and halloysite, which are compact or colloidal varieties of the same mineral, with other decomposition products and minerals which resist weathering such as quartz, muscovite and other silicates. Kaolin is used as a pigment; in pencil manufacture, for mixing with graphite; and as a filler for paper and textiles.

(F. H. HA.)

KAPELLMEISTER, the German name for a conductor or musical director. Originally it meant literally, as the name implies, chapel-master, or the official responsible for the music in a church or chapel, equivalent terms with the same meaning being *Maitre de chapelle* in French and *maestro di capella* in Italian. In the course of time, however, the meaning of the term has been extended to include any kind of musical director, and it was in this sense that Wagner used it when he coined the sarcastic name *Kapellmeistermusik* as a synonym for music of a commonplace and conventional character.

KAPOK (*Ceiba pentandra*, var. *indica*), a tree of the bombax family (Bombaceae) cultivated in Java, and less extensively in the Philippines, Federated Malay States and Ceylon, for the production of down, commercially called kapok or "silk-cotton." The tree is native to the West Indies and other parts of tropical America. Grown under widely different conditions, it has developed numerous strains or varieties. In the American, African and Asiatic Tropics there are about 12 different species of trees of the bombax family which yield down similar, and in some cases apparently superior, to that of Java kapok. There has been little systematic selection in production, less than 10% of the Java kapok trees being grown on exclusively kapok plantations. The tree begins to produce fibre when from five to seven years old, and with reasonable care may yield satisfactory crops for 50 years or longer. Not a textile fibre, kapok does not compete with cotton for yarn or woven fabrics. But it is very resilient, buoyant and water-resisting, and highly moisture proof. Because of these qualities, it is valuable for stuffing mattresses, pillows and life preservers; for use in bathing suits and water wings, and for temperature insulation. Its popularity is growing, especially in the United States, which imports from 6,000 to 10,000 tons of kapok per annum. The seeds of the tree yield kapok oil, a yellowish-green oil of pleasant odour and taste, used for food and in soap-making.

KAPP, GISBERT (1852–1922), electrical engineer, was born at Mauer, near Vienna, in 1852. His father was German and his

mother Scottish. Kapp studied at Zürich, and after travelling in Europe and north Africa he took a post in 1875 with Messrs. Crompton and company, at Chelmsford. In conjunction with Crompton, Kapp invented a system of compound winding for direct current dynamos. From 1894 to 1904 he lived in Berlin, when he was secretary of the German association of electrical engineers, lecturer at the Technische Hochschule, Charlottenburg, and editor of the *Electrotechnische Zeitschrift*. He also lectured at various universities and acted as a consulting engineer on matters concerning electric lighting, power and traction. In this latter capacity he advised a number of European towns. He was appointed professor of electrical engineering at Birmingham university in 1904 and retired in 1918; he died on Aug. 10, 1922. Kapp developed a dynamo which has been used to a great extent but has now been superseded by a more modern type of machine. He designed power stations and transformers and invented many laboratory methods of electrical testing. Kapp applied mathematics to problems of electrical engineering and worked out a number of simple and original theorems for practical use. He worked out the phase difference between an alternating potential difference and the resulting current and wrote a paper on boosters for return currents in electric railway plant. Kapp was awarded a number of honorary degrees and other honours, including the Telford medal. He was the author of *Principles of Electric Engineering, Vector Analysis of Alternating Currents, Dynamos, Alternators and Transformers* and *Electric Transmission of Energy*.

KAPP, WOLFGANG (1868–1922), German politician, was born in New York on July 24, 1868. He was the son of Friedrich Kapp, a National Liberal member of the Reichstag in Bismarck's time, and grew up under the Bismarckian influences. Having held various minor official posts, he founded the agricultural credit institute in East Prussia, which achieved great success in promoting the prosperity of landowners and farmers. He was consequently in close touch with the Junkers of East Prussia and during the World War made himself their mouthpiece in an attack on Bethmann Hollweg (*Die Nationalen Kreise und der Reichskanzler* [1916]). He was also one of the founders of the "Vaterslandspartei." For a brief period in 1918 he was a Conservative member of the Reichstag.

Kapp remained in the background till March 12, 1920, when the Republican Government suddenly issued an order for his arrest, which was not, however, executed. It became known that he had organized, with General von Lüttwitz and other officers and civilians, a conspiracy to occupy the Government offices, and assume power in Berlin. This he actually succeeded in doing on the morning of March 13. The ministers withdrew to Dresden, and then to Stuttgart, and Captain Ehrhardt marched in from Döberitz, and occupied the government buildings. Kapp styled himself "chancellor of the *Reich*," and appointed Lüttwitz minister of war. But he had no real plans. The working classes of Berlin rendered the continuance of the Kapp régime impossible by declaring a universal strike, and on the evening of March 17 Kapp and Lüttwitz fled from Berlin. Warrants were issued for their arrest, but Lüttwitz disappeared completely, and Kapp eventually escaped by aeroplane to Sweden. In April 1922 he returned to Germany and was immediately arrested for high treason, but he died on June 12 before the case was heard.

KAPUNDA: *see* KOORINGA.

KAPURTHALA, an Indian State, within the Punjab. Area, 598 sq.m.; pop. (1921) 284,275; estimated gross revenue, £280,000. The Kapurthala family is descended from Jassa Singh, who by his intelligence and bravery made himself the leading Sikh of his day. At one time it held possessions on both sides of the Sutlej, and also in the Bari Doab. The cis-Sutlej estates and scattered tracts in the Bari Doab were forfeited owing to the hostility of the chief in the first Sikh war; but in recognition of the loyalty of Raja Randhir Singh during the mutiny of 1857, when he led to Oudh a contingent which did good service, he received a grant of land in Oudh, 700 sq m. in extent, with gross rental £98,000. In Oudh, however, the chief has no sovereign powers, but only the status of a large landholder. Maharaja Sir Jagatjit Singh, the present ruler, was born in 1872, and succeeded his father in 1877. The State has a large export trade in wheat, sugar, tobacco and cotton. It contributed liberally for the World War and its troops served with distinction in East Africa. The town of Kapurthala is 11 miles from Jullundur; pop. (1921), 16,242.

KARACHAEV, an autonomous district, U.S.S.R., of the North Caucasian area, lying west of the Kabardin-Balkar autonomous area and extending westwards as far as about longitude 41°, its western boundary running parallel with, but east of the Laba river, and the main ridge of the Caucasus forming its southern boundary. From 1922 to 1926, the Cherkess autonomous area to the north, between the Teberda and the Great Zelenchuk rivers, was included with it, but in 1926 the two areas were given separate administration, and the town of Batalpishinsk was transferred to the Armavir province of the North Caucasian area. The Karachaev area occupies about 8,300 sq.km. The population, including the Cherkess area with Batalpishinsk, was about 65,000 in 1926. The snow and glacier-covered peaks of the Caucasus encircle it on the south, and the region is one of mountain valleys and high peaks, with alpine and sub-alpine meadows, forest clad slopes, and the torrent valleys of the Upper Kuban and its tributaries, the most important being the Teberda; others are the upper courses of the Marka, Aksaut, Maruk, Great Zelenchuk, Kefar and Urun. There are a few passes into Suanetia and Abkhasia, Tchiper Ayatz 10,717 ft., Tchiper Karachi 10,801 ft., Makhar 9,617 ft. and Klukhor 9,450 ft.—the last was used by Byzantine merchants in the 10th century. The water-shed between the Kuban and some tributaries of the Terek, including the sources of the Kuma and Podkoumok, lies within the north-east of the area. The climate varies with the height and aspect of the valleys, but the valleys of the upper streams of the Zelenchuk, Maruk, Aksaut, Teberda and Kuban are drier than the remaining valleys and are specially suitable for development as health resorts and sanatoria, having high insolation, pine woods, clear atmosphere and mineral springs. Capital expenditure on railways and buildings is planned for this purpose. The town of Teberda on the Teberda river is already known as a health resort. Leprosy exists among the Karachaevs and there is a leper colony in the Kuban defile.

The Karachaevs are a Turco-Tatar people who came from the Crimea in the 15th century and settled in the valley of the Great Laba, and afterwards moved into the valley of the Great Zelenchuk and finally into the valley of the Baksan, a tributary of the Terek. They were driven thence by the Kabardians and then settled in their present location. Their language is closely allied to Balkarian and Nogai. Their wanderings led to much racial intermixture, especially with the Osetins, Abkhasians, Kabardins and Suanetians. Under the influence of the Kabardians they became Sunnite Mohammedans, but retained much of their original nature-worship. Their main occupation is sheep and cattle rearing; before the World War they were employed on hunting expeditions by Russian sportsmen, the bear, wild boar and aurochs being found in these regions. Their type of life and the isolation of their valleys have prevented the spread of education and more than 90% of them are illiterate. In 1928 about 17% of children of school age were receiving education. Very little attention is paid to agriculture, a little maize and some potatoes being grown in a primitive way. The main food of the people is milk and meat; "kefir," a lactic ferment is made in the district, and fermented milk is the staple drink. Efforts are being made to improve the breeds of sheep and goats, and to raise the stamina of the draught cattle and horses by introducing the use of winter foods in place of reliance on nomad pastures. If the plan for developing the health resorts is successful, dairying should be valuable. There is already a milk and dairy *artel* supplying Teberda, and there are two cheese factories. The valuable timbers are little worked because of lack of transport facilities. In pre-revolution times silver, lead and zinc ore were worked by the Elburz Mining Company on the Upper Kuban, but the mines have not yet been re-opened (1928). Even *kustar* (peasant) industries are undeveloped, except spinning and weaving wool, and leather work for local necessities. Means of communication are extremely poor; there is no railway and roads are almost

non-existent for freightage purposes. The rivers are too rapid for navigation. It is possible to get into the country either by the Mariinski pass from Kizlovodsk or from Batalpishinsk along the Sukhum military highway; on the latter motor transport is possible as far as Teberda. Plans have been devised for a railway from Nevinnomyssk station on the main railway line, where it crosses Kuban river, south to Teberda, thence to Sukhum. In 1927, Kamennomost, at the junction of the Teberda and Kuban rivers, was made the administrative centre, under the name of Mikoyan-Shakhar, and the Central Government made a grant to the Karachaevs for the purpose of erecting government buildings, a primary and secondary school, a hospital, a cinema and a theatre. Work had already been begun in 1928. A grammar of the Karachaev language exists, and some books in the vernacular. The Latin script has been adopted instead of the Turkish.

KARACHI (kŭ-rah'chē), a seaport city on the west coast of India, immediately to the north of the Indus delta. It is at once the headquarters town of the district of Karachi, the capital of Sind province, administrative, commercial and military, and the third port of India. Its population, which was 216,883 in 1921, has almost doubled since 1901 and continues to increase rapidly.

Neither the actual site nor the immediate surroundings of Karachi suggest conditions favourable to the emergence of a city of such importance. It stands on a backwater opening south on the east-west stretch of coast which marks a sharp change in direction of the shore line between Cape Monze and the Indus delta. Westward this backwater is screened from the sea by the rocky point of Manora, cemented to the mainland by a sand-spit. On its eastern side it is defined by what was once the island of Kiamari but which, as a result of the construction of the Napier Mole (1850) and subsequent reclamation undertakings, no longer retains its insular identity. Formerly the harbour could be entered from both sides of Kiamari. The western approach, passing under Manora point has always been the principal, and to-day is the only one; the eastern was closed when Chinna creek was finally blocked in 1873. Prior to improvements following upon British occupation the backwater filled and emptied with every tide, and presented at low water a stretch of mud flats and mangrove swamps. The deep-water anchorage lay off Kiamari and here ships had to unload into small boats which proceeded with the tide up to Karachi.

To the landward there is desert. A line drawn from the city of Karachi to Tatta roughly divides Karachi district into two physical divisions. To the north is a thirsty, prevailingly hilly landscape (Kohistan), the limestone spurs of the Kirthar range breaking down southwards into sandy wastes. Crossing the line into the southern division the Indus delta is entered. This is a monotonous expanse of recent alluvium riddled by creeks and passing seaward into mangrove swamp. Physically divergent, the two divisions are alike in that they afford little support to human life. On the whole Karachi district is agriculturally one of the poorest in Sind. Yet something may be credited to the natural endowment of Karachi.

The natural scour of the backwater under the action of currents on either side of Kiamari was a real asset along a coast prone to suffer severely from silting, and the port owes its foundation and early development by Hindu merchants, two and a half centuries ago, primarily to this. About that time the port at the outfall of the Habb river in the neighbourhood of Cape Monze, serving Baluchistan, became choked, while a similar fate was always overtaking ports at the mercy of the shifting Indus. The natural protection against monsoon storms afforded by Manora headland may be noted also, and the fact too that it furnished an excellent site for the defence of the harbour. Thus the Mirs, who gained Karachi from the khan of Kalat in 1795, erected a permanent fort on it, eventually demolished by British guns in 1839. Finally, the location of the port, apart from, but in immediate proximity to, the Indus delta and established ports at its head, offered possibilities which the trading genius and rare diplomacy of its founders exploited from the outset. Karachi soon came to short circuit the tidal creeks of the great river by establishing direct connections, road and water, eastwards with centres upstream.

Yet it remains true that the "arrival" of Karachi is due to its key situation in the scheme of empire space relationships, strategic and economic. Its strategic value in relation to the North-West Frontier, Near East, and the all-red route via Suez, is obvious. Karachi is the nearest Indian port to Europe, being 6,077 miles from London, via Suez; 200 miles nearer than Bombay, the only other developed first-class harbour on the west coast of India. Aerial developments are enhancing its situation. It already has an R.A.F. cantonment. It is to serve as a main base in the imperial airship scheme, England to Australia and work on an airship shed began in 1926. The site, covering 600 acres, was presented by the Indian Government, who are also assisting this scheme with a grant-in-aid of four lakhs of rupees. A mast will be erected if ultimately deemed necessary. Meteorological organization is proceeding and weather forecasting for the area Karachi to the head of the Persian gulf is undertaken. Proximity to oil fuel, abundant space at sea-level, immunity from floods and heavy rains, minimum frequency of low cloud all favour Karachi from an aerial standpoint, and it is largely for climatic reasons that it has been preferred as a main base over Bombay and Calcutta. In connection with the Cairo-Karachi aeroplane service, an aerodrome has been provided and cleared, and a hangar is in course of erection. There is also an emergency landing ground available and marked. Lastly, Eastern Airways Ltd. (cap. £375,000) has just issued its programme, which includes, *inter alia,* services between Karachi and Bombay and Karachi and Delhi.

The hinterland served by the port embraces the whole of Sind, Baluchistan, Afghanistan, Punjab and expanding areas in the United Provinces and Rajputana; in addition it handles goods for Persia and Central Asia. It is dependent primarily upon the North Western railway, but is also linked, through Hyderabad, with the metre-gauge railway serving Rajputana. The greatest single stimulus to the growth of modern Karachi has certainly been the expansion of irrigation colonies in Punjab, devoted primarily to raising wheat largely for European consumption, but also yielding increasing quantities of cotton acceptable to Western markets. The aggregate value of the trade of the port in 1926–27 was 7,543 lakhs of rupees, but like its predecessor, this year was on the whole a disappointing one for India's overseas trade, the figure given representing a decrease on 1924–25 of 31%. Karachi handles over 95% of the total quantity of wheat and rapeseed respectively shipped by India, and usually over two-thirds of the gram. In terms of value, raw cotton is easily its main export; it accounted for 55% of all items in 1926–27 and 63% in 1925–26. It is significant as indicating present tendencies, that last year Karachi registered large increases in the receipt of bales from both the United Provinces and Rajputana at the expense of Bombay. Hides, skins, and raw wool are other characteristic exports. The principal imports in order of value are cotton manufactures, sugar, iron and steel goods.

At present Karachi harbour has a depth of 29 ft. It provides 8,600 ft. of wharfage embracing 17 berths in line, and moorings for 20 ocean steamers; this excludes wharfage for coasting steamers and country craft, respectively, and a bulk oil pier. The extension of irrigation under the Sukkur barrage and Sutlej valley schemes (*see* INDIAN DESERT) will increase demand on Karachi. The Port Trust is preparing to meet this. Under the "West Wharfage Scheme" the construction of six new berths, begun at the end of 1923, is proceeding at a pace which promises the completion of all by the close of 1931. Plans exist to furnish ten more thereafter, as required. In addition the existing ship channel is to be widened from 600 ft. to 1,200 ft. and deepened to take vessels drawing 32 ft. at any state of tide. The city is also doubling its water-supply. (A. V. W.)

KARAGEORGE (*c.* 1766–1817), Serbian revolutionary leader and founder of the Serb dynasty of Karageorgević, was born in 1766 or 1788, the son of a peasant of the name of Petrini. His own name, "Black George," was derived from his swarthy complexion and morose disposition: he signed himself indifferently in the Turkish or Serb versions as Kara George Petrovic or Georg

Petrović Cerai. After an apprenticeship with a Turkish brigand named Fazli-Bey, he settled down on a farm; but having killed a Turk, fled to the Austrian military frontier, where he served two years as forest guard to a monastery, then enlisting in a frontier regiment. He served as sergeant in the Austrian war against Turkey (1788–91), then deserted and returned to Serbia, settling in Topola as a dealer in cattle and swine. At the same time he took part in irregular "haiduk" warfare against the Turks, and so distinguished himself that when the Serbs *rayah* rose against the janissaries in 1804, a meeting of the various insurgent leaders at Orašac in Feb.–March 1804 elected Karageorge supreme leader.

For the story of the subsequent wars *see* SERBIA: *History*. Karageorge's chief part was that of military leader, as which he displayed real practical and strategical genius combined with dauntless personal courage, so that his mere appearance was said to suffice to turn defeat into victory for the Serbs. The diplomatic negotiations were largely conducted by others; but it is remarkable with what tenacity Karageorge, perhaps influenced by his past experience, begged Austria to proclaim a protectorate over Serbia. At first, too, he maintained his loyalty to the sultan against the latter's rebellious janissaries; only later, relying on Russian promises, did he aim at complete independence for Serbia. His troops had repeatedly defeated the Turks, and cleared Serbia of them; and in 1808, when the Serb leaders suspected that Russia was attempting to gain an excessive influence in Serbia, they determined "to honour Karageorge so that the Russians too should respect him," and on Dec. 26, 1808 the National Council (Soviet) swore "to recognize Karageorge Petrović and his lawful descendants as rulers," while he swore to care for the people as a father, and to issue his commands through and in agreement with the Soviet.

In the following years Karageorge maintained his reputation as a soldier; but his position and autocratic methods aroused the jealousy of the rival voivodes, which was fostered by the Russian agent, Rodofinikin. When the Treaty of Bucharest (1812) freed Turkey's hands, and she advanced in 1813 against the Serbs, Karageorge was sick of typhus. The unsupported Serb forces were defeated, and Karageorge took refuge in Hungary (Sept. 20, 1813). He was interned in Graz and later settled in Hotin (Bessarabia) on a pension provided by the tsar. In the summer of 1817, he reappeared suddenly and alone, near Surederevo, apparently with the object of organizing a general Balkan rising in conjunction with the Greek Hetairia. The new Serbian leader, Miloš Obrenović I. (*q.v.*) reported his presence to the pasha of Belgrade, who demanded Karageorge's surrender, alive or dead. Karageorge was murdered in his sleep, and his head sent to Constantinople. From this act the responsibility for which, has not, however, been absolutely brought home to Obrenović, sprang the feud between the rival dynasties, which distracted Serbia for a century.

Karageorge was feared rather than loved. His temper was morose and choleric, and he punished the slightest transgression by death. He is believed to have killed his own father in a fit of anger when the old man refused to follow him in his flight to Hungary at the beginning of his career. He hanged his brother for rape, and forbade his mother to go into mourning for him. Even by his admirers he is admitted to have killed by his own hand no fewer than 125 men who provoked his anger. Yet he was a military genius of the very highest order, a man of unsurpassed energy and valour, and the true founder of Serbian independence; and even in civilian matters, if his hand was heavy, he was just and even magnanimous.

See SERBIA; also Ranke, *Die serbische Revolution;* M. G. Militye-vich, *Karadyordye* (Belgrade, 1904); S. Novakovic, *Vaskzhs srpske drzhave* (Belgrade, 1904); *Die Wiedergeburt des Serbischen Staates* (Serajevo, 1912).

KARA-HISSAR ("Black Castle"). (1) AFIUN QARAHISAR (*q.v.*). (2) ICHJE, or ISCHA KARA-HISSAR (anc. *Docimium*), a small village about 14 m N E. of No. 1. Docimium was a Macedonian colony established on an older site. It was a self-governing municipality, striking its own coins, and stood on the Apamea-Synnada-Pessinus road, by which the celebrated marble called Synnadic, Docimian and Phrygian was conveyed to the coast. The quarries are 2½ m. from the village, and the marble was carried thence direct to Synnada (Chifut Kassaba).

See W. M. Ramsay, *Hist. Geog. of Asia Minor* (London, 1890); Murray, *Hbk. to Asia Minor* (1893).

KARA-HISSAR SHARKI [*i.e.*, "eastern Kara-Hissar"], also called Shabin Kara-Hissar from the alum mines in its vicinity, the chief town of a vilayet in Asia Minor. Pop. (1927) 18,483. It is the Roman *Colonia,* which gradually superseded Pompey's foundation, *Nicopolis,* whose ruins lie at Purkh, about 12 m. W. (hence Kara-Hissar is called Nikopoli by the Armenians). In later Byzantine times it was an important frontier station, and did not pass into Ottoman hands till twelve years after the capture of Constantinople. The town, altitude 4,860 ft., is built round the foot of a rock, upon which stand the ruins of the Byzantine castle, *Mauro-castron,* the Kara-Hissar Daula of early Moslem chroniclers. It is connected with its port, Kerasund, and with Sivas, Erzingan and Erzerum by carriage roads.

KARAISKAKIS, GEORGES (1782–1827), leader in the War of Greek Independence, was born at Agrapha in 1782. During the earlier stages of the war he served in the Morea, where he shared in the intrigues which divided the Greek leaders. But he saw the necessity of providing the country with a government, was a steady supporter of Capo d'Istria, and gave honourable service in the middle and later stages of the war. He helped to raise the first siege of Missolonghi in 1823, and did his best to save the town in the second siege in 1826. In that year he commanded the patriot forces in Rumelia, and though he failed to co-operate effectually with other chiefs, or with the foreign sympathizers fighting for the Greeks, he gained some successes against the Turks. He took a share in the unsuccessful attempts to raise the siege of Athens in 1827, and made an effort to prevent the disastrous massacre of the Turkish garrison of fort S. Spiridion. He was shot in action on May 4, 1827.

See G. Finlay, *History of the Greek Revolution* (London, 1861).

KARAITES: *see* QARAITES.

KARAJICH, VUK STEFANOVICH (1787–1864), the father of modern Serbian literature, was born on Nov. 6, 1787, in the Serbian village of Trshich, on the Bosnian border. Having learnt to read and write in the old monastery Tronosha (near his native village), he was engaged as writer and reader of letters to the commander of the insurgents of his district at the beginning of the first Serbian rising against the Turks in 1804. Mostly in the position of a scribe to different voyvodes, sometimes as schoolteacher, he served his country during the first revolution (1804–13), at the collapse of which he left Serbia, but instead of following Karageorge and other voyvodes to Russia he went to Vienna. There he was introduced to the great Slavonic scholar Yerney Kopitar, who encouraged him to collect the poems and popular songs, write a grammar of the Serbian language, and, if possible, a dictionary.

His first book, *Mala Prostonarodna Slaveno-Serbska Pyesmaritsa* (Vienna, 1814), contains 100 lyric songs, sung by the peasant women of Serbia, and six poems about heroes, or as the Serbs call them *Yunachke pesme,* which are generally recited by the blind bards or by peasants. From that time Karajich's literary activity moved on two parallel lines: to give scientific justification and foundation to the adoption of the vernacular Serbian as the literary language; and, by collecting and publishing national songs, folk-lore, proverbs, etc., to show the richness of the Serbian people's poetical and intellectual gifts, and the wealth and beauty of the Serbian language. By his reform of the Serbian alphabet and orthography, his Serbian grammar and his Serbian dictionary, he established the fact that the Serbian language contains 30 distinct sounds, for six of which the Old Slavonic alphabet had no special letters. He introduced new letters for those special sounds, at the same time throwing out of the Old Slavonic alphabet 18 letters for which the Serbian language had no use. This reform was strenuously opposed by the church and many conservative authors, who went so far as to induce the Serbian Government to prohibit the printing of books in new letters, a

prohibition removed in 1859. Karajich's alphabet facilitated his reform of orthography, his principle being: *write as you speak, and read as it is written!* Hardly any other language in the civilized world has such a simple, logical, scientific spelling system and orthography as the Serbian has in Karajich's system. His first grammatical essay was published in Vienna in 1814, *Pismenitsa Serbskoga yezika po govoru prostoga naroda* ("The grammar of the Serbian language as spoken by the common people"). An improved edition appeared in Vienna in 1818, together with his great work *Srpski Ryechnik* (Lexicon Serbico-Germanico-Latinum). This dictionary—containing 26,270 words—was full of important contributions to folk-lore, as Karajich never missed an opportunity to add to the meaning of the word the description of the national customs or popular beliefs connected with it. A new edition of his dictionary containing 46,270 words, was published at Vienna in 1852.

Meanwhile he gave himself earnestly to the work of collecting the "creations of the mind of the Serbian common people." He travelled through Serbia, Bosnia, Herzegovina, Montenegro, Dalmatia, Syrmia and Croatia, and the result was shown in a largely augmented edition of his *Srpske Narodne Pyesme* (Leipzig, 3 vols., 1823; vol. iv., Vienna, 1833). *Popular Stories and Enigmas* was published in 1821, and *Serbian National Proverbs* in 1836. From 1826 to 1834 he was the editor of an annual, called *Danitsa* (The Morning Star), which he filled with important contributions concerning the ethnography and modern history of the Serbian people. In 1828 he published a historical monograph, *Milosh Obrenovich, Prince of Serbia;* in 1837, in German, *Montenegro and Montenegrins;* in 1867, *The Serbian Governing Council of State.* He supplied Leopold Ranke with the materials for his *History of the Serbian Revolution.* He also translated the New Testament into Serbian, for the British and Foreign Bible Society (Vienna, 1847). Karajich died in Vienna on Feb. 6, 1864; and his remains were transferred to Belgrade in 1897 with great solemnity and at the expense of the Government. (C. Mij.; X.)

KARA-KALPAK, an autonomous area, a region north of the Khiva oasis and stretching south-eastwards from the shores of the Aral sea along the right bank of the Amu-Darya; it is linked administratively with Kazakstan A.S.S.R (*q.v.*). Its area is 119,474 sq.km. and for the most part it consists of the Kizil-kum (red sand) desert (*q.v.*), vast plains having an elevation of about 160 ft. near the Sea of Aral and rising gradually towards the south-east. Near the Aral sea the Kizil-kum is covered with sand dunes from 30 to 60 ft. high, mostly arranged in parallel lines. In the intervening spaces are clay covered belts. During the short spring, there is rich pasture available for the nomad Kirghiz flocks. But in summer the great heat and the lack of water, combined with strong winds raising hot sandstorms, make it almost impassable; a sudden heavy rain storm is even more disastrous in the clay area, reducing it to a trackless sea of mud. The average annual rainfall is 4 inches. Farther east are dunes covered with a species of sedge forming food for sheep, and saksaul trees, used as fuel and from which charcoal is made and sent to Bokhara. The climate is continental in type and very dry. At Turt-Kul (Petro-Alexandrovsk) the average January temperature is 5·0° C, average July 29·0° C, though temperatures as high as 43·4° C and as low as 28·4° C have in the past been recorded.

The region of the right bank of the Oxus or Amu-Darya and the right portion of its delta have much fertile alluvial soil, and irrigation is successfully practised here from Turt-Kul (Petro-Alexandrovsk) to the sea. Figs, melons, pomegranates, grapes and other fruits and vegetables grow luxuriously. Wheat forms 33·5% of the harvest, maize 16·5%, lucerne 12·6%, cotton 11·5% and millet 8%. Transport across the river to Khiva is by flat-bottomed boats towed through the channels between the numerous islands; at some places swamps make landing difficult. Steam navigation on the Amu-Darya is just possible for military purposes from Charjui onwards, and a fleet of steel-built steamers carrying 200 tons of cargo and with a draught of 2 ft. was inaugurated in 1887, but for purposes of commerce it is impracticable, since the channel is constantly shifting and sandbanks may appear and disappear in a couple of hours. The Oxus once bifurcated at Kohna Urgani, 70 m. S. of the river, and a branch flowed south-westwards to the Caspian, entering Balkhan bay. At some period in the 15th or 16th centuries, either because of an artificial dam raised by the Khivans, or through some natural obstruction, this branch was diverted and entered the Sea of Aral. Projects for re-opening the exit to the Caspian have at various times been discussed, but have never materialized.

The region came under Russian rule in 1867, forming part of the Turkistan province created after the successful campaigns of General Kaufmann, when Tashkent and Kokhand were captured. In 1873 Khiva was subdued and made a protected native state of Russia, losing the irrigated right bank areas of the Amu-Darya. The river swings perpetually to the right, and thus favours the Kara-Kalpak irrigation systems at the expense of the left bank Khivan district. The population in 1926 was 303,470, and consisted of 37·7% Kara-Kalpaks, Kirghiz-Kazaks 28·9%, Uzbeks 27·3%, Turks 3·0% and Russians 1·6%. The Kara-Kalpaks, or Black Bonnets, so called from their sheepskin hats, are a tribe allied to the Kirghiz-Kazaks. They followed Attila in his raiding expeditions in the 5th century and probably settled on the east of the Sea of Aral after their migration from the Volga region. Little, however, is known of this period of their history. There is a definite record that they were settled and practising cultivation and sheep raising on the eastern side of the Sea of Aral in the early 18th century, and were divided into an Upper and a Lower Horde. A Khan of the Kara-Kalpaks made friendly overtures to the Russians in 1722. They are taller and larger eyed than the Kazaks, and prefer a settled agricultural life. They were much persecuted by their nomad neighbours, so that some returned to the Volga and settled in the Astrakhan district, whilst others crossed the Dzungharian gate into Mongolia. The literacy rate amongst them is barely 3%.

The Kara-Kalpak area is entirely dependent on caravan routes for communication with the outside world, and Kungrad on a left bank arm of the delta of the Amu-Darya, is an important starting point for caravans, whilst other routes link up with Kazalinsk and Kizil-Orda on the Orenburg-Tashkent railway. Chimbai, on the delta, pop. (1926) 5,426, is the administrative centre, and the only other towns are Kungrad (*q.v.*), pop. (1926) 3,098, and Turt-Kul, formerly Petro-Alexandrovsk, a fort built by the Russians on the site of a house and gardens formerly belonging to the family of the khan of Khiva. Its population is barely 1,000, mainly occupied in gardening, though a cotton factory has recently been built.

KARAKOL, a town of Asiatic Russia in the Kirghiz A S.S.R., in 42° 30′ N., 78° 20′ E., 8 m. S.E. of Lake Issyk-kul. The original name of the town was Karakol, but it was renamed in 1889 after the Russian explorer Nikolai Przhevalsky (*q.v.*), who died here in that year. Recently it has reverted to its former name. It is a centre of routes to the east and north, and the products of the district are brought to it for the steamer route on Lake Issyk-kul.

KARAKORUM, a great mountain region between the western Himalaya on the south and the western branch of the Kuenlun on the north. It includes (1) the Northern Foreland, including the region of the Karakorum pass; (2) the main chain of high summits north of the great glaciers, extending westward to the south Hindu Kush and eastward into the Tibetan highland; (3) the Southern Karakorum; (4) the Cadok chain. The south part is mainly granite and syenite and reaches down to the Indus valley, metamorphic rocks of uncertain age and supposedly Triassic limestones are included. In the region of the high peaks, eruptive, metamorphic and sedimentary rocks are mingled; the last are specially important. On the Karakorum pass Liassic and Cretaceous rocks have been identified. In the east the Jurassic strata are of continental formation, and so is the Tertiary, but there is evidence of a Cretaceous maritime transgression. Many peaks are extraordinarily steep, and 60 summits rise about 22,000 ft., K_2 (28,248 ft.) being the highest. The glaciers reach lower in the west (10,500 ft.) than in the east (12,000–16,000 feet).

KARAKORUM, the famous capital of the Mongol confederacy whose ruins lie in what is now northern or Outer Mongolia. This forms a belt of open steppe lying between the Gobi desert on the south and the Siberian forest on the north, and has been occupied for ages by pastoral peoples. During the later decades of the 12th century Jenghiz, a Mongol chief, gradually acquired dominion not only over all the Mongols but also over the related peoples of the whole steppe from the Altai to the Khingan. He placed, at some date between 1206 and 1219, the capital of the new confederacy in the central part of the belt of steppe, which is also the more fertile. This was Karakorum. It lay by the Orchon, a river draining north to Lake Baikal, on a tributary of which now stands Urga, the modern capital of Outer Mongolia. Long before, in the 8th century, there had been, only 25 m. away, the capital of the Uighur kingdom, and this also was known as Karakorum. These successive capitals mark out the upper valley of the Orchon as the focus of the Mongolian steppe. It was from this base that the Mongol conquests spread out to embrace the Old World from China to eastern Europe. So long as the expansion of Mongol power was in progress, under the grand khans from Jenghiz to Kublai, his grandson, Karakorum remained the capital. But when the richness of the conquered lands around the periphery, in contrast to the comparative poverty of the steppe homeland in the centre, began to act as a centrifugal force, the far-flung Mongol domain split up into several khanates. Even Kublai, the grand khan, moved his capital in 1267 from Karakorum to Cambaluc (the modern Peking) in the lowlands of China, the richest and most long-lived of all the Mongol conquests. Karakorum then sunk to the level of the capital of a subordinate province, and soon afterwards, on the insurrection of its khan, was razed to the ground, and has never been restored.

KARA-KUL, the name of two lakes ("Great" and "Little") of Asiatic Russia, situated on the Pamir plateau, in the Autonomous Mountain Badakshan Area of the Tajik S.S.R. Great Kara-kul, 12 m. long and 10 m. wide (formerly much larger), is under 39° N., to the south of the Trans-Alai range, and lies at an altitude of 13,200 ft.; it is surrounded by high mountains, and is reached from the north over the Kyzyl-art pass (14,015 ft.). A peninsula projecting from the south shore and an island off the north shore divide it into two basins, a smaller eastern one which is shallow, 42 to 63 ft, and a larger western one, which has depths of 726 to 756 ft. It has no drainage outlet. Little Kara-kul lies in the north-east Pamir, or Sarikol, north-west of the Mustagh-ata peak (25,850 ft.), at an altitude of 12,700 ft. It varies in depth from 79 ft. in the south to 50 to 70 ft. in the middle, and 1,000 ft. or more in the north.

KARA-KUM ("Black Sands"), a flat desert occupying most of the Turkmenistan S.S.R. and extending on the north-west into the Kazakstan A.S.S.R. Its area is nearly 110,000 sq m.; it is bounded on the north-west by the Ust-urt plateau, between the Sea of Aral and the Caspian sea, on the north-east by the Amu-darya, on the south by the Turkmen oases, and on the west it nearly reaches the Caspian sea. Only part of this surface is covered with sand. There are broad expanses (*takyrs*) of clay soil upon which water accumulates in the spring; in the summer these are muddy, but later quite dry, and merely a few Solanaceae and bushes grow on them. There are also *shors,* similar to the above but encrusted with salt and gypsum, and relieved only by Solanaceae along their borders. The remainder is occupied with sand, which, according to V. Mainov, assumes five different forms: (1) *Barkhans,* chiefly in the east, which are mounds of loose sand, 15 to 35 ft. high, hoof-shaped, having their gently sloping convex sides turned towards the prevailing winds, and a concave side, 30° to 40° steep, on the opposite slope. They are disposed in groups or chains, and the winds drive them at an average rate of 20 ft. annually towards the south and south-east. Some grass (*Stipa pennata*) and bushes of *saksaul* (*Haloxylon ammodendron*) and other steppe bushes (e.g., *Calligonium, Halimodendron* and *Atraphaxis*) grow on them. (2) Mounds of sand, of about the same size, but irregular in shape and of a slightly firmer consistency, mostly bearing the same bushes, and also *Artemisia* and *Tamarix;* they are chiefly met with in the east and south. (3) A sandy desert, slightly undulating, and covered in spring with grass and flowers (*e.g.,* tulips, *Rheum,* various Umbelliferae), which are soon burned by the sun; they cover very large spaces in the south-east. (4) Sands disposed in waves from 50 to 70 ft., and occasionally up to 100 ft. high, at a distance of from 200 to 400 ft. from each other; they cover the central portion, and their vegetation is practically the same as that of the preceding division. (5) Dunes on the shores of the Caspian, composed of moving sands, 35 to 80 ft. high and devoid of vegetation.

A typical feature of the Kara-kum is the number of "old river beds," which may have been either channels of tributaries of the Amu and other rivers, or depressions which contained elongated salt lakes. Water is found only in wells, 10 to 20 m. apart—sometimes as much as 100 m.—which are dug in the *takyrs* and give saline water, occasionally unfit to drink, and in pools of rain-water retained in the lower parts of the *takyrs.* The population of the Kara-kum, consisting of nomad Kirghiz and Turkmen, is very small. The region in the north of the province of Syr-darya, between Lake Aral and Lake Chalkarteniz, is also called Kara-kum.

KARAMAN (anc. *Laranda*), a kaza in the Konia vilayet of Asia Minor, situated in the plain north of Mount Taurus. Pop. (1927) 37,073. It has few industries and little trade, but there are the mediaeval walls, castle and mosques, and the old Seljuk *medresse,* or college. Karaman is connected with Konia by railway, having a station on the first section of the Baghdad railway. Little is known of its ancient history except that it was destroyed by Perdiccas about 322 B.C., and afterwards became a seat of Isaurian pirates. It was occupied by Frederick Barbarossa in 1190; in 1466 it was captured by Mohammed II., and in 1486 by Bayezid II.

KARAMANIA, formerly an independent inland province in the south of Asia Minor, named after Karaman, the son of an Armenian convert to Islam, who married a daughter of Ala ed-Din Kaikobad, the Seljuk sultan of Rum, and was granted Laranda in fief, and made governor of Selefke, 1223–1245. The name Karaman is, however, Turkoman and that of a powerful tribe, settled apparently near Laranda. The Armenian convert must have been adopted into this. On the collapse of the Seljuk empire, Karaman's grandson, Mahmud, 1279–1319, founded a state, which included Pamphylia, Lycaonia and large parts of Cilicia, Cappadocia and Phrygia. Its capital, Laranda, superseded Konia This state was frequently at war with the kings of Lesser Armenia, the Lusignan princes of Cyprus and the knights of Rhodes. It was also engaged in a long struggle for supremacy with the Osmanli Turks, which only ended in 1472, when it was definitely annexed by Mohammed II. The Osmanlis divided Karamania into Kharij north, and Ichili south, of the Taurus, and restored Konia to its metropolitan position. The name Karamania is now often given to Ichili only; but so far as it has had any exact significance in modern times, it has stood for the whole province of Konia. Before 1864, when Turkey was divided into vilayets, Karamania was the vilayet of which Konia was the capital, and it did not extend to the sea, the whole littoral from Adalia eastward being under the pasha of Adana. Nevertheless, in Levantine popular usage, "Karamania" signifies the coast from Adalia to Messina.

KARAMNASA, a river of northern India, tributary to the Ganges on its right bank, forming the boundary between Bengal and the United Provinces.

KARA MUSTAFA (d. 1683), Turkish vizier, surnamed "Merzifunli," was a son of Uruj Bey, a notable Sipahi of Merzifun (Marsovan), and brother-in-law to Ahmed Kuprili, whom he succeeded as grand vizier in 1676. After conducting an unsuccessful campaign in Poland, he responded to the appeal for aid made by the Hungarians under Imre Thököly (*q.v.*) when they rose against Austria, his hope being to form out of the Habsburg dominions a Mohammedan empire of the West, of which he should be the sultan. The plan was foiled by the heroic resistance of Vienna and its timely relief by John Sobieski, king of Poland.

Kara Mustafa was beheaded at Belgrade in 1683 and his head was brought to the sultan on a silver dish.

KARAMZIN, NIKOLAI MIKHAILOVICH (1765–1826), Russian historian, critic, novelist and poet, was born at the village of Mikhailovka, in the government of Orenburg, and not at Simbirsk as many of his English and German biographers incorrectly state, on Dec. 1 (old style) 1765. His father was an officer in the Russian army, of Tatar extraction. He was sent to Moscow to study under Prof. Schaden, whence he afterwards removed to St. Petersburg (Leningrad). After residing there some time, he went to Simbirsk, where he lived in retirement till induced to revisit Moscow. In 1789 he resolved to travel, and visited Germany, France, Switzerland and England. On his return he published in the *Moscow Journal,* which he edited, his *Letters of a Russian Traveller,* afterwards collected and issued in six volumes (1797–1801). In this magazine appeared some of his prose tales, one of which, "Poor Liza," is famous in the history of Russian literature as being the first example of "sensibility" in Russia, the first fruits of the teaching of Rousseau In 1794 and 1795 Karamzin abandoned his literary journal, and published a miscellany in two volumes, entitled *Aglaia,* in which appeared, among other things, "The Island of Bornholm" and "Ilia Muromets," a story based upon the adventures of the hero of many a Russian legend. In 1797–99 he issued another miscellany or poetical almanac, *The Aonides,* in conjunction with Derzhavin and Dmitriev. In 1798 he compiled *The Pantheon,* a collection of pieces from the works of the most celebrated authors ancient and modern, translated into Russian. Many of his lighter productions were subsequently printed by him in a volume entitled *My Trifles.* In 1802 and 1803 Karamzin started the monthly *European Messenger,* which he abandoned in 1804 to make the necessary researches for his *History of the Russian State* (1819–26). In 1816 he removed to St. Petersburg, where he spent the happiest days of his life, enjoying the favour of Alexander, and submitting to him the sheets of his great work, which the emperor read over with him in the gardens of the palace of Tsarkoë Selo He only reached the 11th volume, carrying his work as far as the accession of Michael Romanov in 1613. He died on May 22 (old style) 1826, in the Taurida palace. A monument was erected to his memory at Simbirsk in 1845.

The style of his history is elegant and flowing, modelled rather upon the easy sentences of the French prose writers than the long periodical paragraphs of the old Slavonic school. Karamzin left his mark on the vocabulary and the syntax of the Russian language, and introduced many Gallicisms Perhaps he may justly be censured for the romantic colouring given to the early Russian annals, concealing the coarseness and cruelty of the native manners; in this respect he recalls Sir Walter Scott, whose writings probably had their influence upon him. Karamzin appears openly as the panegyrist of the autocracy; indeed, his work has been styled the "Epic of Despotism." He does not hesitate to avow his admiration of Ivan the Terrible, and considers him and his grandfather Ivan III. as the builders of Russian greatness, a glory which in his earlier writings, perhaps at that time more under the influence of Western ideas, he had assigned to Peter the Great. The characters of many of the chief personages in the Russian annals are drawn in firm and bold lines.

As a historian, Karamzin has deservedly a very high reputation Till the appearance of his work little had been done in this direction in Russia. The preceding attempt of Tatistchev was merely a rough sketch, inelegant in style, and without the true spirit of criticism. Karamzin was most industrious in collecting materials and the notes to his volumes are mines of curious information.

In the battle-pieces (*e.g.,* the description of the field of Koulikovo, the taking of Kazan, etc.) we find considerable powers of description. As a critic, he was undoubtedly of great service to his country; in fact he may be regarded as the founder of the review and essay (in western style) in Russia.

KARANGA, a collective name applied to many of the indigenous Bantu-speaking tribes of southern Rhodesia. They all keep cattle and goats, and raise crops of millet and maize Each tribe occupies its own territory under its own chief, who is assisted in his government by a council of influential heads of households. Within the tribe the people are organized into exogamous patrilineal clans which are totemic. Marriage is polygamous, and involves the payment of a bride-price. Cross-cousin marriage is practised. Ancestor-worship is the main form of religious cult, but there is also a belief in a supreme being known as *Mwari,* who is associated with the phenomena of weather. (*See* SOUTH AFRICA: *Anthropology and Ethnology.*)

See F. W. Posselt, *A Survey of the Native Tribes of Southern Rhodesia* (1927); C. Bullock, *Mashona Laws and Customs* (1913) and *The Mashona* (1928).

KARA SEA, demarcated by Novaya Zemlya, Vaygach Island and the Siberian coast. It is approached from the west by three straits—Matochkin, between the two islands of Novaya Zemlya, and Kara and Yugor to the north and south of Vaygach Island respectively. On the south-east Kara Bay penetrates deeply into the mainland, and to the west of this the short Kara river enters the sea. The sea is shallow, the deepest parts lying off Vaygach I. and the north part of Novaya Zemlya. After Johannesen had demonstrated its accessibility in 1869, and Nordenskiöld had crossed it in 1875, it was considered a possible route between European Russia and the north of Siberia. But the open season is very short, and the western straits are sometimes icebound during the entire year.

KARASU-BAZAR, a town in the Crimean A.S.S.R. in 45° 3′ N., 34° 35′ E., 25 m. E.N.E. of Simferopol. Pop. (1897), 12,961, (1926) 7,625 consisting of Tatars, Armenians, Greeks, Qaraite Jews and about 200 so-called Krymchaki, *i.e.,* Jews who have adopted the Tatar language and dress, and who live chiefly by making morocco leather goods, knives, embroidery and so forth. The site is low, but the town is surrounded by hills, which afford protection from the north wind. Placed on the high road between Simferopol and Kerch, and in the midst of a country rich in corn land, vineyards, and gardens, Karasu-Bazar used to be a chief seat of commercial activity in the Crimea; but it is gradually declining in importance, though still a considerable centre for the export of fruit.

The caves of Akkaya close by give evidence of early occupation of the spot. When in 1736 Khan Feta Chirai was driven by the Russians from Bakhchi-sarai, he settled at Karasu-Bazar, but next year the town was captured, plundered and burned by the Russians.

KARATEGHIN, a former dependency of Bukhara, now included in the Tajik A.S.S.R. (*q.v.*).

KARAULI, an Indian state in the Rajputana agency. Area, 1,242 sq m.; pop. (1921), 133,730. Almost the entire territory is composed of hills and broken ground, with the Chambal river flowing along the south-east boundary of the state Iron ore and building stone comprise the mineral resources The prevailing agricultural products are millets, which form the staple food of the people The only manufactures consist of a little weaving, dyeing, wood-turning and stone-cutting The feudal aristocracy of the state consists of Jadu Rajputs connected with the ruling house. They pay a tribute in lieu of constant military service, but in case of emergency or on occasions of state display they are bound to attend on the chief with their retainers The maharaja is the head of the clan, which claims descent from Krishna. His ancestors founded the state in the 11th century. It passed, like so many of its neighbours, under the yoke of the Mogul Empire, and then of the Mahrattas, until in 1817 it was taken under British protection. The present Maharaja Bhanwar Pal Deo, who was born in 1864 and succeeded in 1886, has a salute of 17 guns.

The town of KARAULI had a population in 1921 of 19,579 It dates from 1348, and is well situated in a position naturally defended by ravines on the north and east, while it is further protected by a great wall. The palace of the maharaja is a handsome block of buildings dating mainly from the middle of the 18th century.

KARBALA, a town in 'Iraq situated in 32° 40′ N, 44′ E., 60 m. S.S.W. of Baghdad on the Husainya canal, 20 m. W. of the Hindiya branch of the Euphrates, on the edge of the Syrian

desert. The population is estimated at 50,000 of whom 75% are Persians and the rest Shiah Arabs, as in Najaf only Muslims may reside in the town. A branch line joins the Baghdad-Basra railway north of Hilla. There is also a caravan route to Hilla and one to Najaf. The town possesses a telegraph and post office. The town is a centre of pilgrimage for all Shiah Muslims. It is second only in holiness to Mecca and Najaf and is visited by the old and infirm and by pious pilgrims bearing their dead, for burial in these holy places is a certain way to paradise. Being both a pilgrim centre and a "desert port" considerable trade is done, the exports consisting principally of dates, hides, wool and pious objects. In return Karbala buys Manchester goods, carpets, candles, spices, coffee and tea.

The country round the town is fertile and well irrigated and there are considerable groves of date palms. The outer town has broad streets, but the inner town (within the walls almost destroyed by the Turks in 1843) is of the usual narrow streeted and crooked lane type of all old Oriental cities. It was here that Husain, the Muslim martyr and son of Ali was murdered by the soldiers of Yasid in A.D. 680. The town centres about his shrine, which includes a gilded dome and three gilded minarets.

Like Najaf the ecclesiastical revenues of the town are very great, but Karbala, owing to its position on the edge of the alluvial plain is able not only to act as an entrepot for desert goods, but also to raise agricultural products. In addition to being itself a holy place, it acts as a stopping place on the way for pilgrims both to Najaf and to Mecca.

KAREL, RUDOLF (1880–), Czech composer, was born at Plzen (Pilsen) and studied at Prague, where he was a pupil of Dvořák, one of whose distinguished successors he may be considered. He spent the years befor the war in composition, but happened to be in Russia in August 1914. He was consequently interned, but presently was made professor in the Conservatoire at Rostov. He joined the Czechoslovak Legion in 1917, and with them eventually returned to Prague. Among his works may be mentioned an opera, *Ilsea's Heart* (Op. 10), first played at the National Theatre, Prague, in 1924, though written 15 years before; a symphony (Renaissance) (Op. 15, in E flat minor, unpublished); a *Theme with variations for piano* (Op. 13); two string quartets; and some vocal and choral music.

KARELIA, an A.S.S.R. in the Russian S.F.S.R., bounded on the west by Finland, on the north by the Murmansk province, on the east by the White sea and the Archangel province, and on the south by the Leningrad province. It lies mainly between 60° 40′ N. and 67° 40′ N., and 29° 46′ E. and 38° E. Orographically and geologically it is closely linked with Finland; its western hills rise to about 1,000 ft., and numerous small ridges run from north-west to south-east. The remainder of the region is dotted with marshes and lakes, the latter being about 2,500 in number, of which Lake Onega (*q.v.*), area 3,764 sq.m., is the largest. The geological structure is varied. Granites, syenites, and diorites, covered with Laurentian metamorphic slates, occur north-west of Lake Onega, and nearer the lake they are overlain with Devonian sandstones and limestones, yielding marble and sandstone for building. The whole region is sheeted with boulder clay, the bottom moraine of the great ice sheet of the Glacial period, and bears traces of glaciation, either in the shape of scratchings and elongated grooves on the rocks, or of *eskers* (*äsar*, *selgas*) running parallel to the glacial striations. The soil and climate are unfavourable for agriculture, and the republic is mainly either *taiga* forest or marsh land. The summers are cool and rainy and the winters severe, though they are somewhat modified by nearness to the Baltic and the Gulf Stream drift. Rivers and lakes are frozen for 180 to 200 days. Kem on the White sea coast has an average temperature in Jan. of 12·4° F and an average in July of 58·3° F. The average annual rainfall is 15 in., adequate in view of the short summer and lack of evaporation. Cyclones of the westerlies influence the climate. Late springs and early frosts are adverse to small quantities of rye and barley sown, which often fail to mature, and manure is difficult to obtain. The three field system of agriculture prevails, rye in the north and oats in the south alternating with rape and hemp. Potatoes and turnips are grown near the towns. The insufficiency of horses, cattle and sheep is a factor in the poor harvests, since manure is necessary for the crops. A few pigs are kept. The reindeer herds have markedly diminished of late years.

The republic never produces sufficient grain for its needs; only 0·3% of the land is under crops. Fishing occupies the coastal inhabitants, who are called *Pomortsi* (those by the sea) and are descendants of migrants from the province of Novgorod who reached Onega in the 11th and 12th centuries, and are much more prosperous than the Karelians. The chief fish are herring and salmon and they are preserved in a frozen state, without salting or smoking, for winter use. Seals are sometimes caught off the coast. Many of the *Pomortsi* migrate to the Murman fisheries in summer. Ptarmigan, grouse and ducks are plentiful and bears, foxes and squirrels are hunted for their skins. Of the population 41·4% are occupied either in fishing or hunting. The forests are the main wealth of Karelia, though at present only 16·3% of the population are employed in the industries dependent on the forest, timber felling, saw-milling, preparing tar, pitch and turpentine and wood-pulp for paper. The two factors militating against development have been lack of motor power and lack of means of transport. An electric plant was under construction in 1928 at Kondopoga on the railway and on the west shore of Lake Onega which will have a capacity of 5,000 kilowatts, and will supply electricity to the regions round, and especially to a large paper factory which is being built. Roads are difficult to make in this marshy country and transport in the past was only possible in winter. But the construction in 1917 through Karelia of the line linking Leningrad with Murmansk is bringing new life to the colonization and economic development of the country, and if the project of linking Soroka on the west coast of the Gulf of Onega with the Kotlas-Vyatka railway is carried out, the development of the region may be rapid. The making of clothes, distilling, brewing, flour-milling, and the making of small metal goods are carried on to some extent. The capital is Petrozavodsk (*q.v.*) on the western shore of Lake Onega. It has metal, carpentry, saw-milling, brewing and flour-milling industries, and its population and importance have greatly increased with the coming of the railway. Kem is a small port at the mouth of the Kem river, the inhabitants of which are occupied in saw-milling and fishing.

Before the Murmansk railway was built through the town in 1916 it was practically deserted in summer, but now cataracts near the town have been used to provide electricity and the harbour has been arranged to provide accommodation for ships. It has a wireless station. Soroka, another small port on the mouth of the Vig river has also been improved since the coming of the railway, and from it a branch railway line is being constructed southwards along the coast. The population consists of Russians 57%, and Karelians 38%, the remainder being of various nationalities; the Russians are mainly settled on the coast and in the towns. The Karelians, whose name is said to mean "cowherd," are closely allied to the Finns; their language is a Russianised Finnish dialect. It was among them that the great Finnish epic Kalevala (*Kalewala*) (*q.v.*) was collected. They are slighter and better proportioned than the Finns, and have as a rule grey eyes and brown hair. Their houses are built on platforms reached by a ladder and the space beneath is used as a shelter for cattle and sheep. The Karelians are first mentioned in the 9th century; the tribe to which they belong overran most of the south-west coast of the White sea until the 14th century, when some of them moved eastward. Like the Vots and the Vepses to whom they are closely related, they have gradually assimilated in speech, religion and customs to the Russians. Education in the republic is partly in Russian and partly in Karelian, but the proportion of illiteracy is higher among the Karelians than among the Russians, and the school provision for them is more inadequate because they are more scattered. The medical and sanitary provision is poor though slowly improving, and the Karelians are in special need of such help, owing to the prevalence of tuberculosis, scurvy and colic, probably due to inadequate diet; bark and straw are used to eke out flour.

KAREN, the collective name for a group of tribes of variant culture comprising perhaps a sixth of the population of Burma and occupying much of eastern Burma between the Shan States and Siam, and found also in the Irrawaddy delta. Most Karens of Lower Burma are divided into the *Sgaw* and *Pwo* (*i.e.*, "male" and "female") Karens, while in Upper Burma the name of *Bghai* (or *Bwe*) has been given to the tribes known as Red Karens, White Karens, Padaungs, Bres, Loilong Karens, Sawntüngs, Banpas, Zayeins and others. The Taungthus (*i.e.*, hillmen) are also a branch of the Karens. Their religion is animistic, and they worship stones and practice fertility ceremonies. Marriage is said to be endogamous but this refers perhaps to the linguistic or tribal group only; the Padaung branch practice exogamy, many Karens permit marriage only between near relatives (? cross-cousin marriage). The bachelors' hall exists; slavery and the practice of blood-brotherhood formerly existed. Antique bronze drums of unusual type are cherished as sacred objects. The Red Karens used to have a rising sun tattooed on the back. (*Cf.* IGOROT.) The Padaung women wear a succession of brass coils round their necks which are thereby preposterously elongated. Guns, spears, daos, cross-bows and poisoned arrows are used as weapons, and a blow-gun with poisoned darts as a quasi-toy by children. Teeth are blackened; the dead are buried or exposed in boat-shaped coffins; chicken-bones are used for divining, and tabu is prevalent. The Karens have a migration legend involving a river of sand (*cf.* KACHIN), which has been taken to refer to the Gobi desert, and a river flowing up to its source interpreted by McMahon (*Karens of the Golden Chersonese,* 1876) as referring to currents in the Bay of Bengal. They have a belief in the continuity of life, the soul of a deceased person taking material form as essential matter which dissolves over the ground, enters growing crops, and thence animals and human beings, and continues the cycle. They are supposed to be the descendants of Chinese tribes driven southwards by the pressure of the Shan races before they were again made to retire into the hills by the expansion of the Môn power.

See Marshall, *Karen Peoples of Burma* (Ohio, 1922).

KAREN LANGUAGES. Considerable interest attaches to these pre-Chinese languages which are spoken in Lower Burma and on the borders of Siam. A number of forms exists, such as Karenni or Reo Karen in the north, Pwo and Sgaw of the south, and Taungthu The relationship of these languages has not been satisfactorily determined, and their detailed examination by the Linguistic Survey of Burma should yield relevant material.

See *Linguistic Survey of India,* vol. i. (1927); *Gazetteer of Upper Burma,* vol. i., part 1; *Census of Burma* (1921).

KAREN-NI, the country of the Red Karens, a collection of small States, formerly independent, but now feudatory to Burma. It is situated approximately between 18° 50′ and 19° 55′ N. and between 97° 10′ and 97° 50′ E. The tract is bounded on the north by the Shan States of Möng Pai, Hsatung and Mawkmai; on the east by Siam; on the south by the Salween district of Burma; and on the west a stretch of mountainous country, inhabited by the Bre and various other small tribes, formerly in a state of independence, divides it from the districts of Toungoo and Yamethin. It is divided in a general way into eastern and western Karen-ni; the former consisting of one State, Kantarawadi, with an approximate area of 3,000 sq.m.; the latter of the four small States of Kyèbogyi, area about 700 sq.m.; Bawlake, 500 sq.m.; Nammekon, 50 sq m.; and Naungpale, about 30 sq. miles. The total population in 1921 was 63,850. The small States of western Karen-ni were formerly all subject to Bawlake, but the subordination has now ceased.

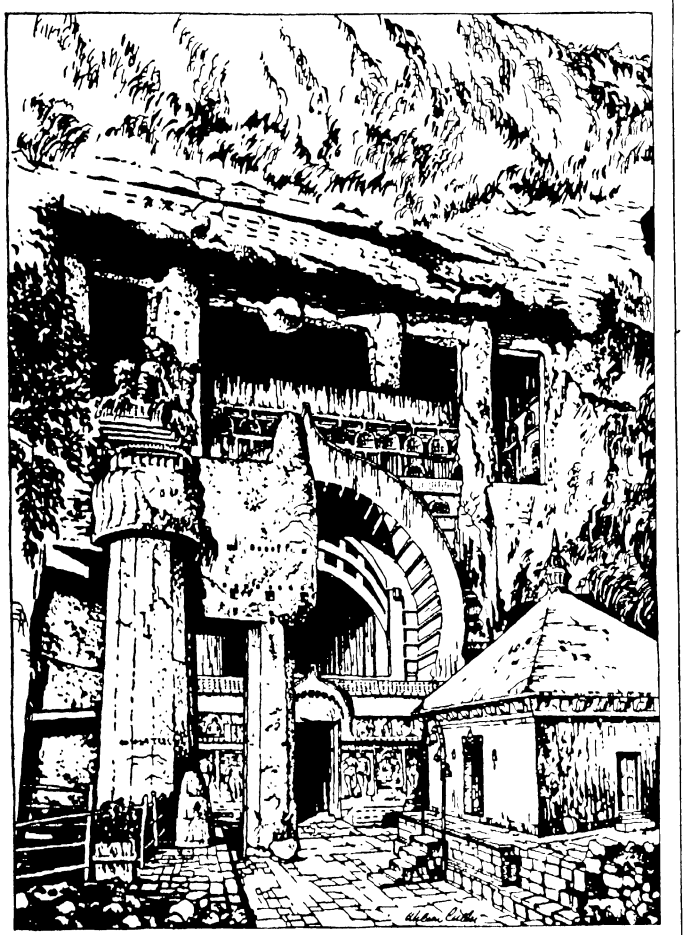
Karen-ni consists of two widely differing tracts of country, which roughly mark now, and formerly actually did mark, the division into east and west. Kantarawadi has, however, encroached westwards beyond the boundaries which nature would assign to it. The first of these two divisions is the southern portion of the valley of the Hpilu, or Balu stream, an open, fairly level plain, well watered and in some parts swampy. The second division is a series of chains of hills, intersected by deep valleys, through which run the two main rivers, the Salween and the Pawn, and their feeder streams. Many of the latter are dried up in the hot season and only flow freely during the rains. The whole country being hilly, the most conspicuous ridge is that lying between the Pawn and the Salween, which has an average altitude of 5,000 feet. It is crossed by several tracks, passable for pack-animals, the most in use being the road between Sawlon, the capital of Kantarawadi and Man Maü. The principal peak east of the Salween is on the Loi Lan ridge, 7,109 ft. above mean sea-level.

The Nam Pawn is a large river, with an average breadth of 100 yd., but is unnavigable owing to its rocky bed. Even timber cannot be floated down it without the assistance of elephants. The Salween throughout Karen-ni is navigated by large native craft. Its tributary, the Me Pai, on the eastern bank, is navigable as far as Mehawnghsawn in Siamese territory. The Balu stream flows out of the Inle lake, and is navigable from that point to close on Lawpita, where it sinks into the ground in a marsh or succession of funnel holes. Its breadth averages 50 yd. and its depth is 15 ft. in some places.

The chief tribes are the Red Karens, Bres and Paduangs. Since Oct. 1, 1922, Karen-ni has been administered as one of the three divisions of the Federated Shan States. (*See* SHAN STATES.) Little of the history of the Red Karens is known; but it appears to be generally admitted that Bawlake was originally the chief State of the whole country, east and west, but eastern Karen-ni under Papaw-gyi early became the most powerful. Slaving raids far into the Shan States brought on invasions from Burma, which, however, were not very successful. Eastern Karen-ni was never reduced until Sawlapaw, having defied the British Government, was overcome and deposed by Gen. Collett in the beginning of 1889. Sawlawi was then appointed myoza, and received a *sanad,* or patent of appointment, on the same terms as the chiefs of the Shan States. The independence of the Western Karen-ni States had been guaranteed by the British Government in a treaty with King Mindon in 1875. They were, however, formally recognized as feudatories in 1892 and were presented with *sanads* on Jan. 23 of that year. Kantarawadi pays a regular tribute or "nazar" of Rs. 5,025 yearly. Bawlake, Rs. 225; and Kyèbogyi, Rs. 100.

The Mawchi mines are worked intermittently, otherwise the chief source of wealth is in lac, cutch, teak and hides. The outturn of teak logs dropped to low levels in 1922–23. The largest and most important forests are those on the left bank of the Salween Others lie on both banks of the Nam Pawn, and in western Karen-ni on the Nam Tu. Rice, areca-nuts, and betel-vine leaf are the chief agricultural products. The birth-rate of the people is considered to exceed the death-rate by very little, and the Red Karen habit of life is most unwholesome. The population of Karen-ni, judging from the census of 1911 and 1921, is about stationary. Numbers enlist in the Burma police but there are various opinions as to their value Rubies and spinets of inferior value are found in the Upper Tu Valley.

See *Report on the Administration of the Shan and Karen-ni States* (annual).

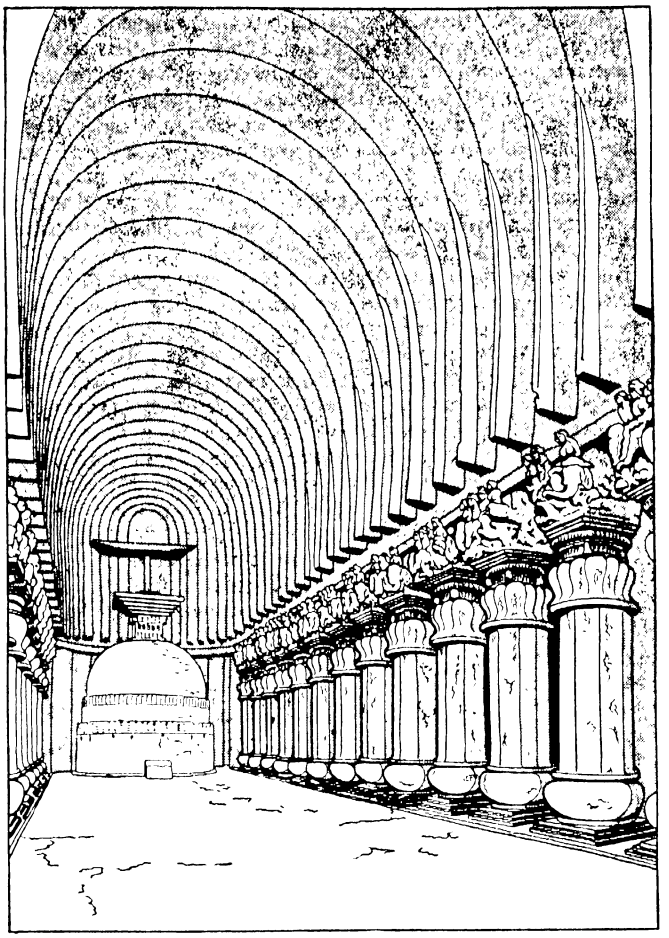


KARIKAL, a French settlement in India, on the south-east coast, within the limits of Tanjore district, with an area of 53 sq m. The population (54,356 in 1921) has been steadily decreasing, but the density is still high. The site was promised to the French by the Tanjore raja in 1738, in return for services rendered, but was only obtained by them by force in 1739. It was captured by the British in 1760, restored in 1765, again taken in 1768, and finally restored in 1817. The town is neatly built on one of the mouths of the Cauvery, and carries on a brisk trade with Ceylon and the Straits Settlements, though the port is an open roadstead. It is connected by a short line with Peralam on the Mayavaram-Tiruvalur railway. A *chef de l'administration,* subordinate to the government at Pondicherry, is in charge of the settlement, and there is a tribunal of first instance and 6 municipal councils.

KARIRIAN, a small group of tribes of South American Indians, forming an independent linguistic stock. They lived in the vicinity of the lower San Francisco river, in the provinces of

Bahia and Pernambuco in eastern Brazil. By the end of the 19th century they appear to have become nearly extinct. They were not warlike, and lived as sedentary agricultural folk, in small scattered groups. Their houses had walls of poles plastered with clay, and thatched roofs. They made excellent pottery and textiles. Their weapons were the bow, javelin, spear and club.

See C. F. P. von Martius, *Beiträge zur Ethnographie und Sprachenkunde Amerika's*, etc. (Leipzig, 1867); L. Adam, *Materiaux pour servir a l'establissement d'une grammaire comparée . . . famille Kariri* (Paris, 1897).



KARLI, a village of British India, in the Poona district of the Bombay presidency, 4 m. from a station on the great Indian Peninsular railway. It is famous for its rock caves. The great cave of Karli, excavated at a time when the style was in its greatest purity, and splendidly preserved, is the largest and finest *chaitya* cave in India. The great hall is 126 ft. long, 45 ft. 7 in. wide, and about 46 ft. high. A row of ornamental columns rises on either side to the ribbed teak roof, and at the far end of the nave is a massive *dagoba*. The cave, which dates from the beginning of the Christian era or earlier, has a wooden roof in a remarkable state of preservation.

EXTERIOR OF CHAITYA OR ROCK TEMPLE AT KARLI, THE LARGEST CAVE TEMPLE IN INDIA. THE WINDOW OVER ENTRANCE LIGHTS THE BUILDING

KARLOVAC (German, *Karlstadt*), a town of Croatia-Slavonia, Yugoslavia. Pop. (1921) 16,827. The town, which was built in 1579, still retains portions of its old fortress, and also of the walls, beneath which the skulls of 900 Turks are said to be interred, their attacks having always been successfully repulsed. There are Orthodox and Roman Catholic cathedrals, a Franciscan monastery, law courts, a popular university, and several large schools, including one for military cadets. Karlovac has a considerable transit trade in timber, grain, wine, spirits and honey, and there are in the town woollen mills, leather tanneries, boot factories, a chemical factory, and distilleries for the manufacture of a liqueur called *rosoglio*.

KARLOWITZ (Serbo-Croatian, *Karlovci*) a city of Croatia-Slavonia, Yugoslavia. Pop. (1921) 5,709. Karlowitz is the seat of an Orthodox metropolitan, and has several churches and schools, and a hospital. The fruit farms and vineyards of the Fruska Gora, a range of hills to the south, yield excellent plum brandy and red wine. An obelisk at Slankamen, 13 m. E. by S., commemorates the defeat of the Turks by Louis of Baden in 1691. The treaty of Karlowitz between Austria, Turkey, Poland and Venice, was concluded in 1699. In 1848–49 the city was the headquarters of the Serbian opposition to Hungary.

INTERIOR VIEW OF THE CHAITYA, KARLI, WHICH, HEWN OUT OF THE ROCK, DATES FROM THE 1ST CENTURY B.C. THE ROOF IS OF TEAK

KARLSKRONA or **CARLSCRONA,** a seaport of Sweden, on the Baltic coast, chief town of the district (*län*) of Blekinge, and headquarters of the Swedish navy. Pop. (1928) 26,969. It is situated upon islands and the mainland, 290 m. S.S.W. of Stockholm by rail. The harbour is capacious and secure, and deep enough for the largest vessels. The principal entrance, and the only one practicable for large vessels, is to the south of the town, and is defended by forts at Drottningskär on the island of Aspö and on the islet of Kungsholm. The large dry docks are cut out of the solid granite. There is slip-accommodation for large vessels. Karlskrona has a navy-arsenal and hospital. The town became the naval headquarters in 1680. There are factories for naval equipments, galvanized metal goods, felt hats, canvas, leather and rice, and breweries and granite quarries. Exports are granite, dairy produce and timber; imports, coal, flour, provisions, hides and machinery.

KARLSRUHE or CARLSRUHE, a city of Germany, capital of the republic of Baden, 33m. S.W. of Heidelberg, on the railway Frankfort-on-Main-Basel, and 30m. W.N.W. of Stuttgart. Pop. (1925) 145,694. It stands on an elevated plain, 5m. E. of the Rhine and on the fringe of the Hardtwald. Karlsruhe takes its name from Karl Wilhelm, margrave of Baden, who, owing to disputes with the citizens of Durlach, erected here in 1715 a hunting

seat, around which the town has been built. The Schloss, built in 1751–76 on the site of the previous erection, is a plain building in the old French style, composed of a centre and two wings, presenting nothing remarkable except the octagon tower (*Bleiturm*), and the marble saloon, in which the meridian of Cassini was fixed or drawn. In front are the Government offices. The older city has a fan-like plan. Other notable buildings are the town hall; the hall of representatives; the mint; the law courts; and the hall of fine arts. The Evangelical town church was the burial-place of the margraves of Baden. Karlsruhe has several fine public squares and one very fine spacious street.

Since 1870 the industry of the city has grown rapidly, as well as the city itself. There are large railway workshops; and the principal branches of industry are the making of locomotives, carriages, tools and machinery, watches, surgical instruments, furniture, gloves, cement, carpets, perfumery, tobacco and beer. Maxau, on the Rhine, serves as the river port of Karlsruhe and is connected with it by a canal finished in 1901.

KARLSTAD, a town of Sweden, capital of the district (*län*) of Vermland, on the island of Tingvalla near the estuary of the Klar, 205 m. W. of Stockholm by Oslo rail. Pop. (1928) 20,313. Karlstad was founded in 1584, and is the seat of a bishop and has a cathedral. Turbines and paper-making machinery are manufactured, and there are numerous iron works. Trade is carried on by way of Lake Vener and the Göta canal. There are match and stockinet factories, and a mineral spring rich in iron. Under the constitution of united Sweden and Norway, in the event of the necessity of electing a Regent and the disagreement of the parliaments of the two countries, Karlstad was indicated as the meeting-place of a delegacy for the purpose. Here, in August 1905 the conference met to decide upon the severance of the union between Sweden and Norway.

KARMA, sometimes written KARMAN, a Sanskrit noun (from the root *kri,* to do), meaning deed or action. As applied to the action of a conscious being, it is the doctrine that every deed, good or bad, receives due retribution. The theory often appears unconvincing in view of the events of one life, but in Hindu thought it has been combined with the doctrine of transmigration, and this makes it possible to explain any apparently undeserved pleasure or pain by the theory that the karma causing them was performed in a previous existence. The doctrine is not found in the earliest Vedic thought, but it appears in the Brāhmaṇas, and is fully developed in the earliest Upanishads. It has always remained an essential part of the Indian religions that accept the doctrine of transmigration. Both the Jains and the Buddhists accepted it, and the former worked it out most consistently by making the extinction of karma essential to the attainment of salvation. The Buddhists offer a kind of evidence for the doctrine in their belief that the enlightened *arhat* can remember his past births and see the destinies of departed individuals. In all sects it remains a powerful ethical argument, used especially in the tales invented to illustrate its effects (*see* AVADĀNA; JĀTAKA).

KÁRMÁN, JOZSEF (1769–1795), Hungarian author, was born at Losoncz on March 14, 1769, the son of a Calvinist pastor. He was educated at Losoncz and Pest, whence he migrated to Vienna. There he met the beautiful and eccentric Countess Markovics, who was for a time his mistress, but not, as has often been supposed, the heroine of his novel *Fanni Hagyománai* (Fanny's testament). Subsequently he settled as a lawyer in Pest. In 1792, together with Count Ráday, he founded the first theatrical society at Buda. He maintained that Pest, not Pressburg, should be the literary centre of Hungary, and in 1794 founded the first Hungarian quarterly, *Urania.* It met with little support and ceased to exist in 1795, after three volumes had appeared. The most important contribution to *Urania* was his romantic novel, *Fanni Hagyománai,* the most exquisite product of Hungarian prose in the 18th century and one of the finest psychological romances in the literature.

Kármán's collected works were published in Abafi's *Nemzeti Könyvtár* (Pest, 1878), etc., preceded by a life of Kármán. *See* F. Baráth, *Joseph Kármán* (Hung. Vas. Ujs. 1874).

KARNAK, a village in Upper Egypt which has given its name to the northern half of the ruins of Thebes on the east bank of the Nile, the southern being known as Luxor (*q.v.*). The Karnak ruins comprise three great enclosures built of crude brick. The northernmost and smallest of these contained a temple of the god Mentu, built by Amenhotep III., and restored by Rameses II. and the Ptolemies. Except a well-preserved gateway dating from the reign of Ptolemy Euergetes I., little more than the plan of the foundations is traceable. Its axis, the line of which is continued beyond the enclosure wall by an avenue of sphinxes, pointed down-stream (north-east). The southern enclosure contained a temple of the goddess Mūt, also built or continued by Amenhotep III., and almost as ruinous as the last, but on a much larger scale. At the back is the sacred lake in the shape of a horse-shoe. The third and greatest enclosure is of vast dimensions, forming approximately a square of 1,500 ft., and it contains the greatest of all known temples, the Karnak temple of Amen.

Inside and outside each of these enclosures there were a number of subsidiary temples and shrines, mostly erected by individual kings to special deities. The triad of Thebes was formed by Amen, his wife Mūt and their son Khansu. The large temple of Khansu is in the enclosure of the Amen temple, and the temple of Mūt is connected with the latter by an avenue of rams. The Mentu temple, on the other hand, is isolated from the others and turned away from them.

It is probable that a temple of Amen existed at Karnak under the Old Kingdom, if not in the prehistoric age. Slight remains of a considerable temple of the Middle Kingdom survive behind the shrine of the great temple, and numbers of fine statues of the XIIth and later dynasties have been found buried in a great pit, which has yielded an enormous number of valuable and interesting monuments reaching to the age of the Ptolemies. The axis of the early temple lay from east to west, and was followed by the main line of the later growth; but at the beginning of the XVIIIth Dynasty, Amenhotep I. built a temple south of the west front of the old one, and at right angles to it. Thothmes I. built a court round the temple of the Middle Kingdom, entered through a pylon (No. V.), and later added the pylon No. IV. with obelisks in front of it. Queen Hatshepsu placed a splendid obelisk (the largest in Egypt) between the Pylons IV. and V., and built a shrine in the court of Thothmes I., in front of the old temple. Thothmes III., greatest of the Pharaohs, remodelled the buildings about the obelisks of his co-regent Hatshepsu with the deliberate intention of hiding them from view, and largely reconstructed the surroundings of the court. At a later date, after his wars were over, he altered Hatshepsu's sanctuary, engraving on the walls about it a record of his campaigns. The small innermost pylon (No. VI.) is likewise the work of Thothmes III. Amenhotep III., though so great a builder at Thebes, seems to have contented himself with erecting a great pylon (No. III.) at the west end. The closely crowded succession of broad pylons here is explained by a trace of a quay found by Legrain in 1905 near the southern line of pylons, indicating how close was the channel of the Nile, which may have limited their growth Thothmes III. continued on the southern axis and erected a larger pylon (No. VII.) to the north of Hatshepsu's sanctuary, to which Haremheb added two great pylons and the long avenue of ram-figures, changing the axis slightly so as to lead direct to the temple of Mūt built by Amenhotep III. All of these southern pylons are well spaced. In the angle between these pylons and the main temple was the great rectangular sacred lake. By this time the temple of Karnak had attained to little more than half of its ultimate length from east to west.

With the XIXth Dynasty there is a notable change. No more was added on the southern line of building, but westward Rameses I. erected pylon No. II. at an ample distance from that of Amenhotep III., and Seti I. and Rameses II. utilized the space between for their immense Hall of Columns, one of the wonders of the world. Rameses III. built a fine temple, still well preserved, to Amen at right angles to the axis westward of pylon No. II ; Shishak I. (XXIInd Dynasty) commenced a great colonnaded court in front of the pylon, enclosing part of this temple and a smaller

triple shrine built by Seti II. In the centre of the court Tirhaka (Tirhaka, XXVth Dynasty) set up huge columns 64 ft. high, rivalling those of the central aisle in the Hall of Columns, for some building now destroyed. A vast unfinished pylon at the west end (No. I.), 370 ft. wide and 142½ ft. high, is of later date than the court, and is usually attributed to the Ptolemaic age. It will be observed that the successive pylons diminish in size from the outside inwards.

Besides the kings named above, numbers of others contributed in greater or less measure to the building or decoration of the colossal temple. Alexander the Great restored a chamber in the festival hall of Thothmes III., and Ptolemy Soter built the central shrine of granite in the name of Philip Arrhidaeus. The walls throughout, as usually in Egyptian temples, are covered with scenes and inscriptions. Many of these, such as those which record the annals of Thothmes III., the campaign of Seti I. in Syria, the exploit of Rameses II. at the battle of Kadesh and his treaty with the Hittites, and the dedication of Shishak's victories to Amen, are of great historical importance. Several large stelae with interesting inscriptions have been found in the ruins, and statues of many ages of workmanship. In December 1903 M. Legrain, who had been engaged for several years in clearing the temple area systematically, first tapped an immense deposit of colossal statues, stelae and other votive objects large and small in the space between pylon No. VII. and the great hypostyle hall. They were found lying in the utmost confusion; in date they range from the XIIth Dynasty to the Ptolemaic period.

The inundation annually reaches the floor of the temple, and the saltpetre produced from the organic matter about the ruins, annually melting and crystallizing, has disintegrated the soft sandstone in the lower courses of the walls and the lower drums and bases of the columns. There is moreover no solid foundation in any part of the temple. Slight falls of masonry have taken place from time to time, and the accumulation of rubbish was the only thing that prevented a great disaster. Repairs have gone on side by side with the clearance, especially since the fall of many columns in the great hall in 1899. All the columns which fell in that year were re-erected by 1908 and systematic restoration, both of the Hypostyle Hall and generally, has been continuously carried on. The whole temple area is now enclosed by a restoration of the old walls of the temenos.

The temple of Khansu, in the south-west corner of the great enclosure, is approached by an avenue of rams, and entered through a fine pylon erected by Euergetes II. It was built by Rameses III. and his successors of the XXth Dynasty. Excavations in the opposite south-east corner have revealed flint weapons and other sepulchral remains of the earliest periods, proving that the history of Thebes goes back to a remote antiquity.

KARNAL, a town and district of British India, in the Punjab. The town is 7 m. from the right bank of the Jumna, with a railway station 76 m. N. of Delhi. Pop. (1921) 22,805. There are manufactures of cotton cloth and boots, besides considerable local trade and an annual horse fair.

The DISTRICT OF KARNAL stretches along the right bank of the Jumna, north of Delhi. It is entirely an alluvial plain, but is crossed by the low uplift of the watershed between the Indian Ocean and the Bay of Bengal. Area, 3,125 sq m.; pop. (1921), 828,726. The principal crops are millet, wheat, pulse, rice, cotton and sugar-cane. There are several factories for ginning and pressing cotton. The district is traversed by the Delhi-Umballa-Kalka railway, and also by the Western Jumna canal.

No district of India can boast of a more ancient history than Karnal, as almost every town or stream is connected with the legends of the *Mahabharata*. The town of Karnal itself is said to owe its foundation to Raja Karna, the mythical champion of the Kauravas in the great war which forms the theme of the national epic. Panipat, in the south of the district, is said to have been one of the pledges demanded from Duryodhana by Yudisthira as the price of peace in that famous conflict. In historical times the plains of Panipat have three times proved the theatre of battles which decided the fate of Upper India. It was here that Ibrahim Lodi and his vast host were defeated in 1526 by the veteran army of Baber; in 1556 Akbar reasserted the claims of his family on the same battlefield against the Hindu general of the house of Adil Shah, which had driven the heirs of Baber from the throne for a brief interval; and at Panipat too, on the 7th of January 1761, the Mahratta confederation was defeated by Ahmad Shah Durani. During the troublous period which then ensued the Sikhs managed to introduce themselves, and in 1767 one of their chieftains, Desu Singh, appropriated the fort of Kaithal. Under British control Karnal was for a time an important cantonment, but was abandoned on account of its unhealthiness.

KARNEBEEK, HERMAN ADRIAAN VAN (1874–), Dutch statesman, son of A.P.C. Karnebeek (1836–1925), who was foreign minister in 1884–88, was born at The Hague on Aug. 21, 1874. He was Netherlands delegate to the second Peace Conference at The Hague in 1907. In 1911 he became burgomaster of The Hague, holding this position until 1918, when he was appointed foreign secretary. In 1921 he presided at the Second Assembly of the League of Nations. As minister of foreign affairs Van Karnebeek presented the Dutch case with regard to the revision of the international conventions governing the Schelde estuary to the Supreme Council of the Allies in Paris in 1919, and he finally concluded with Belgium the treaty of 1920. The question of the ratification of this document, deferred until 1925 (*see* NETHERLANDS: *History*) caused a serious internal crisis in Holland in the course of which Van Karnebeek was violently attacked.

See his *Memorie von Antwoord* (1927).

KÁROLYI, MICHAEL, COUNT (1875–), Hungarian politician, was born on March 4, 1875, and descended from a famous and wealthy family. First elected as a Liberal in the parliament of 1905, Károlyi entered public life definitively in 1909, when he became president of the Hungarian Agricultural Society, and worked for the creation of an agrarian Centre party. He then resigned from the conservative Agricultural Society and, having come under the influence of the writings of Karl Marx, became leader of the Radical wing of the Independence party, and led the Parliamentary opposition against Count Stephen Tisza, then Prime Minister, with whom he fought a duel.

In his autobiography Károlyi admitted that it was Tisza who drove him into a democratic camp, but maintained that his political ambitions were to break the relations between Austria and Hungary, substituting for them a Russo-Hungarian *rapprochement*, and also to destroy the capitalist system. In order to provide party funds for these purposes he entered into secret negotiations with the French Government and visited America. His return from that country coincided with the outbreak of the World War and he was interned in France, but was soon released on the understanding that on reaching Hungary he would do his best to bring the War to a speedy conclusion. He then founded the Károlyi party for the purpose of breaking with the Germans and entering into a separate treaty of peace.

On Oct. 25, 1918, when the War was clearly lost, Count Károlyi founded the National Council composed of his own personal supporters, Social Democrats and Radicals. The Werkerle Cabinet resigned, and Count Hadik was appointed Premier by King Charles. On Oct. 30 there was a revolution, led by the Soldiers' Council and supporters of the National Council, who occupied practically all strategic points in Budapest. The next day Count Hadik resigned and in the name of King Charles Archduke Joseph appointed Count Károlyi as Prime Minister, who then took the oath of allegiance to the King. The same day Count Tisza was assassinated. On Nov. 16 the Hungarian People's Republic was proclaimed, and full powers were entrusted to the Cabinet of which Károlyi was Prime Minister. On Jan. 11, 1919, the National Council formally proclaimed Károlyi as President of the People's Republic.

Károlyi attempted to introduce the reforms which he had advocated and to negotiate with the Entente and with Hungary's noblemen; but the situation was too difficult for him, and on March 21, 1919, he handed over the Government to the Soviet of Bela Kun. He remained in the country unmolested until the eve of the collapse of terrorism and then left Hungary for Czecho-

slovakia. Later he was expelled from Italy for Communist propaganda and made his headquarters in Paris.

The High Court of Hungary found, after public trial at which Count Károlyi was legally represented, that on account of his actions during the War and in organising the revolution he was guilty of high treason and felony. His estates were confiscated, a large portion of them being divided under Land Reform, among some 5,000 smallholders. It was further officially maintained that by negotiating a separate armistice with Gen. Franchet d'Esperey at Belgrade Károlyi deprived Hungary of many territorial and other rights to which she was entitled under an armistice previously concluded by Gen. Diaz on the Italian front with the Austro-Hungarian armies.

See Károlyi's own autobiography *Fighting the World* (1926).

KAROSS, a cloak made of sheepskin, or the hide of other animals, with the hair left on. It is properly confined to the coat of skin without sleeves worn by the Hottentots and Bushmen of South Africa. These karosses are now often replaced by a blanket. The chiefs wore karosses of the skin of the wild cat, leopard or caracal. The word is also loosely applied to the cloaks of leopard-skin worn by the chiefs and principal men of the Kafir tribes. Kaross is probably either a genuine Hottentot word, or else an adaptation of the Dutch *kuras,* a cuirass.

KARPATHOS, an island about 30 m. south-west of Rhodes (Ital. *Scarpanto*), in that part of the Mediterranean which was called, after it, the Carpathian Sea (*Carpathium Mare*). It was both in ancient and mediaeval times closely connected with Rhodes; it was held by noble families under Venetian suzerainty, notably the Cornari from 1306 to 1540, when it was acquired by the Turks. In 1912 it passed into Italian occupation. From its remote position Karpathos has preserved many peculiarities of dress, customs and dialect, the last resembling those of Rhodes and Cyprus.

KARR, ALPHONSE (1808–1890), French critic and novelist, was born in Paris, and became a teacher at the Collège Bourbon. His first novel, *Sous les tilleuls* (1832), partly autobiographical in character, was followed by other stories, of which *Voyage autour de mon jardin* (1845) was most popular. In 1839 he became editor of *Le Figaro,* and he also started a monthly journal, *Les Guêpes,* which brought him the reputation of a somewhat bitter wit. His epigrams were frequently quoted; *e.g.,* "plus ça change, plus c'est la même chose," and, on the proposal to abolish capital punishment, "je veux bien; que messieurs les assassins commencent." In 1848 he founded *Le Journal.* In 1855 he went to live at Nice, where he indulged his love of gardening, and gave his name to more than one new variety of flower. He practically founded the trade in cut flowers on the Riviera. His reminiscences, *Livre de bord,* were published in 1879–80. He died at St. Raphaël (Var) on Sept. 29, 1890.

KARROO, two extensive plateaus in the Cape province, South Africa, known respectively as the Great and Little Karroo Karroo is a corruption of *Karusa,* a Hottentot word meaning dry, barren, and its use as a place-name indicates the character of the plateaus so designated The Little (also called Southern) Karroo is bounded north by the Zwaarteberg, which separates it from the Great Karroo. From west to east the Little Karroo has a length of some 200 m., whilst its average width is 30 m. West of the Zwaarteberg the Little Karroo merges into the Great Karroo. Eastward it is limited by the hills which almost reach the sea in the direction of St. Francis and Algoa Bays. The Great Karroo is of much larger extent. Bounded south, as stated, by the Zwaarteberg, further east by the Zuurberg (of the coast chain), its northern limit is the mountain range which, under various names, such as Nieuwveld and Sneeuwberg, forms the wall of the inner plateau. To the south-west and west it is bounded by the Hex River mountains and the Cold Bokkeveld, eastward by the Great Fish river. West to east it extends fully 350 m in a straight line, varying in breadth from more than 80 to less than 40 m. Whilst the Little Karroo is divided by a chain of hills which run across it from east to west, and varies in altitude from 1,000 to 2,000 ft., the Great Karroo has more the aspect of a vast plain and has a level of from 2,000 to 3,000 ft. The total area of the Karroo plateau is stated to be over 100,000 sq.m. The plains are dotted with low ranges of *kopjes.* The chief characteristics of the Karroo are the absence of running water during a great part of the year and the consequent parched aspect of the country. There is little vegetation save stunted shrubs, such as the mimosa (which generally marks the river beds), wild pomegranate, and wax heaths, known collectively as Karroo bush. Such parts of the Karroo as are under perennial irrigation are among the most productive lands in South Africa. The Karroo is admirably adapted to sufferers from pulmonary complaints. In a looser sense the term Karroo is also used of the vast northern plains of the Cape which are a part of the inner table-land of the African continent and which give it a distinctive physical character. (*See* CAPE COLONY.)

KARS, a vilayet of Turkey. It is a mountainous, or rather a highland, country, being in reality a plateau, with ranges of mountains running across it. The northern border is formed by the Arzyan range, a branch of the Ajari Mts., which attains altitudes of over 9,000 ft In the south the Kara-dagh reach 10,270 ft. in Mount Ala-dagh, and the Agry-dagh 10,720 ft. in Mount Ashakh; and in the middle Allah-akhbar rises to 10,215 ft. The passes which connect valley with valley often lie at considerable altitudes, the average of those in the south-east being 9,000 ft. Chaldir-gol (altitude 6,520 ft.) and one or two other smaller lakes lie towards the north-east; the Chaldir-gol is overhung on the south-west by the Kysyr-dagh (10,470 ft). The east side of the province is throughout demarcated by the Arpa-chai, which receives from the right the Kars river, and as it leaves the province at its south-east corner joins the Aras. The Kura rises within the province not far from the Kysyr-dagh and flows across it westwards, then eastwards and north-eastwards, quitting it in the north-east. The winters are very severe. The towns of Kaghyshman (4,620 ft) and Sarykamish (7,800 ft.) have a winter temperature like that of Finland, and at the latter place, with an annual mean (35°) equal to that of Hammerfest in the extreme north of Norway, the thermometer goes down in winter to 40° below zero and rises in summer to 99°. The annual mean temperature at Kars is 40·5° and at Ardahan, farther north, 37°. The Alpine meadows (*yailas*) reach up to 1,000 ft. and afford excellent pasturage in spring and summer. The province is almost everywhere heavily forested. Firs and birches flourish as high as 7,000 ft., and the vine up to above 3,000 ft. Cereals ripen well, and barley and maize grow up to considerable altitudes. Large numbers of cattle and sheep are bred. Extensive deposits of salt occur at Kaghyshman and Olty. The population in 1927 was 205,464. In remote antiquity the province was inhabited by Armenians, the ruins of whose capital, Ani, attest the ancient prosperity of the country. To the Armenians succeeded the Turks, while Kurds invaded the Alpine pasturages above the valley of the Aras; and after them Kabardians, Circassians, Ossetes and Kara-papaks successively found a refuge in this highland region After the Russo-Turkish War of 1877–78, this region was transferred to Russia by the treaty of Berlin; it was returned to Turkey by treaty with the Union of Socialist Soviet Republics in 1921.

KARS, the capital of a Turkish vilayet on the border of Russian Transcaucasia It is situated in 40° 37′ N. and 43° 6′ E., 185 m. by rail S W of Tiflis, on a dark basalt spur of the Soghanlidagh, above the deep ravine of the Kars-chai, a sub-tributary of the Aras Pop. (1927) 24,302. During the 9th and 10th centuries the seat of an independent Armenian principality, Kars was captured and destroyed by the Seljuk Turks in the 11th century, by the Mongols in the 13th, and by Timur (Tamerlane) in 1387. The citadel, it would appear, was built by Sultan Murad III. during the war with Persia, at the close of the 16th century. It was strong enough to withstand a siege by Nadir Shah of Persia, in 1731, and in 1807 it successfully resisted the Russians, surrendering to them, however, in 1828 and again in 1855. The fortress was stormed by the Russians in the war of 1877–78, and on its conclusion was transferred to Russia. It was returned to Turkey by the Union of Socialist Soviet Republics in 1921 The town has three considerable suburbs—Orta-kapi to the south, Bairam Pasha to the east, and Timur Pasha on the western side

of the river. At the north-west corner of the town, overhanging the river, is the ancient citadel, in earlier times a strong military post, but completely commanded by the high ground around. Coarse woollens, carpets and felt are manufactured.

KARSHI: *see* BEK-BUDI KENIMEKH.

KARST (Ital. *Carso*), in the limited sense the name given to the limestone mountain belt which extends from the River Isonzo towards the Gulf of Quarnero, north-east of the peninsula of Istria. By extension the term is also applied by physical geographers to the type of scenery characteristic of areas in which massive, well-jointed limestone rocks predominate. Such karst lands occur not only throughout a large part of the Dinaric Alps and other chains of the Balkan peninsula, but in the Causses of France, in the Jura, on a small scale in the Pennine region of England and in many other parts of the earth's surface. Karstic phenomena have been studied in most detail in the Balkan region both because of their wide prevalence there, and because of their marked effects on human life.

The essential feature is that owing to the solubility of limestone in rain water, and the percolation of water along joints enlarged by solution, land-forms are determined mainly by subterranean drainage Over large areas, even where the rainfall is considerable, surface streams may be totally absent. When they occur they tend to run in deep, steep-sided, canyon-like gorges, often ending blindly at either end. At the upper end the river may originate from powerful springs rising at the base of limestone cliffs, and at the lower may sink into a deep chasm. Equally characteristic are the closed depressions, often rounded or elliptical with a sink or swallow-hole down which surface water flows (dolines), or much larger (reaching a length of 6–12 m.), flat-bottomed and elongated (poljen). Dolines and poljen alike have usually a covering of soil (*terra rossa*) representing the insoluble residue of limestone rocks. Thus within them cultivation is usually possible, while the intervening plateau areas may be composed of bare limestones, with at best a scanty plant cover where soil accumulates in fissures and cracks. Some of the poljen of the Dinaric Alps are traversed by streams which emerge from one bounding wall and disappear again at another. During the winter rainy season the supply of water may be too great to be carried off by the underground channel and the polje becomes a temporary lake. Cases of seasonal reversal of drainage are also frequent, a chasm at one period absorbing water and at another functioning as a spring. Whether or not the floor of the polje is periodically flooded the water table is usually near the surface, so that poljen are well suited for the growth of maize and other water-demanding plants. As a corollary to these surface features there is in Karst lands a great development of underground channels and caves, which often results in the collapse, partial or complete, of the overlying rocks, producing chaotic surface relief.

See de Martonne, *Traité de Géographie Physique,* iv. ed, t. ii. (1926, bibl.).

KARTEL: *see* CARTEL.

KĀRTIKEYA, in epic Hindu mythology Skanda, god of war. He has been regarded as a deification of Alexander, but this is quite uncertain, and he is unimportant in the early epics Siva, it would seem, needing a new battle-leader chose Kumāra (Skanda), son of Agni, for that post, making him his own son. One of the many myths about his birth says that Siva was his sole parent, and that he was mothered by the Krittikas, the Pleiades, the asterism of battle, whence he was called Kārtikeya. In order that he might be suckled by these six nymphs he was endowed with as many faces; but another tale is that he was miraculously born as the six sons of as many spinsters (*krittika* possibly meaning "web" or "sword"-maidens), and that Parvati, Siva's wife, hugged him in her arms so that he became one, with six faces, 12 arms, etc. His vehicle is the peacock. His title in South India, Subramanya, is post-epic.

See A. A. Macdonell and A. B. Keith, *Vedic Index,* i., *s v. Nakshatna;* E. W. Hopkins, *Epic Mythology* (Strasbourg, 1915).

KARUN, an important river of Persia Its head-waters are in the mountain cluster known since at least the 14th century as Zardeh Kuh (13,000 ft.), and situated in the Bakhtiari country about 100 miles W. of Isfahan. In its upper course, until it emerges from the hills above Shushter it is called Ab-i-Kurang.

From the junction of the two principal sources in the Zardeh Kuh at an altitude of about 8,000 ft., the Ab-i-Kurang is a powerful stream, full, deep, and flowing with great velocity for most of its upper course between precipices varying in height from 1,000 to 3,000 ft. The steepness and height of its banks here make it useless for local irrigation purposes. From its principal sources to Shushter the distance as the crow flies is only about 75 m., but the course of the river is so tortuous that it travels 250 m. before it reaches that town.

Besides being fed on its journey through the Bakhtiyal country by many mountain streams, it receives several tributaries, the most important being the Ab-i-Bazuft from the right and the Ab-i-Bar from the left. At Shushter it divides into two streams, one the Ab-i-Gargar, a channel, in part artificial, cut in olden times and flowing east of the town; the other, and main stream, the Ab-i-Shatait, flowing west. The two streams unite, after a run of about 50 m. at Band-i-Qir, 24 m. S. of Shushter, where the Ab-i-Diz (river of Dizful) also comes in, on the right bank.

From Band-i-Kir to a point two miles above Mohammerah the river is called Karun and is navigable from thence to its mouth except for a distance of about 2 miles just below Ahwaz, where a series of cliffs and rocky shelves cross the river and cause rapids. Between Ahwaz and Band-i-Qir (46 m. by river 24 m. by road) the river has an average depth of about 20 ft., but below Ahwaz down to a point a few miles above Mohammerah it is in places very shallow and in the summer vessels with a draught exceeding 3 ft. are liable to ground. About 12 miles above Mohammerah and branching off to the left, is a choked-up river bed called the "Blind Karun," by which the Karun found its way past Qubban to the sea, until about 1766. Ten miles lower down a channel called the Bahmishir takes off from the left bank and flows southward. It is navigable to the sea for small craft. The main river, here about a quarter of a mile broad and 20 to 30 ft. deep, now flows west and after passing Mohammerah enters the Shatt-al-Arab about 20 m below Basra.

This part of the river, from the Bahmishir to the Shatt, is a little over 3 m. in length, and as its name Hafar (dug) implies, is an artificial channel. We learn from the Arab geographer Muqaddasi (A.D. 986) that it was dug about A.D. 980 to facilitate water communication between Ahwaz and Basra. The total length of the Karun is 460 to 470 m. while the distance from its sources to its junction with the Shatt is only 160 m. as the crow flies. The Karun up to Ahwaz was opened to international navigation on Oct. 30, 1888, and Messrs. Lynch of London established a fortnightly steamer service on it immediately afterwards. River steamers now ply between Mohammerah and Nasiri and there is a daily service of motor bellums to Ahwaz. A boat of the Mesopotamia Persia Corporation runs four times a month from Ahwaz to Shalili and back, and one of the Nasiri Company three times. The shipping on the lower Karun has in the last few years become increasingly important, on account of the activities of the Anglo-Persian Oil Co.'s Oil Fields in south-west Persia.

To increase the water supply of Isfahan, Shah Tahmasp I. (1524–1576) and Shah Abbas I. (1587–1629), undertook some works for diverting the Kurang into a valley which drains into the river of Isfahan, by tunnelling through a narrow rocky ridge separating the two river systems. The result of many years work, a cleft 300 yd. long, 15 broad and 18 deep, can be seen at the junction of the two principal sources of the Kurang.

KASAI or CASSAI, a river of Africa, the chief southern affluent of the Congo. It enters the main stream in 3° 10′ S. 16° 16′ E. after a course of over 800 miles. The Kasai river-system as a whole consists of innumerable consequent streams which have remarkably parallel courses and flow from south to north rising in the highlands which stretch from Angola along the southern boundary of the Belgian Congo and which form the watershed between the Zambesi and the Congo. The chief rivers of the Kasai system which flow in this direction are the Sankuru, Lulua, Kasai, Luembe, Chiumbe, Longachimo, Chikapa, Lovua, Loange, Kwilu, Kwengo, Inzia, Wamba and the largest, the Kwango. In their upper courses, as they flow over the Archaean massif, these streams occasionally assume a subsequent direction, but it is not until they reach the northern plain that this direction becomes dominant. The Sankura, whose waters are a bright yellow colour, is the first to flow westward near Bena Dibele and this stream, which at Basongo is joined by the Kasai and by which name it is henceforward known, intercepts the others or those of them which have been formed by the confluence of several.

Numerous falls and rapids occur in the upper reaches of all the streams thus preventing navigation upon most of the tributaries. The Kasai and its tributaries are navigable for over 1,500 m. by steamer. Navigation is possible on the Sankuru to above the town of Lusambe; on the Kasai it is stopped by the Wissmann falls a few miles below its confluence with the Lovua; the other tributaries are navigable for only short distances whilst even on the Kwango navigation does not proceed very far. Apart from those already mentioned the only important right bank tributary is the Mfini, known above Lake Leopold II. into which it flows, as the Lukenie, which, rising in the eastern Belgian Congo, flows westward and joins the Kasai 450 m from its mouth Near its mouth, the Kasai, in its lower course a broad stream strewn with islands, is narrowed to about half a mile on passing through a gap in the inner line of the West African highlands, by the cutting of which the old lake of the Kasai basin must have been drained The Kasai enters the Congo with a minimum depth of 25 ft. and a breadth of 700 yd., at a height of 942 ft. above the sea. The confluence is known as the Kwa mouth, Kwa being an alternative name for the lower Kasai.

The Kwango affluent of the Kasai was the first of the large affluents of the Congo known to Europeans, being reached by the Portuguese in the 16th century, but of its lower course they were ignorant. The first accurate knowledge of the river basin was obtained by David Livingstone, who reached the upper Kasai from the east and explored in part the upper Kwango (1854–1855). V. L. Cameron and Paul Pogge crossed the upper Kasai in the early '70s. The Kwa mouth was seen in 1877 by H M Stanley, who in 1882, ascended the river to the Kwango-Kasai confluence and then proceeded up the Mfini and discovered Lake Leopold II In 1884 George Grenfell journeyed up the river beyond the Kwango confluence. The systematic exploration of the main stream and its chief tributaries was, however, mainly the work of Hermann von Wissmann, Ludwig Wolf, Paul Pogge, Major Von Mechou, Grenfell and Holman Bentley, Captain C Lemaire and E. Torday. *See* CONGO.

KASBEK (Georgian, *Mkin-vari;* Ossetian, *Urs-khokh*), one of the chief summits of the Caucasus, 7 m from a station of the same name on the high road to Tiflis Its altitude is 16,545 ft It rises on the range which runs north of the main range (main water-parting), and which is pierced by the gorges of the Ardon and the Terek. It represents an extinct volcano, built up of trachyte and sheathed with lava.

KASHAN, a small province and town of Persia, the former being situated between the provinces of Qum on the north and Isfahan on the south, on the Iranian plateau The revenue in 1926–7 amounted to 1,110,799 krans (about £24,684) The administrative centre is Kashan, in 34° N. and 51° 27′ E., 150 m. from Tehran, at an elevation of 3,190 ft. Pop. (variously estimated) at 30–40,000. The town lies on a caravan route somewhat eastward of the Isfahan-Qum-Tehran road, passable by motors. The summer heat is excessive—a mean maximum in July of 100° is recorded for the period 1881–4—and water, which is scarce, is brought by an aqueduct from a spring at the castle of Fin, 4 m. W. of the town.

The melons and figs of Kashan are greatly esteemed, but big black scorpions of a peculiarly dangerous type are common. Manufactures are copper utensils, embroidered silks, plain stuffs and a kind of velours. The trade in velvets and brocades, at the end of the 19th century, had been almost killed by the competition of European machine-made stuffs, but the textile skill of the natives was turned to the weaving of woollen and silk carpets These have become famous as some of the finest Persia can produce, and the prosperity of the town has risen Kashan was especially famous for the making of plaques of faience called *Kashi*, used in the exterior decoration of buildings The industry was brought from Damascus, but the art disappeared about a century ago; an attempt has recently been made to revive it, but the modern work is inferior to the beauty of the ancient pieces. Kashan also exports rose-water made in the villages around; and cobalt is obtained from the mine at Kamsar, 19 m. south.

KASHER: *see* KOSHER.

KASHGAR, a city of Chinese Turkistan, situated at an altitude of over 4,000 ft., in 39° 30′ N., 75° 63′ E , on the Kyzyl Su or Kashgar Darya, originally a tributary of the Tarim but now often losing itself in the marshes before it reaches that river. The town is the ancient Su-leh of the Chinese, which perhaps represents an original Solek or Sorak. Kashgar lies to the east of the nodal point from which the Tian Shan runs north-east, the Alai range runs west and the Kashgar or Sarikol mountains curve south-east along the eastern edge of the Pamirs, fingering out in the eastward running Altyn Tagh. The route from Kashgar to the fertile Ferghana valley to the west of the Alai range lies to the north across the Terek Pass (alt. 12,730 ft) and the journey can be accomplished in a few days. The Kyzyl Art (14,015 ft.) also links it with the west, and through Khotan to the south-east it links via the Karakorum Pass (18,300 ft.) with northern India. The Urumchi gap (2,790 ft.) and the Otun-koza (2,390 ft.) give access to Urumchi and the Ili valley to the north-east

The loess oasis of which Kashgar is the centre depends entirely on irrigation from the Kyzyl Su (Red River) and the Tuman Su, its tributary; grain and fruit grow luxuriously and settlement in the oasis is very ancient. The volume of water available for irrigation depends on the amount of snow in the mountains, which is apparently gradually diminishing; a cold summer in the Pamirs (*e.g.*, 1915) may delay thawing and thus limit the quantity of water at the time of sowing Summer is intensely hot, the three summer months having a maximum av. temp. of 90° F and a minimum of 62° F, while the maximum av. temp for the three winter months is 38° F and the minimum 17° F. The scanty rainfall averages 3·34 in. per annum and is irregularly distributed throughout the year; in 1915 practically no rain fell during spring and summer The prevailing westerly winds bring clouds of dust from the Takla Makan desert, so that the Kashgar oasis is enveloped in a cloud of dust for more than 200 days in the year.

History.—The first recorded link between China proper and Chinese Turkistan is the possibly legendary visit of Mon Wang, an emperor of the Chou dynasty, to Khotan in 1000 B.C. Under the Han dynasty in the 3rd century B C , the Hiung Nu or Huns moved west from Mongolia and drove the Indo-Scythian Yue-chi then living in Kansu, Kokonor and the southern half of the Gobi from their homes, and one branch, the Great Yue-chi, settled in the Kashgar oasis, driving out the Sacae in 163 B C. Following on the perpetual strife between the Huns and the Chinese, the latter in the first century B C. conquered Chinese Turkistan, including Su-leh or Kashgar. (Ptolemy speaks of a *Kasia regio*, included in Scythia beyond the Imaus, possibly an indication of the origin of the word Kashgar), and from 51 B C. the Chinese exacted tribute from the nomad tribes inhabiting the region between Shensi and the Caspian Pan Chao, a famous Chinese warrior of the first

century A.D. is said to be buried in Kashgar and a temple exists on the supposed site of his tomb, overlooking the springs of Pan Chao whose origin legend attributes to him. Later the Yue-chi reasserted their authority in Kashgar as Chinese influence waned. During the 2nd century A.D. the vine was introduced into China via this route, and the Yue-chi introduced Buddhism into China and some elements of Chinese civilization into India; they are also credited with the introduction of the pear and peach into China.

Turkish and Mongol hordes repeatedly swept through the region in the centuries that followed, though the Chinese had a garrison in Kashgar in the 8th century, which struggled against the Tibetans and the Arabs and finally succumbed to the Western Turks. In the 10th and 11th centuries Kashgar formed part of the Turkish Uighur kingdom, overthrown by the Kara-Kitais, another westward moving Turkish tribe, in the early 12th century. In 1219 Jenghiz Khan invaded the district and the sweeping away of local tribal boundaries by his famous empire later resulted in an impetus to trade, witnessed by the visit of the Venetian merchant, Marco Polo, to Kashgar about 1275. In the 14th century the oasis was ravaged by the troops of Timur (Tamerlane), though a last march planned by him through the region in an effort to conquer China was never carried out, owing to his death in 1405. In the succeeding centuries Kashgar suffered many attacks, being completely destroyed in 1514 by Mirza Ababakar, who built a new fortress with massive defences higher up the Tuman river.

The dynasty of the Jagatai khans collapsed in 1572 and from then till 1759 strife between the White and Black Mountaineers (Ak and Kara Taghluk), with interventions by the Dzungarian Kalmucks raged in the region. In 1759 a Chinese army from Ili (Kulja), which had been recaptured by the Chinese in 1755, conquered Kashgaria, settled Chinese emigrants there and established a garrison at Kashgar, which, except for Mohammedan risings, remained in Chinese hands until the great insurrection of the Chinese Mohammedans (the so-called Dungani) in 1862. After this Kashgar and the other cities of the Tarim basin remained under the rule of Yakub Beg until 1877, when the Chinese recaptured their ancient dominion. Yakub Beg was a general in the army of Buzurg Khan, a chief of Khokand, who, just before the Russians captured Khokand in 1866, took advantage of the rebellion of the Chinese Mohammedans, who formed 94% of the population of Kashgar, to proclaim himself king of Kashgar in 1865. Buzurg Khan proved himself an incapable ruler and his general Yakub Beg, a man of extraordinary ability, usurped the throne, and secured recognition from many other governments, including the Russians and the British; the latter were apprehensive of the spread of Russian rule into the region. The Chinese army under General Tso Chung t'ang, sent against Yakub Beg, had to march 4,000 miles without any supply and transport service; they met the difficulty by sending on advance troops who sowed cereals and vegetables in each oasis so that provisions were ready by the following year, when the rear troops reached the next oasis. Their advance under these circumstances was necessarily slow and occupied more than two years, but the spirit of determination evidenced by their procedure carried them through a successful campaign and the region was afterwards treated with marked restraint. Most of the horses in the region were commandeered in order to prevent mobility in case of further rebellions, but otherwise very little vengeance was exacted and Kashgaria has remained loyal ever since, especially as religious freedom was granted to the Mohammedans. After the revolution which began in China in 1911, the Taoyin of Kashgar acknowledged the authority of the new republic and, though disturbances broke out temporarily and Russian troops were sent to the town, these latter were soon withdrawn and Kashgar settled down again under Chinese rule.

Industries.—Kashgar today is the military, though not the administrative, centre of Sinkiang, or the New Dominion, as the Chinese call it; many other names have been given at various times to this province, *e.g.*, Chinese Turkistan, Lesser Bukhara, Moghulistan, Tartary, High Tartary, the Six Cities and Kashgaria. Kashgar is the headquarters of one of the Six Taoyin who each have charge of a circuit in the New Dominion and who are responsible to the governor whose headquarters are at Urumchi. But the military provincial Commander-in-Chief at Kashgar is responsible directly to the central government of China. The chief vegetable products of the oasis are maize, wheat, barley, rice, cotton, millet and peas, with fruits such as apricots, peaches, melons mulberries and grapes. The inhabitants also dress skins and furs and make leather goods and pottery. Homespun cotton cloth (kham), woollen goods and felt are also made. Primitive mining of the rich red, black and green copper ore found north and west-north-west of Kashgar is also carried on, but the art of chemical refining of copper is quite unknown.

The "Ferghana series" of oil-bearing strata extends into Kashgaria through Kanjigan, along the foot of the Tian Shan, past Aksu and right up to Kuchar. Boring and chemical refining are alike unknown, the crude oil being scooped out of surface wells and holes. But gasolene, kerosene, machine oil, grease and mineral wax (ozokerite) are produced in a primitive way, the chief refineries being at Kashgar. Just before the Russian revolution trade between Ferghana and Kashgaria had developed rapidly and was ousting the trade with India across the difficult Karakorum route, for the trade route from Kashgar to Russia involves only an 8 days' caravan route, with the crossing of a single pass (the Terek) to Osh, the railhead of the Russian line up the Ferghana valley. This trade is at present completely disorganized and as trade with China proper is on a small scale, Kashgaria at present depends on India for cotton piece-goods, dyes, tea and sugar which she formerly imported from Russia. A certain amount of trade, some open and some contraband, still goes on, however, between Russia and Kashgar, the chief exports from Kashgar being raw wool, raw cotton, local cotton fabrics, British muslin gut and dyes (re-exported from India), tea and sheep, payment on the Russian side being in gold roubles, silver, jewellery, furs and Bukharan silk, oil and iron. An interesting financial phenomenon is the fact that there is no metallic currency reserve behind the Kashgar issue of paper money, yet the local paper *tael* is still worth 75% of its face value, mainly because the people have complete confidence in the stability of the existing régime and partly because inflation has been kept within bounds and the considerable export trade creates a currency demand.

A postal connection exists between Urumchi and Kashgar, covering the 1,000 m. in 13 or 14 days, and there is telegraphic communication between Urumchi, Kashgar and the Russian frontier. In 1922–23 a wireless station was erected at Kashgar by the Marconi company on behalf of the Chinese government Kashgar has no railway or aviation link at present. The population is estimated at 80,000, but no census figures are available. The region is liable to destructive earthquakes. Yanghi Shahr, the modern town, was built in 1838 and is of an oblong shape running from north to south, entrance being by a single gateway. The whole is surrounded by a deep, wide ditch, which could be filled by the river, though this might mean bringing down the whole mud structure on its porous sandy soil. Kuhna Shahr is the small, clay-walled fortress built on the Tuman river after the destruction of old Kashgar in 1514. The ruins of this old city, Aski Shahr, may still be seen on each side of the Tuman river. Two miles to the north, beyond the river, is the shrine of Hazrat Afak, the saint king of the country who died and was buried here in 1693. It is a handsome mausoleum, faced with blue and white glazed tiles, and silver poplars are planted round it. The college, mosque and monastery, surrounded by orchards, fruit gardens and vineyards, erected by Yakub Beg, are situated in its vicinity.

KASHI or **KASI,** formerly the Persian word for all glazed and enamelled pottery irrespectively; now the accepted term for certain kinds of enamelled tile-work, including brick-work and tile-mosaic work, manufactured in Persia and parts of Mohammedan India, chiefly during the 16th and 17th centuries.

Undoubtedly originating in the Semitic word for glass, *kas*, it is quite possible that the name *kashi* is immediately derived from Kashan, a town in Persia noted for its *faïence*. This ancient pottery site, in turn, probably receives its name from the old-time industry; as a "city of the plain" it would obviously have no claim to the farther-eastern suffix *shan*, meaning a mountain.

Kashi work consisted of two kinds: (*a*) Enamel-faced tiles and bricks of strongly fired red earthenware, or terra-cotta; (*b*) enamel-faced tiles and tesserae of lightly fired "lime-mortar," or sandstone. Tile-mosaic work is described by some authorities as the true *kashi*. From examination of figured tile-mosaic patterns, it would appear that, in some instances, the shaped tesserae had been cut out of enamelled slabs or tiles after firing; in other examples to have been cut into shape before receiving their facing of coloured enamel. Conventional representations of foliage, flowers, fruit, intricate geometrical figures, interlacing arabesques and decorative calligraphy—inscriptions in Arabic and Persian—constitute the ordinary *kashi* designs. The colours chiefly used were cobalt blue, copper blue (turquoise colour), lead-antimoniate yellow (mustard colour), manganese purple, iron brown and tin white. A colour-scheme, popular with Mogul and contemporary Persian *kashigars*, was the design, in cobalt blue and copper blue, reserved on a ground of deep mustard yellow.

In India the finest examples of *kashi* work are in the Punjab and Sind provinces. At Lahore, amongst many beautiful structures, the most notable are the mosque of Wazir Khan (A.D. 1634) and the gateways of three famous pleasure gardens, the Shalamar Bagh (A.D. 1637), the Gulabi Bagh (A.D. 1640), and the Charburji (*c.* A.D. 1665). At Tatta the Jami Masjid, built by Shah Jahan (*c.* A.D. 1645), is a splendid illustration; whilst in that "vast cemetery of six square miles" on the adjacent Malki plateau are numerous Mohammedan tombs (A.D. 1570–1640) with extraordinary *kashi* ornamentation. Delhi, Multan, Jullundur, Shahdara, Lahore cantonment, Agra and Hyderabad (Sind), all possess excellent monuments of the best period, viz., those erected during the reigns of Akbar and Jahangir (A.D. 1556–1628).

In Persia at Isfahan, Kashan, Meshed and Kerman are a few buildings and ruins showing the old *kashi* work; the palace of Chehel Sitùn in Isfahan, built during the reign of Shah Abbas I. (*c.* A.D. 1600), is a magnificent specimen of this art.

Occasional revivals of the manufacture have taken place both in India and Persia. Mohammed Sharif, a potter of Jullundur in the Punjab, reproduced the Mogul enamelled tile-work in 1885, and there is a manuscript record of a certain Ustad Ali Mahommed, of Isfahan, who revived the Persian processes in 1887.

KASHMIR or CASHMERE, native state, India, including much Himalayan country of the Punjab. Famed for its beauty, it is the chief health resort for Europeans in India, while politically it is important as guarding one of the approaches to India on the N.W. frontier. The proper name of the state is Jammu and Kashmir. Estimated area 84,258 sq m. Pop. (1921) 3,320,518. It includes the provinces of Jammu (including the jagir of Punch) Kashmir, Ladakh, Bâltistan and Gilgit; the Shin states of Yaghistan, of which the most important are Chilas, Darel and Tangir, are nominally subordinate to it, and the two former pay a tribute of gold dust. The following are the statistics for the main divisions of the state:—

	Area in sq.m.	*Pop. in 1921*
Jammu	12,165	1,640,259
Kashmir	8,533	1,407,086
Frontier Districts	63,560	273,173

Physical Conformation, Geology and Climate.—The country, mountainous save for the continuation of the plains of the Punjab in the S.W., is divisible into:—(1) The outer hills and the central mountains of Jammu district. (2) The valley of Kashmir. (3) The far side of the great central range, including Ladakh, Baltistan and Gilgit.

The hills forming the northern half-circuit of the Kashmir valley, and running beyond, include many high mountain masses and peaks, the most conspicuous of which, a little outside the confines of Kashmir, is Nanga Parbat, 26,182 ft. above the sea, with a large glacier on its E. face. The great ridge thrown off by Nanga Parbat rises, at a distance of 12 m., to another summit 20,740 ft. in height, from which run S.W. and S.E. the ridges which are the N. water-shed boundary of Kashmir. The former range, after running 70 m. S.W. between the valleys of the Kishenganga and the Kunhar or Nain-sukh, turns S., closely pressing the river Jhelum, after it has received the Kishenganga, with a break a few miles farther S. which admits the Kunhar. The highest summits are 16,487 and 15,544 ft. above sea. The range which runs S.E. from the junction peak above mentioned divides the valley of the Kishenganga from that of the Astor and other tributaries of the Indus. The highest point on this range, where it skirts Kashmir, is 17,202 ft. above sea. For more than 50 m. from Nanga Parbat there are no glaciers on this range; thence eastward they increase; one, near the Zoji-la pass, is only 10,850 ft. above sea. The mountains at the E. end of the valley, running nearly N.-S., drain inwards to the Jhelum, and on the other side to the Wardwan, a tributary of the Chenab. The highest part of this eastern boundary is 14,700 ft. There are no glaciers. The highest point on the Panjal range, which forms the S. and S.W. boundary, is 15,523 ft. above sea-level.

The river Jhelum (*q.v.*) or Behat (Sanskrit *Vitasta*)—the Hydaspes of Greek historians and geographers—flows N.W. through the middle of the valley. After a slow and winding course it expands about 25 m. below Srinagar over a slight depression in the plain, and forms the Wular lake and marsh, about 12½ m. by 5 m. in extent, surrounded by the lofty mountains which tower over the N. and N.E. of the valley. Leaving the lake on the S. W. side, near Sopur, the river flows slowly S.W. about 18 m. to the gorge at Baramulla. From this point the stream is more rapid through the narrow valley which conducts it W. 75 m. to Muzafarabad, where it turns sharply S, joined by the Kishenganga. At Islamabad, about 40 m. above Srinagar, the river is 5,400 ft. above sea-level, and at Srinagar 5,235 ft. It has thus a fall of about 4 ft. per mile in this part of its course. For the next 24 m. to the Wular lake, and thence to Baramulla, its fall is only about 2¼ ft. in the mile. On the 80 m. of the river in the flat valley between Islamabad and Baramulla, there is much boat traffic; but none below Baramulla till the river comes out into the plains.

On the N E. side of this low narrow plain of the Jhelum is a broad hilly tract between which and the higher boundary range runs the Kishenganga River. Near the east end of this interior hilly tract, and connected with the higher range, is one summit, 17,839 ft, possessing many small glaciers. These heights look down on one side into the beautiful valley of the Sind River, and on another into the valley of the Lidar, which join the Jhelum. Among the hills north of Srinagar rises one conspicuous mountain mass, 16,903 ft. in height, from which on its north side descend tributaries of the Kishenganga, and on the south the Wangat River, which flows into the Sind. By these rivers and their numerous affluents the whole valley of Kashmir is watered abundantly.

Geology.—The general strike of the beds, and of the folds which have affected them, is from N W. to S.E, parallel to the mountain ranges. Along the S.W. border lies the zone of Tertiary beds which forms the Sub-Himalayas. Next to this is a great belt of Palaeozoic rocks, through which rise the granite, gneiss and schist of the Zanskar and Dhauladhar ranges and of the Pir Panjal. In the midst of the Palaeozoic area lie the alluvium and Pleistocene deposits of the Srinagar valley, and the Mesozoic and Carboniferous basin of the upper part of the Sind valley. Beyond the great Palaeozoic belt is a zone of Mesozoic and Tertiary beds which commences at Kargil and extends S.E. past the Kashmir boundary to Spiti and beyond. Finally, in Baltistan and the Ladakh range there is a broad zone composed chiefly of old gneiss and schist.

Climate.—The valley of Kashmir, sheltered from the S.W. monsoon by the Panjal range, has not the periodical rains of India. Its rainfall is irregular, greatest in the spring months. Occasionally storms in the monsoon pass over the crests of the Panjal and give heavy rain on the elevated plateaus on the Kashmir side. And again clouds pass over the valley and are arrested by the higher N.E. hills. Snow falls on the surrounding hills at intervals from October to March. As a health resort Kashmir, excluding Srina-

gar, which is insanitary and relaxing, has no rival anywhere in the neighbourhood of India. Its climate is admirably adapted to the European constitution, and in consequence of the varied range of temperature and the facility of moving about the visitor is enabled with ease to select places at elevations most congenial to him. Formerly only 200 passes a year were issued by the government, but now no restriction is placed on visitors, and their number increases annually. The railway to Rawalpindi, and a driving road thence to Srinagar make the valley easy of access. When the temperature in Srinagar rises at the beginning of June, there is a general exodus of visitors to Gulmarg, a fashionable hill-station. This great influx of visitors has resulted in a corresponding diminution of game. Special game preservation rules have been introduced and *nullahs* are let out for stated periods with a restriction on the number of head to be shot. The wild animals of the country include ibex, markhor, oorial, the Kashmir stag, and black and brown bears. Many sportsmen cross into Ladakh and the Pamirs.

People and Industries.—The great majority of the inhabitants of Kashmir are professedly Mohammedans, but they are still strongly influenced by their ancient superstitions. At the census of 1921 out of a total population in the whole State of 2,905,578, there were 2,548,514 Mohammedans, 692,631 Hindus, 37,635 Buddhists and 39,507 Sikhs. The Hindus are mostly found in Jammu, and the Buddhists are confined to Ladakh. In Kashmir proper the few Hindus (64,565), are almost all Brahmans, known as Pundits. Up to recent times flood, fire and epidemics were very serious troubles; the cultivator lived under a system of *begar*, which entitled an official to take either labour or commodities free of payment from the villages. Having no security of property, the people had no incentive to effort, and with no security for life they lost the independence of free men. But the land settlement of 1889 swept many abuses away. Restrictive monopolies, under which bricks, lime, paper and certain other manufactures were closed to private enterprise, were abolished. In consequence of this improvement in their conditions of life and of the influx of wealth into the country brought by visitors, the Kashmiri grows every year in material prosperity and independence of character. The State contributed materially in men and money to the Great War.

The language spoken in Kashmir is akin to that of the Punjab, though marked by many peculiarities. It possesses an ancient literature, which is written in a special character (*see* KASHMIRI).

Crops.—The staple crop of the valley is rice, which forms the chief food of the people. Indian corn comes next; wheat, barley and oats are also grown. Every kind of English vegetable thrives well, especially asparagus, artichoke, seakale, broad beans, scarlet-runners, beetroot, cauliflower and cabbage. Fruit trees are met with all over the valley, wild but bearing fruit, and the cultivated orchards yield pears, apples, peaches, cherries, etc., equal to the best European produce. The chief trees are deodar, firs and pines, *chenar* or plane, maple, birch and walnut. A complete list of the flora and fauna of the valley will be found in Sir Walter Lawrence's book on Kashmir.

Industries.—The chief industry of Srinagar was formerly the weaving of the celebrated Kashmir shawl, which dates back to the days of the emperor Baber. These shawls first became fashionable in Europe in the reign of Napoleon III., when they fetched from £10 to £100; but the industry received a blow at the time of the Franco-German War, and the famine of 1877 scattered the weavers. The place of the Kashmir shawl has to some extent been taken by the Kashmir carpet, but the most thriving industry now is that of silk-weaving. Srinagar is also celebrated for its silver-work, papier mâché and wood-carving.

History.—The history is enshrined in four Sanskrit books. The *Rajatarangini,* commencing with traditional history of very early times, comes down to the reign of Sangrama Deva, 1006; the second work, by Jonaraja, takes up the history in continuation and, entering the Mohammedan period, gives an account of the reigns down to that of Zain-ul-ab-ad-din, 1412. P. Srivara carried on the record to the accession of Fah Shah, 1486. The fourth work, called *Rajavalipataka,* by Prajnia Bhatta, completes the history to the time of the incorporation of Kashmir in the dominions of the Mogul emperor Akbar, 1588.

In the *Rajatarangini* it is stated that the valley of Kashmir was formerly a lake, and that it was drained by the great *rishi* or sage, Kasyapa, son of Marichi, son of Brahma, by cutting the gap in the hills at Baramulla (Varaha-mula). When Kashmir had been drained, he brought in the Brahmans to occupy it. In the 7th century Kashmir is said by the Chinese traveller Hsuan Tsang to have included Kabul and the Punjab, and the hill region of Gandhara, the country of the Gandarae of classical geography.

At an early date the Sanskrit name of the country became *Kásmír.* The earliest inhabitants, according to the *Rajatarangini,* were the people called Naga, a word which signifies "snake." The other races mentioned as inhabiting this country and the neighbouring hills are Gandhari, Khasa and Daradae. The Khasa people are supposed to have given the name Kasmir. In the *Mahabharata* the Kasmira and Daradae are named together among the Kshattriya races of northern India.

In the time of Asoka, about 245 B.C., one of the Indian Buddhist missions was sent to Kashmir and Gandhara. After his death Brahmanism revived. Then in the time of the three Kushan princes, Huvishka, Jushka and Kanishka, who ruled over Kashmir about the beginning of the Christian era, Buddhism was to a great extent restored, though for several centuries the two religions existed together in Kashmir, Hinduism predominating. In this Hindu-Buddhist period, and chiefly between the 5th and 10th centuries of the Christian era, were erected the Hindu temples in Kashmir. In the 6th and 7th centuries Kashmir was visited by some of the Chinese Buddhist pilgrims to India. The country is called *Shie-mi* in the narrative of To Yeng and Sung Yun (578). One of the Chinese travellers of the next century was for a time an elephant-tamer to the king of Kashmir. Hsuan Tsang spent two years (631–633) in Kashmir (*Kia-chi-mi-lo*). He entered by Baramula and left by the Pir Panjal pass. In the following century the kings of Kashmir appear to have paid homage and tribute to China, though this is not alluded to in the Kashmir chronicle. Hindu kings continued to reign till about 1294, when Udiana Deva was put to death by his Mohammedan vizier, Amir Shah, who ascended the throne under the name of Shams-ud-din.

Of the Mohammedan rulers mentioned in the Sanskrit chronicles, one, who reigned about the close of the 14th century, has made his name prominent by his active opposition to the Hindu religion, and his destruction of temples. This was Sikandar, known as *But-shikan,* or the "idol-breaker." It was in his time that India was invaded by Timur, to whom Sikandar made submission and paid tribute. The country fell into the hands of the Moguls in 1588. In the time of Alamgir it passed to Ahmad Shah Durani, on his third invasion of India (1756); and from that time it remained in the hands of Afghans till it was wrested from them by Ranjit Singh, the Sikh monarch of the Punjab, in 1819. Eight Hindu and Sikh governors under Ranjit Singh and his successors were followed by two Mohammedans similarly appointed, the second of whom, Shekh Imam-ud-din, was in charge when the battles of the first Sikh war (1846) brought about new relations between the British Government and the Sikhs.

Gulab Singh, a Dogra Rajput, had from a humble position been raised to high office by Ranjit Singh, who conferred on him the small principality of Jammu. On the final defeat of the Sikhs at Sobraon (Feb. 1846), Gulab Singh was called to take a leading part in arranging conditions of peace. The treaty of Lahore (March 9, 1846) sets forth that, the British Government having demanded, in addition to a certain assignment of territory, a payment of a crore and a half of rupees (1½ millions sterling), and the Sikh government being unable to pay the whole, the maharaja (Dhulip Singh) cedes, as equivalent for one crore, the hill country belonging to the Punjab between the Beas and the Indus, including Kashmir and Hazara. The governor-general, Sir Henry Hardinge, considered it expedient to make over Kashmir to the Jammu chief, securing his friendship while the British Government was administering the Punjab on behalf of the young maharajah. Gulab Singh was well prepared to make up the payment in default of which Kashmir was ceded to the British; and so, in consideration of his services in restoring peace, his inde-

pendent sovereignty of the country made over to him was recognized, and he was admitted to a separate treaty. Gulab Singh had already, after several extensions of territory east and west of Jammu, conquered Ladakh (a Buddhist country, and till then subject to Lhasa), and had then annexed Skardo, which was under independent Mohammedan rulers. He had thus by degrees half encircled Kashmir, and by this last addition his possessions attained nearly their present form and extent. Gulab Singh died in 1857, and was succeeded by his son, Ranbir Singh, who died in 1885. The next ruler, Maharaja Partab Singh, G.C.S.I. (b. 1850), immediately on his accession inaugurated the settlement reforms already described. His rule was remarkable for the reassertion of the Kashmir sovereignty over Gilgit (*q.v.*). In 1925 Colonel H. H. Maharajah Sir Hari Singh, K.C.I.E., K.C.V.O., born 1895, succeeded to the title of Maharajah of Jammu and Kashmir.

Lydekker, "The Geology of the Kashmir and Chamba Territories," *Records of the Geological Survey of India*, vol. xxii. (1883); J. Duke, *Kashmir Handbook* (1903); C. F. Tyndale Biscoe, *Kashmir in Light and Shade* (1922) and the annual *Administration Report*.

KASHMIR GOAT, a goat often confounded with the Angora on account of its exceptional wool-bearing qualities. The Kashmir goat has a short, neat head, a delicate skin, small bones and a long heavy coat composed of two materials. The upper coat is coarse and varies according to the individual but the under coat or *pushm* is much valued as an article of commerce. This undercoat is of a fluffy description resembling down and forms the material from which the far-famed Kashmir shawls are manufactured. *See* GOAT.

KASHMIRI LANGUAGE (properly *Kāśmīrī*), the name of the vernacular spoken in the valley of Kashmir (properly *Kaśmīr*) and in the hills adjoining. By origin it is the most southern member of the Dard group of the Dardic languages (*see* INDO-ARYAN LANGUAGES). The other members of the group are Shinā, spoken to its north in the country round Gilgit, and Kōhistānī, spoken in the hill country on both sides of the River Indus before it debouches on to the plains of India. The Dardic languages also include Khōwār, the vernacular of Chitral, and the Kāfir group of tongues, of which the most important is the Bashgali of Kafiristan. Kashmiri alone possesses a literature, or indeed an alphabet. The whole family occupies the three-sided tract of country between the Hindu-Kush and the north-western frontier of British India.

The Dardic languages are Aryan, but are neither Iranian nor Indo-Aryan. They have developed a phonetic system of their own, while they have retained unchanged forms of extreme antiquity that have long passed out of current use both in Persia and in India. They thus represent a stage of linguistic progress later than that of Sanskrit, and earlier than that recorded in the Iranian Avesta.

The language has lost most of its original Dardic character, and is now a mixed form of speech. Sanskrit has been actively studied in Kashmir for many centuries, and the Kashmiri vocabulary, and even its grammar, are now largely Indian.

Kashmiri has few dialects. The only important variety is Kishtwārī, spoken in the hills south-west of Kashmir. Smaller dialects, such as Pogul and Rāmbanī of the hills south of the Banihāl pass, may also be mentioned.

General Character of the Language.—The two principal features are the numerous epenthetic changes of vowels and consonants, and the employment of pronominal suffixes. In both cases the phenomena are perfectly plain, cause and effect being presented in the complicated systems of declension and conjugation. The Indo-Aryan languages proper long ago passed through this stage, and a study of Kashmiri explains a number of difficulties found by the student of Indo-Aryan vernaculars.[1]

In the following account the contractions employed are: D= Dardic; Ksh.=Kashmiri; Skr.=Sanskrit; Sh.=Shinā.

A. *Vocabulary.*—The vocabulary of Kashmiri is mixed. At its basis it has a large number of words which are also found in the neighbouring Shinā, such as connote the most familiar ideas and are in most frequent use. Thus, the personal pronouns, the earlier numerals, the words for "father," "mother," "fire," "sun," are all closely connected with corresponding Shinā words. There is also a large Indian element, consisting partly of words derived from Sanskrit vocables introduced in ancient times, and partly of words borrowed in later days from the vernaculars of the Punjab. Finally, there is a considerable Persian (including Arabic) element owing to the long Muslim domination of the Happy Valley. Many of these have been considerably altered in accordance with Kashmiri phonetic rules, so that they sometimes appear in strange forms. The difference of religion has strongly influenced the vocabulary. The Muslims employ Persian and Arabic words with great freedom, while the Hindus, or "Pundits" as they are called, borrow almost entirely words derived from Sanskrit. The literary class being mostly Hindu, Kashmiri literature, taken as a whole, hardly represents the actual language spoken by the mass of the people.

B. *Written Characters.*—The Persian character is quite unsuited for representing the very complex Kashmiri vowel system. Hindus employ the Śāradā alphabet, of Indian origin and akin to the well known Nāgarī. Kashmiri vowel sounds can be recorded very successfully in this character, but there is, unfortunately, no fixed system of spelling. The Nāgarī alphabet is also coming into use in printed books, no Śāradā types being yet in existence.

C. *Phonetics.*—There is, as compared with Sanskrit, a considerable extension of the vowel system. Ksh. possesses the vowels *a, ā, i, ī, u, ū, r, ĕ, ai, ŏ, au,* and the nasal symbol ', a flat *ă* (like the *a* in "hat"), a flat *ĕ* (like the *e* in "met"), a short *ŏ* (like the *o* in "hot"), and a broad *å* (like the *a* in "all"); also a series of what natives call "*mātrā*-vowels," which, though slightly heard, yet exercise a great influence on the sound of the preceding syllable. The back-action of these *mātrā*-vowels is technically known as *umlaut* or "epenthesis," and is the most striking feature of the Kashmiri language.

With one important exception, common to all Dardic languages, Kashmiri employs every consonant found in the Sanskrit alphabet. The exception is the series of aspirated consonants, *gh, jh, ḍh, dh* and *bh,* which are wanting in Ksh., the corresponding unaspirated consonants being substituted for them. There is a tendency to use dental letters where Hindī employs cerebrals. Cerebral letters are, however, owing to Sanskrit influence, on the whole better preserved in Ksh. than in the other Dardic languages. The cerebral *ṣ* has almost disappeared, *ś* being employed instead. The only common word in which it is found is the numeral *ṣah,* six, which is merely a learned spelling for *sáh,* due to the influence of the Skr. *ṣaṭ.* From the palatals *c, ch, j,* a new series of consonants has been formed, viz., *ts, tsh* (aspirate of *ts,* i.e., *ts*+*h,* not *t*+*sh*), and *z* (as in English, not *dz*). The sibilant *ś,* and occasionally *s,* are frequently represented by *h.* When such an *h* is followed by a palatal letter the *ś* returns.

The palatal letters *i, e, ū-mātrā* and *y* often change a preceding consonant. These changes are each subject to certain rules. Cerebral letters (*t, ṭh, d*), change only before *i, ĕ* or *y,* and not before *ū-mātrā.* The others change before *ĕ, y* or *ū-mātrā.*

No word can end in an unaspirated surd consonant. If such a consonant falls at the end of a word it is aspirated.

GRAMMAR

D. *Declension.*—If the phonetic rules are borne in mind, declension in Kashmiri is a fairly simple process.

Nouns substantive and adjective have two genders, a masculine and a feminine. Words referring to males are masculine, and to females feminine. Inanimate things are sometimes masculine and sometimes feminine. Pronouns have three genders, arranged on a different principle. One gender refers to male living beings, another to female living beings, and a third (or neuter) to all inanimate things whether they are grammatically masculine or feminine. Nouns ending in ŏ are masculine, and most, but not all,

[1] *See* G. A. Grierson, "On Pronominal Suffixes in the Kāçmīrī Languages," and "On the Radical and Participial Tenses of the Modern Indo-Aryan Languages," in *Journal of the Asiatic Society of Bengal,* vol. lxiv. (1895), pt. i. pp. 336 and 352.

of those ending in ᵢ, ᵘ, *ĕ* or *ñ* are feminine. Of nouns ending in consonants, some are masculine, and some are feminine. No rule can be formulated regarding these, except that all abstract nouns ending in *ar* (a very numerous class) are masculine. There are four declensions. The first consists of masculine nouns ending in a consonant, in *a*, *ĕ* or *ũ* (very few of these last two). The second consists of the important class of masculine nouns in ᵘ; the third of feminine nouns in ᵢ, ᵘ or *ñ* (being the feminines corresponding to the masculine nouns of the second declension); and the fourth of feminine nouns ending in ᵃ, *ĕ* or a consonant.

The noun possesses two numbers, a singular and a plural, and in each number there are, besides the nominative, three organic cases, the accusative, the case of the agent, and the ablative. The accusative, when not definite, may also be the same in form as the nominative.

Other cases are formed by the addition of postpositions, some of which are added to the accusative, while others are added to the ablative case. The genitive terminations, and also the dative termination *kiṭᵘ*, are adjectives, and agree with the governing noun in gender, number and case and are declined regularly as substantives, the masculine ones belonging to the second declension and the feminine ones to the third.

Adjectives ending in ᵘ (second declension) form the feminine in ᵛᵘ, with the usual changes of the preceding consonant. Other adjectives do not change for gender. All adjectives agree with the qualified noun in gender, number and case, the postposition, if any, being added to the latter word of the two.

The first two personal pronouns are *bŏh*, I; *mĕ*, me, by me; *ạsⁱ*, we; *asĕ*, us, by us; and *tʏᵃh*, thou; *tsĕ*, thee, by thee; *tṑhⁱ*, ye; *tṑhĕ*, you, by you. Possessive pronouns are employed instead of the genitive. For the third person, we have sing masc. *suh*, fem. *sŏh*, neut. *tih;* acc. sing. (masc. or fem.) *tamis* or *tas*, neut. *tath;* agent sing. masc. neut. *tamⁱ*, fem. *tami*. The plural is of common gender throughout. The possessive pronoun is *tasạndᵘ*, of him, of her; *tamyukⁿ*, of it; *tihạndᵘ*, of them. The neuter gender is used for all things without life.

Kashmiri makes very free use of pronominal suffixes, which are added to verbs to supply the place of personal terminations. These represent almost any case.

Before these the verbal terminations are often slightly changed for the sake of euphony, and, when necessary for the pronunciation, the vowel *a* is inserted as a junction vowel.

Another set of suffixes is commonly added to verbs, with an adverbial force. Of these *na* negatives the verb, *ā* asks a question, *ti* adds emphasis, and *tyā* asks a question with emphasis. Two or three suffixes may be employed together.

E. *Conjugation.*—The conjugation of the verb is mainly participial. Three only of the old tenses, the present, the future and the imperative have survived, the first having become a future, and the second a past conditional. These three we may call radical tenses. The rest, viz., the Kashmiri present, imperfect, past, aorist, perfect and other past tenses are all participial

The verb substantive, which is also used as an auxiliary verb, has two tenses, a present and a past. The former is made by adding the pronominal suffixes of the nominative to a base *chu* (*h*), and the latter by adding the same to a base *ạsᵘ*.

As for the finite verb, the modern future (old present), and the past conditional (old future) do not change for gender, and do not employ suffixes, but retain relics of the old personal terminations of the tenses from which they are derived.

For the imperative we have second person singular, *kar*, plur. *kariv;* third person singular and plural *karin*.

The present participle is formed by adding *ān* to the root. It does not change for gender. From this we get a present and an imperfect, formed by adding respectively the present and past tenses of the auxiliary verb.

There are several past participles, all of which are liable to change for gender, and are utilized in conjugation.

In the strong past participle and the pluperfect participle, the final *v* and *y* are only added for the sake of euphony. There are three conjugations. The first includes all transitive verbs. These have both the weak and the strong past participles. The second conjugation consists of 66 common intransitive verbs, which also have both of these participles. The third conjugation consists of the remaining intransitive verbs. These have only the strong past participle. The weak past participle in the first two conjugations refers to something which has lately happened, and is used to form an immediate past tense. The strong past participle is more indefinite, and is employed to form a tense corresponding to the Greek aorist. The pluperfect participle refers to something which happened a long time ago, and is used to form the past tense of narration. As the third conjugation has no weak past participle, the strong past participle is employed to make the immediate past, and the pluperfect participle is employed to make the aorist past, while the new pluperfect participle is formed to make the tense of narration.

The corresponding tenses are formed by adding pronominal suffixes to the weak, the strong or the pluperfect participle. In the last two the final *v* and *y*, being no longer required by euphony, are dropped. In the case of transitive verbs the participles are passive by derivation and in signification, and hence the suffix indicating the subject must be in the agent case. If the thing made is feminine the participle must be feminine, and similarly if it is plural it must be plural. The past participles of intransitive verbs are not passive, and hence the suffix indicating the subject must be in the nominative form. These suffixes may be piled one on another.

Tenses corresponding to the English perfect and pluperfect are formed by conjugating the auxiliary verb, adding the appropriate suffixes, with the compound past participle.

Many verbs have irregular past participles. Others must be learnt from the regular grammars.

The infinitive is formed by adding *-un* to the root. It is declined like a somewhat irregular noun of the first declension. There are three forms of the noun of agency.

The passive is formed by conjugating the verb *yi*, come, with the ablative of the infinitive. A root is made active or causal by *-anaw*, *-āw*, or *-ᵃrāw*. Some verbs take one form and some another, and there are numerous irregularities, especially in the case of the last.

F. *Indeclinables.*—Indeclinables (adverbs, prepositions, conjunctions and interjections) must be learnt from the dictionary. The number of interjections is very large, and they are distinguished by minute rules depending on the gender of the person addressed and the exact amount of respect due to him.

Literature.—Kashmiri possesses a small literature, which has been very little studied. The very popular *Lallā-vākyāni*, a collection of verses on Saiva philosophy by a woman named *Lallā-dēvī*, is said to be the oldest work in the language which has survived. Another esteemed work is the *Siva Pariṇaya* of Krishna Rājānaka, a living author.

BIBLIOGRAPHY.—*See* vol. viii., pt. ii. *Linguistic Survey of India.* The only printed lexicographical work is a short vocabulary by W. J. Elmslie (1872). K. F. Burkhard brought out a grammar of the Muslim dialect in the *Proceedings of the Royal Bavarian Academy of Science* for 1887–89, translated by G. A. Grierson in the *Indian Antiquary* of 1895 and the following years (reprinted as a separate publication, Bombay, 1897). The more complete works of the kind in English are G. A. Grierson's *Essays on Kāçmīrī Grammar* (1899), and *Manual of the Kāshmīrī Language* (1911). A valuable native grammar in Sanskrit, the *Kaśmīraśabdāmrta* of Iśvara Kaula, has been edited by the same writer (Calcutta, 1888). For an examination of the origin of Kashmiri grammatical forms and the Dardic question generally, *see* G. A. Grierson's "On certain Suffixes in the Modern Indo-Aryan Vernaculars" in the *Zeitschrift für Vergleichende Sprachforschung auf dem Gebiete der Indogermanischen Sprachen* for 1903 and *The Piśāca Languages of North-Western India* (1906).

The only important texts that have been published are Burkhard's edition, with a partial translation, of Mahmūd Gāmī's "Yūsuf and Zulaikhā" in the *Zeitschrift der Deutschen Morgenländischen Gesellschaft* for 1895 and 1899; G. A. Grierson's edition of the *Siva Parinaya* (1924); the *Lallā Vākyāni*, edited and translated by the same writer and L. Barnett (1920). The *Srī-Krsnâvatara-līlā* of Dīnanātha, edited and translated by G. A. Grierson.

Under the title of "The Word of Lalla the Prophetess" (1924) R. C. Temple has provided a metrical translation into English of the *Lallā Vākyāni*, with notes and an elaborate historical introduction.

See also vol. i., *Linguistic Survey of India* (1927).

KASHUBES, a Slavonic people living on the borders of West Prussia, along the Baltic coast between Danzig and Lake Garden, and inland as far as Konitz. They consist of peasants and fishermen. Their language in some points is quite independent of Polish, in some it offers a resemblance to the language of the Polabs (*q.v.*). In Kashube as against Polish all the vowels can be nasal instead of *a* and *e* only, it has preserved quantity and a free accent, has developed several special vowels, *e g*, *ö*, *oe*, *ü*, and has preserved the original order, *e.g.*, *gard* as against *grod*. The consonants are very like Polish. (*See* also SLAVS.)

Baudouin de Courtenay, "Kurzes Resumé der Kaschubischen Frage," *ibid.* xxvi. (1904); G. Bronisch, *Kaschubische Dialektstudien* (Leipzig, 1896–98); S. Ramult, *Slownik języka pomorskiego czyli kaszubskiego, i e*, "Dictionary of the Seacoast (Pomeranian) or Kashube Language" (Cracow, 1893).

KASIMOV, a town of Russia, in the province of Ryazañ, on the Oka river, in 54° 58′ N. and 41° 23′ E., 75 m. E.N.E. of Ryazañ. Pop. (1926) 12,979. It has flax-spinning, linen and rope-works, a bucket factory and tanneries. Its post-horse bells were famous. Founded in 1152, it was formerly known as Meshcherski Gorodets. In the 15th century it became the capital of a Tatar khanate, subject to Moscow, and remained such until 1667. The town possesses a cathedral, and a mosque supposed to have been built by Kasim, founder of the Tatar principality. Near the mosque stands a mausoleum built by Shah-Ali in 1555. Lying on the direct road from Astrakhan to Moscow and Nizhni-Novgorod, Kasimov is a place of some trade, and has a large annual fair in July, but it is hampered by lack of railway facilities.

See Veliaminov-Zernov, *The Kasimov Tsars* (St. Petersburg, 1863–1866).

KASR AL KEBIR, a town of Morocco in the zone of Spanish influence, on the river Lekkus, 80 m. N.W. of Fez. Pop. about 10,000. Its mud and pantile dwellings are here and there relieved by a mosque tower, but the aspect of the town is far from inviting. Al Kasr al Kebir was built, according to Leo Africanus, by Yakub el Mansur (1184–1199). Not far from the town, by the banks of the river Makhazan, is the site of the battle fought in 1578 between Dom Sebastian, king of Portugal, and the Moors under Abd el Malek, in which the Moors were victorious, though both kings perished, as well as the deposed Mohammed XI., who had called in the Portuguese to his aid against Abd el Malek.

KASSA: *see* KOŠICE.

KASSALA, a town and *mudiria* of the Anglo-Egyptian Sudan. The town, a military station of some importance, lies on the river Gash (Mareb) in 15° 28′ N., 36° 24′ E., 260 m. E.S.E. of Khartum and 240 m. W. of Massawa, the nearest seaport. Pop. about 20,000. It is built on a plain, 1,700 ft. above sea level, at the foot of the Abyssinian highlands 15 m. W. of the frontier of the Italian colony of Eritrea. Two dome-shaped mountains about 2,600 ft. high, jebels Mokram and Kassala, rise abruptly from the plain some 3 m. to the east and south-east. A short distance from the town is Khatmia, containing a tomb mosque with a high tower, the headquarters of the Morgani family, the chiefs of a religious brotherhood widely spread and of considerable influence in the eastern Sudan. The Morgani family are of Afghan descent. Kassala was founded by the Egyptians in 1840 as a fortified post from which to control their newly conquered territory near the Abyssinian frontier. In 1885 Kassala was captured by the dervishes, but was recovered by an Italian force under Colonel Baratieri on the 17th of July 1894 and by the Italians was handed over on Christmas day 1897 to Egypt. The bulk of the inhabitants are Hallenga "Arabs."

Kassala *mudiria* (pop. 158,634) contains some of the most fertile land in Anglo-Egyptian Sudan. It is a region of light rainfall, and cultivation depends chiefly on the Gash flood. The river is however absolutely dry from October to June. White durra of excellent quality is raised, and excellent cotton is now being grown on an extensive scale.

KASSASSIN, a village of Lower Egypt 22 m. by rail W. of Ismailia on the Suez Canal. At this place, on the 28th of August and again on the 9th of September 1882 the British force operating against Arabi Pasha was attacked by the Egyptians—both attacks being repulsed.

KASSEL: *see* CASSEL.

KASSENA, a patrilineal, animistic people related to the Nuruma, living in the upper Volta, south-east of Leo, and in the northern territories, Gold Coast (Navoro district), whose language is akin to Nuruma. They live in scattered groups, each consisting of several households. There are no characteristic marriage customs. The Kassena are cultivators, and possess but few cattle.

See Tauxier, *Le Noir du Soudan* (1912).

KASSERINE, a railway station of western Tunisia, 20 m. S.W. of Sbeitla (Supefula) on the line from Sousse to Metlaoui. It is 2 m. from the site of the ancient Roman Cillium, where a much ruined theatre, an arch restored at the time of Constantine and other buildings remain.

KASSITES, an Elamite tribe who played a considerable part in the history of Babylonia. They inhabited the north-western mountains of Elam, when Sennacherib attacked them in 702 B.C. They are the Cossaeans of Ptolemy, who divides Susiana between them and the Elymaeans; according to Strabo (xi. 13, 3, 6) they were the neighbours of the Medes. They are the Cissians of the older Greek authors who are identified with the Susians by Aeschylus (*Pers.* 17, 120) and Herodotus (v. 49, 52). About 1780 B.C. they overran Babylonia and founded a dynasty there which lasted for 576 years. In the course of centuries they were absorbed into the Babylonian population; the kings adopted Semitic names and married into the royal family of Assyria. Like the other languages of the non-Semitic tribes of Elam that of the Kassites was agglutinative; a vocabulary of it has been handed down in a cuneiform tablet, as well as a list of Kassite names with their Semitic equivalents. It has no connexion with Indo-European.

See Fr. Delitzoch, *Die Sprache der Kossäer* (1884).

KASTAMUNI or KASTAMBUL. (1) A vilayet of Asia Minor, rich in mineral wealth, with many mineral springs and extensive forests, the timber being used for charcoal and building and the bark for tanning. The products are chiefly cereals, fruits, opium, cotton, tobacco, wool, ordinary goat-hair and mohair, in which there is a large trade. Its population (1927) is 335,601. (2) The capital of the vilayet, the ancient *Castamon*, altitude 2,500 ft., situated in the narrow valley of the Geuk Irmak (*Amnias*), and connected by a carriage road, 54 m., with its port Ineboli on the Black Sea. The town is noted for its copper utensils, but the famous copper mines about 36 m. N., worked from ancient times to the 19th century, are now abandoned. The climate is continental with extremes of heat and cold; in winter the roads are often closed by snow. The population (1927) is 63,116. Castamon became an important city in later Byzantine times. It lay on the northern trunk-road to the Euphrates and was built round a strong fortress whose ruins crown the rocky hill west of the town. It was taken by the Danishmand Amirs of Sivas early in the 12th century, and passed to the Turks in 1393.

KASTORIA, a city of Greek Macedonia, in the province of Florina, 45 m. S. by W. of Monastir. Pop. about 10,000, one-third of whom in 1912 were Greeks, one-third Bulgarians, and the remainder Muslims, Albanians or Turks. There are now no Muslims but only Greeks and Bulgarians, the former being 61% of the total. Kastoria occupies part of a peninsula on the western shore of Lake Kastoria, which here receives from the north its affluent the Zhelova. The lake is formed in a deep hollow surrounded by limestone mountains, and is drained on the south by the Vistritza. The lake has an area of 20 sq m., and is 2,850 ft. above sea-level. Kastoria is the seat of an Orthodox archbishop. It is usually identified with the ancient *Celetrum*, captured by the Romans under Sulpicius, during the first Macedonian campaign, 200 B.C., and better known for the defence maintained by Bryennius against Alexis I. in 1084. A Byzantine wall with round towers runs across the peninsula.

KASUR, a town of British India, in the Lahore district of the Punjab, situated on the north bank of the old bed of the river Beas, 34 m. S.E. of Lahore. Pop. (1921), 31,018. Kasur does not appear in history until late in the Mussulman period, when it was settled by a Pathan colony from beyond the Indus. It has an export trade in grain and cotton, and manufactures of cotton and leather goods.

KATAGUM, formerly a sub-province of the province of Kano, Northern Nigeria, since 1926 divided between Kano and Bauchi provinces. It occupies a north central position between Kano and Bornu. In this region are several small but ancient Mohammedan emirates—Katagum, Misau, Jamaari (these three are now in Bauchi province), Gumel, Hadeija, Kazaure and Daura (in Kano province), with a fringe of Bedde pagans on its eastern frontier towards Bornu, and other pagans on the south towards Bauchi.

In ancient times this region formed the debatable country between Bornu and the Hausa states. Though Mohammedan it resisted the Fula invasion. Its northern emirates were for a long time subject to Bornu, and its customs are nearly assimilated to those of Bornu. Katagum and the other emirates were taken under administrative control by the British in Oct. 1903.

Hadeija, a commercial centre of note, was an old Habe town and its name, an evident corruption of Khadija, the name of the celebrated wife and first convert of Mohammed, is a strong presumption of the incorrectness of the Fula claim to have introduced Islam to its inhabitants. The ruling dynasty of Hadeija was, however, overthrown by Fula usurpation towards the end of the 18th century, and the Fula ruler received a flag and a blessing from Dan Fodio at the beginning of his sacred war in the opening years of the 19th century. Nevertheless the habit of independence being strong in the town of Hadeija the little emirate held its own against Sokoto, Bornu and all comers, its boast being that it had never been conquered. It had made nominal submission to the British in 1903, but the emir's attitude became, in the spring of 1906, openly antagonistic to the British and a military expedition was sent against him. The emir with his disaffected chiefs made a plucky stand but after five hours' street fighting the town was reduced. The emir and three of his sons were killed, and a new emir, the rightful heir to the throne, was appointed. The offices of the war chiefs in Hadeija were abolished and 150 yards of the town wall were broken down. For some years a military force was stationed in the town, but its retention was found unnecessary. In 1929 Hadeija was placed in railway communication with Kano and the ports of Nigeria. (*See* NIGERIA.)

KATANGA, the southernmost province of Belgian Congo, being bounded south and south-east by Northern Rhodesia. Area approximately 180,000 sq. miles. Pop. (1927), native, estimated at 900,000; whites, over 5,000, of whom 3,000 were Belgian and 700 British. The Katanga plateau, from which the province takes its name, has a climate resembling in many ways that of South Africa; it is hilly and highly diversified; in it rise the main headstreams of the Congo, and also in it, at Bukama, the Lualaba (Upper Congo) becomes navigable. Much of the plateau, which is geographically a continuation of the high veld of Rhodesia, is suitable for agriculture, and stock is bred by a number of white settlers. The province is, however, best known for its mineral wealth, especially its immense deposits of copper. Since Kambove, where is one of the largest mines, was in 1913 linked to the South African railway system, the output of copper has increased vastly. Other minerals worked are tin, cobalt, uranium (whence radium is extracted) and coal (at Luena, south of Bukama). Iron, gold, platinum and diamonds are all found; the Ruwi gold reef still awaited development in 1928. (For copper output and communications *see* BELGIAN CONGO.)

Katanga was secured for the Congo Free State by the expedition of 1891–92, led by Captain W. G. Stairs, which forestalled Cecil Rhodes' plans to add the country to the South African company's territories. It was not, however, until the coming of the railway that any considerable development occurred. Elisabethville (named after the Queen of the Belgians) was founded in 1910 and became the capital. It has fine buildings and the amenities of a European city, and resembles the towns of South Africa. The white population in 1926 was 2,648 (including 300 children). Much of the money invested in Katanga is British; its outlook is to South Africa, and the administration at one time had some anxiety as to the preservation of its character as part of a Belgian colony.

See authorities cited under BELGIAN CONGO, and A. de Bauw, *La Katanga* (Brussels, 1920). For the Stairs expedition, J. A. Molony, *With Captain Stairs to Katanga* (London, 1893). (F. R. C.)

KATA THERMOMETER. In considering measurement of ventilation we must bear in mind that the ordinary thermometer merely gives the average temperature of its surroundings. While the human body produces heat, and all day long is keeping itself at body temperature, the thermometer does not produce heat, but just registers the effect of the surrounding atmosphere upon itself. An instrument is needed, therefore, to indicate the cooling and evaporating power of the air.

The Kata thermometer is such and is far more indicative of human feeling than the ordinary thermometer. It records not only the effect of the temperature of the surrounding air on the cooling of its surface when at body temperature, but of the wind and any movement of the air, and also how quickly cooling takes place when its surface is wet, as the skin is when perspiration is going on. The Kata thermometer is a large-bulbed alcohol thermometer of standard size with stem graduated from 100° to 95° Fahrenheit. It is warmed up in hot water till the meniscus rises above 100° F, the bulb is then dried, and the rate of cooling of the meniscus from 100° to 95° F taken with a stop-watch. From a factor number determined for each instrument, the cooling power is deduced in millicalories ($\frac{1}{1,000}$ gramme calorie) per sq cm. of the surface of the bulb at body temperature per second. In still air the dry Kata thermometer has a cooling power of about 10 at 0° C, and about 5 at 20° C; with a wind of 9m. per hour it has a cooling power of about 40 at 0° C, and 20 at about 15° or 16° C, and so on with different rates of wind Wind is far more important than temperature to the cooling of the body; thus the still air is easily borne. In the case of the wet Kata thermometer a wet muslin glove covers the bulb. In factories, schools, etc., the reading of the cooling power of the dry Kata thermometer should not be less than 5–6 with a temperature of about 60° F, 7 at 70 and 8 at 80°, otherwise the efficiency of the worker and pupil will tend to go down. Observations made by the Industrial Fatigue Board in pottery, boot and shoe, cotton and printing works, showed that a great number of readings were below 6. The general mortality is greater in the trades with the lower readings. Great improvements could yet be made in this respect. *See* Medical Research Council, *Special Report, No. 73* (1923). (L. E. H.)

KATER, HENRY (1777–1835), English physicist of German descent, was born at Bristol on April 16, 1777. He entered the army in 1794, retired on half pay in 1814, and devoted the remainder of his life to scientific research. He died in London on April 26, 1835. His most valuable work was the determination of the length of the second's pendulum, first at London and subsequently at various stations throughout the country (*Phil. Trans*, 1818–19). In these researches he used a pendulum now known by his name in which the centres of oscillation and suspension were interchanged and the length of the simple pendulum calculated from their distance apart.

As the inventor of the floating collimator, Kater rendered a great service to practical astronomy (*Phil. Trans.*, 1825–28).

KATHA, a district in the Sagaing division of Burma, with an area of 8,917 sq.m., 3,730 of which consists of the former separate State of Wuntho. Katha now includes the former separate district of the Ruby mines. The district stretches from the main divide between the Irrawaddy and Chindwin valleys on the west to the border of the Shan States on the east. Three ranges of hills run through the district, known as the Minwun, Gangaw and Mangin ranges. They separate the three main rivers—the Irrawaddy, the Mèza and the Mu. The Minwun range runs from north to south, and forms for a considerable part of its length the dividing line between the Katha district proper and what formerly was the

Wuntho State. Its average altitude is between 1,500 and 2,000 feet. The Gangaw range runs from the north of the district for a considerable portion of its length close to and down the right bank of the Irrawaddy as far as Tigyaing, where the Myatheindan pagoda gives its name to the last point. Its highest point is 4,400 ft., but the average is between 1,500 and 2,000 feet. The Katha branch of the railway crosses it at Petsut, a village 12 m. W. of Katha town. The Mangin range runs through Wuntho (highest peak, Maingthôn, 5,450 feet).

Gold, copper, iron and lead occur in the district, but are not now worked. Jade and soapstone also exist, and salt is produced from brine wells. There are important forest reserves in Katha. The population in 1921 was 253,725, an increase of 8,128 in the decade. Burmese comprise nearly half the population, Shans (mostly in Wuntho and the hills east of the Irrawaddy) about a third, whilst nearly all the Sak (Lui) of Burma are in this district. Rice is the chief crop in the plains, tea, cotton, sesamum and hill rice in the hills. The district was first occupied by British troops in 1886, but it was not finally quieted till 1890, when the Wuntho sawbwa was deposed and his State incorporated in Katha district. Wuntho and other parts of the district have evil reputations for fever.

The portion of Katha lying east of the Irrawaddy forms geographically a portion of the Shan plateau. Here, in the centre of a valley, 4,000 ft. above sea-level, and 61 m. by motor road from the river port of Thabeitkyin lies Mogôk, the centre of the famous Ruby mines. Synthetic rubies ruined the market for real stones, and after many vicissitudes the Burma Ruby Mines company finally ceased operations in 1927. The system adopted was to excavate large open pits, from which the ruby bearing earth was removed and washed by machinery. The rubies occur *in situ* near the junction of gneissose and calcareous rocks, and some attempt was made at mining the solid rock, but the stones proved inferior to those naturally weathered out. The industry is still carried on by native workers and in addition to rubies, sapphires, spinels and other coloured stones are obtained. Mogôk is also used to a small extent as a hill station.

KATHIAWAR, a peninsula of India, within the Gujarat division of Bombay, giving its name to a political agency. The peninsula is bounded north by the Ran of Cutch, east by Ahmedabad district and the Gulf of Cambay, and south and west by the Arabian sea. Excepting the Tangha and Mandav hills, in the west of Jhalawar, and some unimportant hills in Hallar, the northern portion of the country is flat; but in the south, from near Gogo, the Gir range runs nearly parallel with the coast, and at a distance of about 20 m. from it, along the north of Babriawar and Sorath, to the neighbourhood of Girnar. Opposite this last mountain is the solitary Osam hill, and then still farther west the Barada group, between Hallar and Barada, runs about 20 m. north and south from Gumli to Ranawao. The Girnar group is a granitic mass, rising to 3,500 feet. The principal river is the Bhadar, which rises in the Mandav hills, and flowing south-west falls into the sea at Navi-Bandar; highly cultivated lands adjoin its course of about 115 m. Four of the old races, the Jaitwas, Churasamus, Solunkis and Walas, still exist as proprietors of the soil who exercised sovereignty in the country prior to the immigration of the Jhalas, Jadejas, Purmars, Kathis, Gohels, Jats, Mohammedans and Mahrattas, between whom the country is now chiefly portioned out. Kathiawar has many notable antiquities, comprising a rock inscription of Asoka, Buddhist caves, and fine Jain temples on the sacred hill of Girnar and at Palitana.

The political agency of Kathiawar had an area of 20,911 sq m. in 1921 and a population of 2,538,497. There are altogether 188 states of varying size and importance. Fourteen independent states, previously in the Kathiawar agency, were formed into the Western India States agency in 1924, and brought into direct relations with the British Government. There are two political agents, one with headquarters at Rajkot, in the centre of the peninsula, and the other at Wadhwan. An excellent system of metre-gauge railways has been provided at the cost of the leading states. Maritime trade is also active, the chief ports being Porbandar, Mangrol and Veraval. Tribute of £31,129 is paid to the British Government.

KATHMANDU, the capital of the state of Nepal, bordering on India, situated on the bank of the Bishanmati river at its confluence with the Baghmati, in 27° 36′ N., 85° 24′ E. The town, which is said to have been founded about 723, contains a population estimated at 90,000, occupying 5,000 houses made of brick, and usually from two to four storeys high. Many of the houses have large projecting wooden windows or balconies, richly carved. The town contains numerous temples. One of these, a wooden building, gives it its name (*kath,* wood). The British envoy resides about 1 m. N. of the town.

KATIYA: *see* QATIYA.

KATKOV, MICHAEL NIKIFOROVICH (1818–1887), Russian journalist, born in Moscow, sympathized with the Liberal reaction and strong reform movement which characterized the earlier years of Alexander II.'s reign (1855–1881), and for some time he advocated the introduction of liberal institutions but when the agitation assumed a Socialistic and Nihilist tinge, and indulgence was shown to Polish national aspirations, he changed his attitude. From 1863 to 1887 he controlled the *Moscow Gazette.* During these twenty-four years he voiced the conservative spirit of Moscow in opposition to the liberal and cosmopolitan spirit of St. Petersburg.

KATO, TAKA-AKIRA (1859–1926), Japanese statesman, was born at Nagoya, and commenced life as an employee in the great firm of Mitsu Bishi. In 1887 he became private secretary to Marquis Okuma, minister of state for foreign affairs. Subsequently he served as director of a bureau in the finance department, and from 1894 to 1899 he represented his country at the court of St. James. He received the portfolio of foreign affairs in the fourth Ito Cabinet (1900–1901), which remained in office only a few months. Appointed again to the same position in the Saionji cabinet (1906), he resigned after a brief interval, being opposed to the nationalization of the private railways, which measure the Cabinet approved. He then remained without office until 1908, when he again accepted the post of ambassador in London. He was decorated with the grand cross of St. Michael and St. George, and earned the reputation of being one of the strongest men among the junior statesmen. He was Japanese minister in London from 1894 to 1899, and ambassador from 1908 to 1913. Returning to Japan, he joined Prince Katsura's third Cabinet as foreign minister for the third time but resigned soon after. He then reorganized the Doshikai, created by Katsura, and renamed it the Kenseikai or Constitutionalist party, of which he became president in 1913 (*see* JAPAN).

In April 1914 he joined the Okuma Cabinet as foreign minister, resigning in 1915. It was during his incumbency that Japan sent the so-called 21 demands to China. In Aug. 1915 he was elected a crown member of the house of peers and in the following year was created a viscount. The following decade proved a quiet period for Kato, but in June 1924 he became premier of the Coalition Cabinet of the Kenseikai, the Seiyukai and the Kakushin Club. His administration was made historic by the passage of the universal manhood suffrage law. Owing to dissensions among members of the Cabinet, Kato reorganized his Ministry on Aug. 1, 1925, forming it exclusively with members of the Kenseikai party. On Jan. 28, 1926, he died in Tokyo while in office.

KATOWICE (KATTOWITZ), a town of Poland, on the Rawa, 5 m. S.E. from Beuthen by rail. Pop. (1875) 11,352, (1921) 104,868. There are large ironworks, foundries and machine shops in the town, and near it zinc and anthracite mines. The growth of Katowice, like that of other places in the same district, has been very rapid, owing to the development of the mineral resources of the neighbourhood. In 1815 it was a mere village, and became a town in 1867. As a result of the partition of Upper Silesia between Germany and Poland in 1921 (*see* SILESIA) Katowice was transferred to Poland.

KATRINE, LOCH, a freshwater lake, Scotland, lying almost entirely in Perthshire. The boundary between the counties of Perth and Stirling runs from Glengyle, at the head of the lake,

down the centre to a point opposite Stronachlachar from which it strikes to the south-western shore towards Loch Arklet. The loch, which has a south-easterly trend, is about 8 m. long, and its greatest breadth is 1 mile. It lies 364 ft. above the sea-level, and the greatest depth is 495 ft. The scenery has been immortalized in Sir Walter Scott's *Lady of the Lake*. The surrounding hills culminate in Ben Venue (2,393 ft.).

The lake is fed by the Gyle and numerous burns, and drained by the Achray to Loch Achray and thence by the Black Avon to Loch Vennacher. Since 1859 it has formed the chief source of the water-supply of Glasgow, the aqueduct leaving the lake about 1½ m. S.E. of Stronachlachar. The level of the lake has been increased by 12 ft., and was designed to be raised a further 5 ft. in 1927. As a result the Silver Strand has been submerged, and Ellen's Isle reduced in size. The principal points on the shores are Glengyle, formerly a fastness of the Macgregors, the Trossachs, the Goblins' Cave on Ben Venue, and Stronachlachar (Gaelic, "the mason's nose"), from which there is a ferry to Coilachra on the opposite side. During summer steamers ply between the Trossachs and Stronachlachar.

KATSINA (or KATSENA), an ancient state of the western Sudan, now included in the Zaria province of the British protectorate of Northern Nigeria. Katsina was amongst the oldest of the Hausa states. There exist manuscripts which carry back its history for about 1,000 years and tradition ascribes the origin of the Hausa population, which is known also by the name of Habe or Habeche, to the union of Bajibda of Baghdad with a prehistoric queen of Daura. More trustworthy records show that it was a well organized state in the 14th century. The conquest of the Habe of Katsina by the Fula about the beginning of the 19th century made little difference to the country. The more cultivated Habe were already Mohammedan and the new rulers adopted the existing customs and system of government. These were in many respects highly developed and included elaborate systems of taxation and justice.

The town of Katsina is situated in 13° N., 7° 41′ E., being 84 m. N.W. of Kano. The walls of Katsina have a circuit of between 13 and 14 miles, but only part of the enclosed space is inhabited. In the 17th and 18th centuries it appears to have been the largest town in the Hausa countries, and its inhabitants at that time numbered some 100,000. The present town must be comparatively modern, for at the time of Leo Africanus (*c.* 1513) there was no place of any considerable size in the province of Katsina. The ancient town, probably on another site, was known as the chief seat of learning throughout the Hausa states and this reputation was maintained by the new town. In the beginning of the 19th century the town fell into the hands of the Fula, but only after a protracted and heroic defence. In March 1903 Sir F. Lugard visited Katsina on his way from Sokoto and the emir and chiefs accepted British suzerainty without fighting. The emir was unfaithful to his oath of allegiance to the British crown, and was deposed in 1904. His successor worked cordially with the British authorities, and the native administration reached a considerable degree of efficiency. A training college for Mohammedan teachers was established as well as a well-equipped native hospital. A number of Europeans, traders and others, have settled in Katsina, which is a cotton-growing and cattle raising region.

See the *Travels* of Heinrich Barth (new ed., London, 1890, chs. xxiii. and xxiv.). Consult also the *Annual Report* on Northern Nigeria (Colonial Office, London) for 1902 and other years, and *Nigeria, Annual Report, Northern Provinces* (Kaduna, 1928).

KATSURA, TARO, PRINCE (1847–1913), Japanese soldier and statesman, was born in 1847 in Choshu. He fought under the Imperial banner in the civil war of the Restoration, and he displayed such talent that he was twice sent at public expense to Germany (in 1870 and 1884) to study strategy and tactics. In 1886 he was appointed vice-minister of war, and in 1891 the command of division devolved on him. He led the left wing of the Japanese army in the campaign of 1894–95 against China, and made a memorable march in the depth of winter from the north-east shore of the Yellow sea to Haicheng, finally occupying Niuchwang, and effecting a junction with the second army corps which moved up the Liaotung peninsula. For these services he received the title of viscount. He held the portfolio of war from 1898 to 1901, when he became premier and retained office for four and a half years, a record in Japan.

In 1902 his cabinet concluded the first *entente* with England, which event procured for Katsura the rank of count. He also directed state affairs throughout the war with Russia, and concluded the offensive and defensive treaty of 1905 with Great Britain, receiving from King Edward the grand cross of the order of St. Michael and St. George, and being raised by the mikado to the rank of marquess. He resigned the premiership in 1905 to Marquess Saionji, but was again invited to form a cabinet in 1908. Marquess Katsura might be considered the chief exponent of conservative views in Japan. Adhering strictly to the doctrine that ministries were responsible to the emperor alone and not at all to the diet, he stood wholly aloof from political parties, only his remarkable gift of tact and conciliation enabling him to govern on such principles. In Aug. 1911 he resigned the premiership in favour of Marquess Saionji, after completing the work of financial reform and treaty revision which he had undertaken, and received the rank of prince. On Dec. 20, 1912, he again accepted office as premier. In Feb. 1913, however, a vote of censure on the premier was moved in the Diet for the alleged misuse of imperial rescripts, and on Feb. 10 the prince resigned office. His health was already failing, and he died in Tokyo on Oct. 10, 1913.

KATTOWITZ: *see* KATOWICE.

KATYDID, the name given to certain North American insects, belonging to the family *Tettigoniidae* and related to the green or tree grasshoppers of England. Their stridulation, alleged to resemble the words "Katy did," is produced by the friction of a file on the underside of the left forewing over a ridge on the upperside of the right. (*See* ORTHOPTERA.)

KAUB, a town of Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, north-west of Bingen. Pop. (1925) 1,969. Kaub, first mentioned in the year 983, originally belonged to the lords of Falkenstein, passed in 1277 to the Rhenish Palatinate, and attained civic rights in 1324. On a rock in the middle of the Rhine is the small castle of Pfalz, or Pfalzgrafenstein, which served as a toll-gate on the Rhine

KAUFBEUREN, a town in the republic of Bavaria, on the Wertach, 55 m. S.W. of Munich by rail. Pop. (1925) 9,160. Kaufbeuren is said to have been founded in 842, and is first mentioned in chronicles of the year 1126. It appears to have become a free imperial city about 1288, retaining the dignity until 1803, when it passed to Bavaria. It was formerly a resort of pilgrims, and Roman coins have been found in the vicinity. Kaufbeuren is still surrounded by its mediaeval walls It has a town hall with fine paintings, and an old tower. The chief industries are cotton spinning, weaving, bleaching, dyeing, printing and machine building, and there is a trade in wine, beer and cheese.

See F. Stieve, *Die Reichsstadt Kaufbeuren und die bayrische Restaurationspolitik* (Munich, 1870); and Schröder, *Geschichte der Stadt und Katholischen Pfarrei Kaufbeuren* (Augsburg, 1903).

KAUFFER, EDWARD McKNIGHT (1890–), American artist and designer, was born at Great Falls, Montana, and led an eventful life in the States before starting on his career as an artist. After working for a time at the Art Institute, Chicago, he went abroad, visiting Munich and Paris and eventually settling in London. There the art of the poster was the art of the moment, and before long McKnight Kauffer was recognized as its most brilliant exponent. His boldness in design, combined with economy of means and a keen sense of colour values, gives to his posters a personal stamp that is unmistakable. Some of the most successful are executed in black on grey, or black and white on grey, as in the "Rocket," one of the long series designed for London's underground railways. A complete contrast to this is "London History at the London Museum" (1922) with the flames of the Great Fire for its subject. His woodcut "Flight," a geometrical design of birds flying, is very remarkable. McKnight Kauffer's style has strongly influenced the poster artists of the day. Examples of his purely illustrative work may be found in his drawings for Burton's *Anatomy of Melancholy* (1925). He edited *The Art of the Poster* (1924).

KAUFFMANN (MARIA ANNA) ANGELICA (1741–1807), the once popular artist and Royal Academician, was born at Coire in the Grisons, on Oct. 30, 1741. Her father, John Josef Kauffmann, was a painter. She was a very gifted child and showed marked talents as a musician and painter at an early age; and in her 12th year she had become a notability, with bishops and nobles for her sitters. In 1754 her father took her to Milan. Later visits to Italy of long duration have succeeded this excursion; in 1763 she visited Rome. From Rome she passed to Bologna and Venice, being everywhere fêted, as much for her talents as for her personal charms. She was induced by Lady Wentworth, the wife of the English ambassador to accompany her to London, where she appeared in 1766. One of her first works was a portrait of Garrick, exhibited in the year of her arrival at "Mr. Moreing's great room in Maiden Lane." She was everywhere well received, the royal family especially showing her great favour.

Her firmest friend was Sir Joshua Reynolds. In his pocket-book her name as "Miss Angelica" or "Miss Angel" appears frequently, and in 1766 he painted her, a compliment which she returned by her "Portrait of Sir Joshua Reynolds," aetat. 46. About Nov. 1767, she was entrapped into a clandestine marriage with an adventurer who passed for a Swedish count (the Count de Horn), from whom she was then separated Her name is found among the signatories to the famous petition to the king for the establishment of the Royal Academy. In its first catalogue of 1769 she appears with "R A." after her name (an honour which she shared with another lady and compatriot, Mary Moser); and she contributed the "Interview of Hector and Andromache," and three other classical compositions. From this time until 1782 she was an annual exhibitor. One of the most notable of her performances was the "Leonardo expiring in the Arms of Francis the First," which belongs to the year 1778. In 1773 she was appointed by the Academy with others to decorate St. Paul's, and it was she who, with Biagio Rebecca, painted the Academy's old lecture room at Somerset House

In 1781, after her first husband's death, she married Antonio Zucchi (1728–1795), a Venetian artist then resident in England. Shortly afterwards she retired to Rome She continued to contribute to the Academy, her last exhibit being in 1797. She died in Nov. 1807, being honoured by a splendid funeral under the direction of Canova. The entire Academy of St. Luke, with numerous ecclesiastics and virtuosi, followed her to her tomb in S. Andrea delle Fratte, and, as at the burial of Raphael, two of her best pictures were carried in procession.

At Hampton Court is a portrait of the duchess of Brunswick; in the National Portrait Gallery a portrait of herself. There are pictures by her also at Paris, at Dresden, in the Hermitage at St. Petersburg (Leningrad) and in the Alte Pinakothek at Munich. The Munich example is a portrait of herself; and there is a third in the Uffizi at Florence. A few of her works are in private collections The museum of Schwarzenberg in the Tyrol, where she often stayed, has several of her works. Her life has been used as the basis of a romance by Léon de Wailly, 1838; and it prompted the charming novel contributed by Mrs. Richmond Ritchie to the *Cornhill Magazine* in 1875 under the title of "Miss Angel." (A. Do)

See Giovanni de Rossi, *Angelica Kauffmann* (1810); F. A. Gerard, *A. Kauffmann* (1893).

KAUFMANN, CONSTANTINE PETROVICH (1818–1882), Russian general, was born at Maidani on March 3, 1818. He entered the engineering branch (1838), served in the campaigns in the Caucasus, rose to be colonel, and commanded the sappers and miners at the siege of Kars in 1855. After the peace he held important war office appointments. In 1867 he became governor of Turkestan. He captured Samarkand in 1868, and gradually subjugated the whole of the khanate of Bukhara. In 1873 he took Khiva, and forced the khan to become a vassal of Russia. In 1875 Khokand north of the Syrdaria was annexed to Russia, and the independence of the rest of the country became merely nominal. This rapid absorption of the khanates brought Russia into close proximity to Afghanistan, and the reception of Kaufmann's emissaries by the Amir was a main cause of the British war with Afghanistan in 1878. Although Kaufmann failed to find support for his ambitious schemes of further conquest, he sent Skobeleff in 1880 and 1881 against the Akhal Tekkés, and was arranging to add Merv to the Russian empire, when he died suddenly at Tashkend on May 15, 1882.

KAUKAUNA, a city of Outagamie county, Wisconsin, U.S.A., on the Fox river, 1oom. N. by W. of Milwaukee. It is served by the Chicago and North Western railway, inter-urban electric lines and river steamers. The population was 5,951 in 1920 (86% native white). It is the market town for a farming and dairying region, and has machine shops and paper mills. Traders with the Indians made a small settlement here as early as 1820, and in 1830 a Presbyterian mission was established. The city was chartered in 1885.

KAULBACH, WILHELM VON (1805–1874), German painter, was born in Arolsen on Oct. 15, 1805. As a youth of seventeen, he entered the art academy of Dusseldorf, then under the directorship of Peter von Cornelius. The ambitious work by which Louis I. sought to transform Munich into a German Athens afforded the young painter an appropriate sphere. Cornelius had been commissioned to execute the enormous frescoes in the Glyptothek, and his custom was in the winters, to complete the cartoons at Düsseldorf, and in the summers, accompanied by his best scholars, to carry out the designs in colour on the museum walls in Munich. When Cornelius became director of the Bavarian academy in 1824, Kaulbach settled in Munich, and in 1849, when Cornelius left for Berlin, succeeded to the directorship of the academy, an office which he held till his death on April 7, 1874.

Early in the series of his multitudinous works came the famous "Narrenhaus," the appalling memories of a certain madhouse near Düsseldorf; the composition shows points of contact with Hogarth. Somewhat to the same category belong the illustrations to *Reineke Fuchs*. These show how dominant and irrepressible were the artist's sense of satire. Occasionally the grotesque degenerates into the vulgar, the grand into the ridiculous, as in the satire on "the Pigtail Age" in a frescoe outside the New Pinakothek. Kaulbach contracted a fatal facility in covering wall and canvas by the acre. He painted in the Hofgarten, the Odeon, the Palace and on the external walls of the New Pinakothek. His perspicuous and showy manner also gained him abundant occupation as a book illustrator; he was glad to take inspiration from Wieland, Goethe, even Klopstock; among his engraved designs are the Shakespeare gallery, the Goethe gallery and a folio edition of the Gospels. With regard to these examples of "the Munich school," it was asserted that Kaulbach had been unfortunate alike in having found Cornelius for a master and King Louis for a patron, that he attempted "subjects far beyond him, believing that his admiration for them was the same as inspiration"; and supplied the lack of real imagination by "a compound of intellect and fancy."

Nevertheless in such compositions as the "Destruction of Jerusalem" and the "Battle of the Huns" Kaulbach shows creative imagination. As a dramatic poet he tells the story, depicts character, seizes on action and situation. The manner may be occasionally noisy and ranting, but the effect after its kind is tremendous. The cartoon, which, as usual in modern German art, is superior to the ultimate picture, was executed in the artist's prime at the age of thirty. Ten or more years were devoted to the decoration of the grand staircase of the Berlin museum with a series of pictures depicting the Tower of Babel, the Age of Homer, the Destruction of Jerusalem, the Battle of the Huns, the Crusades and the Reformation. These tableaux, severally 30 ft. long, and each comprising over one hundred figures above life-size, are surrounded by minor compositions making more than 20 in all. The idea was to congregate around the world's historic dramas the prime agents of civilization; thus here are assembled allegoric figures of Architecture and other arts, of Science and other kingdoms of knowledge, together with lawgivers from the time of Moses. To the painter's last period belongs the series of melodramatic designs illustrative of Goethe. The canvas, more than 30 ft. long, the Sea Fight at Salamis, painted for the Maxi-

milianeum, Munich, evinces wonted imagination and facility in composition.

See F. von Ostini, *Wilhelm von Kaubach* (Bielefeld and Leipzig, 1906).

KAULBARS, ALEXANDER VASSILIEVICH, BARON, Russian general and traveller, born at St. Petersburg (Leningrad), travelled in central Asia between 1869 and 1873. He explored the Tian-Shan mountains, and was a member of Goluchowski's expedition in the Amur-Daria region. His important contributions to the knowledge of these regions were published in the *Proceedings* of the Russian Geographical society between 1874 and 1888. In 1882–83 Kaulbars was war minister in Bulgaria under Alexander I. He then served in China and at Odessa, and held an army command in the Russo-Japanese War, after which he returned to the Odessa command, retiring in 1909.

KAULBARS, NIKOLAI VASSILIEVICH (1842–1905), Russian general, elder brother of A. V. Kaulbars, born on June 3, 1842, at St. Petersburg (Leningrad), entered the Russian army. During the Russo-Turkish War of 1887–88 he served on a divisional staff, and was afterwards member of the Montenegrin boundary commission. In 1886 he was sent to Bulgaria to consolidate Russian interests there after the fall of Alexander, nominally to assist the Bulgarians. He tried to postpone the elections to the Sobranji, but by his tactless behaviour merely succeeded in alienating the Bulgarians. In 1889 he held command in Warsaw, and in 1891 in Finland. In 1899 he joined the intelligence department of the general staff. He died at St. Petersburg on Dec. 3, 1905.

KAUNAS, a town of Lithuania, situated at the confluence of the Nemunas and Viliya (Neris) in 54° 54′ N, 23° 54′ E. Since the occupation of Vilnius by the Poles, it has been the seat of government. Pop. (1923) 92,446. There is a large Jewish element in the town, contrasting sharply with the blue-eyed, fair-haired Lithuanians. The town is situated in a hollow surrounded by hills, and was fortified by the Russians, but was easily captured by the Germans in 1918, when churches and factories were razed to the ground and much damage was done. Lying on the high road to the east, at a vital navigation point, Kaunas has many times been attacked since its foundation in the 11th century and is said to have been reduced to ashes on 13 occasions. Napoleon passed through it on his march to Moscow. Since Lithuania gained her independence, much money has been spent on improving the town, which now has a municipal electricity supply and a number of new buildings. The Gedimine university was opened here in 1922. The red brick Lithuanian-Gothic church of Vytautas (15th century) still remains. Kaunas has many industrial enterprises, including the manufacture of metal goods and bone meal, and is an entrepôt for river trade with East Prussia. Since Memel was united with Lithuania in 1923, the transit trade of Kaunas has increased. It was formerly called Kovno.

KAUNITZ-RIETBURG, WENZEL ANTON, PRINCE VON (1711–94), Austrian chancellor and diplomatist, was born at Vienna Feb. 2, 1711, son of Max Ulrich, third count of Kaunitz, and Maria Ernestine Franziska von Rietburg. Wenzel Anton, being a second son, was designed for the church, but on the death of his elder brother was trained for the law and for diplomacy, at Vienna, Leipzig and Leiden, and by travel. His family's influence soon obtained him employment, and by 1735 he was a *Reichshofrath.*

When the Emperor Charles VI. died in 1740, he is said to have hesitated before deciding to support Maria Theresa. If so, his hesitation did not last long, and left no trace on his loyalty. From 1742 to 1744 he was minister at Turin, and in the latter year was sent as minister with the Archduke Charles of Lorraine, the governor of Belgium. In 1748 Maria Theresa sent him as representative of Austria to the peace congress of Aix-la-Chapelle. His tenacity and dexterity established his reputation as a diplomatist. He confirmed his hold on the regard and confidence of the empress by insisting in 1749, contrary to the views of most of her advisers, that Austria's true enemy was Prussia, and the traditional policy of alliance with the maritime powers must be exchanged for alliance with France and Russia, directed exclusively against Prussia. The empress eagerly accepted views which were already her own, and entrusted the adviser with the execution of his own plans, clearly recognizing that his ideas and principles were in harmony with her own.

From 1750 till his retirement in 1792 Kaunitz was the leading figure in the politics of eastern and central Europe. His governing principle was to forward the interests of "the august house of Austria," a phrase sometimes repeated at every few lines of his despatches. In internal affairs he helped to promote simplification of the Austrian administration. But his main concern was always with diplomacy and foreign policy. Here he strove with untiring energy, and some success, to extend the Austrian dominions. After the Seven Years' War he endeavoured to avoid great risks, and sought to secure his ends by alliances, exchanges and claims professing to have a legal basis, and justified at enormous length by arguments both pedantic and hypocritical. Of the French Revolution he never understood the full meaning. Yet his despatch of July 17, 1794, contains the first outlines of Metternich's policy of "legitimacy," and the first proposal for the combined action of the powers, based on the full recognition of one another's rights, to defend themselves against subversive principles. Kaunitz died at his house, the Garten Palast, near Vienna, on June 27, 1794. He married on May 6, 1736, Maria Ernestine von Starhemberg, who died Sept. 6, 1754. Four sons were born of the marriage, which was a happy one.

See Hormayr, *Oesterreichischer Plutarch* (Vienna, 1823), for a biographical sketch based on personal knowledge. Also *see* Brunner, *Joseph II.: Correspondance avec Cobenzl et Kaunitz* (Mayence, 1871); A. Beer, *Joseph II., Leopold II. und Kaunitz* (Vienna, 1873).

KAURI PINE, in botany, *Agathis australis* (Coniferae), a native of New Zealand where it is abundant in forests in the North Island between the North Cape and 38° south latitude. The forests are rapidly disappearing owing to use as timber and to destruction by fires. It is a tall resiniferous tree, usually ranging from 80 to 100 ft. in height, with a trunk 4 to 10 ft. in diameter, but reaching 150 ft., with a diameter of 15 to 22 ft.; it has a straight columnar trunk and a rounded bushy head. The thick resiniferous bark falls off in large flat flakes. The leaves, which persist for several years, are very thick and leathery; on young trees they are lance-shaped 2 to 4 in. long and ¼ to ½ in. broad, becoming on mature trees linear-oblong or obovate-oblong and ¾ to 1½ in. long. The ripe cones are almost spherical, erect and 2 to 3 in. in diameter; the broad, flat, rather thin cone-scales fall from the axis when ripe. Each scale bears a single compressed seed with a membranous wing. The timber is remarkable for its strength, durability and the ease with which it is worked. The resin, kauri-gum, is an amber-like deposit dug in large quantities from the sites of previous forests, in lumps generally varying in size from that of a hen's egg to that of a man's head. The colour is of a rich brown or amber yellow, or it may be almost colourless and translucent. Because of its peculiar qualities, Kauri gum is of value for varnish-making.

KAUTSKY, KARL (1854–), German Marxist and historian of Socialism, was born on Oct. 16, 1854, at Prague. In 1883 he founded the socialist paper *Die Neue Zeit,* issued at first (1885–88) from London and later (1890–1917) from Stuttgart. He was a friend and disciple of Marx, and after the death of Engels universally regarded as the most important interpreter of Marx's philosophy. Kautsky, who was one of the creators of the Erfurt programme of 1891, took the lead in the resistance to the modification of Marxian doctrine by Eduard Bernstein, under the title of "revisionism." Bernstein, arguing from the increase of small fortunes (due largely to the increase of shareholding in joint-stock companies), deduced that the concentration of capital and the intensification of class conflict were not proceeding as Marx had predicted, and in consequence he advocated a reformist policy. Kautsky dissented from his interpretation of the figures and defended the thesis of the necessity of revolution. At the outbreak of war in 1914 Kautsky took up a pacifist attitude and in 1917 joined with Hugo Haase in organizing the Independent Social Democratic Party. But he was strongly opposed to the Russian Revolution, and declined to follow the majority of his

party into the ranks of the United German Communist Party (V.K.P.D.). He eventually, with others, rejoined the Social Democratic Party. Kautsky, who had settled in Vienna, was still regarded as the most distinguished theorist of the party. Of his considerable controversial literature against Lenin, Trotsky and others, the most important is his *Dictatorship of the Proletariat* (1918, Eng. trans. 1920), in which he attacks the Leninist doctrine and the application of the dictatorship of the proletariat and claims that the Russian Revolution is only a "bourgeois" revolution whose chief achievement is the importance of the transfer of land to the peasants. He agrees that the new Russian organization of industry may pave the way for Socialism.

After the World War he was given access by the first revolutionary Government to the archives of the German Foreign Office, and made a selection for publication. In March 1919 Kautsky told Brockdorff-Rantzau that they were ready for publication, the intention of the selection being to place war guilt on the kaiser and to exonerate the new Government from being continuators of pre-war policy. But in 1919 more cautious counsels prevailed, and only in December were the documents issued under the joint editorship of Prof. Schücking, Montgelas and Kautsky. Kautsky's advance summary (Nov. 29) created some sensation. (*See* Eng. trans. *The Guilt of William Hohenzollern*, 1920.)

His other works include *Der Einfluss der Volksvermehrung auf den Fortschritt der Gesellschaft* (1880); *Thomas More und seine Utopie* (1887, 6th ed. 1926); *Karl Marx, Ökonomische Lehren gemeinderständlich dargestellt* (1887); *Das Erfurter Programm in seinem grundsatzlichen Teil erlautert* (1892, 17th ed. 1922); *Bernstein und das sozialdemokratische Programm* (1899); *Der Ursprung des Christentums* (1908, 13th ed. 1923); *Der Weg zur Macht* (1909); *Vorlaufer des Sozialismus* (4 vols. 1909–21); popular edition of *Das Kapital* (1913); *Der politische Massenstreik* (1914). (FR. BR.)

KAVA (CAVA or AVA).—An intoxicating, but non-alcoholic beverage, produced principally in the islands of the south Pacific, from the roots or leaves of a variety of the pepper plant (*Piper methysticum*). The method of preparation is somewhat peculiar. The roots or leaves are first chewed by young girls or boys, care being taken that only those possessing sound teeth and excellent general health shall take part in this operation. The chewed material is then placed in a bowl, and water or coco-nut milk is poured over it, the whole is well stirred, and subsequently the woody matter is removed by an ingenious but simple mechanical manipulation. The resulting liquid, which has a muddy or *café-au-lait* appearance or is of a greenish hue if made from leaves, is now ready for consumption. The taste of the liquid is at first sweet, and then pungent and acrid. The usual dose corresponds to about two mouthfuls of the root. Intoxication (but this apparently only applies to those not inured to the use of the liquor) follows in about 20 minutes. The drunkenness produced by kava is of a melancholy, silent and drowsy character. Excessive drinking is said to lead to skin and other diseases, but *per contra* many medicinal virtues are ascribed to the preparation. There appears to be little doubt that the active principle in this beverage is a poison of an alkaloidal nature. It seems likely that this substance is not present as such (*i.e.*, as a free alkaloid) in the plant, but that it exists in the form of a glucoside, and that by the process of chewing, this glucoside is split up by one of the ferments in the saliva into the free alkaloid and sugar.

KAVADH, a Persian name which occurs first in the mythical history of the old Iranian kingdom as Kai Kobadh (Kaikobad). Other forms of Kavadh are Kabades and Kanades. It was borne by two kings of the Sassanid dynasty.

(1) KAVADH I., son of Pērōz, crowned by the nobles in 488 in place of his uncle Balash, who was deposed and blinded. At this time the empire was utterly disorganized by the invasion of the Ephthalites or White Huns from the east. After one of their victories against Pērōz, Kavadh had been a hostage among them during two years, pending the payment of a heavy ransom. In 484 Pērōz had been defeated and slain with his whole army. Balash was not able to restore the royal authority. The hopes of the magnates and high priests that Kavadh would suit their purpose were soon disappointed. Kavadh gave his support to the communistic sect founded by Mazdak, son of Bamdad, who demanded that the rich should divide their wives and their wealth with the poor. His intention evidently was, by adopting the doctrine of the Mazdakites, to break the influence of the magnates. But in 496 he was deposed and incarcerated in the "Castle of Oblivion (Lethe)" in Susiana, and his brother Jamasp (Zamaspes) was raised to the throne.

Kavadh took refuge with the Ephthalites, whose king gave him his daughter in marriage and aided him to return to Persia. In 499 he became king again and punished his opponents. He had to pay a tribute to the Ephthalites and applied for subsidies to Rome, which had before supported the Persians. But now the emperor Anastasius refused subsidies, expecting that the two rival powers of the East would exhaust one another in war. At the same time he intervened in the affairs of the Persian part of Armenia. So Kavadh joined the Ephthalites and began war against the Romans. In 502 he took Theodosiopolis in Armenia, in 503 Amida (Diarbekr) on the Tigris. In 505 an invasion of Armenia by the western Huns from the Caucasus led to an armistice, during which the Romans paid subsidies to the Persians for the maintenance of the fortifications on the Caucasus. When Justin I. (518–527) came to the throne the conflict began anew. The Persian vassal, Mondhir of Hira, laid waste Mesopotamia and slaughtered the monks and nuns. In 531 Belisarius was beaten at Callinicum. Shortly afterwards Kavadh died, at the age of eighty-two, in September 531.

During his last years Kavadh's favourite son Chosroes had had great influence over him and had been proclaimed successor. He also induced Kavadh to break with the Mazdakites, whose doctrine had caused great social confusion throughout Persia. In 529 they were refuted in a theological discussion held before the throne of the king by the orthodox Magians, and were slaughtered and persecuted everywhere; Mazdak himself was hanged. Kavadh evidently was, as Procopius (*Pers.* i. 6) calls him, an unusually clear-sighted and energetic ruler. Although he could not free himself from the yoke of the Ephthalites, he succeeded in restoring order in the interior and fought with success against the Romans. He built some towns which were named after him, and began to regulate the taxation.

(2) KAVADH II. SHEROE (Siroes), son of Chosroes II., was raised to the throne in opposition to his father in February 628, after the great victories of the emperor Heraclius. He put his father and eighteen brothers to death, began negotiations with Heraclius, but died after a reign of a few months. (ED. M.)

KAVALLA or **CAVALLA,** a walled town and seaport on the Bay of Kavalla, the capital of the Drama province of Greek Macedonia. Kavalla is built on a promontory stretching south into the bay, and opposite the island of Thasos. There is a harbour on each side of the promontory. The immediate hinterland is a rich tobacco-growing country, but Kavalla is handicapped by the fact that the railway from Salonika to Dedeagach runs through Drama, 22m. inland from the coast, with no branch line to Kavalla. Kavalla has belonged to Greece since the Balkan War of 1912–13. It was coveted by Bulgaria as a maritime outlet, and during the negotiations over the peace treaty of Neuilly (*q.v.*) with Bulgaria, M. Venezelos offered to connect Kavalla with the already existing narrow-gauge railway in the Struma valley, which runs from the Bulgarian side of the frontier to Sofia. This would have contributed to the fulfilment of Article 48 of the treaty, in which the principal Allies assured to Bulgaria an economic access to the Aegean Sea; but no action has been taken upon the offer of M. Venezelos.

Mehemet Ali was born at Kavalla in 1769, and founded a Turkish school which still exists. His birthplace can be distinguished by the tablet which the municipal authorities have affixed to its front wall. Numerous Roman remains have been found in the neighbourhood, of which the chief is the large aqueduct on two tiers of arches which still serves to supply the town and dilapidated citadel with water from Mt. Pangeus.

Kavalla has been identified with Neapolis, at which St. Paul landed on his way from Samothrace to Philippi (Acts xvi. 11).

KAVANAGH, ARTHUR MACMORROUGH (1831–1889), Irish politician, son of Thomas Kavanagh, M.P., who

traced his descent to the ancient kings of Leinster, was born in Co. Carlow, Ireland, on March 25, 1831. He had only the rudiments of arms and legs, but in spite of these physical defects had a remarkable career. He learnt to ride in the most fearless way, strapped to a special saddle, and also fished, shot, drew and wrote. He travelled extensively in Egypt, Asia Minor, Persia and India between 1846 and 1853, and after succeeding to the family estates in 1853 he married in 1855 his cousin, Frances Mary Leathley. He was a philanthropic landlord, and an active county magistrate and chairman of the board of guardians. A Conservative and a Protestant, he sat in Parliament for Co. Wexford from 1866 to 1868, and for Co. Carlow from 1868 to 1880. He was opposed to the disestablishment of the Irish Church, but supported the Land Act of 1870, and sat on the Bessborough Commission. In 1886 he was made a member of the Privy Council in Ireland. He died of pneumonia on Dec. 25, 1889, in London.

See S. L. Steele, *Arthur MacMorrough Kavanagh* (1891).

KAVASS, a Turkish name for an armed police-officer; also for a courier such as it is usual to engage when travelling in Turkey. (Adapted from the Turkish *qawwas,* a bow-maker; Arabic *qaws,* a bow).

KAVIRONDO, the general name of two distinct groups of tribes, one Bantu and the other Nilotic, who dwell in the valley of the Nzoia River, on the western slopes of Mount Elgon, and along the north-east coast of Victoria Nyanza. Both groups are immigrants, the Bantu from the south, the Nilotic from the north, the Bantu the first comers. The Nilotic tribes appear to have crossed the lake to reach their present home, the country around Kavirondo Gulf. The Bantu "are practically the most northerly representatives of that race" (Hobley). Their further progress north was stopped by the southward movement of the Nilotic tribes, who in turn were checked by Elgumi people from the east, themselves probably of Nilotic origin. Both groups of Kavirondo are physically fine, the Nilotic stock appearing more virile than the Bantu. The Bantu Kavirondo are divided into three main groups —the Awa-Rimi, the Awa-Ware and the Awa-Kisii. By the Nilotic Kavirondo their Bantu neighbours are known as Ja-Mwa. The generic name for the Nilotic tribes is Ja-Luo. The Bantu Kavirondo call them Awa-Nyoro. The two groups have many characteristics in common. A characteristic feature of the people is their nakedness. Among the Nilotic Kavirondo married men who are fathers wear a small piece of goat-skin, even when European clothing is worn. Among the Bantu Kavirondo married women wear a short fringe of black string in front and a tassel of banana fibre suspended from a girdle behind, this tassel having at a distance the appearance of a tail. Hence the report of early travellers as to a tailed race in Africa. The Nilotic Kavirondo women wear the tail, but dispense with the fringe in front. Some of the Bantu tribes practise circumcision, the Nilotic tribes do not. Patterns are tattooed on chest and stomach for ornament. Men, even husbands, are forbidden to touch the women's tails, which must be worn even should any other clothing be wrapped round the body. The Kavirondo are independent and honest. They practice polygamy. Among the Bantu tribes a man has the refusal of all the younger sisters of his wife as they attain puberty. The Nilotic Kavirondo practise exogamy. Girls are betrothed at six or seven, and the husband-elect continually makes small presents to his father-in-law-elect till the bride reaches womanhood. Premarital intercourse is permitted. Among the Bantus if the girl be not found a virgin on her wedding day, she is sent back to her parents, who have to return the marriage price, and pay a fine. The wife's adultery was formerly punished with death, and the capital penalty was also inflicted on young men and girls guilty of unchastity. Among the Bantu Kavirondo the usual minimum price for a wife is forty hoes, twenty goats and one cow, paid in instalments. The Nilotic Kavirondo pay twenty sheep and two to six cows. If a woman dies without bearing children, the amount of her purchase is returnable by her father, unless the widower consents to replace her by another sister. The women are prolific and the birth of twins, a lucky event, is celebrated by feasting and dances. Among the Bantu Kavirondo the mother of twins must remain in her hut for seven days. Among the Nilotic Kavirondo the parents and the infants must stay in the hut for ten days. If a Bantu mother has lost two children in succession the next child born is taken out at dawn and placed on the road, where it is left till a neighbour, usually a woman friend who has gone that way on purpose, picks it up. She takes it to its mother who gives a goat in return. A similar custom prevails among the Nilotic tribes. Names are not male and female, and a daughter often bears her father's name.

The Kavirondo bury their dead. Among one of the Bantu tribes, the Awa-Kisesa, a chief is buried in the floor of his own hut in a sitting position, but at such a depth that the head protrudes. Over the head an earthenware pot is placed, and his principal wives have to remain in the hut till the flesh is eaten by ants or decomposes, when the skull is removed and buried close to the hut. Later the skeleton is unearthed, and reburied with much ceremony in the sacred burial place of the tribe. Married women of the Bantu tribes are buried in their hut lying on their right side with legs doubled up, the hut being then deserted. Men of the Bantu tribes are buried in an open space in the midst of their huts; in the Nilotic tribes, a man may not be buried in the same house as his wife if she has pre-deceased him. A child is buried near the door of its mother's hut. A "mourning," a cord of banana fibre, is worn round the neck and waist. The chief chooses, sometimes years before his death, one of his sons to succeed him, often giving a brass bracelet as insignia. A man's property is divided equally among his children

The Kavirondo are an agricultural people: both men and women work in the fields with large iron hoes. In addition to sorghum, *Eleusine* and maize, tobacco and hemp are both cultivated and smoked. Both sexes smoke, but the use of hemp is restricted to men and unmarried women, as it is thought to injure child-bearing women The Kavirondo cultivate sesamum and make an oil from its seeds which they burn in little clay lamps. These lamps are of the ancient saucer type, probably introduced into the country by the coast people. Some tribes live in isolated huts, others in the north have strongly walled villages. The walls are of mud and formerly, among the Nilotic tribes, occasionally of stone. Their huts are circular with conical thatched roof, and fairly broad verandah all round. A portion of the hut is partitioned off as a sleeping-place for goats, and the fowls sleep indoors in a large basket. Skins form the only bedsteads. In each hut are two fireplaces, about which a rigid etiquette prevails. Strangers or distant relatives are not allowed to pass beyond the first, which is near the door, and is used for cooking. At the second, which is nearly in the middle of the hut, sit the hut owner, his wives, children, brothers and sisters. Around this fireplace the family sleep. Cooking pots, water pots and earthenware grain jars are the only other furniture. The food is served in small baskets. Every full grown man has a hut to himself, and one for each wife. The huts of the Masaba Kavirondo of west Elgon have the apex of the roof surmounted by a carved pole obviously a Phallus. Among the Bantu Kavirondo a father does not eat with his sons, nor do brothers eat together. Among the Nilotic tribes father and sons eat together, usually in a separate hut with open sides. Women eat apart and only after the men have finished. The Kavirondo keep cattle, sheep, goats, fowls and a few dogs. Women do not eat sheep, fowls or eggs, and are not allowed to drink milk except when mixed with other things. The flesh of the wild cat and leopard is esteemed by most of the tribes. From *Eleusine* a beer is made. The Kavirondo are plucky hunters, capturing the hippopotamus with ropes and traps, and attacking with spears the largest elephants. Fish, of which they are very fond, are caught by line and rod or in traps. Bee-keeping is common, and where trees are scarce the hives are placed on the roof of the hut. Among the Bantu Kavirondo goats and sheep are suffocated, the snout being held until the animal dies. The Kavirondo fight well. Their weapons are spears with rather long flat blades and broad-bladed swords. Some use slings, and most carry shields. Bows and arrows are also used; firearms are however displacing other weapons. Kavirondo warfare was mainly defensive and intertribal. When a man had killed his enemy in battle special rites were necessary to defend him from

the spirit of the dead man. Kavirondo industries are salt-making, effected by burning reeds and water-plants and passing water through the ashes; the smelting of iron ore (confined to the Bantu tribes); pottery and basket-work.

The Bantu Kavirondo have many exogamous totemic divisions. Their religion appears to be a vague ancestor-worship, but the northern tribes have two gods, Awafwa and Ishishemi, the spirits of good and evil. To the former cattle and goats are sacrificed. They believe in witchcraft and practise trial by ordeal. They dress wounds with butter and leaves, and for inflammation of the lungs or pleurisy pierce a hole in the chest. There are no medicine-men—the women are the doctors. Certain of the incisor teeth are pulled out. If a man retains these he will, it is thought, be killed in warfare. Among certain tribes the women also have incisor teeth extracted, otherwise misfortune would befall their husbands. For the same reason the wife scars the skin of her forehead or stomach. A Kavirondo husband, before starting on a perilous journey, cuts scars on his wife's body to ensure him good luck. The Kavirondo have four dances—the birth dance, the death dance, that at initiation and one performed in seasons of drought. They use a large lyre-shaped instrument and various drums. The Nilotes call their supreme being Nyasi who is to be found in large trees. Sickness is attributed to magic or ghostly visitation.

The Ja-Luo women use as ear ornaments small beads which are ancient, being generally blue, occasionally yellow or green, and are picked up in certain districts after heavy rain, supposed to come down with the rain. They are identical in shape and colour with ancient Egyptian beads.

See C. W. Hobley, *Eastern Uganda, an Ethnological Survey* (Anthrop. Inst., *Occasional Papers*, No. 1, London, 1902); Sir H. H. Johnston, *Uganda Protectorate* (1902); J. F. Cunningham, *Uganda and its Peoples* (1905); Paul Kollmann, *The Victoria Nyanza* (1899); Rev. J. Roscoe, Northern Bantu (1915).

KAW (*Akha*), a tribe living in Kengtung and the hills east of the Mekong on the Burma-Siam frontier, probably allied to the Lolos, etc. (*See* MAN.) They have at least seven tribal divisions; practise a form of ancestor-worship; fortify their villages; bury their dead in coffins, placing no mark over the grave; eat dogs; play the gourd mouth-organ, and are believed to have migrated from Yunnan. They are reported to be stolid, timid and unresourceful in character.

See Scott and Hardiman, *Gazetter of Upper Burma* (1900).

KAWACHI, one of the five home provinces or *Go-kinai* of Japan, lying near Kyōto. It contains the Hakuzan or White Mountain (8,920 ft.) and is renowned for the manufacture of Kaga porcelain. *See* JAPAN.

KAWAHLA: *see* ARABS.

KAWARDHA, a feudatory state of India within the Central Provinces, to the west of the Bilaspur district. Area 798 sq.m.; pop. (1921) 61,783, showing a fall in the decade from 77,654. Half the State consists of hill and forest, but the open area is fertile and produces besides millets, wheat, cotton and rice. The State has suffered greatly from bad crops in the past and has never fully recovered from the effects of the great famines at the end of the last century. There was very considerable temporary migration on account of scarcity at the time the last census was taken. The residence of the Chief, who is a Raj Gond, is at Kawardha (pop. 4,773) which is also the headquarters of the Kabirpanthi sect.

KAWIA TRIBE. A Shoshonian tribe inhabiting south-west California. *See* NORTH AMERICA: *Ethnology.*

KAY, JOHN (1742–1826), Scottish caricaturist, was born near Dalkeith. He went to Edinburgh, painting miniatures and publishing at short intervals his sketches and caricatures of local celebrities and oddities, who abounded at that period in Edinburgh society. He died on Feb. 21, 1826.

Kay's portraits were collected by Hugh Paton and published under the title *A series of original portraits and caricature etchings by the late John Kay, with biographical sketches and illustrative anecdotes* (Edin., 2 vols. 4to, 1838; 8vo ed., 4 vols., 1842; new 4to ed., with additional plates, 2 vols., 1877).

KAY, JOSEPH (1821–1878), English economist, was born at Salford, Lancashire, on Feb. 27, 1821. Educated at Trinity college, Cambridge, he was called to the bar in 1848, and in 1869 became queen's counsel. He is best known for his works on the social conditions of the poor in various European countries. He died at Dorking, Surrey, on Oct. 9, 1878. His works include: *The Education of the Poor in England and Europe* (1846); *The Social Condition of the People in England and Europe* (2 vols., 1850); *The Condition and Education of Poor Children in English and German Towns* (1853); and *The Law Relating to Land* (1879).

KAYAK or **CAYAK,** an Eskimo word for a fishing boat, in common use from Greenland to Alaska. It has been erroneously derived from the Arabic *caique,* supposed to have been applied to the native boats by early explorers. The boat is made by covering a light wooden framework with sealskin. A hole is pierced in the centre of the top of the boat, and the *kayaker* (also dressed in sealskin) laces himself up securely when seated to prevent the entrance of water. The kayak is propelled like a canoe by a double-bladed paddle. The name *kayak* is properly only applied to the boat used by an Eskimo man—that used by a woman is called an *umiak.*

KAYANS. The Kayans are a cultured people who, from the Northern Central region, where the district Apo Kayan preserves their history, have gradually made their way to the coast of Borneo in search of better lands, and are commonly found about the middle reaches of the great rivers. In appearance they have a Mongol rather than a Caucasian cast of face, with a broad nose and reddish skin, and are heavily built, with stout joints and a general anatomical crudeness. In Borneo they have been a conquering people among tribes of a lower culture, taking their characteristic habits with them, but neither imposing their way of life upon other tribes nor mixing very freely with them. Their particular activities are the building of long houses and boats, the cultivation of rice (doubtless brought with them on their first appearance in Borneo) and working in iron, in which their skill is surpassed only by the best Kenyah work.

Though a warlike and conquering people, Kayans are neither aggressive nor truculent; their qualities are rather slowness and certainty, than enterprise or enthusiasm. (*See* BORNEO.)

BIBLIOGRAPHY.—C. Hose and W. McDougall, *The Pagan Tribes of Borneo* (1912). (C. H.)

KAYASTH, the "writer"-caste of Bengal. They claim to be Kshatriyas who took to clerical work. They secured many offices under Mohammedan, and occupy more under British rule. (*See* CASTE: *Indian.*)

KAYSER, HEINRICH GUSTAV JOHANNES (1853–), German physicist, was born at Bingen on the Rhine on March 16, 1853. He was educated at Strasbourg and Berlin, and has held the following posts: assistant in the Physical institute, Berlin (1878–85), professor in the Technische Hochschule, Hanover (1885–94), and professor of physics at Bonn (1894–1920). His early research work was on sound, and he published papers on the determination of the ratio of the specific beats of air by measuring the velocity of sound in air, effect of intensity on the velocity of a sound wave, the velocity of sound in wood and other similar subjects. His name, however, is associated with his later work on spectroscopy; a good deal of this work was done in conjunction with Runge. They carefully mapped a large number of spectra of the elements, using a Rowland grating, and discovered the existence of a series in the spectra of the elements. They developed a formula connecting the wave-length of the lines with constants depending on the element. About the same time Rydberg used the data of other workers and developed a similar formula. Kayser wrote *Lehrbuch der Spectralanalyse* (1883); *Lehrbuch der Physik für Studierende* (1890), and *Handbuch der Spectroskopie* (1900), (Vols. I.–VI. 1900–1913); *Tabelle der Schwingungszahlen* (1925); *Tabelle der Hauptlinien der Linienspektra aller Elemente nach Wellenlänge geordnet* (1926).

KAY-SHUTTLEWORTH, SIR JAMES PHILLIPS, 1st BART., cr. 1849 (1804–1877), English politician and educationalist, was born at Rochdale, Lancashire, on July 20, 1804, the son of Robert Kay. He qualified in medicine at Edinburgh university, and practised in a poor district of Manchester. In 1839 he was appointed first secretary of the committee formed by

the privy council to administer the Government grant for the public education in Great Britain. He founded at Battersea, London, with E. Carleton Tufnell, the first training college for school teachers (1839–40). He died in London on May 26, 1877.

KAZAKSTAN, an autonomous Socialist Soviet republic of the Russian S.F.S.R. stretching between 40° 15′ N., and 55° 30′ N., and 46° 30′ E. and 87° E., occupying 2,960,000 sq.km. In size it is the second republic in the U.S.S.R.; Yakutsk (area 4,023,407 sq.km.), being the first. Its boundaries are Bashkiria, the Uralsk area, and the Siberian area on the north; the Oirat autonomous area, and Chinese Turkistan on the east; the Kirghiz A.S.S.R., Uzbekistan and Turkmenistan on the south; the Caspian sea, and the provinces of Astrakhan, Stalingrad and Samara on the west. It is essentially a steppe area in a region of increasing desiccation, and much of it is characterised by salt lakes, some temporary and rapidly drying, and by rivers which once reached the sea by linking with larger streams, but now lose themselves in the desert sands. In the west the low Mugojar hills, *c.* 1,000 ft., are really a plateau-like extension of the Urals. They are built up of Permian and Cretaceous deposits and deeply entrenched by rivers. To the west of them lies the Kazak province of Uralsk, a region of steppe and desert inclining imperceptibly to the Caspian, much of it lying below sea-level. It is drained by the Ural or Yaik river, many of whose former tributaries, both on the left and right bank, now lose themselves in the desert The Emba river, flowing from the Mugojar hills, reaches the Caspian by a series of rapidly drying shallow lagoons which even as late as the 18th century were navigable The winter climate of Uralsk (av. Jan. temp. 3° F) is colder than that of Finland (average July temperature 73° F). It is under the regime of the Asiatic winds, and is a drought area, with sandstorms in summer and snowstorms and biting winds in winter. The Ural river is frozen from November to mid-March at Guryev and farther north until mid-April, and is sufficiently full to flood its banks in spring, but is otherwise so shallow that it is not navigable. Pallas found 19 branches of the delta in 1769, but in 1821 only 9 remained and of these only three now remain, except in spring. To the north the Mugojar hills join the undulating plateau, built up of sandstones and marls, which separates the tributaries of the Tobol and the Ural and falls by steep crags, a former coast line, to the Turgai steppe. Remains of aquatic plants, and shells of Mytilus and Cardium, both still found in the sea of Aral, show that during the glacial period the Aral-Caspian sea covered the Turgai steppe, which is now about 300 ft. above sea-level. It is dotted with lakes, of which Chalkar-Teniz, into which the Turgai river and its tributary, the Irgiz, drain, is the largest. At a recent epoch the Turgai river received tributaries now lost in the sands and was of sufficient volume to reach the Sea of Aral. The climate of the Turgai steppe is extreme, average January temperature −4° F, average July temperature 73° F in N.W., and 7° F and 77° F in the south. The west winds are parched before they reach the area, and the north-east winds in summer bring sandstorms and in winter dry, cold, stinging snow. Precipitation varies from 10 to 12 in., about 3 in. falling in summer.

Shrubs such as the wild cherry (*Cerasus chamaecerasus*) and dwarf almond (*Amygdalus nana*) grow on the hilly slopes, while the rich black earth of the northern steppe is clothed with feather grass (*Stipa pennata*). In spring the grass vegetation is abundant, and geese and cranes are attracted in vast numbers from the heart of the steppe by the fields of the Kirghiz. The jerboa (*Dipus jaculus*) and the marmot (*Spermophilus rufescens*), another species of marmot (*Arctomys bobac*) and the steppe fox (*Canis corsac*) are characteristic. The Central Asian saiga antelope is occasionally met. Farther south the black earth is replaced by chestnut brown and alkaline soils and the *Stipa pennata* gives place to *S. capillata.* River willows and pseudo-acacia or Siberian pea-tree (*Caragana microphyla*) grow near the streams. The clayey soil of the centre is covered with wormwood (*Artemisia fragrans and A. monogyna*), with a few grassy plants near the rivers and lakes. Large areas consist of shifting sands and saline clays clothed with *Salsolaceae,* and the desiccated beds of old lakes. Thickets haunted by wild boars surround many lakes.

THE AGRICULTURAL SETTLEMENTS

East of the Turgai lies Akmolinsk, low and dotted with salt lakes on the north, but rising to an undulating plateau in the centre, the dying down of the Tarbagatai and Chinghiz-tau ranges. It is deeply cut by the northward flowing Ishim, and this northern region is fertile and dotted with agricultural settlements. Akmolinsk town has an average Jan. temperature of 1·5° F, July 70° F, rainfall 9 in. South of the plateau, however, lies the desert region of the lesser Moyun-kum and the Bak-pak-dala or Famine Steppe, a plateau lying between the Sary-su and the Chu rivers. The surface of this arid region is a friable sand, resting on chalk or chalky marl. Along the course of the Chu are Palaeozoic formations of the Devonian period, and limestone rocks containing fossils. Vegetation and water are entirely absent in the Famine steppe, which presents great difficulties to the nomad herdsmen and to the caravan traders, and has thus earned its name. The most easterly province is Semipalatinsk, on the fringes of the Tian Shan mountain system. The snow-clad ranges of the Altai and Narym enter it on the south-east, stretching southwards to Lake Zaisan. The Kalbin (5–6,000 ft.) range continues from them westwards, and between the Kalbin and Narym is a broad valley through which the Irtish flows north-east from Lake Zaisan, and then turns north-west, cutting its way through the Altai, by a wild gorge with dangerous rapids, down which boats are daringly floated. Lake Zaisan, 80 m. long and 10–20 m. wide, is navigable for steamers, which may also pass down the Black Irtish to Kulja in Chinese Turkistan. Many extensions of the Kalbin-Narym complex stretch northwards. South of Lake Zaisan, the Tarbagatai (Marmots') Range 9–10,000 ft., extends westward, and the lower, but wild Chinghiz-tau, sends spurs into the steppe The Kizil-rai, further west, rises to 4,821 ft. Many varieties of crystalline rocks, granites, syenites, diorites, porphyries and slates are found in the mountain region, and there are gold-bearing sands, silver, lead, graphite, coal and precious stones. The boulders on the mountains indicate a former much wider extension of glaciation. There are forests in the mountain region and on the Irtish plain, with Siberian flora in the north and Central Asiatic in the south. Wide steppes fill the space between the mountains; the Zaisan steppe between the Altai and Tarbagatai is 1,200–1,500 ft. above sea-level. In accord with its more continental situation the climate of Semipalatinsk is extreme Frosts of −44° F are not uncommon in winter and summer may reach 122° F in the shade. Precipitation is slight, and rain falls in sudden heavy storms that may render the ground impassable for camels and cause disaster to the caravans. It is calculated that quite as many deaths in the steppe-desert fringe are due to starvation through these storms obliterating tracks and making it impossible for camels to move, as to thirst.

The two great lakes in Kazakstan are Balkhash or Denghiz and the Aral Sea. East of Balkhash lies Lake Ala-kul, which in post-Pliocene times was linked with it. Sissik-kul, to the north-west, and Ala-kul, are connected by a chain of smaller lakes. To the south and east of Lake Balkhash lie the sandy deserts of the Sary-Ishik-Otrau and the Tau-kum, through which the Ili discharges by a delta into Lake Balkhash. From these the land rises in the south to the Kunghei Ala-tau, north of Lake Issyk-kul, which dies out in the lower north-western spur, the Chan-tau. In the valleys and mountains, the climate is modified, and Alma-Ata, altitude 2,405 ft , has an average January temperature 17° F, July 74° F, rainfall 21 in. per annum. Eastwards and southwards from the Sea of Aral stretch the sandy deserts of Kara-Kum and Kizil-Kum (*q.v.*), and to the north of the Syr-Darya, south of the Akmolinsk district, lies the great Moyun-Kum stretch of sandy desert. West of the Aral Sea, between it and the Caspian, lies the barren Ust-Urt plateau, consisting mainly of alkaline and gypsiferous desert, with patches of dry sandy desert.

CONDITIONS OF THE PEOPLE

The geographic conditions favoured cattle breeding of a nomadic type from earliest times, and the isolation and vast extent of the difficult steppe-desert have preserved this primitive nomadic life of herdsmen up to present times, though in diminishing num-

bers. After the Russian conquest, up to the latter half of the 19th century, the occupation of the region was purely strategic, but then agricultural settlement began in the northern black earth region and in the south-east, where irrigation could be practised, and even in these vast territories the pressure of settled cultivation on nomad herding begins to be felt severely and the region is in a transition state to agriculture wherever possible, with consequent limitation of movements of herds and need for replacing extensive by intensive breeding, with supplementary foods to pasture. Already a few winter camping grounds with provision of artificial foods have been arranged. Of the population of Kazakstan in 1926, about six and a half million, 62% were Kazaks, 19·7% Russians, 13·2% Ukrainians, 3·3% Uzbeks, and 1·8% Kara Kalpaks. Thus 32·9% of the population were Russian colonists, and it is estimated that of the total area under cultivation, at least 20% is in the hands of Kazaks who have taken to a settled life.

The Kazaks are a branch of the Kirghiz, a name applied to them by the Russians, their own name for themselves being Kazaks, said to mean "riders." The name was borrowed by the Russians and the term *Cossack* applied to Russian soldiery must be distinguished from that of the Kirghiz-Kazak. They are of Turkish origin, allied in physique to the Mongolians, and in language to the Tatars. They are of medium stature, square built, with black hair, small, black, oblique eyes, broad flat nose, high cheek-bones, small hands and feet. They are brachycephalic and have a brown or swarthy complexion. The Kazaks of the steppe region, however, have intermarried with Finns in the north, and light eyes and complexion occur among them They ride on horseback from earliest infancy and keep flocks of sheep, goats and camels, both horses and camels being small, sturdy, and very shaggy Though nominally Mohammedans of the Sunnite sect since the 16th century, their type of life prevents the observance of strict rules; their women go unveiled; ablutions in the great scarcity of water are impossible; the fasts imposed by nature take the place of religious fasts, and mosques and mullahs are absent. Their herds supply them with food and clothing, but in summer butter, sour cheese and "kumiss" or fermented mare's milk are the staple food; meat must then be eaten sparingly in order to preserve the flocks, depleted by wolves, storms, and exchange for necessities. An example of the severity of the storms is that of 1827, recorded by Helmersen, when a blizzard swept over the region between the Volga and the Urals and in two days the Kirghiz of the Inner Horde lost 280,000 horses, 30,480 oxen and 1,012,000 sheep, in addition to camels. The recurrent droughts and famines of the cultivated areas have their repercussions on the steppe, when supplementary barley for the horses and flour for the "balamyk," flour fried in dripping and diluted in water, are unobtainable, and the increased aridity cuts off water supplies in wells and streams. The 1921 famine, following on the requisition of horses and sheep for military needs, diminished the flocks so severely that the number in 1923 was only about 30% of that in 1916. In 1923 the numbers began to increase and in 1926–7, the total number was about 30,000,000, more than half being sheep, draught cattle coming next, then horses, goats, camels and pigs. The amount of recovery still needed is indicated by the fact that before the World War draught cattle alone numbered 35 million. The increase in the number of horses, here as everywhere in Russia, lags behind that of sheep, cattle and pigs.

The women are occupied in spinning and weaving wool and in making felt, often of gay colours, and rugs of every shade and pattern. Clothing is of sheepskin and felt, supplemented by cotton head-dresses for the women. Milk, cheese and butter are kept in partially dressed sheepskins, and a certain amount of leather dressing is carried on. Their round tents are made of a folding willow-lattice frame, covered with felt, and rugs, wooden bowls and sheepskin bags are their main furniture. For fuel they rely mainly on the *saksaul scrub*, and on dried dung. The Kirghiz flocks are an important source of raw wool and leather to the factories of industrial Russia and 2,443,000 dekatons of wool were supplied in 1926–7 and about 6,000,000 hides. A difficult problem is the recurrence of cattle murrain in a district where veterinary centres are few and restrictions on cattle movement impossible. Dysentery, smallpox, typhus, Siberian plague and malaria often work havoc among the nomads, for whom no medical aid is available; in illness they rely on Shamanistic practices. Their healthy out-of-door life is balanced against the great hardships of their extreme climate, their monotonous and often insufficient diet and their lack of sanitary practices. Thus they succumb easily to disease in spite of their robust appearance. About 95% of them are illiterate and this adds to the difficulty of inculcating hygiene for themselves and their flocks.

The first authentic reference to the Kazaks is that of the Persian, Firdousi (1020). S. Herbertstein (1486–1566) refers to them as *Tatars*. They came under the sway of Jenghiz Khan, and afterwards were allotted to the Golden Horde. Fragments of the Golden Horde, *e.g.*, Kipchaks, Naimans, Konrats, Jalairs, Kankali are still to be traced in the names of tribal Kazak divisions. The Kirghiz-Kazaks have long been grouped into three large "hordes," the great, the little and the middle, said to be due to their division by a Khan among his three sons. The great horde chiefly occupies the east from Semipalatinsk, to the Ala-tau; the middle horde occupies the water-shed between the Aral-Caspian and the Ob river, being most numerous in the Semipalatinsk and Akmolinsk districts, while the little horde is mainly found in the Orenburg, Uralsk, Turgai and Astrakhan regions. The two latter accepted Russian rule in 1730 and the former in 1798–1819. Since 1801, a fourth horde, the inner or Bukeyevskaya, has been settled in the Orenburg steppe. These hordes are subdivided into races, and again into tribes, and the tribes into sections, branches and "auls," or communities of 5 to 15 tents or "kibitkas." Through all their troubled history they have retained these divisions, which were still closely adhered to in 1928.

Cultivation in the Kirghiz A S S R is densest along the northern valley of the Ural river, especially from Uralsk to Ilek, along the Tobol river in the Kustanai district, along the right bank of the Ishim, in the Kokchetav-Atbazar-Akmolinsk district, and in a little patch near the town of Semipalatinsk. Less dense patches of cultivation fringe the eastern and southern mountains along the loess terraces and extend along the Syr-Darya as far as Kyzil-Orda. Of the crops, wheat 63%, is the main, millet, oats, rye, sunflower seed, flax, hemp and cotton are also grown. Rice is increasing in quantity. Much of the grain is exported to Central Asia. Tobacco and the opium poppy are cultivated, and near Lake Balkhash the *kendyr* plant, whose fibres are valuable, grows wild. Irrigation culture is peculiarly dependent upon good government, and the disorders of 1914–1921 severely affected the region; by 1927 the irrigated area was still only 82% of that of 1915. Fishing and hunting form a supplementary source of income, the latter in the mountain region, and about £960,000 worth of furs were exported in 1925–6. The republic is rich in mineral wealth, as yet little exploited. The copper mines were re-started in 1925 and the output in 1926–7 was 700,000 tons. The mines working are Spasski, Atlas, Riddersk and Atbazar. Lead and zinc are also worked at the latter, and the lead mines of Ekibastus give gold as a by-product. Gold is also obtained from the Turgai steppe, and gold, lead and zinc occur in the Altai. The extensive Karagandinsk coal beds near Spasski, are comparatively little worked. Naphtha is increasingly worked on the Emba river; the output 1926–7 was 250,000 tons. Silver is mined in a primitive way. The coal, naphtha, ozokerite and bitumen of the Mangishlak peninsula are as yet unworked Salt is obtained from the Iletsk rock salt beds, and from the lakes of the Pavlodar district and Glauber's salt from Kara Bugaz gulf; salt fish is exported from the Caspian and Aral regions. The industries of the republic include leather, flour, food-stuffs and printing. There is a large cloth factory in Alma-Ata and a chemical works and santonin factory in Chimkent. *Kustar* (home) industries include the making of woollen goods, felt, carpets, sheepskin garments and leather goods. The timber area of the foothills and mountains on the east and south is great and with better transport could be made available for areas where irrigation is necessary and wood needed. It could also supplement the deficient fuel supply.

A sign of the transition taking place in the steppe district is the rapid growth of towns, and the contrast between their elec-

tricity, radio and railway stations, and cinemas, and the primitive huts of the nomad herders is sharp. Semipalatinsk, the largest, had a population (1926) of 56,411, Alma-Ata, the administrative centre, 45,379, Petropavlovsk 44,272, Uralsk, Kustanai, Kyzil-Orda, Aktyubinsk, Chimkent and Turkistan, between 22,000 and 35,000.

Guryev, at the mouth of the Ural and Fort Alexandrovsk on Mangishlak peninsula are small ports on the Caspian. The only railway is part of the Orenburg-Tashkent line from which a branch goes from Arys to Alma-Ata, which is to be linked with Semipalatinsk. Work has been begun from both ends, and it is hoped that the line will be working by 1933. Considering that the republic covers an area as large as Germany, France, Spain and Italy combined, the inadequacy of railway communication is evident. Much trade is still, therefore, done by camel caravan across the desert and steppe. Bazaars and fairs are numerous. The republic shows a marked deficit in its budget, but it is hoped that the new railway link will open up trading and mining prospects and remedy this, and will also develop cultivation of wheat and cotton for export. Serious efforts are being made to cope with illiteracy and to increase the possibilities of education for the Kirghiz-Kazak children, always a difficult problem in a nomad district with poor communications. The difficulty here is complicated by the lack of Kirghiz-Kazak teachers, and short courses to enable teachers to reach literacy standard have been arranged. There are 20 centres where children may board during their education, and about 200,000 children are receiving primary education, though a large percentage of these are town children. Kazakstan was a region where war and famine resulted in numbers of children becoming homeless wanderers, and in 1924 of 30,036 such children, 11,429 had been accommodated in 160 orphanages.

D. Haviland, *Forest, Steppe and Tundra* (1926).

KAZALA or KAZALINSK, a town in the Syr Darya province of the Kazakstan A S S.R., at the point where the Kazala river falls into the Syr Darya about 50 m. from its mouth in the Aral sea in 45° 45′ N. and 62° 7′ E. Pop. (1926) 6,961. The floods in the river make it an island in spring; in summer it is parched by the sun and hot winds, and hardly a tree can be got to grow. The streets are wide, but the houses, as well as the fairly strong fort, are built of mud bricks It is a station on the Orenburg-Tashkent railway and a centre for the wool trade with the Kirghiz; it has a wool cleaning factory and an electric plant.

KAZAN (called by the Cheremisses Ozon), the chief town of the Tatar Autonomous Socialist Soviet Republic, situated on the Kazanka river, in 55° 50′ N., 49° 10′ E., 3 m. from the Volga, which reaches the town in the spring floods only Pop. (1926) 174,732, mainly Russian, though the Tatar element is rapidly increasing. It is a flourishing river port and has railway communication westward and eastward. The ancient leather industry, dating back to the Bolgar empire on the Volga, is still important and there are 18 leather factories in the town, a good number making morocco leather goods. It is famous for its soap, glycerine and toilet article factory, the largest in Russia up to 1914. It closed during the war and famine period, but is now working at full strength. There are also copper-smelting, machinery, tallow, tobacco, felt boot, textile and brewing industries. The Kazan fair was formerly a great centre for trade between western Russia and Persia and Turkestan, and was held on an island in the Volga opposite to the town.

Kazan was a centre of Mohammedan culture in pre-1914 times, and had an important printing press This press now issues Tatar magazines, newspapers, school text-books, and a bulletin of research into Tatar culture Among the educational institutions are the Communist Tatar university, an Oriental Pedagogical institute, a Department of Agriculture and a Clinical observatory. The House of Tatar Culture was opened in 1926. Kazan is of peculiar interest as a place where waves of Slav influence from the west have alternated with Mongol influences from the east, the latter being predominant culturally to-day, while the former still has the political supremacy. The 13 mosques of the Islamic faith, where, though the Revolution has had some effect, the muezzin still calls the faithful to prayer five times a day, stand side by side with the numerous churches of the Slav Greek Orthodox faith. The ancient Kremlin or citadel, founded in 1437, within which were many beautiful churches and monasteries, and the red brick Suyumbeka tower (246 ft.) the reputed burial place of a Tatar saint, also contained an arsenal.

During the civil war following the 1917 revolution, Kazan, as a military centre, became the headquarters of the Bolshevist command in the district, after the fall of Simbirsk (Ulianovsk). The Czech army captured it in Aug. 1918, but it was re-captured by Trotsky in September, and was attacked by Kolchak's army in 1919. Much of the town was damaged or destroyed during this period, the Kremlin, as an arsenal, suffering specially. The 1921 famine was particularly severe in the Tatar republic and the town still feels the effect of these disasters. One of the first activities since its revival has been an effort to restore as far as possible, the damaged Kremlin buildings. The treasures of the cathedral of the Annunciation (1562) have been removed to museums, but the cathedral itself still stands. The famous miracle working image of the Black Virgin of Kazan used to be housed in the Bogoroditski convent, built for its reception in 1579, but was removed to Moscow in 1612 and St. Petersburg (Leningrad) in 1710. The city of Kazan originally stood 30 m. N.E. of its present position, where traces of it can still be seen and 60 m. S. of Kazan are the ruins of Bolgary (*see* TATAR AUTONOMOUS SOCIALIST SOVIET REPUBLIC). Kazan was the capital of the kingdom founded by Ulugh Mohammed (Ulu Makhmet), khan of the Golden Horde, in 1438, but was captured by Ivan the Terrible of Russia in 1552, thus opening the Volga to Russian trade and settlement. Pugachev laid the city waste in 1774 and it was afterwards frequently destroyed by fire.

See Pineghin's *Kazañ Old and New* (in Russian); Velyaminov-Zernov's *Kasimov Tsars* (3 vols., St. Petersburg, 1863–66); Zarinsky's *Sketches of Old Kazañ* (Kazañ, 1877); Trofimov's *Siege of Kazañ in 1552* (Kazañ, 1890); Firsov's books on the history of the native population (Kazañ, 1864 and 1869); and Shpilevski, on the antiquities of the town and Government, in *Izvestia i Zapiski* of the Kazañ university (1877). A bibliography of the Oriental books published in the city is printed in *Bulletins* of the St. Petersburg Academy (1867). *Cf.* also L. Léger's "Kazañ et les tartares," in *Bibl. Univ. de Genève* (1874). *See* also the bulletins now issued regularly by the press of the Tatar A.S.S.R.

KAZBEK (Georgian, *Mkin-vari;* Ossetian, *Urs-khokh*), one of the chief summits of the Caucasus, situated in lat. 42° 48′ N., long. 44° 29′ E., altitude 16,545 ft. It rises on the range which runs north of the main water parting and which is pierced by the gorges of the Ardon and the Terek. It represents an extinct volcano, built up of trachyte and sheathed with lava, and has the shape of a double cone, whose base lies at an altitude of 5,800 ft. Owing to the steepness of its slopes, its eight glaciers cover an aggregate surface of not more than 8 sq.m , though one of them, Maliev, is 36 m. long. The heights of the lower terminations of these glaciers vary from 7,532 ft. for Devdorak, the best known of them, to 9,793 ft. for the Shau glacier. The Ardon and Terek rivers are glacial in origin. At the eastern foot runs the Georgian military road through the pass of Darial (7,805 ft.). The summit was first climbed in 1868 by D. W. Freshfield, A. W. Moore and C. Tucker, with a Swiss guide. Several successful ascents have been made since, the most valuable in scientific results being that of Pastukhov, (1889) and that of G. Merzbacher and L. Purtscheller in 1890. Many primitive legends gathered round its naked, austere sides, with the vast snowy dome above them, and in monastic times its treasures were reputed to include the tent of Abraham and the cradle of Christ. It has a great literature and has left a deep mark in Russian poetry. At its foot lies the village and posting station of Kazbek, so named by the Russians after a native chief, Kazibeg. This name was printed in atlases and so has superseded the more poetic native names, "Christ's Moun-

tain," "White Mountain," "Ice Mountain," etc. Antiquities dating from the iron age have been found at the village, and at a site 2,000 ft. above it.

KAZERUN, a town of Persia, in the province of Fars, situated in the midst of a plain, amongst lofty limestone ridges, 29° 37′ N., 51° 43′ E., at an elevation of 2,800 ft., on the main road between Bushire (96 m.) and Shiraz (70 m.), now passable for light motor cars. The town is unwalled and has a population of about 7,000; the water supply is from wells and pipes, as there is no river. Adjoining the town on the west is the famous Nazar garden with fine avenues of orange trees, first planted by a former governor in 1767. In the vicinity lies the Daryacheh Famur, a very salt lake teeming with fish. The town is surrounded by tobacco fields, and a horse-market much frequented by the nomad tribes is held there. Other products of the district are rice of excellent quality, cotton and opium. Wild almond trees are very numerous and the produce is largely exported. In former times a special kind of cotton stuff called *shatawi* was made at Kazerun. Twenty miles to the south, are the ruins of Shapur (Sabur) where are Sassanian bas-reliefs and, in a cave, a statue of that monarch. A couple of miles north of the town are the imposing ruins of a marble building said to stand over the grave of a Shaikh Amin ed Din Muhammad (d. A.D. 1339) and south-east on a high mound are the ruins of buildings with underground chambers known as Qaleh i Gabr, or the castle of the fire-worshippers.

KAZINCZY, FERENCZ (1759–1831), Hungarian author, was born on Oct. 27, 1759, at Ér-Semlyén, in the county of Bihar, Hungary. He studied at Kassa, Eperies and Pest. In 1784 Kazinczy became subnotary for the county of Abaúj; and in 1786 was nominated inspector of schools at Kassa. There he worked for the restoration of the Magyar language and literature by translations from classical foreign works, and by the augmentation of the native vocabulary from ancient Magyar sources. In 1788, with Baróti Szabó and John Bacsányi, he started at Kassa the first Magyar literary magazine, *Magyar Muzeum;* the *Orpheus,* which succeeded it in 1790, was his own creation. As a non-Catholic Kazinczy was obliged to resign his post at Kassa on the accession of Leopold II. He assisted Gideon Ráday in the establishment and direction of the first Magyar dramatic society, and enriched the repertoire with translations from foreign authors. Implicated in the democratic conspiracy of the abbot Martinovics, Kazinczy was arrested on Dec. 14, 1794, and condemned to death; but the sentence was commuted to imprisonment. He was released in 1801, and retired to his estate at Szephalom, where he died on Aug 22, 1831. Kazinczy was one of the founders of the Hungarian Academy.

A collective edition of his works (*Szép Literatura*), consisting for the most part of translations, was published at Pest, 1814–1816, in 9 vols. His original productions (*Eredeti Mukái*), largely made up of letters, were edited by Joseph Bajza and Francis Toldy at Pest, 1836–1845, in 5 vols. Editions of his poems appeared in 1858 and in 1863.

KAZVIN (Qazvin), a province and town of Persia. The province is bounded on the north by Gilan and Mazanderan, west by Khamseh, east by Tehran and south by Hamadan and is pre-eminently a grain and fruit producing district, great quantities of the latter being dried and exported. The revenue in 1926–27 was 3,012,190 krans (about £66,937).

Kazvin, the chief town, 36° 15′ N. and 50° E., is 100 miles from Tehran, at the foot of the southern slope of the Elburz range at an altitude of 4,165 ft. The population is variously estimated at 50,000–100,000. It is an important centre of roads which have been made more or less suitable for carriage and motor traffic—to Tehran, to Pahlavi on the Caspian, to Tabriz, and to Hamadan—and it carries on a thriving transit trade. It is especially a market for the raw silk, rice and fish of Gilan, and manufactures carpets

The city, founded by Shapur II., was a strong place in early Persian times and flourished greatly under the Muslims. Harun-ar-Rashid built a mosque there and showed it distinguished marks of favour. Though ruined later by the Mongol invasion at the beginning of the XIIIth century, it revived again under the Safavis. Tahmasp I. (1524–76) made it his capital and Abbas I. adorned it with fine buildings, but transferred the seat of government to Isfahan. In 1723 its inhabitants drove back the Afghans. More than once the town has been damaged by earthquakes.

KEA, a parrot allied to the nestor (*q.v.*) and, like it, confined to New Zealand. Originally feeding on carrion, grubs, fruits and seeds, the kea (*Nestor notabilis*) came to rely more and more upon the offal of slaughter-houses on the sheep-runs. This taste for flesh has led it to acquire the habit of attacking living sheep. It is particularly fond of the kidneys, which it obtains by pecking its way through the flesh of the back.

See G. R. Marriner, *The Kea* (Christchurch, 1909).

KEAN, CHARLES JOHN (1811–1868), son of Edmund Kean, was born at Waterford, Ireland, on Jan. 18, 1811. After three years at Eton he was offered, in 1827, a cadetship in the East India Company's service, which he was prepared to accept if his father would settle an income of £400 on his mother. The elder Kean refused to do this, and his son determined to become an actor. He made his first appearance at Drury Lane on Oct. 1, 1827, as Norval in Home's *Douglas.* At Glasgow, on Oct. 1 in the following year, father and son acted together in Arnold Payne's *Brutus,* the elder Kean in the title-part and his son as Titus. After a visit to America in 1830, he appeared in 1833 at Covent Garden as Sir Edmund Mortimer in Colman's *The Iron Chest.* He then returned to the provinces, but in January 1838, he returned to Drury Lane, where he played Hamlet with great success. He married the actress Ellen Tree (1805–1880) on Jan. 29, 1842, and paid a second visit to America with her from 1845 to 1847. Returning to England, he entered on a successful engagement at the Haymarket, and in 1850, with Robert Keeley, became lessee of the Princess Theatre. The most noteworthy feature of his management was a series of gorgeous Shakespearian revivals. Charles Kean was not a great tragic actor; but in melodramatic parts such as the king in Boucicault's adaptation of Casimir Delavigne's *Louis XI,* and Louis and Fabian dei Franchi in Boucicault's adaptation of Dumas's *The Corsican Brothers,* his success was complete. Kean returned in 1866 from an extended tour abroad in broken health, and died in London on Jan. 22, 1868.

See J. W. Cole, *Life and Theatrical Times of Charles Kean* (1859).

KEAN, EDMUND (1787–1833), was born in London on March 17, 1787. His father was probably Edmund Kean, an architect's clerk; and his mother was an actress, Ann Carey, grand-daughter of Henry Carey. In his fourth year Kean made his first appearance on the stage as Cupid in Noverre's ballet of *Cymon.* At seven years old he was sent to school, but ran away to sea as cabin boy. Finding the restraint on board ship even worse than that of the school, he counterfeited both deafness and lameness with a histrionic mastery which deceived even the physicians at Madeira. On his return to England he sought out his uncle Moses Kean, mimic, ventriloquist and general entertainer, who introduced him to the study of Shakespeare, while Miss Tidswell, an actress who had been kind to him from infancy, taught him to act. On the death of his uncle Miss Tidswell took charge of him, and under her direction he began the systematic study of the principal Shakespearian characters His talents induced a Mrs. Clarke to adopt him, but the slight of a visitor wounded his pride, and he went back to his old surroundings. In his fourteenth year he obtained an engagement to play leading characters for twenty nights in York Theatre, appearing as Hamlet, Hastings and Cato. Shortly afterwards, while he was in the strolling troupe belonging to Richardson's show, the rumour of his abilities reached George III, who commanded him to recite at Windsor. He subsequently joined Saunders's circus, where in the performance of an equestrian feat he fell and broke his legs. About this time he picked up music from Charles Incledon, dancing from D'Egville, and fencing from Angelo. In 1807 he played leading parts in the Belfast theatre with Mrs. Siddons, who began by calling him "a horrid little man" and on further experience of his ability said that he "played very, very well," but that "there was too little of him to make a great actor" An engagement in 1808 to play leading characters in Beverley's provincial troupe ended in his marriage (July 17) with Mary

Chambers of Waterford, the leading actress. For several years his prospects were very gloomy, but in 1814 the committee of Drury Lane theatre resolved to give him a chance among the "experiments" they were making to retrieve the fortunes of the house. His opening at Drury Lane on Jan. 26, 1814, as Shylock roused the audience to almost uncontrollable enthusiasm. Successive appearances in Richard III., Hamlet, Othello, Macbeth and Lear served to demonstrate his complete mastery of the whole range of tragic emotion. He himself said on one occasion, "I could not feel the stage under me." On Nov. 29, 1820, Kean appeared for the first time in New York as Richard III.; the American visit, which lasted until the next summer, was a great success.

After his return to England Kean fell into a series of difficulties. His wife left him after his appearance as co-respondent in the case of *Cox* v. *Kean,* and he was violently attacked when he appeared on the stage both in England and in America, where he spent the year 1825–26. His last performance in New York was on Dec. 5, 1826, and after his return to England the public hostility had vanished. But his great powers were failing, and the process was hastened by his irregular habits. His last appearance on the stage was at Covent Garden, on March 25, 1833, when he played Othello to the Iago of his son Charles. At the words "Villain, be sure," in scene 3 of act iii, he suddenly broke down, and crying in a faltering voice "O God, I am dying. Speak to them, Charles," fell insensible into his son's arms. He died at Richmond on May 15, 1833.

It was in the impersonation of the great Shakespearian characters that the varied beauty and grandeur of the acting of Kean were displayed in their highest form, although probably his most powerful performance was in the part of Sir Giles Overreach in Massinger's *A New Way to Pay Old Debts,* the effect of his first impersonation of which was such that the pit rose *en masse,* and even the actors and actresses themselves were overcome by the terrific dramatic illusion. His only personal disadvantage as an actor was his small stature. His countenance was unusually mobile; he had a matchless command of facial expression; his fine eyes scintillated with the slightest shades of emotion and thought; his voice, though weak and harsh in the upper register, possessed in its lower range musical tones of penetrating and resistless power. Kean specially excelled as the exponent of passion. In Othello, Iago, Shylock and Richard III., characters utterly different from each other, but in which the predominant element is some form of passion, his identification with the personality, as he had conceived it, was as nearly as possible perfect, and each isolated phase and aspect of the plot was elaborated with the minutest attention to detail, and yet with an absolute subordination of these to the distinct individuality he was endeavouring to portray. Coleridge said, "Seeing him act was like reading Shakespeare by flashes of lightning." If the range of character in which Kean attained supreme excellence was narrow, but no one except Garrick has been so successful in so many great impersonations.

Kean's eccentricities at the height of his fame were numerous. Sometimes he would ride recklessly on his horse Shylock throughout the night. He was presented with a tame lion with which he might be found playing in his drawing-room. The prizefighters Mendoza and Richmond the Black were among his visitors. Grattan was his devoted friend In his earlier days Talma said of him, "He is a magnificent uncut gem; polish and round him off and he will be a perfect tragedian." The life of Edmund Kean formed the subject for a play by the elder Dumas, entitled *Kean, ou désordre et génie,* in which Frederick-Lemaître archieved one of his greatest triumphs.

See Francis Phippen, *Authentic Memoirs of Edmund Kean* (1814); B. W. Procter (Barry Cornwall), *The Life of Edmund Kean* (1835); F. W. Hawkins, *The Life of Edmund Kean* (1869); J. Fitzgerald Molloy, *The Life and Adventures of Edmund Kean* (1888); Edward Stirling, *Old Drury Lane* (1887), also G. C. D. Odell, *Shakespeare from Bellerton to Irving* (vol. ii., 1926).

KEANE, AUGUSTUS HENRY (1833–1912), Irish anthropologist, was born at Cork on June 1, 1833. He was educated at Dublin and in Rome for the Roman Catholic priesthood; but he declined to enter the Church, and devoted himself to geographical and ethnological research. He registered and classified almost every known language, and from these data worked out a system of ethnology. He was professor of Hindustani at University College, London, until 1885. He died on Feb. 3, 1912.

He published *Man, Past and Present* (1899); *Ethnology* (1896 and later editions); *The Gold of Ophir* (1901); etc.

KEANE, JOHN JOSEPH (1839–1918), American Roman Catholic archbishop and educator, was born in Ballyshannon, Co. Donegal, Ireland, on Sept. 12, 1839. When he was seven years old his family settled in the United States. He was educated at St. Charles' college, Ellicott City, Md, and at St. Mary's seminary, Baltimore. In 1866 he was ordained a priest and made a curate of St. Patrick's, Washington, D.C.; in 1878 he was bishop of Richmond. During service at Washington and Richmond he founded churches and schools for negroes and established the Confraternity of the Holy Ghost. From 1886 to 1897 he was rector of the Catholic University of America, Washington, which he did much to upbuild. He was then called to Rome and raised to archiepiscopal rank with the title of archbishop of Damascus, serving in 1897–1900 as canon of St. John Lateran, assistant bishop at the pontifical throne, and counsellor of the Propaganda. Returning to America in 1900, he was consecrated archbishop of Dubuque (Iowa). He resigned this see in 1911 and was appointed titular archbishop of Ciana A selection of his writings, largely on educational subjects, edited by M F Egan, was published under the title *Onward and Upward,* in 1902. He died in Dubuque, Ia., on June 22, 1918.

KEARNEY, a city of Nebraska, U.S.A., 150m. west of Lincoln and just north of the Platte river, at an altitude of 2,146ft.; the county seat of Buffalo county. It is on the Lincoln highway; is served by the Burlington and the Union Pacific railways; and has an aviation field. The population was 7,702 in 1920 (92% native white), and was estimated locally at 10,000 in 1928 It is the seat of the State industrial school for boys, the State tuberculosis hospital, a State teachers' college and the "1733 Amusement Park" (including a tourist camp) so called because it is 1,733m. from both Boston and San Francisco by highway. The city has a substantial wholesale trade, ships great quantities of wheat and other grain and has sundry manufacturing industries. Kearney takes its name from old Ft. Kearney (established 1848), which stood across the river, 6m. south-east of the present city, at the junction of the old trails from Kansas City and from Omaha. Here in 1861 the post office of Kearney City was established. Around the fort grew up in the '50s a settlement called Dobey Town (from *adobe*), which was one of the most important towns west of the Missouri in the days of the freighting caravans across the prairies. It was the scene of desperate fighting and hair-raising adventures with the Indians, especially during the construction of the Union Pacific railroad, of which every mile through this territory was surveyed and built under military protection. After the railroad was built, north of the river, Dobey Town dwindled, and in 1871 both the town-site and the fort were abandoned. The site of the present city was settled about 1872, and the city was incorporated and made the county seat in 1874. Fort and city were named after Gen. Stephen W. Kearny and the name was spelled correctly at first, without the second "e."

KEARNY, PHILIP (1815–1862), American soldier, was born in New York on June 2, 1815. He graduated from Columbia university (1835), and in 1837 obtained a commission in the cavalry. In 1839 he was sent to France to study cavalry training and before his return in 1840 he had served, on leave, in Algeria. He inherited a large fortune, but remained in the service in the headquarters staff of the army. After six more years' service he left the army, but almost immediately rejoined with a company of cavalry he had raised and equipped, chiefly at his own expense, for the Mexican War. In Dec. 1846 he was promoted captain. In leading a brilliant charge at Churubusco he lost his left arm, but remained at the front, and won the brevet of major. In 1851 he again resigned in order to travel. He saw further active service with the French cavalry in the Italian War of 1859, and received the cross of the Legion of Honour for his conduct at Solferino. Up

to the outbreak of the American Civil War he lived in Paris, but early in 1861 he hastened home to join the Federal army. As a brigade commander and as a divisional commander of infantry in the Army of the Potomac, he infused into his men his own spirit of dash and bravery. At Chantilly (Sept. 1, 1862), after repulsing an attack of the enemy, he rode out in the dark too far to the front, and mistaking the Confederates for his own men was shot dead. His body was sent to the Federal lines with a message from Gen. Lee, and was buried in Trinity churchyard, New York. His commission as major-general of volunteers was dated July 4, 1862, but he never received it.

See J. W. de Peyster, *Personal and Military History of Philip Kearny* (1869).

KEARNY, town, Hudson county, New Jersey, U.S.A., between the Passaic and the Hackensack rivers, opposite Newark and adjoining Harrison. It is on the Lincoln highway and is served by the Central of New Jersey, the Erie, and the Pennsylvania railways, electric trolleys, and motor-coach lines. The Manhattan Transfer of the Hudson tubes is within its limits. The population was 26,724 in 1920 (29.6% foreign-born white) and was estimated locally at 35,000 in 1928. Kearny covers 7 sq m., including a large tract of marshland. The section known as Arlington, in the northwest part of the town, is one of the best residence districts. The town is a residential suburb, and also has important manufacturing industries, including the Meadow shops of the Pennsylvania railroad, a Ford assembly plant, a slaughter house, and numerous large factories with a nation-wide market. The aggregate factory output in 1925 was valued at $118,447,462. The pioneer settler in this region was William Sandford, who came from Barbados in 1668 and bought the neck of land from the mouth of the rivers 7m. to the north, and called it New Barbados. He paid the proprietors of East Jersey £20 sterling, and for the Indian rights he gave 170 fathoms of black wampum, 200 of white, 19 black coats, 10 pairs of breeches, 16 guns, 60 double hands of powder, 60 knives, 67 bars of lead, 30 axes, 20 hoes, 11 blankets, one anker of brandy, and 3½ vats of beer. In 1719 Arent Schuyler bought a plantation covering the present site of Arlington, and a little later one of his slaves turned up an unusual stone which proved to be copper ore 85% fine. From this mine 1,368 tons of ore was sent to the foundry at Bristol (England). From New Barbados the town of Lodi was formed in 1825 and the town of Harrison in 1840; and in 1867 a part of Harrison was made a separate township and named after Gen. Phil Kearny, a former resident. The town of Kearny was incorporated in 1895.

KEATE, JOHN (1773–1852), English schoolmaster, was born at Wells, Somersetshire, in 1773, the son of Prebendary William Keate. He was educated at Eton and King's college, Cambridge, and was headmaster of Eton from 1809 to 1834. His partiality for the birch became a by-word, but beneath an outwardly rough manner the little man concealed a really kind heart, and when he retired the boys presented him with a handsome testimonial. A couple of years before he had publicly flogged eighty boys on one day. Keate died on March 5, 1852, at Hartley Westpall, Hampshire, of which parish he had been rector since 1824.

See Maxwell Lyte, *History of Eton College* (3rd ed., 1899); Collins, *Etoniana;* Harwood, *Alumni Etonienses; Annual Register* (1852); *Gentleman's Magazine* (1852).

KEATS, JOHN (1795–1821), English poet, was born in London on Oct. 29 or 31, 1795. His father, Thomas Keats, had come to London from the West Country, and was at this time managing a livery stable, having married the daughter of the proprietor, Frances Jennings. John Keats was their eldest son, and was born prematurely. He was sent to a school kept by the Rev. John Clarke at Enfield, and soon after lost his father, who was killed by a fall from his horse on April 16, 1804. His mother married again within the year, but was soon separated from her new husband, and went to live with her mother, Mrs. Jennings, at Edmonton; this was Keats' home for the next few years. At school, Keats was not remarkable for anything very much except an intense pugnacity, vented frequently even on his brother George, then and afterwards one of the closest of his friends. Tom, the youngest brother, was already delicate, and had to be looked after by the other two; the family sentiment between them was always strong, and only his brothers were allowed to see the strain of melancholy that lay beneath his surface high spirits. With the school as a whole he was very popular. Towards the end of his time, in his fourteenth and fifteenth years, he suddenly turned to study, and read widely in addition to his school work, particularly in mythology. He also started a translation of the *Aeneid* into English prose. In February his mother, to whom he was passionately attached, died of consumption. His grandmother put the boys under the care of two guardians, Rowland Sandell and Richard Abbey. At the end of 1810 Mr. Abbey had Keats apprenticed to Hammond, a surgeon of Edmonton. About this time he finished his translation of the *Aeneid.* He used often to walk over to the school at Enfield to see Cowden Clarke, the son of the headmaster, and one of the books Clarke lent him was the *Faerie Queene.* This inspired him to his first efforts at poetry, though it was not till two years later, in 1815, that he showed any of his work to Clarke.

In the summer or autumn of 1814 he quarrelled with Hammond, and went to live in London, studying at St. Thomas's and Guy's Hospitals. He lodged, first in the Borough by himself, then in St. Thomas street with fellow-students; in the summer of 1816 he joined his brothers in the Poultry, and in spring 1817 they moved to Cheapside. He worked steadily at first, and passed his examination as licentiate in July 1816. But his real inclinations were beginning to appear, and it seems to have been at some time in the winter 1816–1817 that he decided to devote himself entirely to poetry. In literature his passion, then as always, was for the Elizabethan age, but his early verses written at this time, such as *On Death* (1814), *To Hope* and *To Apollo* (Feb. 1815), are in a typically 18th century style, full of personified abstractions of the Passions and the like. Early in 1815 Clarke came to live in London, and it was after a night spent in the study of Chapman that Keats sent him the famous sonnet *On First Looking into Chapman's Homer,* the first poem in which he unmistakably finds his voice.

Soon after this Clarke introduced him to Leigh Hunt, who had a profound influence on him, as he had on other men far greater than himself. Hunt's critical aim was the sound and valuable one of overthrowing the "classical" school and inaugurating a return to the natural freedom of the great age of English poetry; this cause prevailed, however much or little Hunt may have had to do with it, as everybody knows, and the Return to Nature, or the Romantic Revival, won the day. At the same time Hunt tried to put his own specific ideas of verse construction, the central point of which was the freer form of the heroic couplet, into practice in *Rimini,* and whatever his critical gifts Hunt was no poet. Keats adopted the same method, and while the free form of the heroic couplet was fertile of good results in his hands, he also seems to have been infected with Hunt's worst fault, the tendency to lapse into a casual pertness of diction that at times gives some colour to the gibes of *Blackwood* about the "Cockney school." This tendency is occasionally noticeable in Keats' earlier work, but is far more disastrous when it intrudes, as it does once or twice, into the splendour of his maturity; it is such lines as

> "Good-bye, I'll soon be back"; "Good-bye," said she,

in *Isabella,* and

> That Lycius could not love in half a fright

in *Lamia,* for which we have a serious grudge against Hunt. In addition to his influence on Keats' style, Hunt had a considerable effect on his fortunes; it was Keats' friendship with Hunt that was his real crime in the eyes of the Reviews.

Hunt's house was the centre of a circle of men of literary tastes, and here Keats met J. H. Reynolds and James Rice, who both became friends of his; Shelley, to whom Keats did not take as kindly as Shelley did to him; and Haydon, with whom he at once became intimate. Hunt had already (May 16 and Dec. 1, 1816) printed verse of Keats' in the *Examiner,* and the circle decided that a volume must be published. The Olliers firm undertook its production, and it came out in March 1817 as *Poems,* by

John Keats. It is a collection of youthful work, full of promise but not of much else, though in *Sleep and Poetry* there is an interesting passage that expresses the aspirations of the new school of poetry. The substance of the book is six poems in heroic couplets, three of them poetic epistles. They are more interesting for their style than for their matter, and show various methods of varying the monotony of the measure, such as frequent use of overflow, dissyllabic rhymes, the shortening of the second line, and so on.

In April 1817 Keats went away by himself to the Isle of Wight, urged especially by Haydon to solitude and concentration. He took rooms at Carisbrooke, and began to work at *Endymion*. In May he moved to Margate, where he received an advance payment on the poem from Taylor and Hessey. After a stay in Canterbury with Tom, the two brothers came to Hampstead early in the summer, where they settled down. Hunt lived near, and Keats made two new friends near by, Charles Wentworth Dilke and Charles Brown. By the late summer, when he went to stay in Oxford, he had reached the third book of *Endymion*. He returned to Hampstead in the autumn, to find that the attack in *Blackwood* on the "Cockney school" had just begun; there were also dissensions between Reynolds and Haydon, and Haydon and Hunt, which distressed him. At Christmas he took Reynolds's place as dramatic critic on the *Champion* for a while, and on Dec. 28 he was at Haydon's famous dinner party, with Wordsworth, Lamb and Monkhouse. In the first two months of this year he had a burst of poetic activity, and at one time wrote a new poem nearly every day. This period includes *Hence Burgundy Claret and Port, When I have fears that I may cease to be,* and the sonnet on the Nile. At this time also he and Reynolds had the idea of publishing a book of tales from Boccaccio, which was the origin of *Isabella*. In March he went to Teignmouth to look after Tom, George having decided to marry and go abroad, and there *Isabella* was written. He and Tom came back to Hampstead in May, and about this time *Endymion* was published (1818). Of this poem all that need be said in criticism has been said by Keats himself in the preface. The basis of it is the story of Endymion and the moon-goddess, but it has been allegorised and mixed with other myths, and incidents of his own invention, till it becomes something entirely new. The metre is again the heroic couplet, treated with the same freedom as before, and relieved with incidental lyrics. The strength and weakness of the poem lie in the same feature, his intense and luxuriant imagination, that is ever bursting with new beauties, but, being more or less undisciplined, has the poet at its mercy, and leads to a certain dissipation of interest and lack of cohesion in the poem as a whole.

In the summer of this year Keats went with Brown on a walking tour in the north. George Keats and his wife were starting for America, and the two friends went with them to Liverpool, and thence to Lancaster, where the tour started. They walked through the Lake district to Carlisle, took a coach to Dumfries, and wandered about the coast for some time, finally crossing to Ireland for a day or two. Then they went on up the coast to Ayr, and so by Glasgow and Inverary to Oban. Exertion and exposure were already affecting Keats's throat, and when, after climbing Ben Nevis, they reached Inverness, a doctor advised him to go home, and he sailed from Cromarty for London. This throat trouble brought on by the hardships of the tour was the first sign of the consumption that killed him. Simultaneously with his return the attacks in the Reviews developed in earnest; the August number of *Blackwood's* contained No. IV. of the "Cockney school" articles, devoted entirely to Keats this time, probably by Wilson or Lockhart; in September followed the review of *Endymion* in the Quarterly, in the same strain. Perhaps it should be added that there is no foundation for the belief that Keats' death was hastened by the treatment he received in the Reviews. He took it quite calmly, and at this time was quite preoccupied with a more personal trouble. He returned to find his brother Tom much worse, and the rest of the year was devoted to nursing him. He died in the first week in December. After Tom's death Keats went to live with Brown at Wentworth Place, Hampstead, and was soon settled to work on *Hyperion*.

And now a new distraction was to come into his life, and never to leave it. Fanny Brawne was the eldest daughter of a lady who had taken Brown's house while they were away in the north, and was now living close by. Keats met her at the Dilkes', and was soon completely enslaved. She was an attractive girl, and constant to Keats through the troubles that were to follow; his friends thought that she was no fit mate for him, but what woman would have been? The effect of this passion, to which Keats gave himself up with all the violence of an extraordinarily ardent nature, seems in the end to have been further to strain a constitution already giving way under incipient consumption, but at the moment it only stimulated his poetic energies. During a visit to Sussex with Dilke in January he finished *The Eve of St. Agnes,* and began the unfinished *Eve of St. Mark;* he came back to Hampstead in February, and that spring saw another burst of activity. Between now and June all but one of the great *Odes* were written; *On Indolence* can be dated from his correspondence to about March 19, *On a Grecian Urn* was sent to his brother on April 15, and *To a Nightingale* a week or two later. Yet just at this time his prospects, darkened by his reception by the Reviews, seemed so bad that he was thinking of giving up poetry altogether; Brown dissuaded him, and lent him enough to live on through the summer. In July he went to stay with Rice in Shanklin, and later Brown came and Rice left. He and Brown now collaborated in *Otho the Great,* Brown outlining the scenes and Keats working them out, until they came to the fourth act, when Keats took entire command. At the same time he was writing *Lamia*. From August to September they stayed at Winchester, where, in the last good days of his life, he finished *Lamia,* added to and abandoned the *Eve of St. Mark* and *Hyperion,* and wrote the *Ode to Autumn*. He also started *King Stephen,* which he left unfinished.

Early in October he returned to London, determined to take lodgings by himself and look for work on the Press; a single visit to the Brawnes broke down his resolution, and he was soon back at the Browns' house again, unable to think of anything else. Though his disease was still undisclosed, his genius was now declining under the double strain, as the rest of his work shows. Kean accepted *Otho,* but his manager proposed too long a delay to suit Keats and Brown, and the plan dropped. Keats now started the *Cap and Bells,* but the plan of the work was never congenial to him; he was not designed for a satirist. Later he attempted to recast *Hyperion* in the form of a vision. The new version is not on the level of the old, but throws interesting light on the state of his thoughts at the time, and his conception of the function of poetry:

> Only the dreamer venoms all his days
> Bearing more woe than all his sins deserve.

On February 3, 1820, he had the first attack of consumption; Brown has left an account of how he realised from the first moment that it was his death-warrant. From then on the disease ran the usual course of rally and relapse until the end. In April he was better, and in May he moved to Kentish Town, near Leigh Hunt. In July the last great volume came out, *Lamia, Isabella, The Eve of St. Agnes and other Poems,* which contains all his work of major importance, except *On Indolence, The Eve of St. Mark,* and *La Belle Dame sans Merci,* which first appeared in the *Indicator,* May 20. He was nursed through the summer, first by the Hunts and then by the Brawnes, and his doctor said he must go south for the winter. Shelley wrote asking him to Pisa, but eventually Severn, who was going to Rome, offered to take him. They sailed on Sept. 18, and on the way down Channel they landed for a while near Lulworth, where he wrote his last poem, *Bright Star, would I were stedfast as thou art.* From Naples they went to Rome, where on Dec. 10 he had a final relapse; he was carefully tended by Severn to the last, and died on Feb. 23, 1821.

With the contents of the 1820 volume everyone is familiar; here we have the true measure of his powers, and though some faults remain, the early weakness is quite left behind. In *Isabella,* a story taken from Boccaccio, but, needless to say, given a wholly personal romantic colouring, there are still occasional slipshod

phrases, and the old tendency to follow idly the chance suggestion of a rhyme, but with all his old colour and music there is a new depth of passion and tragedy. The metre is the octave stanza, recently popularised by Byron. In *Hyperion,* a fragment of a blank verse epic, the influence of Milton is clear, and in the end he found the Miltonic note too unnatural to sustain. The theme is Greek, though the treatment is Gothic; it tells of the supplanting of the old deities by the Olympians. *St. Agnes' Eve* is romantic narrative at its height; its enchanted atmosphere and blaze of colour are such that one never pauses to ask whether the characters are anything more than a formal foreground to the setting. Of *Lamia* much the same can be said; the story of the serpent-lady, dissolved before her lover's eyes by the "sophist's eye, keen, cruel, perceant, stinging," comes through Burton from Philostratus. The metre is rhymed heroics, but more in Dryden's manner than *Endymion,* with less use of the overflow. The great *Odes* stand alone in literature, new in form and spirit, and owing nothing to any predecessor. They are too well known for description and too perfect for criticism. As a dramatist Keats is hard to judge; he died too young to accomplish anything great in that sphere; *Otho* is not a success *Stephen,* so far as it goes, has far more promise, being full of stir and action.

The first life of Keats was R. M. Milnes' (Lord Houghton) *Life, Letters and Literary Remains of John Keats* (2 vols., 1848). The standard life is *Keats* by S. Colvin, in the *English Men of Letters* series (1887). The standard edition of the poems is by H. B. Forman; *Poetical works and other Writings* (4 vols, 1883); *Poetical Works* (1884); there have been several subsequent editions of this, the 1915 edition containing the new sonnets first printed in *The Times,* May 18, 1914, and discussed in the *Literary Supplement,* May 21. Both this edition and Colvin's *Keats* contain a full bibliography.

KEBLE, JOHN (1792–1866), English poet and divine, the author of the *Christian Year,* was born on April 25, 1792, at Fairford, Gloucestershire, the second child of the Rev. John Keble. He became a scholar of Corpus Christi college, Oxford, in 1807, and in 1810 obtained double first class honours, a distinction which had been obtained only once before, by Sir Robert Peel. After his election to an Oriel fellowship in 1811 Keble gained the University prizes, both for the English essay and also for the Latin essay. Oriel College was, at that time, the centre of all the finest ability in Oxford. Copleston, Davison, Whately, were among the fellows who elected Keble; Arnold, Pusey, Newman, were soon after added to the society. In 1815 Keble was ordained deacon, and priest in 1816 His real bent and choice were towards a pastoral cure in a country parish; but he remained till 1823 in Oxford, acting first as a public examiner in the schools, then as a tutor, when he returned to Fairford to assist his father, and with his brother to serve one or two small and poorly endowed curacies in the neighbourhood of Coln.

In 1827 he published anonymously the *Christian Year* (2 vols., Oxford). The poems which make up that book had been the silent gathering of years. There is one for each Sunday and for each Saint's day and festival observed by the Church of England. Keble had purposed to keep them beside him, correcting and improving them, as long as he lived, and to leave them to be published only "when he was fairly out of the way." This resolution was at length overcome by the importunities of his friends, and by the desire of his father to see his son's poems in print before he died. Between 1827 and 1872 one hundred and fifty-eight editions appeared, and it has been largely reprinted since.

In 1831 Keble succeeded Milman as professor of poetry at Oxford. He delivered a series of lectures, printed as *Praelectiones academicae,* clothed in excellent idiomatic Latin (as was the rule), in which he expounded a theory of poetry which was original and suggestive. He distinguished between what he called primary and secondary poets—the first employing poetry to relieve their own hearts; the second, poetic artists, composing poetry from some other and less impulsive motive. Of the former kind were Homer, Lucretius, Burns, Scott; of the latter were Euripides, Dryden, Milton. His regular visits to Oxford kept him in intercourse with his old friends at Oriel. Catholic emancipation and the Reform Bill had deeply stirred, not only the political spirit at Oxford, but also the church feeling which had long been stagnant. Newman wrote, "On Sunday July 14, 1833, Mr. Keble preached the assize sermon in the University pulpit It was published under the title of *National Apostasy.* I have ever considered and kept the day as the start of the religious movement of 1833." The occasion of this sermon was the suppression, by Earl Grey's Reform ministry, of ten Irish bishoprics. Against Erastianism Keble had long chafed inwardly, and he now asserted the claim of the church to a heavenly origin and a divine prerogative. About the same time, and partly stimulated by Keble's sermon, leading spirits in Oxford began a systematic course of action to revive High Church principles and patristic theology. Thus arose the Tractarian movement, a name it received from the famous *Tracts for the Times.* If Keble is to be reckoned, as Newman would have it, as the primary author of the movement, it was from Pusey that it received one of its best known names, and in Newman that it soon found its genuine leader. To the tracts Keble made only four contributions: —No. 4, containing an argument, in the manner of Bishop Butler, to show that adherence to apostolical succession is the safest course; No. 13, which explains the principle on which the Sunday lessons in the church service are selected; No. 40, on marriage with one who is unbaptized; No. 89, on the mysticism attributed to the early fathers.

In 1835 Keble married Miss Clarke, and became vicar of Hursley, Hampshire, a living to which he had been presented by his attached pupil, Sir William Heathcote, and which continued to be Keble's cure for the remainder of his life. In 1841 the tracts were brought to an abrupt termination by the publication of Newman's tract No 90 (*see* NEWMAN, JOHN) The same year in which the ecclesiastical storm burst Keble's tenure of the professorship of poetry closed, and thenceforward he was seen but rarely in Oxford. No other public event ever affected Keble so deeply as the secession of Newman to the Church of Rome in 1845 It was to him both a public and a private sorrow, which nothing could repair. In all the ecclesiastical contests of the twenty years which followed 1845, Keble resolutely maintained those High Anglican principles with which his life had been identified. These absorbing duties, added to his parochial work, left little time for literature. But in 1846 he published the *Lyra Innocentium;* and in 1863 he completed a life of Bishop Wilson He died at Bournemouth on March 29, 1866, and was buried at Hursley

See J. T. Coleridge, *Memoir of John Keble* (1869). The following is a list of his writings:—*Christian Year* (1827); *Psalter* (1839); *Praelectiones Academicae* (1844), *Lyra Innocentium* (1846); *Sermons Academical* (1848); *Argument against Repeal of Marriage Law,* and *Sequel* (1857); *Eucharistical Adoration* (1857); *Life of Bishop Wilson* (1863); *Sermons Occasional and Parochial* (1867). Posthumous publications. *Village Sermons on the Baptismal Service* (1868); *Miscellaneous Poems* (1869); *Letters of Spiritual Counsel* (1870); *Sermons for the Christmas Year, etc.* (11 vols., 1875–80); *Occasional Papers and Reviews* (1877); *Studia Sacra* (1877); *Outlines of Instruction or Meditation* (1880).

KECSKEMET, a town in Hungary, 65 m SSE of Budapest by rail Situated on an extensive drift-sand plain, it is the market centre of a thriving agricultural region devoted to the growth mainly of fruit and vine, with cattle-rearing and rye cultivation as subsidiary activities. In addition the town has industrial interests, *e.g.,* milling, fruit and vegetable preserving and the preparation of leather. It covers a large area, being the third largest provincial town, but is poorly built and surrounded by growing *tanya* settlements. Pop (1920), 73,109.

KEDDAH (from Hindu, *Khedna,* to chase), the term used in India for the enclosure constructed to entrap elephants. In Ceylon the word employed in the same meaning is *corral*

KEDGE, a small anchor, also called a kedge anchor, used for kedging; *i.e.,* hauling the stern of a ship from one part of a harbour or waterway to another.

KEDGEREE, an Indian dish, composed of boiled rice and various highly flavoured ingredients (Hindustani, *khichri*). Kedgeree is of two kinds, white and yellow. The white is made with grain, onions, ghee (clarified butter), cloves, pepper and salt. Yellow kedgeree includes eggs, and is coloured by turmeric. Kedgeree is a favourite and universal dish in India; among the poorer classes it is frequently made of rice and pulse only, or rice and beans. In European cookery kedgeree is a similar dish

usually made with fish.

KEDIRI, a residency in East Java, Dutch East Indies, bounded on the east by Pasuruan, on the west by Madiun, on the north by Surabaya, and on the south by the Indian ocean. The middle eastern and middle western parts are very hilly, with high mountains, Mt. Willis 7,481 ft., and Mt. Kelut, 5,625 ft., also the extreme south, and limestone hills of low formation shut off practically all the coast from the interior, which consists of fertile plains bordering the river Brantas, which flows from the eastern border in a westerly direction and then turns north-eastwards and continues to the northern border. Area 7,118 sq. kilometres; pop. 2,153,696 (4,814 Europeans and Eurasians, and 19,529 foreign Asiatics, including Chinese). The natives are almost entirely Javanese. Rice (giving a yield of 2,798 lb. per acre), sugar-cane, cotton, coffee, cocoa, coca, cassava, ground nuts and coconuts are grown; the principal crops are those of cassava and sugar-cane, and there are tapioca and sugar factories; teak is obtained from the forests. Kediri (pop. 32,406), is the capital. It is on the banks of the Brantas, and is one of the centres of the sugar industry; there are remains of Hindu temples in the neighbourhood (*see* JAVA). Other towns are Blitar (pop. 19,754), with the ruins of Panataram temple (Hindu) near by, Tulung Agung (pop. 28,886), Kertosono and Papar. All these towns are on the railway which branches off from the main line to Surabaya at Kertosono and runs southwest to Tulung Agung, and thence eastwards to Blitar, and on into Pasuruan. Steam tramways connect with Wates, Para and Kepung, other small towns. The Brantas is navigable. There are no harbours on the coast. Kediri was made into a residency in 1830, just after the war in Central Java.

KEDU (Dutch, Kedoe), a residency in Middle Java, Dutch East Indies, bounded east by Surakarta and Jokjakarta, north by Semarang, west by Banjumas, and south by the Indian ocean. Area 5,493 sq. kilometres; pop. 2,447,712 (5,911 Europeans and Eurasians). Kedu is one of the most densely inhabited regions in the world. The natives are almost wholly Javanese. There are high mountains all along the eastern border, in the centre, Mt. Sumbing (10,955 ft.), and north of Sumbing, where lie Mt. Sendoro (10,318 ft.) and the Dieng plateau (6,500 ft.). The population is chiefly in the fertile valley which spreads on either side of the river Praga (there are three small rivers in the south), which runs southwards to the sea between the mountain ranges The coast is a difficult one, with high sand ridges, and it has no harbours. Principal crops are rice, sugar-cane, tobacco and coconuts; maize, rubber and ground-nuts are grown, and timber woods are extracted from the forests. Magelang, pop. 34,214 (2,893 Europeans and Eurasians), is the capital. Its altitude (1,250 ft), gives it a comparatively cool climate, and it is an important military station. It is on the steam tramway which traverses Kedu from south to north, running from the main railway line at Jokjakarta northwards to Parakan, and is a convenient starting-place for Boro Budur and Mendut (*see* JAVA), which lie a few miles to the south. Another important town is Wonosobo, altitude 3,400 ft., which may be termed the capital of the Dieng plateau. It is connected by steam tramway with the main railway line at Purwakerto, in Banjumas, and is the *rendezvous* of travellers wishing to explore the highly interesting Hindu ruins of the Dieng plateau (*see* JAVA). Other towns are Muntilan, with a large Chinese colony, Purworejo (pop. 18,057), Krakal (thermal springs), Kebumen (pop. 11,027), Kutuarjo and Setjang, junction for a steam tramway connecting with Semarang. The main railway line from Batavia to Surabaya traverses the southern part of Kedu. The rivers are not navigable. Kedu was made into a residency in the time of Raffles.

KEELER, JAMES EDWARD (1857–1899), American astronomer, was born in Lasalle, Ill., Sept. 10, 1857, and removed with his family to Florida when he was quite young. In 1877 he made an important meridian instrument from a marine spyglass. He graduated from Johns Hopkins in 1881, and had two years of study at the universities of Heidelberg and of Berlin where he made an investigation of the absorption by carbon monoxide of radiant heat with the use of Langley's newly invented bolometer. He then became an assistant to Langley in his research on the infra-red portion of the spectrum and radiation of the moon. He was for four or five years at Mt. Hamilton as astronomer of the Lick Observatory. In 1891 he was made director of the Allegheny Observatory, and in 1898 director of Lick Observatory. His greatest work was in spectroscopy, especially his observations on the nebular spectrum. He also demonstrated the truth of Maxwell's theory regarding the meteoric constitution of the rings of Saturn He died on Aug. 12, 1899.

For a complete bibliography see *Nat. Acad. of Science, Biog. Memoirs,* v. 5, p. 233.

KEELEY, MARY ANNE (1806?–1899), English actress, was born at Ipswich on Nov. 22, 1805 or 1806 Her maiden name was Goward, her father being a brazier and tinman. After some experience in the provinces, she first appeared on the stage in London on July 2, 1825, in the opera *Rosina.* It was not long before she gave up "singing parts" in favour of the drama proper, where her powers of character-acting could have scope. In June 1829 she married Robert Keeley (1793–1869), an admirable comedian, with whom she had often appeared In 1838 she made a great success as Nydia, the blind girl, in a dramatized version of Bulwer Lytton's *The Last Days of Pompeii,* and followed this with a striking impersonation of Smike in *Nicholas Nickleby.* In 1839 she achieved a triumph as the hero of a play founded upon Harrison Ainsworth's *Jack Sheppard.* As Jack Sheppard Mrs. Keeley lived in the memory of playgoers, despite her many later successes in other parts. She managed the Lyceum (1844–47) with her husband; acted with Webster and Kean at the Haymarket; returned for five years to the Adelphi; and made her last regular public appearance at the Lyceum in 1859. She died on March 12, 1899

See Walter Goodman, *The Keeleys on the stage and off* (1895).

KEELING ISLANDS (often called Cocos and Cocos-KEELING ISLANDS), a group of coral islands in the Indian ocean, between 12° 4′ and 12° 13′ S., and 96° 49′–57′ E., but including a smaller island in 11° 50′ N. and 96° 50′ E. The group furnished Charles Darwin with the typical example of an atoll or lagoon island. There are altogether 23 small islands, 9½ m. being the greatest width of the whole atoll. The lagoon is very shallow and an opening on the north side of the reef permits the entrance of vessels. The coco-nut is the characteristic product and is cultivated on all the islands. The flora is scanty in species. One of the commonest living creatures is a monstrous crab which lives on the coco-nuts; and in some places also there are great colonies of the pomegranate crab. The group was visited by Dr. H. O. Forbes in 1878, and later, by Dr. Guppy, Ridley and Dr. Andrews for the purpose of studying the fauna and flora and, more especially the formation of the coral reefs. Dr. Guppy secured a landing on North Keeling island, which is about 1 m. long and with a shallow enclosed lagoon with an opening on its east side. A dense vegetation of iron-wood (*Cordia*) and other trees and shrubs, together with a forest of coco-nut palms, covers its surface. It is tenanted by myriads of sea-fowl, frigate-birds, boobies, and terns (*Gygis candida*), which find here an excellent nesting-place, and in consequence the island contains valuable calcium phosphate deposits. The lagoon is slowly filling up and becoming cultivable land, but the rate of recovery from the sea was specially marked after the eruption of Krakatoa, the pumice from which was washed on to it in enormous quantity, so that the lagoon advanced its shores from 20 to 30 yards.

The atoll has an exceedingly healthy climate, the temperature never reaching extremes, its range being from 89° F to 70°, and the rainfall rarely exceeds 40 inches. The south-east trade blows almost ceaselessly for ten months of the year. Terrific storms sometimes break over the island; and it has been more than once visited by earthquakes. A profitable trade is done in coconuts, but there are few other exports. The imports are almost entirely foodstuffs and other necessaries for the inhabitants.

The islands were discovered in 1609 by Captain William Keeling. In 1823 Alexander Hare, an English adventurer, settled on the southernmost island with a number of slaves. Some two or three years after, J. Ross settled with his family on Direction island, and his little colony was soon strengthened by Hare's run-

away slaves. The group was taken under British protection in 1856. In 1878 it was attached to the Government of Ceylon, and in 1882 placed under the governor of the Straits Settlements, and in 1903, annexed to Singapore. The ownership and superintendency continues in the Ross family.

See C. Darwin, *Journal of the Voyage of the "Beagle,"* and *Geological Observations on Coral Reefs;* also Henry O. Forbes, *A Naturalist's Wanderings in the Eastern Archipelago* (1884); H. B. Guppy, "The Cocos-Keeling Islands," *Scottish Geographical Magazine* (vol. v., 1889).

KEEL-MOULDING, in architecture, a round convex moulding, along one side of which there is attached a small, projecting fillet or flat member, so called from a resemblance to the keel of a ship. It was common throughout the Gothic period, especially as an arch moulding.

KEEN, WILLIAM WILLIAMS (1837–), American surgeon, was born at Philadelphia (Pa.), Jan. 19, 1837. He graduated at Brown university (1859), and Jefferson medical college (1862); was made assistant surgeon of the 5th Massachusetts Regiment in 1861 and was acting assistant surgeon U S. Army (1862–64). After two years' study abroad, he started practice in Philadelphia and conducted the Philadelphia School of Anatomy (1866–75). He was a lecturer on pathological anatomy at Jefferson medical college (1866–75), professor of surgery at Woman's medical college (1884–89), professor of surgery at Jefferson medical college (1889–1907) and professor emeritus (1907). In 1909 he was made 1st lieutenant of the Medical Reserve Corps, U S. Army, and major in 1917. A specialist in the surgery of the brain and the nervous system, he was a pioneer in performing successfully new and difficult operations in this field He wrote several surgical and other works, and was editor of many well-known works including Gray's *Anatomy* and Keen's *Surgery.*

He wrote *Reflex Paralysis* and *Gunshot Wounds and Other Injuries of Nerves* (with Weir Mitchell and Morehouse) (1864); *Keen's Clinical Charts* (1870); *History of the Philadelphia School of Anatomy* (1874); *Early History of Practical Anatomy* (1870); *Surgical Operations of President Cleveland* (1893); *Bicentenary History of the First Baptist Church of Philadelphia* (1898); *Surgical Complications and Sequels of Typhoid Fever* (1898); *Addresses and Other Papers* (1905); *Animal Experimentation and Medical Progress* (1914); *The Early Years of Brown University, 1764–1770* (1914); *Ether Day Address* (1916); *Treatment of War Wounds* (1917); *Colver Lectures at Brown University on Medical Research and Human Welfare* (1917); *Selected Papers and Addresses* (1922).

KEENE, CHARLES SAMUEL (1823–1891), English black-and-white artist, the son of Samuel Browne Keene, a solicitor, was born at Hornsey on Aug. 10 His earliest known design is the frontispiece, signed "Chas. Keene," to *The Adventures of Dick Boldhero,* etc. In Dec. 1851 he made his first appearance in *Punch* and, after nine years of steady work, was called to a seat at the famous table. It was during this period of probation that he first gave evidence of those transcendent qualities which make his work at once the joy and despair of his brother craftsmen. On the starting of *Once a Week,* in 1859, Keene's services were requisitioned, his most notable series in this periodical being the illustrations to Charles Reade's *A Good Fight* (afterwards rechristened *The Cloister and the Hearth*) and to George Meredith's *Evan Harrington* There is a quality of conventionality in the earlier of these which later disappears In 1864 John Leech died, and Keene's work in *Punch* thenceforward found wider opportunities. In 1872 Keene made the acquaintance of Joseph Crawhall, who had been in the habit for many years of jotting down any humourous incidents he might hear of or observe, illustrating them at leisure for his own amusement. These were placed unreservedly at Keene's disposal, and to their inspiration we owe at least 250 of his most successful drawings in the last 20 years of his connection with *Punch.* A list of more than 200 of these subjects is given at the end of *The Life and Letters of Charles Keene of "Punch."* In 1881 a volume of his *Punch* drawings was published by Bradbury and Agnew, with the title *Our People.* He died on Jan 4, 1891.

See G. S. Layard, *Life and Letters of Charles Keene of "Punch"; The Work of Charles Keene,* with an introduction and notes by Joseph Pennell, and a bibliography by W. H. Chesson. (G. S. L.; X.)

KEENE, LAURA (*c.* 1820–1873), Anglo-American actress and manager, whose real name was Mary Moss, was born in England. In 1851, in London, she was playing Pauline in *The Lady of Lyons.* She made her first appearance in New York Sept. 20, 1852, on her way to Australia. She returned in 1855, and till 1863 managed Laura Keene's theatre, in which was produced, in 1858, *Our American Cousin.* It was her company that was playing at Ford's theatre, Washington, on the night of Lincoln's assassination. Miss Keene was a successful melodramatic actress, and an admirable manager. She died at Montclair (N J.) Nov. 4, 1873.

See John Creahan, *Life of Laura Keene* (1891).

KEENE, city of southern New Hampshire, U.S A., on the Ashuelot river; county seat of Cheshire county It is served by the Boston and Maine railroad. The population was 11,210 in 1920 (87% native white) and was estimated locally at 13,250 in 1928. The city covers 37 sq m , and its beautiful main street is 220ft. wide from curb to curb. In every direction are hills 800 to 1,500ft. high, and Mount Monadnock (3,166ft.) is 15m. S.E. Keene is the seat of a State normal school (established 1908); the trading centre for the county; and a summer and winter resort. It has one of the longest toboggan slides in the state; weekly ice-hockey contests are held during the season, and a carnival of winter sports annually. The city has many and varied factories, with an output in 1925 valued at $10,663,927. Among the leading products are chairs, shoes, screens, portable houses, mechanical toys, machinery, woollens, narrow silk fabrics, celluloid, mica and feldspar products, and loose-leaf ledgers. The site of Keene was one of the Massachusetts grants of 1733, but it was abandoned from 1746 until 1750 because of forays by the Canadian Indians. In 1753 the town was incorporated, and was named after Sir Benjamin Keene (1697–1757), an English diplomatist in high repute at the time. It was chartered as a city in 1874.

Keene has a beautiful church designed by Sir Christopher Wren, but it is too much shut in by stores.

KEENE'S CEMENT: *see* CEMENT.

KEEP, an English term corresponding to the French donjon (*q.v.*) for the strongest portion of the fortification of a castle (*q.v.*), the place of last resort in case of siege or attack. It was either a single tower or a larger fortified enclosure, sometimes approximately round, and then known as a shell keep, as in Berkeley castle, or Windsor The most famous of the Norman keeps of England is the White Tower of London of the 11th century, supposedly designed by Gundulf, Bishop of Rochester. Other famous examples are those at Rochester, Arundel and Newcastle.

KEEWATIN, the name now given to the most easterly district of the three divisions of the North-West Territories of Canada It is bounded on the east by Hudson bay and Foxe channel, on the west by 102° W. long. and on the south by Lat. 60° N.

The district, as at present defined, is wholly within the Laurentian Shield physiographic division, and only the extreme southwest of it is forested, and that sparsely. The remainder is a tundra area, with frequent rock outcrops and many lakes and marshes. It lies well to the north of any present area of development.

Before the present boundaries of the three prairie provinces were established the name was applied to a more extensive region.

KEF, more correctly El-Kef (the Rock), a town of Tunisia, 125 m. by rail south-south-west of the capital, and 75 m. south-east of Bona in Algeria. It occupies the site of the Roman colony of Sicca Veneria; and is built on the steep slope of a rock in a mountainous region through which flows the Mellegue, an affluent of the Mejerda. Situated at the intersection of main routes from the west and south, Kef occupies a position of strategic importance. The town with its half-dozen mosques and tortuous, dirty streets, is still partly walled The *kasbah,* or citadel, occupies a rocky eminence on the west side of the town. It was built, or rebuilt, by the Turks, the material being Roman. It has been restored by the French, who maintain a garrison here.

The Roman remains include fragments of a large temple and

of the baths. The ancient cisterns remain, but are empty, being used as part of the barracks. The town is, however, supplied by water from the same spring which filled the cisterns. The Christian cemetery is on the site of a basilica. There are ruins of another Christian basilica, excavated by the French, the apse being intact and the narthex serving as a church. Many stones with Roman inscriptions are built into the walls of Arab houses. The modern town is much smaller than the Roman colony. Kef, chief town of a contrôle civil, has 7,362 inhabitants, of whom 1,163 are Europeans. Kef in ancient times bore the name of Sicca Veneria, derived from a famous temple dedicated to an oriental goddess whom the Romans identified with Venus. Augustus made of it a colony which was a very prosperous town in the first centuries of our era.

KEHL, a town in the republic of Baden, on the right bank of the Rhine, opposite Strassburg. Pop. (1925) 9,467. Since 1697 the town has belonged to Baden but has, at various times, been occupied by the French. It has river trade in timber, cattle and coal, which has been developed by the formation of a harbour. It manufactures sugar, soap, chemicals, and hats.

KEIGHLEY (Kēth'lĭ or Kē'lĭ), municipal borough in the West Riding of Yorkshire, England, 17 m. W N.W. of Leeds, on the L.M S. railway. Pop. (1921) 41,921. It is situated in a deep valley near the confluence of the river Worth and the Aire, but well away from the flat valley bottom of the latter river. It is served by the Leeds and Liverpool canal which affords water communication with both Liverpool and Hull. The parish church of St. Andrew, dating from the time of Henry II., was much modernized in 1710, rebuilt with the exception of the tower, in 1805, and again rebuilt in 1878. The grammar school was founded in 1713, and from it were established in 1871 a trade school for boys and a grammar school for girls. The technical school was founded in 1870. The principal industries are manufactures of woollen goods, spinning, sewing and washing machines, and tools. The town was incorporated in 1882.

KEI ISLANDS, a group of islands of the Moluccas, Dutch East Indies, lying on a ridge which extends south-eastwards from Ceram and continues to Timor Laut (alternative spelling, Ke; native, *Ewaf*). They are in the residency of Amboyna, and are separated by deep water from the Banda Isles to the west and the Aru group to the east and are situated between 5° and 6° 5′ S., and 131° 50′ and 133° 15′ E. They consist of Great Kei (Nuhu Yut), Little Kei (Nuhu Roa and Kei Dula), the Kur group, and the Tayando group. The principal island is Great Kei, which is long (64 m.) and narrow, of Tertiary formation, and very mountainous, with heights rising to nearly 3,000 ft. The mountains run down the centre of the island, whilst the coast is high, with steep cliffs. Kei Dula has low hills in the south and north-west, but the other islands are, comparatively, without high ground; most of them are encircled by shoals, and all are covered with dense forest, from which excellent timber is obtained. Excepting Great Kei, they are of Post-Tertiary formation, coralline limestone. The area of the whole group is 572 sq.m., and the pop. is 35,731 (33 Europeans, 108 Chinese and 119 Arabs). The natives are described by Wallace as typical black Papuans, but since his visit to Kei there has been a pronounced admixture of Malay blood. Originally pagans, the people to-day are largely Christian, the result of work by the Mission of the Sacred Heart, which has its headquarters for Kei, Timor Laut, and New Guinea here. There are, however, many Mohammedans, the result of Malay and Arab influence, which endeavours to spread Mohammedanism. Under the new *régime* old customs are tending to disappear, but where Christianity and Islam have not displaced them the division of *pata-lima* and *pata-siwa* exists; as well as three classes of society, *melmel,* an upper class, which appears to have come to Kei from the west, *rinrin,* made subject by the *melmel,* and *iri,* the descendants of slaves brought over from New Guinea. The old form of marriage is endogamic, and society is democratic in organization, untilled land being owned by the community, and cultivated ground by the individual. The right to the land is never alienated, so that a stranger cannot own it unless he marries into the community. Houses are built very simply, of bamboo and *atap,* sometimes on piles; and where the people are pagan there is a holy stone in the midst of a number of houses, also stone and wooden images, the "protectors" of the village: the cromlech is known in Kei. The Christian and Mohammedan people wear *baju,* or *kabayah* and *sarong:* the loin cloth is still used amongst the pagans. Amongst interesting pagan customs, now dying out rapidly, are those of maintaining quietude amongst near female relatives of sailors on a voyage, to ensure a calm passage; the exorcism of evil spirits by tempting them to another spot, with sacks of rice; the preservation of an infant's soul which is "deposited" in a coco-nut shell, the latter being hung up beside the image of a worthy ancestor; and the preservation of the navel-string of an infant, which is regarded as its brother or sister, and set in some spot where it may bring its "brother" or "sister" good fortune. At Banda Elat on the eastern side of Great Kei, midway along the coast, and also at Banda Eli in the north, there is a community of the original inhabitants of the Banda islands, who were expelled thence by the Dutch in the time of Jan Pieterzen Coen, and who have retained the Bandanese language, now unknown in Banda, and the Bandanese customs. They are Mohammedans, and clever smiths and potters; racially they appear to be Malay-Papuan, but it is unlikely that they have kept purity of blood. The Kei islanders have a quarrelsome nature, they are not given to cleanliness, and are not good agriculturists. They are, however, good at wood-carving and basket-work, and they are first-class boat builders.

The flora of the Kei islands includes the fig and the ironwood tree, various palms (sago, areng, coco-nut, the latter thriving on quite high ground, over 1,000 ft., as well as at sea level), mangrove, and in the forests orchids and arboreal Liliaceae and Pandanaceae abound. Plantain, yams, maize, rice to a small extent, and tobacco are cultivated. Fishing and hunting add largely to the native dietary, which consists mainly of sago. The fauna comprises a wild pig and a cuscus, a small green lizard, a rare species of pigeon, *Carpophaga concinna,* and red lories, a number of rare species of butterfly, including the black *Papilio euchenor,* a blue and black beetle, *Eupholus,* a fine green floral beetle, *Lomaptera papua, Therates labia,* and *Tricondyla aptera,* a wingless beetle shaped like a very large ant. There are many kinds of fish, in large quantities, and trepang and tortoise are found in great numbers on the reefs. Practically the only trade is in copra, timber, trepang and tortoise-shell. Roads are confined to the immediate vicinity of Langgur and the ports Tual (where the Gesaghebber, or resident magistrate, resides) and Elat, all of which are visited regularly by Dutch steamships. Wallace says Kei has no affinity with the Malay languages

See A. R. Wallace, *The Malay Archipelago* (1890). (E. E. L.)

KEISER, REINHOLD (1673–1739), German composer, was born at Teuchern near Weissenfels, Leipzig, in 1673 (baptized Jan. 12, 1674). He received his early musical training from his father, a composer of church music, and afterwards went to the Thomasschule in Leipzig. In 1694 he settled in Hamburg and became the most famous composer of German opera of his day. He wrote a hundred and sixteen pieces for the Hamburg theatre, ran a successful series of "winter concerts" (which were a combination of concert and banquet), married the daughter of a Hamburg patrician, and in 1728 became cantor and canon of Hamburg cathedral. In between he held court appointments at Stuttgart and Copenhagen but Hamburg remained his home and he died there on Sept. 13, 1739. Keiser's facility in writing and gift for melody must have been extraordinary. His operas contained on an average forty airs and for forty years he remained a favourite with the public. Those were critical days for German opera, which was then in its infancy with Hamburg for its cradle, and it was Keiser, with his colleagues Mattheson and Telemann, who in the beginning enabled it to hold its own against the French and Italian schools. Unfortunately Keiser's early promise was never fulfilled. His work not only became trivial but was often—as in the opera *Störtebecker und Gödje Michael*—of unparalleled coarseness, and the attempt to establish German opera ended in failure. In his later years he turned to church music, which he seems to have approached with due seriousness. His oratorios were dramatic, as was natural, but had earnestness and

dignity. He also wrote motets, cantatas and psalms.

For the full catalogue of his works see *Vierteljahrsschrift*, vol. vi, pp. 196–203. Examples from his operas are included in "The Age of Bach and Handel" (*Oxford History of Music*, vol. iv.). *Octavia* was reprinted as a supplement to the Händelgesellschaft edit., 1902, and *Krösus* and *Inganns fidele* are in the *Denkmäler deutscher Tonkunst*, xxxvii., xxxviii. *See* also Chrysander, *Geschichte d. Hamburger Oper*, Allgemeine Musikztg. (1878–79); Kljefeld, *Das Oper*, Internat. Musikgesellsch. (Leipzig).

KEITH, the name of an old Scottish family which derived its name from the barony of Keith in East Lothian, said to have been granted by Malcolm II., king of Scotland, to a member of the house for services against the Danes. The office of great marishal of Scotland, afterwards hereditary in the Keith family, was confirmed, together with possession of the lands of Keith, to Sir Robert Keith by a charter of King Robert Bruce. Keith commanded the Scottish horse at Bannockburn, and was killed at the battle of Neville's Cross in 1346. At the close of the 14th century Sir William Keith, by exchange of lands with Lord Lindsay, obtained the crag of Dunnottar in Kincardineshire, where he built the castle of Dunnottar, which became the stronghold of his descendants. He died about 1407. In 1430 a later Sir William Keith was created Lord Keith, and a few years afterwards earl marishal, and these titles remained in the family till 1716. William, fourth earl marishal (d. 1581), was one of the guardians of Mary queen of Scots during her minority, and a member of her privy council on her return to Scotland. While refraining from extreme partisanship, he was an adherent of the Reformation; he retired into private life at Dunnottar Castle about 1567, thereby gaining the sobriquet "William of the Tower." He was reputed to be the wealthiest man in Scotland. His eldest daughter Anne married the regent Murray. His grandson George, 5th earl marishal (*c.* 1553–1623), was one of the most cultured men of his time. He was educated at King's College, Aberdeen, where he became a proficient classical scholar, afterwards studying divinity under Theodore Beza at Geneva. He was a firm Protestant, and took an active part in the affairs of the kirk. He acted as special ambassador to Denmark to arrange the marriage of James VI. with the Princess Anne. He was subsequently employed on a number of commissions. He founded and endowed in 1593 the Marischal College in the university of Aberdeen. From an uncle he inherited the title of Lord Altrie about 1590.

WILLIAM, 7th earl marishal (*c.* 1617–1661), was a leader of the covenanting party in north-east Scotland, and the most powerful opponent of the marquess of Huntly. He co-operated with Montrose in Aberdeenshire and neighbouring counties against the Gordons. With Montrose he signed the Bond of Cumbernauld in August 1640, but took no active steps against the popular party till 1648, when he joined the duke of Hamilton in his invasion of England, escaping from the rout at Preston. In 1650 Charles II. was entertained by the marishal at Dunnottar; and in 1651 the Scottish regalia were left for safe keeping in his castle. Taken prisoner in the same year, he was committed to the Tower and was excluded from Cromwell's Act of Grace. He was made a privy councillor at the Restoration and died in 1661. Sir John Keith (d. 1714), brother of the 7th earl marishal, was, at the Restoration, given the hereditary office of knight marishal of Scotland, and in 1677 was created earl of Kintore, and Lord Keith of Inverurie and Keith-Hall, a reward for his share in preserving the regalia of Scotland, which were secretly conveyed from Dunnottar to another hiding-place, when the castle was besieged by Cromwell's troops. From him are descended the earls of Kintore.

GEORGE, 10th earl marishal (*c.* 1693–1778), served under Marlborough, and like his brother Francis, Marshal Keith (*q.v.*), was a zealous Jacobite, taking part in the rising of 1715, after which he escaped to the continent. In the following year he was attainted, his estates and titles being forfeited to the Crown. He lived at first in Spain, and, after 1745, in Prussia, where he became, like his brother, intimate with Frederick the Great. Frederick employed him in diplomacy, and he is said to have conveyed information to Chatham, for which he received a pardon from George II., and returned to Scotland in 1759.

From the Keith family through the female line was descended George Keith Elphinstone, Baron of Stonehaven, Marishal and afterwards Viscount Keith (*q.v.*), whose titles became extinct at the death of his daughter Margaret, Baroness Keith, in 1867.

Bain (4 vols., Edinburgh, 1881–88); Peter Buchan, *An Account of the Ancient and Noble Family of Keith* (Edinburgh, 1828); *Memoirs and Correspondence of Sir Robert Murray Keith*, edited by Mrs. Gillespie Smyth (London, 1849); J. Spalding, *Memorialls of the Troubles in Scotland, 1624–1645* (2 vols, Aberdeen, 1850–51); E. E. Cuthell, *The Scottish Friend of Frederick the Great* (1915). See *Dictionary of National Biography* (ed. L. Stephen and S. Lee, 1908, etc.).

KEITH, SIR ARTHUR (1866–), British anthropologist, was born at Old Machar, Aberdeen, on Feb. 5, 1866. He studied medicine at Aberdeen, London and Leipzig. He became a leading authority on anthropology, and an expert on the reconstruction of prehistoric man from fragments or fossil remains. He was Fullerian professor of comparative anatomy at the Royal Institution (1917–23), became conservator of the Museum and Hunterian professor at the Royal college of surgeons in 1908 and acted as honorary secretary of the Royal Institution (1922–26). He was secretary and later president of the Anatomical Society of Great Britain, president of the Royal Anthropological Institute (1913–7), and in 1913 was elected F.R.S. and *membre de la Société d'anthropologie de Paris*. He was knighted in 1921, and was designated president of the British Association in 1927. (*See* MAN, EVOLUTION OF.)

His published works include *Introduction to the Study of Anthropoid Apes* (1897); *Human Embryology and Morphology*, 4th ed. (1921); *Ancient Types of Man* (1911); *The Human Body* (1912); *Antiquity of Man* (1915, 2nd ed. 1925); *Menders of the Maimed* (1919); *Engines of the Human Body* (1919, 2nd ed. 1925); *Nationality and Race* (1919); and *Religion of a Darwinist* (1925).

KEITH, FRANCIS EDWARD JAMES (1696–1758), Scottish soldier and Prussian field marshal, was the second son of William, 9th earl marishal of Scotland, and was born on June 11, 1696 at the castle of Inverugie near Peterhead. His share in the rising of 1715 drove him from Scotland. After two years in Paris, chiefly spent in study, he took part in 1719 in the ill-starred expedition of the Pretender to the Highlands of Scotland. He then served the Spanish and the Russian armies. He had the reputation of being one of the ablest officers in the Russian service as well as a capable and liberal civil administrator. In 1747 he offered his services to Frederick II. of Prussia, who at once gave him the rank of field marshal, in 1749 made him governor of Berlin, and evinced towards him, as towards his brother, the 10th earl marishal, a strong personal regard Keith was employed in high command during the Seven Years' War. In 1756 he commanded the troops covering the investment of Pirna, and distinguished himself at Lobositz. In 1757 he commanded at the siege of Prague; later in this same campaign he defended Leipzig against a greatly superior force, was present at Rossbach, and, while the king was fighting the campaign of Leuthen, conducted a foray into Bohemia. In 1758 he took a prominent part in the unsuccessful Moravian campaign, and the autumn campaign in the Lausitz. He was killed on Oct 14, 1758 at the battle of Hochkirch. Keith had several children by his mistress, Eva Mertens, a Swedish prisoner captured by him in the war of 1741–43. In 1889 the 1st Silesian infantry regiment No. 22 of the German army received his name.

Carlyle, *Frederick the Great, passim;* V. Paczynaski-Tenczyn, *Leben des G F. M. Jakob Keith* (Berlin, 1889); Peter Buchan, *Account of the Family of Keith* (Edinburgh, 1878); Anon, *Memoir of Marshal Keith* (Peterhead, 1869); Pauli, *Leben grosser Helden*, part iv.

KEITH, GEORGE (1639?–1716), British divine, was born at Aberdeen and was educated for the Presbyterian ministry at Marischal College in his native city. In 1662 he became a Quaker and worked with Robert Barclay (*q.v.*). After being imprisoned for preaching in 1676 he went to Holland and Germany on an evangelistic tour with George Fox and William Penn. Two further

terms of imprisonment in England induced him (1684) to emigrate to America, where he was surveyor-general in East New Jersey and then a schoolmaster at Philadelphia. He travelled in New England, defending Quakerism against the attacks of Increase and Cotton Mather, but after a time fell out with his own folk on the subject of the atonement, accused them of deistic views, and started a community of his own called "Christian Quakers" or "Keithians." He then came to London to defend his views, but the Yearly Meeting of 1694 disowned him, and he established a society of Turner's Hall in Philpot Lane, where he departed from Quaker usage, and administered the two sacraments. In 1700 he conformed to the Church of England, and from 1702 to 1704 was an agent of the Society for the Propagation of the Gospel in America. He died on March 27, 1716, at Edburton in Sussex, of which parish he was rector. Among his writings were *The Deism of William Penn and his Brethren* (1699); *The Standard of the Quakers Examined; or, an Answer to the Apology of Robert Barclay* (1702); *A Journal of Travels* (1706).

KEITH, GEORGE KEITH ELPHINSTONE, VISCOUNT (1746–1823), British admiral, fifth son of the 10th Lord Elphinstone, was born in Elphinstone Tower, near Stirling, on Jan. 7, 1746. He entered the navy in 1761, in the "Gosport," then commanded by Captain Jervis, afterwards Earl St. Vincent. In 1767 he made a voyage to the East Indies in the Company's service, and made a fortune in trading. He was engaged afloat throughout the American War. At the outbreak of the War of the French Revolution in 1793 he was appointed to the "Robust" (74), in which he took part in the occupation of Toulon by Hood. He distinguished himself by beating a body of the French ashore at the head of a naval brigade of English and Spaniards. In 1794 he was promoted rear-admiral, and in 1795 he was sent to occupy the Dutch colonies at the Cape of Good Hope and in India, and in August 1796 captured a whole Dutch squadron in Saldanha Bay. When the mutiny at the Nore broke out in 1797 he was appointed to the command, and restored order there and at Plymouth. At the close of 1798 he was sent as second in command to St. Vincent. St. Vincent was at once half incapacitated by ill-health and very arbitrary, while Nelson, who considered that Keith's appointment was a personal slight to himself, was insubordinate. The escape of a French squadron which entered the Mediterranean from Brest in May 1799 was mainly due to jarrings among the British naval commanders. Keith followed the enemy to Brest on their retreat, but failed to bring them to action. He returned to the Mediterranean in November as commander-in-chief, and was in charge of the operations at Genoa (1800). The close of 1801 and the beginning of the following year were spent in transporting the army sent to Egypt. He was made a baron of the United Kingdom—an Irish barony having been conferred on him in 1797. In 1803–07 he was commander-in-chief in the North Sea. In February 1812 he was appointed commander-in-chief in the Channel, and in 1814 he was raised to a viscounty. He was at Plymouth when Napoleon surrendered and was brought to England in the "Bellerophon" by Captain Maitland (1777–1839). The decisions of the British government were expressed through him to the fallen Emperor. Keith died on March 10, 1823 at Tullyallan, and was buried in the parish church.

There is a panegyrical *Life of Lord Keith* by Alex. Allardyce (Edinburgh, 1882); and biographical notices will be found in John Marshall, *Royal Naval Biography*, i. 43 (1823–35). See *The Keith Papers* (ed. W. G. Perrin, pub. Navy Records Society, 1927, etc.).

KEITH, police burgh and parish, Banffshire, Scotland, on the Isla, 53¼ m. N.W. of Aberdeen by the L.M.S. railway. Pop. (1921) 4,270. A branch of the L.N.E. railway also gives access to Elgin, and there is a line to Buckie and Portessie on the Moray Firth. The burgh includes Old Keith and New Keith on the east bank of the Isla, and Fife-Keith on the west bank. Old Keith, which has a charter dating from William the Lion, fell into gradual decay; New Keith was founded in the 18th century by the second earl of Seafield, and Fife-Keith has grown up since 1816. In the Roman Catholic church there is a painting of the "Incredulity of St. Thomas," presented by Charles X. of France. The industries include manufactures of manure, meal, tweeds, blankets and agricultural implements; there are also distilleries and breweries. Keith is also important as the centre of the agricultural trade of the shire, and for its September horse fair, one of the largest in the north of Scotland.

KEJ or KECH, the chief place in a district of the province of Makran in Baluchistan, which has given its name to Kej-Makran, as distinguished from Persian Makran. There is no town, but a number of small villages dominated by a fort built upon a rock, on the eastern bank of the Kej river. This fort, like many others similarly placed throughout the country, is supposed to be impregnable, but is of no strength except against the matchlocks of the surrounding tribes. Kej (or Kiz) was an important trade centre in the days of Arab supremacy in Sind, and the rulers of Kalat at various times marched armies into the province with a view to maintaining their authority. At the beginning of the 19th century it had the reputation of a commercial centre, trading through Panjgur with Kandahar, with Karachi via Bela, and with Muscat and the Persian gulf by the seaport of Gwadar, distant about 80 m. The present Khan of Kalat exercises but a feeble sway over this portion of his dominion, although he appoints a governor to the province. The principal tribe residing around Kej is that of the Gichki, who claim to be of Rajput origin, and to have settled in Makran during the 17th century, having been driven out of Rajputana. The climate during summer is too hot for Europeans. During winter, however, it is temperate. The principal exports consist of dates, which are considered of the finest quality. A local revolt against Kalat rendered an expedition against Kej necessary in 1898, when the fort was captured.

KEKCHI, a group of Maya Indians, speaking a distinctive dialect, who occupy the department of Alta Verapaz in Guatemala. They number about 80,000. According to tradition they and the Poconchi, who were once part of the same people, lived long ago in the Mexican State of Chiapas and north-eastern Guatemala. Kekchi to-day is spoken between the Rio Chixoy and Lake Isabal, chiefly in the towns of Cobán, San Juan Chamelco, San Pedro, Carchá, Zamac, Lanquin, Cahabón and Senahú. At the time of the Spanish conquest, three incursions were repulsed by the Kekchi, whose territory was called the "Land of War." Las Casas, the celebrated missionary and historian, then intervened, and offered to secure the Indians to the Crown by peaceful penetration. This he did, and the king in recognition changed the name of the region to "True Peace" (Verapaz). To-day the Kekchi are devoted to agriculture, many of them working on coffee estates. They retain many features of aboriginal life, and still wear the brilliant costumes characteristic of the Guatemalan highlands.

BIBLIOGRAPHY.—Bartolomé Las Casas, *Historia de las Indias* (Madrid, 1875–76); Robert Burkitt, "Guatemalan Myths" (The *Museum Journal*, vol vi, No. 3) (Philadelphia, 1915); Karl Sapper, *Mittelamerikanische Reisen und Studien* (Braunschweig, 1902).

KEKULE, FRIEDRICH AUGUST (1829–1896), German chemist, was born at Darmstadt on Sept. 7, 1829. He studied architecture at Giessen and later, coming under the influence of Liebig, he took up chemistry. From Giessen he went to Paris, and then visited England where he enjoyed personal intercourse with the leading chemists. On his return to Germany he started a small chemical laboratory at Heidelberg, where, with a very slender equipment, he carried out several important researches. In 1856 he became assistant professor of chemistry at Heidelberg, and in 1858 professor at Ghent; in 1865 he was called to Bonn to fill a similar position, which he held till his death on June 13, 1896. Kekule's main importance lies in the far-reaching contributions which he made to chemical theory, especially in regard to the constitution of the carbon compounds (*see* CHEMISTRY: *Organic*). The doctrine of atomic saturation capacity (valency) had already been enunciated by E. Frankland (*q.v.*), when in 1858 Kekule published a paper in which, after giving reasons for regarding carbon as a tetravalent element, he set forth the essential features of his famous doctrine of the linking of atoms. He explained that in substances containing several carbon atoms it must be assumed that some of the affinities of each carbon atom are bound by the affinities of the atoms of other elements contained in the sub-

stance, and some by an equal number of the affinities of the other carbon atoms. This conception led Kekulé in 1865 to formulate his "closed-chain" or "ring" theory of the constitution of benzene (*q.v.*), which has been called the "most brilliant piece of prediction to be found in the whole range of organic chemistry." This in turn led to the elucidation of the constitution of the "aromatic compounds." These contributions to the theory of chemical structure are so important that Kekulé's other valuable work on fulminate of mercury, and on unsaturated and thio-acids, etc., appears insignificant in comparison. Professor F. R. Japp, in the Kekulé memorial lecture (*Journ. Chem. Soc.*, 1898), declared that three-fourths of modern organic chemistry is directly or indirectly the product of Kekulé's benzene theory.

Many of Kekulé's papers appeared in the *Annalen der Chemie*, of which he was editor, and he also published an important work, *Lehrbuch der organischen Chemie*, of which the first three volumes are dated 1861, 1866 and 1882, while of the fourth only one small section was issued in 1887.

KELANTAN: *see* MALAY STATES.

KELLER, ALBERT VON (1844–1920), German painter, was born at Gais, in Switzerland on April 27, 1844; he studied at the Munich academy under Lenbach and Ramberg, and must be counted among the leading colourists of the modern German school. Travels in Italy, France, England and Holland, and a prolonged sojourn in Paris, helped to develop his elegant and refined style. In his portraits and the scenes from fashionable life, such as the famous "Dinner" (1890), he displays great sensibility to colour and a subtle skill in the treatment of satin and lustrous materials. There are good examples of his work at Munich, Königsberg and elsewhere He died on July 14, 1920, at Zürich.

See F. V. Ostini: "Albert von Keller" in Velhagen und Klasings *Monatsheft* (xvi. 2. 1902).

KELLER, GOTTFRIED (1819–1890), German-Swiss poet and novelist, was born at Zurich on July 19, 1819 He was apprenticed (1835) to a landscape painter, and spent two years (1840–42) in Munich in the study of art. Poverty drove him home again; he then wrote a small volume of *Gedichte* (1846), which proved his real talent The cantonal Government gave him a small pension which enabled him to study philosophy at Heidelberg From 1850 to 1855 he lived in Berlin, where he wrote the novel, *Der grüne Heinrich* (1851–53; revised ed 1879–80), remarkable for its delicate autobiographic portraiture and the beautiful episodes interwoven with the action This was followed by *Die Leute von Seldwyla* (1856), studies of Swiss provincial life, including *Romeo und Julia auf dem Dorfe*, one of the most powerful short stories in the German language, and *Die drei gerechten Kammacher*, almost as great a masterpiece of humorous writing. From 1861 to 1867 he was first secretary to the canton. For a time his creative faculty seemed paralysed by his public duties, but in 1872 appeared *Sieben Legenden*, and in 1874 a second admirable series of *Die Leute von Seldwyla*. In his later years appeared *Zuricher Novellen* (1878), *Das Sinngedicht*, a collection of short stories (1881), *Gesammelte Gedichte* (1883), and a novel, *Martin Salander* (1886). He died on July 15, 1890, at Hottingen. Keller's place among German novelists is very high. Few have united such fancy and imagination to such uncompromising realism, or such tragic earnestness to such abounding humour. As a lyric poet, his genius is no less original; he takes rank with the greatest German poets in the second half of the 19th century.

Keller's *Gesammelte Werke* were published in 10 vols. (1889–90), to which was added another volume, *Nachgelassene Schriften und Dichtungen*, containing the fragment of a tragedy (1893). In English appeared, *G. Keller: A Selection of his Tales translated with a Memoir by Kate Freiligrath-Kroeker* (1891). *See* also F. Baldensperger, *G. Keller; sa vie et ses oeuvres* (1893); A. Frey, *Erinnerungen an Gottfried Keller* (1893); J. Baechtold, *Kellers Leben. Seine Briefe und Tagebucher* (3 vols., 1894–97 revised ed. by Ermatinger, 1915); A. Köster, *G. Keller* (1900; 2nd ed., 1907); Ricarda Huch, *Gottfried Keller* (1904); Mayne, *Gottfried Keller* (1923); and for his work as a painter, H. E. von Berlepsch, *Gottfried Keller als Maler* (1895). A new edition of *Der grüne Heinrich* in its original form, before Keller changed its tragic ending, was published by Ermatinger in 1913.

KELLER, HELEN ADAMS (1880–), American blind deaf-mute, was born at Tuscumbia, Ala., on June 27, 1880. When barely two years old she was deprived of sight, smell and hearing, by an attack of scarlet fever. At the request of her parents, who were acquainted with the success attained in the case of Laura Bridgman (*q.v.*), one of the graduates of the Perkins Institution at Boston, Miss Anne M. Sullivan, who was familiar with the teachings of Dr. S. G. Howe (*q.v.*), was sent to instruct her at home. Unfortunately, an exact record of the steps in her early education was not kept; but from 1888 onwards, at the Perkins Institution, Boston, and under Miss Sarah Fuller at the Horace Mann school in New York, and at the Wright Humason school, she not only learned to read, write and talk, but became proficient to an exceptional degree in the ordinary educational curriculum. In 1900 she entered Radcliffe college, and graduated in 1904.

Miss Sullivan, whose ability as a teacher must be considered almost as marvellous as the talent of her pupil, was throughout her devoted companion. The case of Helen Keller is the most extraordinary ever known in the education of blind deaf-mutes (*see* DEAF AND DUMB *ad fin.*), her acquirements including several languages and her general culture being exceptionally wide. She wrote *The Story of My Life* (1902), *Optimism* (1903), *The World I Live In* (1910) and *My Religion* (1927), which in literary style and in outlook on life are a striking revelation of the results of modern methods of educating those who have been so handicapped by natural disabilities.

KELLERMANN, BERNHARD (1879–), German novelist, was born at Fürth on March 4, 1879. His early novels, *Yester und Li* (1904), *Ingeborg* (1906), *Der Tor* (1909), English trans. *The Fool* (1925), were subjective and emotional. *Das Meer* (1910), English trans. *The Sea* (1925), and *Sassa Yo Sassa* (1912), a novel of Japan, were the fruit of travels. Kellermann had now acquired an excellent technique and descriptive power, and his further novels, which were very popular, dealt with social problems in a sensational fashion. These include *Der Tunnel* (1913), *Der 9. November* (1920), English trans. *The 9th November* (1925), *Die Heiligen* (1922), *Schwedenklees Erlebnis* (1923), *Die Brüder Schellenberg* (1925). Kellermann also wrote a drama *Die Wiederlaufer von Munster* (1925) and two books of war journalism, *Der Krieg im Westen* (1915) *and Der Krieg im Argonnerwald* (1916).

KELLERMANN, FRANÇOIS CHRISTOPHE DE (1735–1820), duke of Valmy and marshal of France, was born in Strasbourg of a Saxon family on May 28, 1735. He entered the French army and served in the Seven Years' War and in Louis XV.'s Polish expedition of 1771, after which he was made a lieutenant-colonel. He became brigadier (1784), *maréchal-de-camp* (1785), and in 1791 general of the Revolutionary army in Alsace. In April 1792 he was made a lieutenant-general, and in August his victory of Valmy (*see* FRENCH REVOLUTIONARY WARS) over the Prussians, in Goethe's words, "opened a new era in the history of the world." Transferred to the army on the Moselle, Kellermann was accused of neglecting to support Custine's operations on the Rhine, but was acquitted and placed at the head of the army of the Alps and of Italy. Shortly afterwards he received instructions to reduce Lyons, then in revolt against the Convention, but after the surrender he was imprisoned in Paris for thirteen months. He was acquitted and reinstated in his command, maintaining the south-eastern border against the Austrians until his army was merged into that of General Bonaparte in Italy. His active career then came to an end, but the hero of Valmy was never forgotten. When Napoleon came to power Kellermann was named successively senator (1800), honorary marshal of France (1803), and duke of Valmy (1808). His experience in army administration made him one of Napoleon's most valuable assistants. In 1814 he voted for the deposition of the emperor and became a peer under the royal government. After the "Hundred Days" he sat in the Chamber of Peers and voted with the Liberals He died at Paris on Sept. 23, 1820.

See J. G P de Salve, *Fragments historiques sur M. le maréchal de Kellermann* (1807), and De Botidoux, *Esquisse de la carrière militaire de F. C. Kellermann, duc de Valmy* (1817).

His son, FRANÇOIS ÉTIENNE DE KELLERMANN, duke of Valmy (1770–1835), French cavalry general, was born at Metz and served

in his father's regiment of Hussars before entering the diplomatic service in 1791. In 1793 he again joined the army and rose in 1796 to the rank of *chef de brigade*. During the Italian campaign (1796–97), he attracted Bonaparte's notice by his brilliant conduct at the forcing of the Tagliamento He was made general of a brigade, and employed successively in the armies of Rome and Naples under Macdonald and Championnet. In the campaign of 1800 he commanded a cavalry brigade, and at Marengo (*q.v.*) he carried out one of the most famous cavalry charges of history, which, with Desaix's infantry attack, regained the lost battle and decided the issue of the war. He was promoted general of a division immediately. He was perhaps the ablest of all Napoleon's cavalry leaders, and distinguished himself at Austerlitz (*q.v.*) in Portugal, at Tormes (Nov. 28, 1809), and on many other occasions in the Peninsular War and in the campaigns of 1813–14. He retained his rank under the first Restoration, but joined Napoleon during the Hundred Days, and fought in the Waterloo campaign, where he was again wounded. He was disgraced at the second Restoration, and maintained till the fall of Charles X. in 1830 an attitude of determined opposition to the Bourbons. He succeeded his father and died June 2, 1835.

His son FRANÇOIS CHRISTOPHE EDMOND DE KELLERMANN, duke of Valmy (1802–1868), was a distinguished statesman, political historian, and diplomatist under the July Monarchy.

KELLGREN, JOHAN HENRIK (1751–1795), Swedish poet and critic, was born at Floby, West Gothland, on Dec. 1, 1751. He studied at Åbo, where he began to lecture (1774) on aesthetics. With Carl Leongren he founded (1778) the journal *Stockholmsposten*, of which he was sole editor from 1788 onwards. Kellgren was librarian to Gustavus III. from 1780, and from 1785 his private secretary. He was an original member of the Swedish Academy. He died at Stockholm on April 20, 1795. His poetical works are partly lyrical, partly dramatic; of the plays the versification belongs to him, the plots being due to Gustavus III. The songs interspersed in the four operas which they produced in common, viz., *Gustaf Vasa*, *Gustaf Adolf och Ebba Brahe*, *Aeneas i Kartago*, and *Drottning Kristina*, are wholly the work of Kellgren. His lyrics are among the best of the Gustavian age.

His *Samlade skrifter* (3 vols., 1796; a later edition, 1884–85) were revised by himself. His correspondence with Rosenstein and with Clewberg was edited by H. Schück (1886–87 and 1894). *See* Wieselgren, *Sveriges skona litteratur* (1833–49); Atterbom, *Svenska stare och skalder* (1841–55); C. W. Böttiger in *Transactions of the Swedish Academy*, xlv. 107 *seq.* (1870); and Gustaf Ljunggren's *Kellgren, Leopold, och Thorild*, and his *Svenska vitterhetens hafder* (1873–77).

KELLOGG, CLARA LOUISE (1842–1916), American singer, was born at Sumterville, S C., on July 12, 1842, and was educated in New York for the musical profession, singing first in opera there in 1861. Her fine soprano voice and artistic gifts soon made her famous. She appeared as prima donna in Italian opera in London, and at concerts, in 1867 and 1868; and from that time till 1887 was one of the leading public singers. She appeared at intervals in London, but was principally engaged in America. In 1874 she organized an opera company which became widely known in the United States. In 1887 she married Carl Strakosch, and retired from the profession. In 1913 she published *Memoirs of an American Prima Donna*. She died at Hartford, Conn., on May 13, 1916.

KELLOGG, FRANK BILLINGS (1856–), American diplomat and lawyer, was born at Potsdam, N.Y., on Dec. 22, 1856. In 1865 he went with his parents to Minnesota, where he studied law and was admitted to the bar in 1877. He practised in Rochester, Minn., for ten years, removing in 1887 to St. Paul. He was retained as special counsel for the United States in the actions against the Paper Trust and in the Standard Oil case. He also appeared as special counsel for the Interstate Commerce Commission in the investigation of the Harriman railways, and for the United States in the action to dissolve the Union Pacific and Southern Pacific railway merger. He was a delegate to the Republican national conventions of 1904, 1908 and 1912, and was elected U.S. senator from Minnesota for the term 1917–23. He was also U.S. delegate to the fifth International Conference of American States at Santiago, Chile, 1923. In 1924 he was appointed ambassador to Great Britain, succeeding G. B. M. Harvey. He resigned in Feb. 1925, to accept an appointment in the cabinet of President Coolidge as secretary of State, which office he held until April, 1929.

In this capacity he protested firmly against the threatened forfeiture of American rights in lands in Mexico under new laws of retroactive effect. He advocated intervention in Nicaragua to suppress a rebellion and pacify the country until a fair election could be held. He secured a treaty with Panama for co-operation in protection of the Panama Canal in case of war. He made a firm stand in China for the protection of American lives and property. He received much criticism from the liberal press for many of these acts on the ground that they were too aggressive, also for his decisions as to the exclusion of certain foreigners under the undesirable alien exclusion acts. He aided the Treasury Department in negotiating debt-funding agreements with European countries. He aided in bringing about a conference with Great Britain and Japan on limitation of naval armaments, (Geneva, 1927), and in the discussion of the Tacna-Arica dispute between Chili, Peru and Bolivia. In 1928, he attended the Sixth Pan American Conference at Havana, Cuba. His most important achievement, doubtless, was bringing about the signing of a multilateral treaty for the renunciation of war, known as the "Pact of Paris" (*see* OUTLAWRY OF WAR) by 15 principal nations at Paris Aug. 27, 1928. The contracting parties, in the language of the treaty, "condemn recourse to war for the solution of international controversies and renounce it as an instrument of national policy in their relations with one another."

KELLOGG, VERNON LYMAN (1867–), American zoologist, was born at Emporia (Kan.), on Dec. 1, 1867. He graduated from the University of Kansas, subsequently studying at Cornell university, Leipzig and Paris. He was successively assistant and associate professor of entomology at the University of Kansas 1890–94, and professor of entomology and lecturer in bionomics at Stanford university, 1894–1920. Having acted as a director, in Brussels, of the American commission for relief in Belgium, 1915, he served as assistant to the U S. food administration, 1917, and in various capacities with the American relief commission in Poland and Russia, 1918–21. He became permanent secretary and chairman of the division of educational relations of the national research council, Washington (D.C.), 1919.

He wrote *American Insects* (1904); *Evolution and Animal Life*, with D. S. Jordan (1907); *Darwinism To-day* (1907); *The Animals and Man* (1911); *Headquarters Nights* (1917); *Herbert Hoover, the Man and His Work* (1920); *Nuova, or the New Bee* (1921); *Human Life as the Biologist Sees It* (1922); *Mind and Heredity* (1923); *Evolution* (1925) and other books.

KELLS, a market town of Co. Meath, Ireland, on the Blackwater, 9¾ m. N.W. of Navan by rail. Pop. of urban district (1926) 2,198. St. Columbkille's house, originally an oratory, was converted into a church, the chancel of which existed in 1752. The present church is modern, with the exception of the belltower, rebuilt in 1578. Near the church is a round tower, 99 ft. in height; and there are several ancient crosses, the finest being that now erected in the market-place. Kells was originally a royal residence, whence its ancient name *Ceanannus*, meaning the *dun* or circular northern fort, in which the king resided, and the intermediate name *Kenlis*, meaning head fort. Here Conn of the Hundred Fights resided in the 2nd century; and here was a palace of Dermot, king of Ireland, in 544–565. The other places in Ireland named Kells are probably derived from *Cealla*, signifying church. In the 6th century Kells was granted to St. Columbkille. The town owes its chief ecclesiastical importance to the bishopric founded about 807, and united to Meath in the 13th century.

The *Book of Kells*, an illuminated copy of the Gospels in Latin, contains also local records, dating from the 8th century, and is preserved in the library of Trinity college, Dublin. It is asserted to be the finest extant example of early Christian art of its kind. Neighbouring antiquities are the church of Dulane, with a fine doorway, and the *dun* or fortification of Dimor, the principal erec-

tion of a series of defences on the hills about 6 m. W. of Kells.

KELLY, EDWARD (1854–1880), Australian bushranger, was born at Wallan Wallan, Victoria. His father was a transported Belfast convict, and as boys he and his brothers were constantly in trouble for horse-stealing; "Ned" served three years' imprisonment for this offence. In April 1878, an attempt was made to arrest his brother Daniel on a similar charge. The whole Kelly family resisted this and Ned wounded one of the constables. Mrs. Kelly and some of the others were captured, but Ned and Daniel escaped to the hills, where they were joined by two other desperadoes, Byrne and Hart. For two years, despite a reward of £8,000 offered jointly by the governments of Victoria and New South Wales for their arrest, the gang under the leadership of Kelly terrorized the country on the borderland of Victoria and New South Wales, "holding up" towns and plundering banks. In June 1880, however, they were at last tracked to a wooden shanty at Glenrowan, near Benalla, which the police surrounded, riddled with bullets, and finally set on fire. Kelly was severely wounded, captured and taken to Beechworth, where he was tried, convicted and hanged in October 1880. The total cost of the capture of the Kelly gang was reckoned at £115,000.

See F. A. Hare, *The Last of the Bushrangers* (London, 1892).

KELLY, HOWARD ATWOOD (1858–), American gynaecologist, was born at Camden, N.J., on Feb. 20, 1858. He graduated in medicine from the University of Pennsylvania in 1882 and following an interneship at the Episcopal hospital he founded the Kensington hospital for women, Philadelphia. In 1888 he devised the open cystoscope by which a light is introduced into the interior of the body to aid in diagnosis and operations. He was associate professor of obstetrics at the university from 1888 to 1889; professor of gynaecology and obstetrics at Johns Hopkins university (1889–99); professor of gynaecology (1899–1919); emeritus professor since 1919. At Johns Hopkins Hospital he was gynaecological surgeon (1899–1919) and had been consulting gynaecologist since 1919. His high attainments in the field of gynaecology have brought him many honours. He was also a pioneer in the use of radium for cancer.

Besides contributing some 500 valuable articles to medical journals, he wrote *Operative Gynecology*, 2 vol. (1898, 1906); *The Vermiform Appendix and Its Diseases* (with Elizabeth Hurdon, 1905); *Walter Reed and Yellow Fever* (1906, '07, '23); *Medical Gynecology* (1908, 1912); *Appendicitis and Other Diseases of the Vermiform Appendix* (1909); *Myomata of the Uterus* (with T. S. Cullen, 1909); *Diseases of the Kidneys, Ureters, and Bladder* (with C. F. Burnam, 1914, 1922); *Gynecology* (1928); *American Medical Biography* (with W. L. Burrage, 1928).

KELLY, HUGH (1739–1777), Irish dramatist and poet, son of a Dublin publican, was born in 1739 at Killarney. He was apprenticed to a staymaker, and in 1760 went to London. Here he worked at his trade for some time, and then became an attorney's clerk. He contributed to various newspapers, wrote pamphlets for the booksellers, and a novel, once famous, *Memoirs of a Magdalen, or the History of Louisa Mildmay* (2 vols., 1767). In 1766 he published an anonymous poem, *Thespis; or, A Critical Examination into the Merits of All the Principal Performers belonging to Drury Lane Theatre*. Kelly's first comedy, *False Delicacy*, written in prose, was produced by Garrick at Drury Lane on Jan. 23, 1768. The piece had a great vogue in London, and in French and Portuguese versions it drew crowded houses in Paris and Lisbon.

Kelly was a journalist in the pay of Lord North, and therefore hated by the party of John Wilkes, especially as being the editor of the *Public Ledger*. His *Thespis* had also made him many enemies; and Mrs. Clive refused to act in his pieces. The production of his second comedy, *A Word to the Wise* (Drury Lane, 3rd of March 1770), occasioned a riot in the theatre, repeated at the second performance, and the piece had to be abandoned.

His other plays are: *Clementina* (Covent Garden, Feb. 23, 1771), a blank verse tragedy, given out to be the work of a "young American Clergyman" in order to escape the opposition of the Wilkites; *The School for Wives* (Drury Lane, Dec. 11, 1773), a prose comedy given out as the work of Major (afterwards Sir William) Addington; a two-act piece, *The Romance of an Hour* (Covent Garden, Dec. 2, 1774), borrowed from Marmontel's tale *L'Amitié à l'épreuve;* and an unsuccessful comedy, *The Man of Reason* (Covent Garden, Feb. 9, 1776). Kelly gave up literature for law in 1774. He died in poverty on Feb. 3, 1777.

See *The Works of Hugh Kelly, to which is prefixed the Life of the Author* (1778); Genest, *History of the Stage* (v. 163, 263–269, 308, 399, 457, 517). Pamphlets in reply to *Thespis* are: "Anti-Thespis . . ." (1767): "The Kellyad . . ." (1767), by Louis Stamma; and "The Rescue or Thespian Scourge . . ." (1767), by John Brown-Smith.

KELLY, MICHAEL (1762–1826), British actor, singer and composer, was the son of a Dublin wine-merchant and dancing-master. He studied in Italy, and for four years from 1783 was engaged to sing at the Court Theatre at Vienna, where he became a friend of Mozart. In 1786 he sang in the first performance of the *Nozze di Figaro* Appearing in London, at Drury Lane in 1787, he had a great success, and thenceforth was the principal English tenor at that theatre. In 1793 he became acting-manager of the King's Theatre. He wrote a number of songs (including "The Woodpecker"), and the music for many dramatic pieces. In 1826 he published his entertaining *Reminiscences*, in writing which he was helped by Theodore Hook. He combined his professional work with conducting a music-shop and a wine-shop, but with disastrous financial results. He died at Margate on Oct. 9, 1826.

KELP (a term of unknown derivation) is the ash produced by the incineration of various kinds of seaweed (*Algae*) obtainable in great abundance on the west coasts of Ireland and Scotland, and the coast of Brittany It is prepared from the deep-sea tangle (*Laminaria digitata*), sugar wrack (*L. saccharina*), knobbed wrack (*Fucus nodosus*), black wrack (*F. serratus*) and bladder wrack (*F. vesiculosus*) The Laminarias yield what is termed "drift-weed kelp," obtainable only when cast up on the coasts by storms or other causes The species of *Fucus* growing within the tidal range are cut from the rocks at low water, and are therefore known as "cut-weeds." The weeds are first dried in the sun and are then collected into shallow pits and burned till they form a fused mass, which, while still hot, is sprinkled with water to break it up into convenient pieces A ton of kelp is obtained from 20 to 22 tons of wet seaweed. The average composition may vary as follows: Potassium sulphate, 10 to 12%; potassium chloride, 20 to 25%; sodium carbonate, 5%; other sodium and magnesium salts, 15 to 20%; and insoluble ash from 40 to 50%. The iodine content of different samples of kelp may vary from 1 to 6%. (*See* IODINE.)

The kelp beds off the Pacific coast of the United States have been the object of experiment by the Federal government and private enterprise owning several small plants.

KELSO, burgh of barony, police burgh and market town, Roxburghshire, Scotland, on the left bank of the Tweed, 52 m. (43 m by road) S E of Edinburgh and 10¼ m. N E. of Jedburgh by the L N E R. Pop. (1921), 3,527. The name has been derived from the old Welsh *calch*, or Anglo-Saxon *cealc*, "chalk," and the Scots *how*, "hollow," a derivation more evident in the earlier forms Calkon and Calchon, and illustrated in Chalkheugh, the name of a locality in the town. The ruined abbey was founded in 1128 by David I. for monks from Tiron in Picardy, whom he transferred hither from Selkirk, where they had been installed fifteen years before. The abbey, completed towards the middle of the 13th century, became one of the most powerful in Scotland, claiming precedence over the other monasteries and disputing the supremacy with St. Andrews. It suffered damage in numerous English forays, was pillaged by the 4th earl of Shrewsbury in 1522, and was reduced to ruins in 1545 by the earl of Hertford (afterwards the Protector Somerset). In 1602 the abbey lands passed into the hands of Sir Robert Ker of Cessford, 1st earl of Roxburghe. The ruins were disfigured by an attempt to render part of them available for public worship, and one vault was long utilized as the town gaol, but they were cleared at the beginning of the 19th century and presented to the nation by the duke of Roxburghe in 1919. The late Norman and Early Pointed cruciform church has an unusual ground-plan, the west end of the

cross forming the nave and being shorter than the chancel. The nave and transepts extend only 23 ft. from the central tower. The remains include most of the tower, nearly the whole of the walls of the south transept, less than half of the west front, the north and west sides of the north transept, and a remnant of the chancel. The predominant feature is the great central tower, which, as seen from a distance, suggests the keep of a Norman castle.

The Tweed is crossed at Kelso by a bridge of five arches constructed in 1803 by John Rennie. The grammar school occupies the site of the school which Sir Walter Scott attended in 1783. The public park lies in the east of the town, and the race-course to the north of it. The leading industries are the making of fishing tackle, agricultural implements, and chemical manures, besides coach-building, cabinet-making and upholstery, corn and saw mills, iron founding, etc. James and John Ballantyne, friends of Scott, set up a press about the end of the 18th century, from which there issued, in 1802, the first two volumes of the *Minstrelsy of the Scottish Border*. The *Kelso Mail*, founded by James Ballantyne in 1797, is now the oldest of the Border newspapers. The town is an important agricultural centre, with weekly corn and fortnightly cattle markets.

Kelso became a burgh of barony in 1634. On Oct. 24, 1715 the Old Pretender was proclaimed James VIII. in the market square, but in 1745 Prince Charles Edward found no active adherents in the town.

About 1 m. W. of Kelso is Floors or Fleurs Castle, the principal seat of the duke of Roxburghe. The mansion as originally designed by Sir John Vanbrugh in 1718 was severely plain, but in 1849 William Henry Playfair converted it into a magnificent structure in Tudor style.

On the peninsula formed by the junction of the Teviot and the Tweed stood the formidable castle and flourishing town of Roxburgh from which the shire took its name. No trace exists of the town, and of the castle all that is left are a few ruins shaded by ancient ash trees. Built by the Northumbrians, after the consolidation of the kingdom of Scotland it became a favoured royal residence; the town beneath its protection reached its palmiest days under David I., and formed a member of the Court of Four Burghs with Edinburgh, Stirling and Berwick. It possessed a church, court of justice, mint, mills, and, what was remarkable for the 12th century, grammar school. Alexander II. was married and Alexander III. was born in the castle. During the long period of Border warfare, the town was repeatedly burned and the castle captured. The castle was finally razed to the ground in 1460. It was at the siege that the king, James II., was killed by the explosion of a huge gun called "the Lion" On the fall of the castle the town was abandoned in favour of the rising burgh of Kelso. The town, whose patron-saint was St James, is still commemorated by St. James's Fair, held on the 5th of every August on the vacant site, and the most popular of Border festivals.

Sandyknowe or Smailholm Tower, 6 m. W. of Kelso, dating from the 15th century, is a fine example of a Border Peel Two m. N. by E. of Kelso is the pretty village of Ednam (Edenham, "The Village on the Eden"), the birthplace of the poet James Thomson, to whose memory an obelisk, 52 ft high, was erected on Ferney Hill in 1820

KELTIE, SIR JOHN SCOTT (1840–1927), British geographer, was born at Dundee on March 29, 1840 In 1880 he was appointed editor of the *Statesman's Year Book*. He became in 1884 inspector of geographical education in connection with the Royal Geographical society, and was librarian of the society in 1885 and secretary in 1892. In 1915 he was appointed joint-editor of the *Geographical Journal*. In 1917 he retired and in 1918 was knighted. He acted during the winter of 1918–19 as geographical adviser to the historical section of the Foreign Office. He died on Jan. 10, 1927.

His book *The Partition of Africa* (1894) is a standard work. He has also published *A History of the Scottish Highlands and Clans* (1874); *Report on Geographical Education* (1886); *Applied Geography* (1890; new ed. 1908); *The History of Geography* (with O. J. R. Howarth, 1914), and many articles in scientific and geographical journals.

KELVIN, WILLIAM THOMSON, Baron (1824–1907), British physicist, the second son of James Thomson, LL.D., professor of mathematics in the University of Glasgow, was born at Belfast, Ireland, on June 26, 1824, his father being then teacher of mathematics in the Royal Academical Institution. In 1832 James Thomson accepted the chair of mathematics at Glasgow. In 1841 William Thomson entered Peterhouse, Cambridge, and in 1845 took his degree as second wrangler and won the first Smith's Prize. At that time there were few facilities for the study of experimental science in Great Britain. Thomson therefore had recourse to Paris, and for a year worked in the laboratory of Regnault, who was then engaged in his classical researches on the thermal properties of steam. In 1846, he accepted the chair of natural philosophy in the University of Glasgow, which he filled for 53 years, attaining universal recognition as one of the greatest physicists of his time. The Glasgow chair was a source of inspiration to scientific men for more than half a century, and many of the most advanced researches of other physicists grew out of the numerous suggestions made by Thomson. One of his earliest papers dealt with the age of the earth. Thomson's calculations on the conduction of heat showed that at some time between 20 millions and 400 millions, probably about 100 millions, of years ago, the physical conditions of the earth must have been entirely different from those which now obtain. This led to a long controversy with geologists in which the physical principles held their ground.

In 1847 Thomson first met James Prescott Joule at the Oxford meeting of the British Association. Joule's views of the nature of heat strongly influenced Thomson's mind, with the result that in 1848 Thomson proposed his absolute scale of temperature, which is independent of the properties of any particular thermometric substance, and in 1851 he presented to the Royal Society of Edinburgh a paper on the dynamical theory of heat, which reconciled the work of N. L. Sadi Carnot with the conclusions of Count Rumford, Sir H. Davy, J. R. Mayer and Joule, and placed the dynamical theory of heat and the fundamental principle of the conservation of energy in a position to command universal acceptance. It was in this paper that the principle of the dissipation of energy, briefly summarized in the second law of thermodynamics, was first stated.

Although his contributions to thermodynamics may properly be regarded as his most important scientific work, it is in the field of electricity, especially in its application to submarine telegraphy, that Lord Kelvin is best known to the world at large From 1854 he is most prominent among telegraphists. The stranded form of conductor was due to his suggestion; but it was in the letters which he addressed in that year to Sir G. G Stokes, and which were published in the *Proceedings of the Royal Society* (1855), that he discussed the mathematical theory of signalling through submarine cables, and enunciated the conclusion that in long cables the retardation due to capacity must render the speed of signalling inversely proportional to the square of the cable's length. Thomson set to work to overcome the difficulty by improvement in the manufacture of cables, by the production of copper of high conductivity and the construction of apparatus which would readily respond to the slightest variation of the current in the cable. The mirror galvanometer and the siphon recorder, which was patented in 1867, were the outcome of these researches. Thomson's work in connection with telegraphy led to the production in rapid succession of instruments adapted to the requirements of the time for the measurement of every electrical quantity, and when electric lighting came to the front a new set of instruments was produced to meet the needs of the electrical engineer

When W. Weber in 1851 proposed the extension of C. F. Gauss's system of absolute units to electromagnetism, Thomson took up the question, and, applying the principles of energy, calculated the absolute electromotive force of a Daniell cell, and determined the absolute measure of the resistance of a wire from the heat produced in it by a known current. In 1861 Thomson induced the British Association to appoint its first famous committee for the determination of electrical standards.

The oscillatory character of the discharge of the Leyden jar, the foundation of the work of H. R. Hertz and of wireless telegraphy, were investigated by him in 1853.

It was in 1873 that he undertook to write a series of articles for *Good Words* on the mariner's compass. He wrote the first, but so many questions arose in his mind that it was five years before the second appeared. In the meanwhile the compass went through a process of complete reconstruction in his hands, a process which enabled both the permanent and the temporary magnetism of the ship to be readily compensated, while the weight of the 10-in. card was reduced to one-seventeenth of that of the standard card previously in use, although the time of swing was increased. Thomson also invented his sounding apparatus, whereby soundings can be taken in shallows and in deep-water. Thomson's tide gauge, tidal harmonic analyser and tide predicter are famous, and among his work in the interest of navigation must be mentioned his tables for the simplification of Sumner's method for determining the position of a ship at sea. Thomson published more than 300 original papers bearing upon nearly every branch of physical science. It is only by reference to his published papers that any approximate conception can be formed of his life's work; but the student who had read all these knew comparatively little of Lord Kelvin if he had not talked with him face to face. Extreme modesty, almost amounting to diffidence, was combined with the utmost kindliness in Lord Kelvin's bearing to the most elementary student, and nothing seemed to give him so much pleasure as an opportunity to acknowledge the efforts of the humblest scientific worker. The progress of physical discovery during the last half of the 19th century was perhaps as much due to the kindly encouragement which he gave to his students and to others who came in contact with him as to his own researches and inventions; and it would be difficult to speak of his influence as a teacher in stronger terms than this.

In 1866, perhaps chiefly in acknowledgment of his services to trans-Atlantic telegraphy, Thomson received the honour of knighthood, and in 1892 he was raised to the peerage with the title of Baron Kelvin of Largs. The Grand Cross of the Royal Victorian Order was conferred on him in 1896, the year of the jubilee of his professoriate In 1890 he became president of the Royal Society, and he received the Order of Merit on its institution in 1902 In 1896, on the occasion of the jubilee of his professorship, the city authorities joined with the university in honouring their most distinguished citizen Three years after this celebration Lord Kelvin resigned his chair at Glasgow, though by formally matriculating as a student he maintained his connection with the university, of which in 1904 he was elected chancellor. Much of his time after his retirement was given to writing and revising the lectures on the wave theory of light which he had delivered at Johns Hopkins university, Baltimore, in 1884 (published 1904) At the Leicester meeting of the British Association in 1884 he delivered a long and searching address on the electronic theory of matter. He died on Dec 17, 1907, at his residence, Netherhall, near Largs, Scotland; there was no heir to his title, which became extinct A statue was erected to him at Glasgow in 1913

In addition to the Baltimore lectures, he published with Professor P. G. Tait a standard but unfinished *Treatise on Natural Philosophy* (1867). A number of his scientific papers were collected in his *Reprint of Papers on Electricity and Magnetism* (1872), and in his *Mathematical and Physical Papers* (1882, 1883 and 1890), and three volumes of his *Popular Lectures and Addresses* appeared in 1889–94.

See Andrew Gray, *Lord Kelvin* (1908); S. P. Thompson, *Life of Lord Kelvin* (1910), which contains a full biblography of his writings.

KEMBLE, the name of a family of English actors, of whom the most famous were Mrs. Siddons (*q v*) and her brother John Philip Kemble, the eldest of the 12 children of ROGER KEMBLE (1721–1802), a strolling player and manager, who in 1753 married an actress, Sarah Wood.

JOHN PHILIP KEMBLE (1757–1823), the second child, was born at Prescot, Lancashire, on Feb. 1, 1757. He was educated for the Roman Catholic priesthood at Sedgeley Park Catholic seminary, near Wolverhampton, and the English college at Douai, France. But he had no vocation, and on his return to England he joined the theatrical company of Crump and Chamberlain, his first appearance being as Theodosius in Lee's tragedy at Wolverhampton on Jan. 8, 1776. In 1778 he joined the York company of Tate Wilkinson, appearing at Wakefield as Captain Plume in Farquhar's *The Recruiting Officer;* in Hull for the first time as Macbeth on Oct. 30, and in York as Orestes in Ambrose Philips's *Distressed Mother.*

He appeared as Hamlet in Dublin on Nov. 2, 1781, and was engaged at Drury Lane in 1783, where he made his début on Sept. 30, 1783, in the same part. The Drury Lane public were moderately enthusiastic, but his performance with his sister, Mrs. Siddons, in *Macbeth* (March 31, 1785) established him as a popular favourite. Brother and sister had first appeared together at Drury Lane on Nov. 22, 1783, as Beverley and Mrs. Beverley in Moore's *The Gamester,* and as King John and Constance in Shakespeare's tragedy. In the following year they played Montgomerie and Matilda in Cumberland's *The Carmelite,* and in 1785 Adorni and Camiola in Kemble's adaptation of Massinger's *A Maid of Honour,* and Othello and Desdemona. Between 1785 and 1787 Kemble appeared in a variety of rôles, his Mentevole in Jephson's *Julia* producing an overwhelming impression. He married (Dec. 8, 1787) Priscilla Hopkins Brereton (1756–1845), the widow of an actor and herself an actress.

Kemble's appointment as manager of Drury Lane in 1788 gave him full opportunity to dress the characters less according to tradition than in harmony with his own conception of what was suitable. In his own version of *Coriolanus,* which was revived during his first season, the character of the "noble Roman" exactly suited his powers; it is even said that he allowed its influence to colour his private manner and modes of speech His tall and imposing person, noble countenance, and solemn and grave demeanour were uniquely adapted for the Roman characters in Shakespeare's plays; and when he had to depict the gradual growth and development of one absorbing passion, his representation gathered a momentum and majestic force that were irresistible. His defect was in flexibility, variety, rapidity; the characteristic of his style was method, regularity, precision, elaboration even of the minutest details, founded on a thorough psychological study of the special personality he had to represent. Kemble excelled in declamation, but physically he was incapable of giving expression to impetuous vehemence and searching pathos

On account of the eccentricities of Sheridan, the proprietor of Drury Lane, Kemble withdrew from the management, and, although he resumed his duties at the beginning of the season 1800–01, he at the close of 1802 finally resigned connection with it. In 1803 he became manager of Covent Garden, in which he had acquired a sixth share for £23,000 The theatre was burned down on Sept. 20, 1808, and the raising of the prices after the opening of the new theatre, in 1809, led to riots, which practically suspended the performances for three months. Kemble was only saved from ruin by a loan, afterwards converted into a gift, of £10,000 from the duke of Northumberland Kemble's last performance was as Coriolanus on June 23, 1817 His retirement was probably hastened by the rising popularity of Edmund Kean. He died at Lausanne on Feb. 26, 1823

See Boaden, *Life of John Philip Kemble* (1825); Fitzgerald, *The Kembles* (1871).

STEPHEN KEMBLE (1758–1822), the second son of Roger, was rather an indifferent actor, ever eclipsed by his wife and fellow player, Elizabeth Satchell Kemble (*c* 1763–1841), and a man of such portly proportions that he played Falstaff without padding. He managed several other theatres situated in Edinburgh and elsewhere.

CHARLES KEMBLE (1775–1854), a younger brother of John Philip and Stephen, was born at Brecon, South Wales, on Nov. 25, 1775. He, too, was educated at Douai. He made his first recorded appearance at Sheffield as Orlando in *As You Like It* in 1792. His first London appearance was on April 21, 1794, as Malcolm to his brother's Macbeth. Ultimately he won independent fame, especially in such characters as Archer in George

Farquhar's *Beaux' Stratagem,* Dorincourt in Mrs. Cowley's *Belle's Stratagem,* Charles Surface and Ranger in Dr. Benjamin Hoadley's *Suspicious Husband.* His Laertes and Macduff were hardly less interesting than his brother's Hamlet and Macbeth. In comedy he was ably supported by his wife, Marie Therèse De Camp (1774–1838), whom he married on July 2, 1806. His visit, with his daughter Fanny, to America during 1832 and 1834, aroused much enthusiasm. The later period of his career was clouded by money embarrassments in connection with his joint proprietorship in Covent Garden theatre. He formally retired from the stage in Dec. 1836, but his final appearance was on April 10, 1840. For some time he held the office of examiner of plays. In 1844–45 he gave readings from Shakespeare at Willis's Rooms. He died on Nov. 12, 1854.

See *Gentleman's Magazine,* Jan. 1855; *Records of a Girlhood,* by Frances Anne Kemble.

ELIZABETH WHITLOCK (1761–1836), who was a daughter of Roger Kemble, made her first appearance on the stage in 1783 at Drury Lane as Portia. In 1785 she married Charles E. Whitlock, went with him to America and played with much success there. She had the honour of appearing before President Washington. She seems to have retired about 1807, and she died on Feb. 27, 1836.

FRANCES ANNE KEMBLE (Fanny Kemble) (1809–1893), the actress and author, was Charles Kemble's elder daughter; she was born in London on Nov. 27, 1809, and educated chiefly in France. She first appeared on the stage on Oct. 25, 1829 as Juliet at Covent Garden. Her attractive personality at once made her a great favourite, her popularity enabling her father to recoup his losses as a manager. She played all the principal women's parts, notably Portia, Beatrice and Lady Teazle; Julia in Sheridan Knowles's *The Hunchback,* especially written for her, was perhaps her greatest success. In 1832 she went with her father to America, and in 1834 she married there a Southern planter, Pierce Butler. They were divorced in 1849. In 1847 she returned to the stage, and later, following her father's example, appeared with much success as a Shakespearian reader. In 1877 she returned to England, where she lived till her death in London on Jan. 15, 1893. Fanny Kemble was a popular figure in London society. Besides her plays, *Francis the First,* unsuccessfully produced in 1832, *The Star of Seville* (1837), a volume of *Poems* (1844), and a book of Italian travel, *A Year of Consolation* (1847), she published a volume of her *Journal* in 1835, and in 1863 another (dealing with life on the Georgia plantation), and also a volume of *Plays* (1863), including translations from Dumas and Schiller. These were followed by *Records of a Girlhood* (1878), *Records of Later Life* (1882), *Notes on some of Shakespeare's Plays* (1882), *Far Away and Long Ago* (1889), and *Further Records* (1891). Her various volumes of reminiscences contain much valuable material for the social and dramatic history of the period.

ADELAIDE KEMBLE (1814–1879), Charles Kemble's second daughter, was an opera singer of great promise, whose first London appearance was made in *Norma* on Nov. 2, 1841. In 1843 she married Edward John Sartoris, a rich Italian, and retired after a brief but brilliant career. She wrote *A Week in a French Country House* (1867), a bright and humorous story, and of a literary quality not shared by other tales that followed.

Among more recent members of the Kemble family, mention may also be made of Charles Kemble's grandson, HENRY KEMBLE (1848–1907), a popular London actor.

KEMBLE, JOHN MITCHELL (1807–1857), English scholar and historian, eldest son of Charles Kemble the actor, was educated at Bury St. Edmunds, at Trinity college, Cambridge, and under the brothers Grimm at Göttingen (1831). His early works were: *Beowulf* (1833–37), *Über die Stammtafel der Westsachsen* (1836), *Codex Diplomaticus Aevi Saxonici* (1839–48). His *History of the Saxons in England* (1849; new ed. 1876) attempted an examination of the original sources of the early period of English history. He was editor of the *British and Foreign Review* from 1835 to 1844; and from 1840 to his death was examiner of plays. He died at Dublin on March 26, 1857. Other works of his are *State Papers . . . from the Revolution to the Home of Hanover* (1857); and *Horae Ferales,* completed by R. G. Latham (1864).

KEMÉNY, ZSIGMOND, BARON (1816–1875), Hungarian author, was on the staff of the *Pesti Hirlap,* when he brought out his first great novel, *Pál Gyulay* (1846). He was a member of the revolutionary diet of 1848, and spent a short time in exile. In his two pamphlets, *Forradalom után* (After the Revolution) and *Még egysz ó a forradalom után* (One word more after the Revolution), he defended the point of view which was realized by Deák in 1867. He subsequently edited the *Pesti Napló,* which became virtually Deák's political organ. Kemény also published several political essays (e.g., *The Two Wesselényis,* and *Stephen Szechenyi*), and some excellent novels: *Férj és nö* (Husband and Wife), *Szivörvényei* (The Heart's Secrets), etc. During the 'sixties Kemény actively assisted Deák; he popularized the Composition of 1867 which he had done so much to bring about. He was elected to the diet of 1867 for one of the divisions of Pest, but took no part in the debates. The last years of his life were passed in complete seclusion in Transylvania. To the works of Kemény already mentioned should be added the fine historical novel *Rajongok* (The Fanatics) (Pest, 1858–1859), and *Collected Speeches* (Hung.) (Pest, 1889).

See L. Nogrady, *Baron Sigismund Kemény's Life and Writings* (Hung.) (Budapest, 1902); G. Beksics, *Sigismund Kemény, the Revolution and the Composition* (Hung.) (Budapest, 1888).

KEMMERER, EDWIN WALTER (1875–), American economist, was born at Scranton, Pa., on June 29, 1875, and educated at Wesleyan (A.B., 1899) and Cornell (Ph.D., 1903). He was instructor in economics at Purdue university, 1901–03; assistant professor of political economy, 1906–09, professor of economics and finance, 1909–12, at Cornell, and after 1912 professor of economics and finance at Princeton. He served as financial adviser to the U.S. Philippine Commission in 1903 and was chief of the Division of Currency, Philippine Islands, 1904–06. He was financial adviser to the Governments of Mexico, 1917, and Guatemala, 1919; U.S. trade commissioner in South America, 1922; chairman of the Commission of American Financial Advisers in Colombia, 1923; Chile, 1925; Poland, 1926; Ecuador, 1926–27; Bolivia, 1927; China, 1929. He served on the Gold Standard Inquiry Committee for the Union of South Africa, 1924–25, and as expert on currency and banking to the Dawes Committee, 1925.

Besides articles in economic journals and various commission reports he is the author of *Money and Credit Instruments in their Relation to General Prices* (1907); *Seasonal Variations in the Relative Demand for Money and Capital* (1910); *Modern Currency Reforms* (1916); *The U.S. Postal Savings System* (1917); *The ABC of the Federal Reserve System* (1918); *High Prices and Deflation* (1920).

KEMP, JAMES FURMAN (1859–1926), American geologist, was born in New York city on Aug. 14, 1859. He graduated from Adelphi academy, Brooklyn (1876), and later studied in Amherst and at Columbia university. After studying at Leipzig and Munich, he returned to America to become a member of the teaching staff at Cornell university (1886–91). In 1891 he was called to Columbia as adjunct professor, and the following year became professor of geology and head of the department, remaining in this position until his death, except during the years 1914–18.

While at Cornell he was one of a group of 13 who organized the Geological Society of America, and was president in 1921. He was considered a leading authority on ore deposits, and was the author of text-books and many scientific papers. Among these were: *Ore Deposits of the United States and Canada* (1903) and *Handbook of Rocks* (1896), *The Trap Dikes of the Lake Champlain Region* (1893), *Geology of the Lake Placid Region* (Albany, 1898), *The Titaniferous Iron Ores of the Adirondacks* (1899), *The Geological Relations and Distribution of Platinum and Associated Metals* (1902), *The Economic Geology of the non-metallic Minerals based on American Examples* (1903), *Geology of the Mount Marcy Quadrangle, Essex County, New York* (Albany, 1921) and many others.

He died at Great Neck, L.I., on Nov. 17, 1926.

KEMPE, JOHN (*c.* 1380–1454), English cardinal, archbishop of Canterbury, and chancellor, son of Thomas Kempe of Ollantigh, near Ashford, Kent, was born about 1380 and educated at Merton college, Oxford. He practised as an ecclesiastical lawyer, was an assessor at the trial of Oldcastle, and in 1415 was made dean of the Court of Arches. He passed into the royal service and after being entrusted with several diplomatic missions was eventually made chancellor of the duchy of Normandy. He was consecrated bishop of Rochester at Rouen on Dec. 3, 1419. In Feb. 1421 he was translated to Chichester, and in November following to London. During the minority of Henry VI. Kempe had a prominent position in the English council as a supporter of Henry Beaufort. In 1426 he became archbishop of York. Succeeding Henry Beaufort, in 1426, Kempe held office as chancellor for six years; his main task was to keep Humphrey of Gloucester in check. His resignation on Feb. 28, 1432, was a concession to Gloucester. He still enjoyed Beaufort's favour and was sent to the congress of Arras in 1435 and the conference at Calais in 1438. In Dec. 1439 he was created cardinal. He supported Suffolk over the king's marriage with Margaret of Anjou; but later there arose some difference between them arising from the nomination of the cardinal's nephew, Thomas Kempe, to the bishopric of London. In Jan. 1450 Kempe once more became chancellor and pronounced the final sentence on Suffolk in March. In spite of his age he dealt vigorously with Cade's rebellion, and by his official experience and skill did what he could for four years to sustain the king's authority. He was rewarded by his translation to Canterbury in July 1452, when Pope Nicholas added as a special honour the title of cardinal-bishop of Santa Rufina. As Richard of York gained influence, Kempe became unpopular and his fall seemed imminent when he died suddenly on March 22, 1454. He was buried at Canterbury, in the choir. Kempe was a politician first, and he was accused with some justice of neglecting his dioceses. He founded a college at Wye, which was suppressed at the Reformation.

BIBLIOGRAPHY.—For contemporary authorities *see* under HENRY VI. *See* also W. Dugdale, *Monasticon*, iii. 254, vi., 1430–1432 (1655); W. F. Hook, *Lives of the Archbishops of Canterbury*, v. 188–267 (1860–76); J. Raine, *Historians of the Church of York*, vol. ii. (1879–94).

KEMPE, WILLIAM (*fl.* 1600), English actor and dancer. He probably began his career as a member of the earl of Leicester's company, but his name first appears after the death of Leicester in a list of players authorized by an order of the privy council in 1593 to play 7 m out of London. In 1594–95 he was one of the Lord Chamberlain's men, but he probably left the company in 1599, as he ceases to appear on the actor-list, and is known to have sold out his share in the Globe theatre. He was the successor, both in parts and reputation, of Richard Tarlton. But it was as a dancer of jigs that he won his greatest popularity, and in Feb.–March 1600, for a wager, he danced his morris dance from London to Norwich. Examples of the music may be seen in the ms. collection of John Dowland now in the Cambridge university library. At the same time Kempe was given parts like Dogberry, and Peter in *Romeo and Juliet;* indeed his name appears by accident in place of those of the characters in early copies. Kempe seems to have exhibited his dancing on the Continent, but in 1602 he was a member of the earl of Worcester's players. He is mentioned as dead in Heywood's *Apology* (*c.* 1608).

KEMPEN, town in Prussian Rhine Province, 40 m. N.W. of Cologne by the railway to Zevenaar. Pop. (1925) 8,139. It belonged in the middle ages to the archbishopric of Cologne and received civic rights in 1294. It has a monument to Thomas à Kempis, who was born there. The industries include silk-weaving, glass-making and the manufacture of electric plant.

KEMPENER, PETER DE (1505–1580), Flemish painter, active chiefly at Seville, where he was known as Pedro Campaña. He was born at Brussels, and was the most distinguished member of a family of painters and tapestry weavers. He went to Italy in 1529. When in Bologna he painted a triumphal arch for festivities connected with the coronation of Charles V., and he also painted that emperor in his coronation robes for Cardinal Marin-Grimani. He is said to have studied the works of Michelangelo and Raphael, but little is known of him at this period. He then went to Spain, and settled at Seville from about 1537–62. Here he became one of the leading representatives of the Seville school of painting. Fr. Pacheco says of him that besides being a painter he was an architect, a sculptor, a mathematician, an astronomer, and well versed in perspective. His masterpiece is the "Deposition from the Cross," painted in 1548 for the church of Santa Cruz and now in the sacristy of the cathedral. In the cathedral is also the large altarpiece of Mariscal representing "The Presentation of Christ" on the central panel, with portrait of donors on the two wings. An earlier version of the "Deposition from the Cross," painted in 1547, is now in the museum of Montpellier. Kempener's pictures were deeply felt and appealed to the emotions. They were greatly admired by Murillo. His portraiture was vivid and noble in conception Anumber of pictures attributed to this artist are in Seville, Corboda, Carmona, Eciga and Rota in Spain. The Berlin museum contains a small "Adoration of the Magi," signed by the artist, very fine in colour. Kempener returned to Brussels in 1563 and was made director of the tapestry works and chief engineer under the duke of Alva. He died in Brussels in 1580. His portrait appears in Fr. Pacheco's *Libro de Descripción de verdadores retratos* (Seville, 1876).

KEMPENFELT, RICHARD (1718–1782), British rear-admiral, son of Magnus Kempenfelt, a Swede said to have been in the British army, was born at Westminster in 1718. He went into the navy and saw his first service in the West Indies, taking part in the capture of Portobello. In 1746 he returned to England, and from that date to 1780, when he was made rear-admiral, saw active service in the East Indies with Sir George Pocock and in various quarters of the world. In 1781 he gained, with a vastly inferior force, a brilliant victory over the French fleet under De Guichen, fifty leagues south-west of Ushant. In 1782 he hoisted his flag on the "Royal George," which formed part of the fleet under Lord Howe. In August this fleet was ordered to refit at top speed at Portsmouth and proceed to the relief of Gibraltar. The shifting of weights on the "Royal George" to facilitate the repairs of a leak, caused a large piece of her bottom to fall out and she sank with 800 persons on board. Kempenfelt perished with the rest. Cowper's poem, the "Loss of the Royal George," commemorates this disaster. A painting of the loss of the "Royal George" is in the Royal United Service Institution, London. Kempenfelt effected radical alterations and improvements in the signalling system then existing in the British navy.

See Charnock's *Biog. Nav.*, vi. 246, and Ralfe's *Naval Biographies*, i. 215.

KEMPT, SIR JAMES (1764–1854), British soldier, son of Gavin Kempt, was born at Southampton. He joined the army, saw service in India, and accompanied Sir Ralph Abercromby to Holland (1799), and to Egypt as aide-de-camp (1801). In 1803 he went with the 81st Foot to the Mediterranean, under Craig, and at Maida the light brigade led by him bore the heaviest share of the battle. He was employed as brevet-colonel in North America from 1807 until he joined Wellington's army (1811) in Spain, where he was wounded at Badajoz. On rejoining the army he led a brigade of the Light Division at Vera, the Nivelle, Bayonne, Orthez and Toulouse, and was made G.C.B. for his services at Waterloo. From 1828 to 1830 he was governor-general of Canada, and afterwards master-general of the ordnance. At the time of his death in 1854 he had been for some years a full general.

KEMPTEN, a town in the republic of Bavaria on the Iller, 81 m. S.W. of Munich by rail. Pop. (1925) 21,874. Kempten, identified with the Roman Cambodunum, consisted in early times of two towns, the old and the new, whose rivalry was intensified by the welcome given by the old town, a free imperial city since 1289, to the Reformed doctrines, the new town keeping to the older faith. The Benedictine abbey of Kempten, said to have been founded in 773 by Hildegarde, the wife of Charlemagne, was an important house and in 1360 its abbot was promoted to the dignity of a prince of the Empire. The town and abbey passed to Bavaria in 1803. The town contains a castle, the old palace of the abbots

of Kempten, dating from the end of the 17th century, now partly used as barracks, and the abbey church. The industries include cotton-spinning and weaving and the manufacture of paper, beer, machines, cement and soap. As the commercial centre of the Algäu, Kempten carries on trade in timber and dairy produce.

KEMP-WELCH, LUCY ELIZABETH (1869–), R.I. 1917, English animal painter, was born at Bournemouth in 1869. She studied under Herkomer at Bushey, and, after the success of her first Academy picture in 1894, exhibited regularly every year. Her bold treatment of animals, in particular of horses, has given her an international reputation. In 1905 she became head of the Art School at Bushey. She was made president of the newly-formed Society of Animal Painters in 1914; a member of the Pastel Society in 1917; of the Royal Cambrian Academy in 1919, and was awarded the bronze medal at the Paris Salon of 1921 and the silver medal in 1922. Among her best known paintings are: "Colt Hunting in the New Forest" (1897), bought by the Chantry Bequest; "Horses Bathing in the Sea" (1900), now in the National Gallery of Victoria; "Timber Hauling" (1914) at Bristol; "The Riders" (1911); "Forward, the Guns" (1917); "The Straw Riders" (1920), presented to the Imperial War Museum, London; and the large wall panel, commemorating women's work in the World War, at the Royal Exchange, London.

KEN, THOMAS (1637–1711), English divine, the most eminent of the English non-juring bishops, and one of the fathers of modern English hymnology, was born at Little Berkhampstead, Herts. He was the son of Thomas Ken of Furnival's Inn; his mother was a daughter of the now forgotten poet, John Chalkhill. Ken's step-sister, Anne, married Izaak Walton in 1646. Ken was educated at Winchester College, and Hart Hall, Oxford, and became fellow (1657) and subsequently tutor of New College. He was ordained in 1662, and after holding several preferments returned in 1672 to Winchester, as a prebendary of the cathedral, chaplain to the bishop, and a fellow of Winchester College. He remained there for several years, preparing his *Manual of Prayers for the use of the Scholars of Winchester College* (1674), and composing hymns. At this time he wrote, primarily for the scholars, his morning, evening and midnight hymns, the first two of which, "Awake, my soul, and with the sun," and "Glory to Thee, my God, this night," are household words in the English-speaking countries. In 1674 Ken visited Rome with young Izaak Walton. In 1679 he was appointed by Charles II. chaplain to the Princess Mary, wife of William of Orange. But he incurred the displeasure of William, and gladly returned to England in 1680, when he was immediately appointed one of the king's chaplains. He was once more residing at Winchester in 1683 when Charles came to the city, and Ken's residence was chosen as the home of Nell Gwynne. Ken stoutly, and successfully, objected. In August of this same year he accompanied Lord Dartmouth to Tangier as chaplain to the fleet, and in 1684, was appointed bishop of Bath and Wells. It is said that, upon the occurrence of the vacancy, Charles, mindful of the spirit he had shown at Winchester, exclaimed, "Where is the good little man that refused his lodging to poor Nell?" and determined that no other should be bishop.

In 1685 he published *Exposition on the Church Catechism,* perhaps better known by its sub-title, *The Practice of Divine Love.* In 1688, when James reissued his "Declaration of Indulgence," Ken was one of the "seven bishops" who refused to publish it. They were committed to the Tower on June 8, 1688, on a charge of high misdemeanour. With the revolution which speedily followed their acquittal, new troubles encountered Ken; for, having sworn allegiance to James, he thought himself thereby precluded from taking the oath to William of Orange. He stood firm to his refusal and was, in August 1691, superseded in his bishopric by Dr. Kidder, dean of Peterborough. From this time he lived mostly with Lord Weymouth, his friend from college days, at Longleat, Wilts; and though pressed to resume his diocese in 1703, upon the death of Bishop Kidder, he declined. He died at Longleat on March 19, 1711. Ken lives in history, apart from his three hymns, mainly as a man of unstained purity and invincible fidelity to conscience, weak only in a certain narrowness of view which is a frequent attribute of the intense character which he possessed. The closing verse of his morning and evening hymns, beginning "Praise God from whom all blessings flow," is one of the most familiar stanzas in the English language, being widely sung as a doxology.

See the edition of his *Poetical Works* (4 vols., 1721) ed. W. Hawkins; and of his *Prose Works* (1838), ed. J. T. Round.

See also J. Lavicount Anderdon (*The Life of Thomas Ken, Bishop of Bath and Wells, by a Layman,* 1851; 2nd ed., 1854); and Dean Plumptre, *Life of Thomas Ken* (2 vols., 1888; revised, 1890); F. G. Gilman, *The Evolution of the English Hymn* (1927).

KEN, a river of northern India, tributary to the Jumna on its right bank, flowing through Bundelkhand. An irrigation system, including a weir 60 m. S. of Banda and a main canal 37 m. long, irrigates 89,000 acres in a normal year. A dam at Gangae to increase the supply of water was finished in 1917.

KENA: *see* QENA.

KENDAL, DUKEDOM OF. The English title of duke of Kendal was first bestowed in May 1667 upon Charles (d. 1667), the infant son of the duke of York, afterwards James II. Several persons have been created earl of Kendal, among them being John, duke of Bedford, son of Henry IV.; John Beaufort, duke of Somerset (d. 1444); and Queen Anne's husband, George, prince of Denmark.

In 1719 Ehrengarde Melusina (1667–1743), mistress of the English king George I., was created duchess of Kendal. This lady was the daughter of Gustavus Adolphus, count of Schulenburg (d. 1691), and was born at Emden on Dec. 25, 1667. Her father held important positions under the elector of Brandenburg; her brother Matthias John (1661–1747) won great fame as a soldier in Germany and was afterwards commander-in-chief of the army of the republic of Venice. Melusina was attached to the household of the Electress Sophia, and became George's mistress about 1690. She followed him to England in 1714, and ousted her principal rival, Charlotte Sophia, Baroness von Kilmannsegge (*c.* 1673–1725), afterwards countess of Darlington, as his first favourite. In 1716 she was created duchess of Munster; then duchess of Kendal; and in 1723 the emperor Charles VI. made her a princess of the Empire. The duchess was avaricious and obtained large sums of money by selling public offices and titles; she also sold patent rights, one of these being the privilege of supplying Ireland with a new copper coinage. This she sold to a Wolverhampton iron merchant named William Wood (1671–1730), who flooded the country with the coins known as "Wood's halfpence," which occasioned Swift's *Drapier's Letters.* After George's death she lived at Kendal House, Isleworth, Middlesex, until her death on May 10, 1743. The duchess was by no means a beautiful woman, and her thin figure caused the populace to refer to her as the "maypole." By the king she had two daughters: Petronilla Melusina (*c.* 1693–1778), who was created countess of Walsingham in 1722, and who married the great earl of Chesterfield; and Margaret Gertrude, countess of Lippe (1703–1773).

KENDAL, WILLIAM HUNTER (1843–1917), English actor, whose family name was Grimston, was born in London on Dec. 16, 1843, the son of a painter. He made his first stage appearance at Glasgow in 1862 as Louis XIV., in *A Life's Revenge.* He joined the Haymarket company in London in 1866, acting everything from burlesque to Romeo. In 1869 he married Margaret (Madge) Shafto Robertson (b. 1849), sister of the dramatist, T. W. Robertson. As "Mr. and Mrs. Kendal" their professional careers then became inseparable. Mrs. Kendal's first stage appearance was as Marie, "a child," in *The Orphan of the Frozen Sea* in 1854 in London. By 1865 she was playing Ophelia and Desdemona. She was Mary Meredith in *Our American Cousin* with Sothern, and Pauline to his Claud Melnotte. But her real triumphs were at the Haymarket in Shakespearian revivals and the old English comedies. While Kendal played Orlando, Charles Surface, Jack Absolute and Young Marlowe, his wife made the combination perfect with her Rosalind, Lady Teazle, Lydia Languish and Kate Hardcastle; and she created Galatea in Gilbert's *Pygmalion and Galatea* (1871). Short seasons followed at the Court theatre and at the Prince of Wales's, at the latter of which they joined the

Bancrofts in *Diplomacy* and other plays. Then in 1879 began a long association with Sir John Hare as joint-managers of the St. James's theatre, some of their notable successes being in *The Squire, Impulse, The Ironmaster* and *A Scrap of Paper.* In 1888, however, the Hare and Kendal régime came to an end. From that time Mr. and Mrs. Kendal chiefly toured in the provinces and in America, with an occasional season at rare intervals in London. William Kendal died on Nov. 7, 1917, in London.

See T. E. Pemberton, *The Kendals* (1900).

KENDAL, market town, municipal borough, Westmorland parliamentary division, England, 251 m. north-west of London on the L.M.S. railway. Pop. (1921) 14,146. The town, the full name of which is Kirkby-Kendal or Kirkby-in-Kendal, is the largest in the county. It is picturesquely placed on the river Kent, and is irregularly built. The white-walled houses with their blue-slated roofs, and the numerous trees, give it an attractive appearance. The church of the Holy Trinity, the oldest part dating from 1200, is Gothic, with five aisles and a square tower. Among the public buildings are the town hall, classic in style; the market house, and literary and scientific institution, with a museum. Educational establishments include a free grammar school, in modern buildings, founded in 1525 and well endowed; a blue-coat school, science and art school, and green-coat Sunday school (1813). East of the town are the ruins of Kendal castle, attributed to the first barons of Kendal. It was the birthplace of Catherine Parr, Henry VIII.'s last queen. On the Castlebrow hill, an artificial mound probably of pre-Norman origin, an obelisk was raised in 1788 in memory of the revolution of 1688. The woollen manufactures of Kendal have been noted since 1331, and, although the coarse cloth known to Shakespeare as "Kendal green" is no longer made, tweeds, railway rugs, horse clothing, knitted woollen caps and jackets, worsted and woollen yarns, and similar goods are manufactured. Other manufactures are machine-made boots and shoes, cards for wool and cotton, agricultural and other machinery, paper, and, in the neighbourhood, gunpowder. There is a large weekly market for grain, and annual horse and cattle fairs.

The outline of a Roman fort is traceable at Watercrook. The barony and castle of Kendal, held by Turold, were granted by William I. to Ivo de Taillebois, but the barony was divided into three parts in the reign of Richard II., one part with the castle passing to Sir William Parr, knight, ancestor of Catherine Parr. After the death of her brother William Parr, his share of the barony reverted to Queen Elizabeth. The castle was in ruins in 1586. In 1745 the Pretender was proclaimed king here. Burgesses in Kendal are mentioned in 1345, and charters were granted in 1472, 1484 and the town was incorporated in 1576. Under the Municipal Reform act of 1835 the corporation was altered. A weekly market on Saturday granted by Richard I. to Roger Fitz Reinfred was purchased by the corporation from the earl of Lonsdale and Captain Bagot, lords of the manor, in 1885 and 1886. Of the five fairs which are now held three are ancient, that now held on April 29 being granted to Marmaduke de Tweng and William de Ros in 1307, and those on Nov. 8 and 9 to Christiana, widow of Ingelram de Gynes, in 1333.

KENDALL, HENRY CLARENCE (1841–1882), Australian poet, son of a missionary, was born in New South Wales on April 18, 1841. He was a clerk in the Lands Department at Sydney, being afterwards transferred to the colonial secretary's office. Later on he became an inspector of forests. His principal volumes of verse were *Leaves from an Australian Forest* (1869) and *Songs from the Mountains* (1880), his feeling for nature, as embodied in Australian landscape and bush-life, being very true and full of charm. He died on Aug. 1, 1882. In 1886 a memorial edition of his poems was published at Melbourne.

KENDALLVILLE, a city of north-eastern Indiana, U.S.A., served by the New York Central and the Pennsylvania railways and by electric inter-urban lines. The population in 1920 was 5,273 (96% native white). It is in a fine farming region, and has a large trade in grain and onions. The principal manufactures are refrigerators, wind-mills, pumps and display cases. The assessed valuation of property is about $10,000,000. The city was founded about 1833 and was incorporated in 1863.

KENEALY, EDWARD VAUGHAN HYDE (1819–1880), Irish barrister and author, born at Cork on July 2, 1819, was educated at Trinity college, Dublin; was called to the Irish bar in 1840 and to the English bar in 1847; and became a Q.C. and a bencher of Gray's Inn (1868). In 1873 he was leading counsel for the Tichborne claimant. After the verdict against his client he started a paper to plead his cause and to attack the judges In 1874 he was disbenched and disbarred by his Inn. In 1875 he was elected to parliament for Stoke; but no member would introduce him when he took his seat. Kenealy died on April 16, 1880, in London.

KENG TUNG (now TUNG KENG): *see* SHAN STATES.

KENILWORTH, market town, Warwickshire, England; situated on a tributary of the Avon, on a branch of the L.M.S. railway, 99 m. N.W. from London. Pop. (1921) 6,751. The town is only of importance for the ruins of its old castle. The walls originally enclosed an area of seven acres. The gatehouse is now used as a dwelling-house; Caesar's tower, the only portion built by Geoffrey de Clinton now extant, has massive walls 16 ft. thick; Merwyn's tower of Scott's *Kenilworth;* the great hall built by John of Gaunt; and the Leicester buildings, also survive. Near the castle are remains of an Augustinian monastery founded in 1122, and afterwards made an abbey. The Norman doorway of St. Nicholas church is supposed to have been the entrance of the former abbey church.

Kenilworth (*Chinewrde, Kenillewurda, Kinelingworthe, Kenilord, Killingworth*) is said to have been a member of Stoneleigh before the Norman Conquest and a possession of the Saxon kings. The town was granted by Henry I. to Geoffrey de Clinton, a Norman who built the castle. Geoffrey's grandson released his right to King John, and the castle remained with the crown until Henry III. granted it to Simon de Montfort, earl of Leicester. The famous "Dictum de Kenilworth" was proclaimed here in 1266. After the battle of Evesham the rebel forces rallied at the castle, which, after a siege of six months, was surrendered by Henry de Hastings, the governor. The king then granted it to his son Edmund. Through John of Gaunt it came to Henry IV. and was granted by Elizabeth in 1562 to Robert Dudley, afterwards earl of Leicester, but on his death in 1588 again merged in the possessions of the Crown. The earl spent large sums on restoring the castle and grounds, and here in July 1575 he entertained Queen Elizabeth at "excessive cost," as described in Scott's *Kenilworth.* During the civil wars the castle was dismantled by the soldiers of Cromwell and from that time abandoned. The only mention of Kenilworth as a borough occurs in a charter of Henry I. to Geoffrey de Clinton and in the charters of Henry I. and Henry II. to the church of St. Mary of Kenilworth confirming the grant of lands made by Geoffrey to this church, and mentioning that he kept the land in which his castle was situated and also land for making his borough, park and fishpond. The town possesses large tanneries.

KENITES, in the Bible, a clan of the south of Palestine, closely associated with the Amalekites, whose hostility towards Israel, however, it did not share. Saul spared them when bidden by Yahweh to destroy Amalek; and David appears to have been on friendly terms with them (1 Sam. xv. 6; xxx. 29). Moses married into a Kenite family (Judges 1: 16) and it would seem that the Kenites were only a branch of the Midianites (*see* JETHRO, MIDIAN). Jael, the slayer of Sisera (*see* DEBORAH), was the wife of Heber the Kenite, who lived near Kadesh in Naphtali. There is an obscure allusion to the destruction of the Kenites in an appendage to the oracles of Balaam (Num. xxiv. 21 *seq.*), and with this, the only unfavourable reference to them, may perhaps be associated the curse of Cain (Kayin). In view of the part played by the Kenite (or Midianite) father-in-law of Moses, as related in Exod xviii., and of the Kenite origin of the Rechabites (*q.v.*), this obscure tribe was evidently an important factor in the history of the religion of Israel. (*See* CALEB, GENESIS, JERAHMEEL, JUDAH)

KENMORE, village and parish, Perthshire, Scotland, 6 m. W. of Aberfeldy. Pop. of parish (1921), 1,008. It is situated at the

foot of Loch Tay, near the point where the river Tay leaves the lake. Taymouth castle (1801) the former seat of the marquess of Breadalbane, standing near the base of Drummond hill in a park through which flows the Tay, is now a hotel. It is a stately four-storeyed building with corner towers and a central pavilion, built on the site of the mansion erected in 1580 for Sir Colin Campbell of Glenorchy. Two miles S.W. of Kenmore are the falls of the Acharn, 80 ft. high. At the village of Fortingall, on the north side of Loch Tay, are the remains of a Roman camp. Glenlyon house was the home of Campbell of Glenlyon, chief agent in the massacre of Glencoe. At Garth, 2½ m. N.E., are the ruins of an ancient castle, said to have been a stronghold of Alexander Stewart, the Wolf of Badenoch (1343–1405).

KENMORE, a village of Summit county, Ohio, U.S.A., on the Tuscarawas river, 8m. S.W. of Akron. It is served by the Baltimore and Ohio, the Erie and the Pennsylvania railways, and by inter-urban electric lines. The population was 12,683 in 1920 (13% foreign-born white). It is a rapidly growing residential and industrial suburb of Akron, with rubber and match factories, salt works and packing plants.

KENMURE, WILLIAM GORDON, 6th viscount (d. 1716), Jacobite leader, son of Alexander, 5th viscount (d. 1698), was descended from the same family as Sir John Gordon of Lochinvar (d. 1604), whose grandson, Sir John Gordon (d. 1634), was created Viscount Kenmure in 1633. The family had generally adhered to the Presbyterian cause, but Robert, the 4th viscount, had been excepted from the amnesty granted to the Scottish royalists in 1654, and the 5th viscount, who succeeded his kinsman Robert in 1663, after some vacillation, joined the court of the exiled Stuarts. The 6th viscount's adherence to the Pretender in 1715 is said to have been due to his wife Mary Dalzell (d. 1776), sister of Robert, 6th earl of Carnwath.

The sixth earl raised the royal standard of Scotland at Lochmaben on Oct. 12, 1715, and was joined by about two hundred gentlemen. This small force received some additions before Kenmure reached Hawick, where he learnt the news of the English rising. He effected a junction with Thomas Forster and James Radclyffe, 3rd earl of Derwentwater, at Rothbury. Their united forces of some fourteen hundred men were reinforced at Kelso by a brigade under William Mackintosh. Threatened by an English army under General George Carpenter, they eventually crossed the English border to join the Lancashire Jacobites, and the command was taken over by Forster. Kenmure was taken prisoner at Preston on Nov. 14. In January 1716 he was tried with other Jacobites before the House of Lords, when he pleaded guilty and appealed to the king's mercy. At his execution on Tower Hill on Feb. 24, he reiterated his belief in the claims of the Pretender. His estates and titles were forfeited, but in 1824 an act of parliament repealed the forfeiture and his descendant, John Gordon (1750–1840), became Viscount Kenmure. On the death of the succeeding peer, Adam, 8th viscount, without issue in 1847, the title became dormant.

KENNEDY, the name of a famous and powerful Scottish family long settled in Ayrshire, derived probably from the name Kenneth. John Kennedy of Dunure obtained Cassillis and other lands in Ayrshire about 1350. John's descendant, Sir James Kennedy, married Mary, a daughter of King Robert III. and their son, Sir Gilbert Kennedy, was created Lord Kennedy before 1458. Another son was James Kennedy (*c.* 1406–1465), bishop of St. Andrews, who founded and endowed St. Salvator's college at St. Andrews and built a large and famous ship called the "St. Salvator."

One of Gilbert Kennedy's sons was the poet, Walter Kennedy (*q.v.*), and his grandson David, third Lord Kennedy (killed at Flodden, 1513), was created earl of Cassillis before 1510; David's sister Janet Kennedy was one of the mistresses of James IV. The earl was succeeded by his son Gilbert, who was killed at Prestwick (Dec. 22, 1527). His son Gilbert, the 3rd earl (*c.* 1517–1558), was educated by George Buchanan, and was a prisoner in England after the rout of Solway Moss in 1542. He was lord high treasurer of Scotland from 1554 to 1558, although he had been intriguing with the English and had offered to kill Cardinal Beaton in the interests of Henry VIII. He died at Dieppe late in 1558 when returning from Paris, where he had attended the marriage of Mary Queen of Scots, and the dauphin of France. He was the father of the "king of Carrick" and the brother of Quintin Kennedy (1520–1564), abbot of Crossraguel. The abbot wrote several works defending the doctrines of the Roman Catholic Church, and in 1562 had a public discussion with John Knox at Maypole. He died on Aug. 22, 1564.

Gilbert Kennedy, 4th earl of Cassillis (*c.* 1541–1576), called the "king of Carrick," became a protestant, but fought for Queen Mary at Langside in 1568. He tortured Allan Stewart, the commendator abbot of Crossraguel in 1570 in order to compel him to renounce his title to the abbey lands which had been seized by Cassillis. John, 6th earl (*c.* 1595–1668), was one of the leaders of the Scots in their resistance to Charles I. In 1643 he went to the Westminster Assembly of Divines and several times he was sent on missions to Charles I. and to Charles II.; for a time he was lord justice general and he was a member of Cromwell's House of Lords. His granddaughter Margaret, married Gilbert Burnet, afterwards bishop of Salisbury. The direct line failed with the death of John, the 8th earl, in August 1759.

The titles and estates of the Kennedys were now claimed by William Douglas, afterwards duke of Queensberry, a great-grandson in the female line of the 7th earl and also by Sir Thomas Kennedy, Bart., of Culzean, a descendant of the 3rd earl, *i.e.*, by the heir general and the heir male. In January 1762 the House of Lords decided in favour of the heir male. The 10th earl died unmarried, and the earldom then passed to a branch of the family settled in America. Archibald, the 12th earl, was created marquess of Ailsa in 1831.

See R. Pitcairn, *Historical and genealogical account of the principal families of the name of Kennedy* (1830).

KENNEDY, SIR ALEXANDER BLACKIE WILLIAM (1847–1928), British engineer, was born at Stepney on March 17, 1847, and educated at the City of London School, and the School of Mines. About 1863 he became a pupil at Dugeon's, Millwall, marine engineers, who were constructing the earliest twin-screw engines. Kennedy took a large part in designing the first compound marine engines built on the Tyne, but by the time he went to Palmer's engine works at Jarrow-on-Tyne as a draughtsman (1868), the types were already beginning to be standardized. After a few years at Leith, Edinburgh and Glasgow, he was appointed, in 1874, professor of engineering at University college, London. His leading methods, founded on Reuleaux's kinematic analysis, have had a wide influence in England and America. He translated Reuleaux's *Kinematics* (1876), and *The Mechanics of Machinery* (1886). In 1887 he was elected F.R.S. In 1889 he set up in practice as an electrical engineer, supervising the construction of power stations in London, Edinburgh, Glasgow and elsewhere. He applied the underground conduit system to part of the London County Council tramway service, and he acted as electric adviser to many companies. Kennedy was knighted in 1905. In 1913 he was a member of Lord Parker's committee on wireless telegraphy. During the World War he presided over the committee on gun-sights and range-finders, and took active part on other similar bodies. He published in 1921 a book, illustrated by his own photographs, entitled *Ypres to Verdun.* In 1920 he was chairman of the electric railways committee set up by the Ministry of Transport.

At the age of 75, in 1922, he set out to explore Petra, publishing the results of his work in an admirable monograph, *Petra: Its History and Monuments* (1925). His book was also illustrated by his excellent photographs. He died on Nov. 1, 1928.

KENNEDY, BENJAMIN HALL (1804–1889), English scholar, was born at Summer Hill, near Birmingham, Nov. 6, 1804. He was elected fellow and classical lecturer of St. John's college, Cambridge, in 1828. From 1836–66 he was headmaster of Shrewsbury. In 1867 he was elected regius professor of Greek at Cambridge and canon of Ely. From 1870–80 he was a member of the committee for the revision of the New Testament. He died near Torquay April 6, 1889. A Latin professorship at Cambridge was founded in memory of him.

His chief works, besides his *Latin Primer* and *Public School Latin Grammar*, are: Sophocles, *Oedipus Tyrannus* (1885), Aristophanes, *Birds* (1874); Aeschylus, *Agamemnon* (1882), with introduction, metrical translation and notes; a commentary on Virgil (1881); and a translation of Plato, *Theaetetus* (1881). He contributed largely to the collection known as *Sabrinae Corolla*, and published a collection of verse in Greek, Latin and English under the title *Between Whiles* (1882).

His brother, CHARLES RANN KENNEDY (1808–1867) became a barrister. From 1849–56 he was professor of law at Queen's college, Birmingham. In the celebrated will case Swinfen *v.* Swinfen (1856) he brought an action for remuneration for professional services, but the verdict given in his favour was set aside by the court of Common Pleas. He died in Birmingham Dec. 17, 1867.

His works include a translation of the orations of Demosthenes (1852–63, in Bohn's *Classical Library*), and a blank verse translation of Virgil (1861), besides *New Rules for Pleading* (1841) and *A Treatise on Annuities* (1846).

Another brother, REV. WILLIAM JAMES KENNEDY (1814–91), was a prominent educationalist, and the father of Lord Justice Sir William Rann Kennedy (b. 1846), himself a distinguished Cambridge scholar.

KENNEDY, WALTER (*c.* 1460–*c.* 1508), Scottish poet, was the third son of Gilbert, 1st Lord Kennedy. He matriculated at Glasgow university in 1475 and took his M.A. degree in 1478. In 1481 he was one of four examiners in his university, and in 1492 he acted as depute for his nephew, the hereditary bailie of Carrick. He is best known for his share in the *Flyting* with Dunbar (*q.v.*). In this combat of wits Dunbar taunts his rival with his Highland speech (the poem is an expression of Gaelic and "Inglis," *i.e.*, English, antagonism); and implies that he had been involved in treason, and had disguised himself as a beggar in Galloway. Kennedy's poems, chiefly religious in character, are printed in the rare supplement to David Laing's edition of *William Dunbar* (1834); they have been re-edited by Dr. J. Schipper in the proceedings of the Kais. Akad. der Wissenschaften (Vienna, 1902).

See the prolegomena to *The Poems of William Dunbar* (ed. J. Small, The Scottish Text Society, 3 vols., 1884–93); J. Schipper, *Poems of Walter Kennedy* (with introduction, life and bibliography, in English, Leipzig and Vienna, 1902); F. Holthauser, *Kennedy-Studien* (vol. cx; in new series, x., 1903; vol. cxii., in new series, xii., 1904, in *Archiv für das Studium der neueren Sprachen und Litteraturen*, Braunschweig, 1874, etc.); and for Kennedy's life, *Historie of the Kennedies* (ed R. Pitcairn, 1830)

KENNEL, a small hut for a dog, also a group of buildings for a pack of hounds (*see* DOG) (*cf.* French *chenil*, from popular Latin *canile*, place for a dog, *canis*). The word "kennel," a gutter in a street, is a corruption of the M.E. *canel, cannel*, in modern English "channel."

KENNETH, the name of two kings of the Scots.

KENNETH I., MacAlpin (d. *c.* 860), often described as the first king of Scotland (kingdom of Scone), was the son of Alpin, called king of the Scots, a descendant of Conall Gabhrain of the old Dabriadic Scottish kingdom. His father was slain in 832 or 834, whilst endeavouring to assert his claim to the Pictish throne and Kenneth is said to have succeeded him in the kingdom of the Scots. The region of his rule is a matter of conjecture, though Galloway seems the most probable suggestion, in which case he probably led a piratic host against the Picts. Their chief support seems to have been found in Fife. In 841 he took advantage of a Danish invasion of the Pictish kingdom to attack the remaining Picts, whom he finally subdued in 846. He is said also to have carried out six invasions of Northumbria, in the course of which he burnt Dunbar and took Melrose. According to the *Scalacronica* of Sir Thomas Gray he drove the Angles and Britons over the Tweed, reduced the land as far as that river, and first called his kingdom Scotland He died in 860 at Forteviot.

KENNETH II. (d. 995), son of Malcolm I., king of Alban, succeeded Cuilean, son of Indulph, who was slain by the Britons of Strathclyde in 971 in Lothian. Kenneth began his reign by ravaging the British kingdom. Soon afterwards he attacked Eadulf, earl of the northern half of Northumbria, and ravaged the whole of his territory. He fortified the fords of the Forth and again invaded Northumbria, carrying off the earl's son. About this time he gave the city of Brechin to the church. In 977 he is said to have slain Amlaiph or Olaf, son of Indulph, king of Alban, perhaps a rival claimant to the throne. According to the English chroniclers, Kenneth paid homage to King Edgar for the cession of Lothian, but these statements are probably due to the controversy as to the position of Scotland. Kenneth's chiefs were continually engaged in a contest with Sigurd the Norwegian, earl of Orkney, for the possession of Caithness and the district of Scotland north of the Spey, but the Scots attained no permanent success. The central districts of Scotland were, however, consolidated during his reign. In 995 Kenneth was slain treacherously by his own subjects, according to the later chroniclers at Fettercairn in the Mearns through an intrigue of Fenella, daughter of Cunchar, a mormaor of the earl of Angus. He was buried at Iona.

See *Chronicles of the Picts and Scots*, ed. W. F. Skene (Edinburgh, 1867), and W. F. Skene, *Celtic Scotland* (Edinburgh, 1876).

KENNETT, WHITE (1660–1728), English bishop and antiquary, was born at Dover and was educated at Westminster school and at St. Edmund's Hall, Oxford, where as tutor and vice-principal he gave considerable impetus to the study of antiquities. He became rector of St. Botolph's, Aldgate, London (1700), archdeacon of Huntingdon (1701), dean of Peterborough (1707) and bishop of Peterborough (1718). He joined the Low Church party, opposed the Sacheverell movement, and in the Bangorian controversy supported with zeal and considerable bitterness the side of Bishop Hoadly. He died at Westminster in Dec. 1728.

Kennett wrote the third volume (Charles I.–Anne) of the composite *Compleat History of England* (1706), and a more detailed and valuable *Register and Chronicle* of the Restoration. He was one of the founders of the S.P.G.

See W. Newton, *Life of Bishop White Kennett* (1730), J. Nichols's *Literary Anecdotes of the Eighteenth Century* (9 vol., 1812–15) and I. Disraeli's *Calamities of Authors* (2 vols., 1812; new ed. by the Earl of Beaconsfield, 1881).

KENNEY, JAMES (1780–1849), English dramatist, was the son of James Kenney, one of the founders of Boodles' club in London. His first play, a farce called *Raising the Wind* (1803), was a success owing to the popularity of the character of "Jeremy Diddler." Kenney produced more than 40 dramas and operas between 1803 and 1845, the most famous of which was *Sweethearts and Wives*, produced at the Haymarket theatre in 1823. Kenney, who numbered Charles Lamb and Samuel Rogers among his friends, died in London on July 25, 1849. He married the widow of the dramatist Thomas Holcroft, by whom he had two sons and two daughters. He also wrote: *False Alarms* (1807), a comic opera with music by Braham; *Love, Law and Physic* (1812); *Spring and Autumn* (1827); *The Illustrious Stranger, or Married and Buried* (1827); *Masaniello* (1829) and *The Sicilian Vespers* (1840), a tragedy.

See J. Genest, *Some Account of the English Stage, 1660–1830*, vols. vii. and viii. (10 vols., 1832); P. W. Clayden, *Rogers and his Contemporaries* (2 vols., 1889); *Dict. Nat. Biography*.

KENNICOTT, BENJAMIN (1718–1783), English divine and Hebrew scholar, was born at Totnes, Devonshire, on April 4, 1718. He studied at Wadham college, Oxford, where he distinguished himself in Hebrew and divinity. In 1747 he was elected fellow of Exeter college, and in 1767 keeper of the Radcliffe Library. He was also canon of Christ Church (1770) and rector of Culham (1753), Oxfordshire. He died at Oxford on Sept. 18, 1783.

His chief work is the *Vetus Testamentum hebraicum cum variis lectionibus* (2 vols. fol., Oxford, 1776–80), for which 615 Hebrew mss. and 52 printed edd. were collated, together with 16 mss. of the Samaritan Pentateuch. Before this he had published *The State of the Printed Hebrew Text of the Old Testament considered* (1753–59), which were designed to combat the then current ideas as to the "absolute integrity" of the received Hebrew text.

Kennicott's work was perpetuated by his widow, who founded two university scholarships at Oxford for the study of Hebrew. The fund yields an income of £200 per annum.

KENNINGTON, a district in the south of London, England, within the municipal borough of Lambeth. There was a royal palace here until the reign of Henry VII. Kennington Common,

now represented by Kennington Park, was the site of a gallows until the end of the 18th century, and was the meeting-place appointed for the great Chartist demonstration of April 10, 1848. Kennington Oval is the ground of the Surrey County Cricket club. (*See* LAMBETH.)

KENORA, a town and port in Ontario, Canada, and chief town of Rainy River district, situated at an altitude of 1,087 feet. Pop. (1921) 5,407. It is 133 m. east of Winnipeg, on the Canadian Pacific railway, and at the outlet of the Lake of the Woods. The Winnipeg river has at this point a fall of 16 ft., which, with the lake as a reservoir, furnishes abundant water-power. The industrial establishments comprise reduction works, saw-mills and flour-mills, one of the latter being the largest in Canada. It is the distributing point for the gold mines of the district, and during the summer months steamboat communication is maintained on the lake. There is important sturgeon fishing.

KENOSHA, a city of Wisconsin, U.S.A., on Lake Michigan, 35m. S. of Milwaukee; a port of entry and the county seat of Kenosha county. It is served by the Chicago and North Western railway and inter-urban electric lines, and by lake steamers. The population was 40,472 in 1920 (31% foreign-born white) and estimated locally at 56,660 in 1928. The city has a fine situation above the lake, and its excellent harbour is open throughout the year. A beautiful civic centre is one feature of a city plan that is in process of development. The commerce of the port in 1925 amounted to 97,368 tons, valued at $32,138,950, of which $8,254,250 represented receipts of automobile parts and $18,397,000 shipments of automobile parts and finished automobiles. Kenosha is an important manufacturing centre, and its factories had an output in 1926 valued at $130,000,000. Among the products which have a country-wide market are motor cars, hosiery, underwear and brass and iron beds. The assessed valuation of property in 1926 was $71,594,159. Retail trade transactions amount to $32,500,000 annually. Kenosha was settled about 1832 and was called Southport until (in 1850) it was chartered as a city. The city operates under a city-manager form of government.

KENSETT, JOHN FREDERICK (1818–1872), American artist, was born in Cheshire (Conn.), March 22, 1818. After studying engraving he went abroad, took up painting and exhibited at the Royal Academy, London, in 1845. In 1849 he was elected to the National Academy of Design, New York, and in 1859 he was appointed a member of the committee to superintend the decoration of the United States Capitol at Washington, D.C. After his death the contents of his studio realized at public auction over $150,000. He painted landscapes more or less in the manner of the Hudson River school.

KENSINGTON, a western metropolitan borough of London, England, bounded north-east by Paddington and the city of Westminster, south-east by Chelsea, south-west by Fulham, north-west by Hammerssmith, and extending north to the boundary of the county of London. Pop. (1921) 175,859. It includes the districts of Kensal Green (partly) in the north, Notting Hill in the north-central portion, Earl's Court in the south-west, and Brompton in the south-east. A considerable area adjoining Brompton is called South Kensington; but the area known as West Kensington is within the borough of Fulham.

The name appears early as *Chenesitun* and *Kenesitune,* and has been connected with a Saxon royal residence (King's town), a family of the name of Chenesi, and the word *caen,* meaning wood, from the forest which originally covered the district and was still traceable in Tudor times. The most probable derivation, however, finds in the name a connection with the Saxon tribe or family of Kensings. The history of the manor is traceable from the time of Edward the Confessor, and after the Conquest it was held of the bishop of Coutances by Aubrey de Vere. Soon after it became the absolute property of the de Veres, subsequently earls of Oxford. The memory of the manorial courts is preserved in the name Earl's Court. There were also three submanors, one given by the first Aubrey de Vere early in the 12th century to the abbot of Abingdon; whence the present parish church is called St. Mary Abbots; while in another, Knotting Barnes, the origin of the name Notting Hill is found.

The period of history for which Kensington is famous may be dated from the settlement of the Court here by William III. A mansion on the west flank of the present Kensington Gardens had been the seat of Heneage Finch, lord chancellor and afterwards earl of Nottingham. It was known as Nottingham House, but when bought from the second earl by William, to avoid residing in London as he suffered from asthma, it became known as Kensington Palace. The additions and alterations made by Wren resulted in a severely plain edifice of brick; the orangery, added in Queen Anne's time, is an example of the same architect's work. Caroline, the wife of George II., formed the lake called the Serpentine (1733). The palace became open to the public by order of Queen Victoria.

Kensington Square, south of High Street in the vicinity of St. Mary Abbots church, still preserves some picturesque houses. Holland House was built by Sir Walter Cope, lord of the manor, in 1607, and obtained its present name on coming into the possession of Henry Rich, earl of Holland, through his marriage with Cope's daughter. General Fairfax and General Lambert are mentioned as occupants after his death, and later the property was let, William Penn of Pennsylvania being among those who leased it. Addison, marrying the widow of the 6th earl, lived here until his death in 1719. During the tenancy of Henry Fox, third Lord Holland (1773–1840), the house gained a European reputation as a meeting-place of statesmen and men of letters.

The parish church of St. Mary Abbots, High Street (an ancient site) was built from the designs of Sir Gilbert Scott in 1869. The oratory of S. Philip Neri is a well-known Roman Catholic church in Brompton Road. South Kensington has become a great centre of museums and institutions of learning, with the British Museum of Natural History, the Victoria and Albert, also called the South Kensington, Museum of the Arts and Crafts, the Science museum, and Library, the Imperial Institute with its museum galleries (within the bounds of Westminster), the Imperial College of Science, the University of London housed in part of the Imperial Institute, the Royal College of Art, the house of the Royal Geographical Society, the Albert Hall, etc. Kensington Gardens, laid out in the time of Queen Anne, were the site of the "Great Exhibition" of 1851. Most of them are within the bounds of Westminster. In Holland Park Road is the house of Lord Leighton (d. 1896), given to the nation, and open, with its art collection, to the public.

Kensington is a suffragan bishopric in the diocese of London. The parliamentary borough of Kensington has north and south divisions, each returning one member.

KENT, EARLS AND DUKES OF. The first holder of the English earldom of Kent was probably Odo, bishop of Bayeux, and the second a certain William de Ypres (d. 1162), both of whom were deprived of the dignity. The regent Hubert de Burgh obtained this honour in 1227, and in 1321 it was granted to Edmund Plantagenet, the youngest brother of Edward II. Edmund (1301–1330), who was born at Woodstock on Aug. 5, 1301, steadily supported his brother until the last act in Edward's life opened in 1326. He fought in Scotland and then in France, and was a member of the council when Edward III. became king in 1327 Soon at variance with Queen Isabella and her lover, Roger Mortimer, Edmund was involved in a conspiracy to restore Edward II., who he was led to believe was still alive; he was arrested, and beheaded on March 19, 1330. Although he had been condemned as a traitor his elder son Edmund (*c.* 1327–1333) was recognized as earl of Kent, the title passing on his death to his brother John (*c.* 1330–1352).

The Holand Earls.—After John's childless death the earldom appears to have been held by his sister Joan, "the fair maid of Kent," and in 1360 Joan's husband, Sir Thomas de Holand, or Holland, was summoned to parliament as earl of Kent. Holand, who was a soldier of some repute, died in Normandy on Dec. 28, 1360, and his widow married Edward the Black Prince, by whom she was the mother of Richard II. The next earl was Holand's eldest son Thomas (1350–1397), who was marshal of England from 1380 to 1385, and was in high favour with his half-brother,

Richard II. The 3rd earl of Kent of the Holand family was his son Thomas (1374–1400). In September 1397, a few months after becoming earl of Kent, Thomas was made duke of Surrey as a reward for assisting Richard II. against the lords appellant; but he was degraded from his dukedom in 1399, and was beheaded in January of the following year for conspiring against Henry IV. However, his brother Edmund (1384–1408) was allowed to succeed to the earldom, which became extinct on his death in Brittany in September 1408.

The Nevilles.—In the same century the title was revived in favour of William, a younger son of Ralph Neville, 1st earl of Westmorland, and through his mother Joan Beaufort a grandson of John of Gaunt, duke of Lancaster. William (*c.* 1405–1463), who held the barony of Fauconberg in right of his wife, Joan, fought for the Yorkists during the Wars of the Roses, and was chiefly responsible for the victory of Edward IV. at Towton (1461); soon after this event he was created earl of Kent and admiral of England. At his death the title became extinct. Neville's natural son Thomas, "the bastard of Fauconberg" (d. 1471), was a follower of Warwick, the "Kingmaker."

The Greys.—The long connection of the family of Grey with this title began in 1465, when Edmund, Lord Grey of Ruthin, was created earl of Kent. Edmund (*c.* 1420–1489) was the eldest son of Sir John Grey, while his mother, Constance, was a daughter of John Holand, duke of Exeter. During the earlier part of the Wars of the Roses Grey fought for Henry VI.; but by deserting the Lancastrians during the battle of Northampton in 1460 he gave the victory to the Yorkists. He was treasurer of England and held other high offices under Edward IV. and Richard III. His son and successor, George, 2nd earl of Kent (*c.* 1455–1503), also a soldier, married Anne Woodville, a sister of Edward IV.'s queen, Elizabeth, and was succeeded by his son Richard (1481–1524). Henry, the 12th earl, was created in 1706 earl of Harold and marquess of Kent, becoming duke of Kent four years later. His titles of earl, marquess and duke of Kent became extinct at his death in 1740.

A Royal Duke.—In 1799 Edward Augustus, fourth son of George III., was created duke of Kent and Strathearn by his father. Born on Nov. 2, 1767, Edward served in the British army in North America and elsewhere, becoming a field marshal in 1805. He was unpopular with the troops, and his severity at Gibraltar led to his retirement from the post of governor. His debts compelled him to spend most of his time out of England. He died at Sidmouth on Jan. 23, 1820. In 1818 the duke married Maria Louisa Victoria (1786–1861), widow of Emich Charles, prince of Leiningen (d. 1814), and sister of Leopold I., king of the Belgians; and his only child was Queen Victoria (*q.v.*).

KENT, JAMES (1763–1847), American jurist, was born at Philippi, N.Y., July 31, 1763. He graduated at Yale college in 1781, and in 1785 began to practise law at Poughkeepsie From 1791 to 1793 Kent was a representative of Dutchess county in the State Assembly. In 1793 he removed to New York city, where Governor Jay appointed him a master in chancery. He was professor of law in Columbia college in 1793–98, and again served in the assembly in 1796–97. In 1797 he became recorder of New York, in 1798 judge of the supreme court of the State, in 1804 chief justice, and in 1814 chancellor of New York. In 1822 he was a member of the convention to revise the State Constitution. Next year, Chancellor Kent resigned his office and was re-elected to his former chair. Out of the lectures he now delivered grew the *Commentaries on American Law* (4 vols., 1826–30), which won for him a high and permanent place among English and American jurists. His judgments as chancellor (*see* Johnson's *Chancery Reports*, 7 vols., 1816–24) cover a wide range of topics, and are so thoroughly considered and developed as unquestionably to form the basis of American equity jurisprudence. He died in New York Dec. 12, 1847.

Kent wrote several other works (including a *Commentary on International Law*) of less importance than the *Commentaries*. *See* J. Duer's *Discourse on the Life, Character and Public Services of James Kent* (1848); *The National Portrait Gallery of Distinguished Americans*, vol. ii. (1852); W. Kent, *Memoirs and Letters of Chancellor Kent* (1898).

KENT, ROCKWELL (1882–), American painter, was born at Tarrytown Heights, N.Y., on June 21, 1882. He studied and practised architecture but turned to painting, and was a pupil of William M. Chase, Robert Henri, Hayes Miller and Abbott Thayer. Of a roving disposition he worked as a lobsterman and carpenter on the coast of Maine, lived in Newfoundland and Alaska, and explored the waters about Tierra del Fuego in a small boat, went to sea as ship's carpenter, painting what he saw in his travels and writing his impressions. His work was individual in character and attracted great attention by its dramatic realism. He also produced some book illustrations. He is represented in the principal museums of the United States:—"Deer Season," in the Chicago Art Institute; "Annie McGinley," Carnegie Institute, Pittsburgh; "Marine," in the Metropolitan Museum, New York; "Mother and Child" and "Lone Woman," in the Brooklyn Museum, etc. He wrote two books of travel, *Wilderness* (1920) and *Voyaging Southward from the Strait of Magellan* (1924), and contributed to magazines. In 1927 he assumed the editorship of a new magazine, *Creative Art*.

See F. Newlin Price, "Rockwell Kent, Voyager," *International Studio*, vol. lxxix., p. 272–276 (1924).

KENT, WILLIAM (1685–1748), English "painter, architect, and the father of modern gardening," as Horace Walpole in his *Anecdotes of Painting* describes him, was born in Yorkshire in 1685. He found patrons, who sent him in 1710 to study painting in Italy; and at Rome he made other friends, among them Lord Burlington, with whom he returned to England in 1719. Under that nobleman's roof Kent chiefly resided till his death on April 12, 1748—obtaining abundant commissions in all departments of his art, as well as various court appointments. Walpole says that Kent was below mediocrity in painting. He had some little taste and skill in architecture, of which Holkham palace is perhaps the most favourable example. The mediocre statue of Shakespeare in Westminster abbey sufficiently stamps his powers as a sculptor. His merit in landscape gardening is greater He was the first in English gardening to vindicate the natural against the artificial. Banishing the topiary art in yew, box or holly, releasing the streams from the conventional canal and marble basin, and rejecting the mathematical symmetry of ground plan then in vogue for gardens, Kent endeavoured to imitate the variety of nature, with due regard to the principles of light and shade and the rules of perspective.

KENT, one of the kingdoms of Anglo-Saxon Britain, the dimensions of which seem to have corresponded with those of the present county (*see* p. 328). According to tradition it was the first part of the country occupied by the invaders, its founders, Hengest and Horsa, having been employed by the British king Vortigern against the Picts and Scots. Their landing, according to English tradition, took place between 450–455, though in the Welsh accounts the Saxons are said to have arrived in 428 (cf. *Hist. Britt.* 66) According to *The Anglo-Saxon Chronicle*, which probably used some lost list of Kentish kings, Hengest reigned 455–488, and was succeeded by his son Aesc (Oisc), who reigned till 512; but little value can be attached to these dates. Continuous history begins with Aethelbert, the great-grandson of Aesc, who reigned probably 560–616 He is famous as the author of a code of laws which is the oldest document of its kind written in any Germanic language. He married Berta, daughter of the Frankish king Haribert, or Charibert, an event which no doubt was partly responsible for the success of the mission of Augustine, who landed in 597. Aethelbert was at this time supreme over all the English kings south of the Humber. On his death in 616 he was succeeded by his son Eadbald, who renounced Christianity and married his stepmother, but was shortly afterwards converted by Laurentius, the successor of Augustine. Eadbald was succeeded in 640 by his son Erconbert, who enforced the acceptance of Christianity throughout his kingdom, and was succeeded in 664 by his son Egbert, the latter again by his brother Hlothhere in 673. The early part of Hlothhere's reign was disturbed by an invasion of Aethelred of Mercia. He issued a code of laws, which is still extant, together with his nephew Eadric, the son of Egbert, but in 685 they quarrelled and Eadric called in the South Saxons.

Hlothhere died of his wounds, and was succeeded by Eadric, who reigned under two years.

The death of Eadric was followed by a disturbed period, in which Kent was under kings whom Bede calls "*dubii vel externi.*" An unsuccessful attempt at conquest seems to have been made by the West Saxons, but there is some evidence for a successful invasion by the East Saxon king Sigehere in 687. A king named Oswine, who apparently belonged to the native dynasty, seems to have obtained part of the kingdom in 688. The other part came in 689 into the hands of Swefheard, probably a son of the East Saxon king Sebbe. Wihtred, a son of Egbert, succeeded Oswine about 690, and obtained possession of the whole kingdom before 694. From him also we have a code of laws. At Wihtred's death in 725 the kingdom was divided between his sons Aethelbert, Eadbert and Alric, the last of whom appears to have died soon afterwards. Aethelbert reigned till 762; Eadbert, according to the *Chronicle,* died in 748, but some doubtful charters speak of him as alive in 761–762. Eadbert was succeeded by his son Eardwulf, and he again by Eanmund, while Aethelbert was succeeded by a king named Sigered. From 764–779 we find a king named Egbert, who in the early part of his reign had a colleague named Heabert. At this period Kentish history is very obscure. Another king named Aethelbert appears in 781, and a king Ealhmund in 784, but there is some reason for suspecting that Offa annexed Kent about this time. On his death (796) Eadbert Praen made himself king, but in 798 he was defeated and captured by Coenwulf of Mercia who made his own brother Cuthred king in his place. On Cuthred's death in 807 Coenwulf seems to have kept Kent in his own possession. His successors Ceolwulf and Beornwulf likewise appear to have held Kent, but in 825 we hear of a king Baldred who was expelled by Egbert king of Wessex. Under the West Saxon dynasty Kent, together with Essex, Sussex and Surrey, was sometimes given as a dependent kingdom to one of the royal family. During Egbert's reign it was entrusted to his son Aethelwulf, on whose accession to the throne of Wessex, in 839, it was given to Aethelstan, probably his son, who lived at least till 851. From 855 to 860 it was governed by Aethelbert son of Aethelwulf. During the last years of Alfred's reign it seems to have been entrusted by him to his son Edward. Throughout the 9th century we hear also of two earls, whose spheres of authority may have corresponded to those of the two kings whom we find in the 8th century. The last earls of whom we have any record were the two brothers Sigehelm and Sigewulf, who fell at the Holm in 905 when the Kentish army was cut off by the Danes, on Edward the Elder's return from his expedition into East Anglia. At a later period Kent appears to have been held, together with Sussex, by a single earl.

The internal organization of the kingdom of Kent seems to have been peculiar. Besides the division into West Kent and East Kent, which probably corresponds to the kingdoms of the 8th century, we find a number of lathes, apparently administrative districts under reeves, attached to royal villages. In East Kent there were four of these, namely, Canterbury, Eastry, Wye and Lymne, which can be traced back to the 9th century or earlier In the 11th century we hear of two lathes in West Kent, those of Sutton and Aylesford.

The social organization of the Kentish nation was wholly different from that of Mercia and Wessex. Instead of two "noble" classes we find only one, called at first eorlcund, later as in Wessex, gesithcund. Again, below the ordinary freeman we find three varieties of persons called *laetas,* probably freedmen, to whom we have nothing analogous in the other kingdoms. Moreover the wergeld of the ceorl, or ordinary freeman, was two or three times as great as that of the same class in Wessex and Mercia, and the same difference of treatment is found in all the compensations and fines relating to them. It is not unlikely that the peculiarities of Kentish custom observable in later times, especially with reference to the tenure of land, are connected with these characteristics. An explanation is probably to be obtained from a statement of Bede—that the settlers in Kent belonged to a different nationality from those who founded the other kingdoms, namely the Jutes (*q.v.*).

See Bede, *Historia ecclesiastica,* ed. C. Plummer (Oxford, 1896); *Two of the Saxon Chronicles,* ed. J. Earle and C. Plummer (Oxford, 1892–99); W. de G. Birch, *Cartularium Saxonicum* (1885–89); B. Seebohm, *Tribal Custom in Anglo-Saxon Law* (1902); H. M. Chadwick, *Studies on Anglo-Saxon Institutions* (Cambridge, 1905); Liebermann, *Gesetze der Angelsachsen* (Halle 1903–16). (F. G. M. B.)

KENT, a south-eastern county of England, bounded north by the Thames estuary, east and south-east by the English Channel, south-west by Sussex, and west by Surrey. In the north-west the administrative county of London encroaches upon the ancient county of Kent, the area of which is 1,554·7 sq. miles. The county is divided from west to east by the chalk hills of the North downs, which near Westerham reach a height of over 800 ft but are lower towards the east. Towards the north the chalk is covered by the Eocene Woolwich-beds and London clay, which dip towards the north. At three points the chalk downs have been cut right through by rivers. In the west the Darent, flowing to join the Thames at Dartford, pierces the hills north of Sevenoaks. The Medway, after traversing the Vale of Kent, composed mainly of Weald clay, forces its way through the downs near Maidstone to enter the Thames at Chatham. In the east the Stour cuts its way through the downs between Ashford and Canterbury. The isles of Sheppey and Grain are formed of clay beds and alluvium; the former is divided from the mainland by the Swale (bridged at Queensbridge) and the latter by a branch of the Medway. Along the banks of the Thames the coast is alluvial and generally low and marshy, embankments being in several places necessary to prevent inundation. At a few points, however, as at Gravesend, spurs of the North downs descend directly upon the shore

In the estuary of the Medway there are a number of low marshy islands, but Sheppey, with its clay beds along the north coast, presents to the sea a range of slight cliffs. The marshes extend along the Swale to Whitstable, whence stretches a low line of clay and sandstone cliffs towards the Isle of Thanet, a chalk outlier, when they become lofty and grand, extending round the Foreland southward to Pegwell bay. The coast from Sheppey round to the South Foreland is skirted by numerous flats and sands, the most extensive of which are the Goodwin sands off Deal. The whole valley of the Stour and the depression from Sarre to Reculver is composed of alluvium, and marks the course of the channel (Wantsume) which used to separate Thanet from the mainland. South of Deal the coast rises again into chalk cliffs, the eastward termination of the North downs These cliffs continue round the South Foreland to Folkestone, where they fall away, and are succeeded west of Sandgate by a flat, shingly shore. To the south of Hythe this shore borders the wide expanse of Romney marsh, which, immediately west of Hythe, is overlooked by a line of abrupt hills, but for the rest is divided on the north from the drainage system of the Stour only by a slight uplift Between Folkestone and Hythe, gault and lower greensand emerge from beneath the chalk, and these formations run across the county to Westerham as a band of varying width. To the south of Sevenoaks the lower greensand forms the Ragstone ridge, over 600 ft. high.

Romney marsh, drained by many channels, seldom rises over a dozen feet above sea-level. At its south-eastern extremity, and at the extreme south of the county, is the shingly promontory of Dungeness. Within historic times much of this marsh was covered by the sea, and the valley of the river Rother, which forms part of the boundary of Kent with Sussex, entering the sea at Rye harbour, was represented by a tidal estuary for a considerable distance inland.

The south-west of the county is crossed by a line of hills, the continuation of the Forest ridge of Sussex, which have a height varying from 200 ft. to 500 feet. These hills consist of the Hastings beds, which are the oldest rock formations in the county.

History and Early Settlement.—Ightham was the scene of the work of Benjamin Harrison, who claimed to find implements of pre-Palaeolithic (Eolithic) type in the plateau gravels. It is widely, though not universally agreed, that many of the flints he found are human artefacts of a very rough type, their age is a subject of much discussion. Palaeolithic implements have been

found chiefly in the river gravels. The number of Neolithic artefacts found in the county may be taken to suggest that towards the dawn of the age of metal, Kent already had a considerable population. Beaker pottery is of some importance and the megáliths near the Medway entry may have kinship with those of Holland. The links of the county at that stage were clearly with the Continental shores of the North sea. In the later Bronze age these were as clearly with Gaul, as they were also in the later centuries of the 1st millennium B.C. and the immigrants kept up contact with the Continent. From Caesar we know that they worked some of the Wealden iron mines and corn was widely grown. Kent was the Roman gateway into Britain, and along the coast they developed a number of ports. The focus behind the ports was what has become Canterbury (*q.v.*), and from here Watling street ran in the direction of Rochester and London, while the Pilgrims' Way of the middle ages, along the line of the downs, in all probability had a prehistoric predecessor. The chief ports on and near the straits included Regulbium (Reculver), Rutupiae (Richborough), Dubrae (Dover), and Portus Lemanis (Lympne). (For the history of Kent in Anglo-Saxon times *see* the article on the KINGDOM OF KENT.)

Kent is remarkable as the only English county which comprises two entire bishoprics, Canterbury, the see for East Kent, having been founded in 597, and Rochester, the see for West Kent, in 600. In 1291 the archdeaconries were co-extensive with the diocesan boundaries, but in 1845 the new archdeaconry of Maidstone was formed out of that of Rochester. The shire organization of Kent dates from the time of Aethelstan, the name as well as the boundary being that of the ancient kingdom. The inland boundary has varied with the course of the Rother. In 1888 the county was diminished by the formation of the county of London.

At the time of the Domesday survey Kent comprised 60 hundreds, and there was a further division into six leets, probably representing the shires of the ancient kingdom. The five modern lathes (Aylesford, St. Augustine, Scray, Sheppey and Sutton-at-Hone), all existed in the time of Edward I, with the additional lathe of Hedeling, which was absorbed before the next reign in that of St. Augustine. The *Nomina Villarum* of the reign of Edward II. mentions all the 66 modern hundreds, more than two-thirds of which were at that date in the hands of the Church.

Sheriffs of Kent are mentioned in the time of Aethelred II., and in Saxon times the shiremoot met three times a year on Penenden heath, near Maidstone. Four of the Cinque Ports, viz., Dover, Hythe, New Romney and Sandwich, belonged to this county. The assizes for the county were held in the reign of Henry III. at Canterbury and Rochester, and also at the Lowey of Tonbridge under a mandate from the Crown as a distinct liberty; since the Restoration they have been held at Maidstone.

Between the Conquest and the 14th century the earldom of Kent was held successively by Odo, bishop of Bayeux, William of Yprēs and Hubert de Burgh (sheriff of the county in the reign of Henry III.), and it was bestowed by Edward I. on his youngest son, Edmund of Woodstock, and subsequently passed to the families of Holland and Neville (*see* KENT, EARLS AND DUKES OF). The chief local events under the Norman and Plantagenet kings were the capture of Rochester by William Rufus during the rebellion of Odo of Bayeux; the capture of Dover and Leeds castles by Stephen; the murder of Thomas à Becket at Canterbury in 1170; the submission of John to the pope's legate at Dover in 1213, and the capture of Rochester castle by the king in the same year. Rochester castle was, in 1216, captured by the dauphin of France, to whom nearly all Kent submitted, and during the wars of Henry III. with his barons was captured by Gilbert de Clare. In the peasants' rising of 1381 the archbishop's palace at Canterbury was plundered. In 1450 Kent took a leading part in Jack Cade's rebellion; and in 1554 the insurrection of Sir Thomas Wyat, who was born at Allington castle, began at Maidstone. Greenwich was the birthplace of three Tudor sovereigns. Sir Philip Sidney was born at Penshurst. Bocton Malherbe was the seat of the Wottons, and Hever castle of the Boleyns. Sir Francis Walsingham was born at Chislehurst, where his family had long flourished. On the outbreak of the Great Rebellion feeling was much divided, but after capturing Dover castle the parliament soon subdued the whole county. In 1648, however, a widespread insurrection was organized on behalf of Charles, and was suppressed by Fairfax. The county was among the first to welcome back Charles II. In 1667 the Dutch fleet under De Ruyter levelled the fort at Sheerness and burnt the ships at Chatham.

In 1290 Kent returned two members to parliament for the county, and in 1295 Canterbury, Rochester and Tonbridge were also represented; Tonbridge, however, made no returns after this date. In 1552 Maidstone acquired representation, and in 1572 Queenborough. Under the act of 1832 the county returned four members in two divisions, Chatham was represented by one member and Greenwich by two, while Queenborough lost its member. Under the act of 1868 the county returned six members in three divisions, and Gravesend returned one member. By the act of 1885 the county returned eight members in eight divisions, and the representation of Canterbury, Maidstone and Rochester was reduced to one member each. By the London Government Act of 1892 the borough of Greenwich was taken out of Kent and made one of the 28 metropolitan boroughs of the county of London. By the Representation Act of 1918 the county was divided into 11 divisions. Rochester was maintained as a parliamentary borough with 2 members, and Bromley and Hythe with one each.

FEATURES OF THE COUNTY

Architecture.—As was to be expected from its connection with the life of the Continent, Kent possessed a larger than average number of monastic foundations. The earliest were the priory of Christ's Church and the abbey of St. Peter and St. Paul, now called St. Augustine's, both at Canterbury, founded by Augustine and the monks who accompanied him to England. Other Saxon foundations were the nunneries at Folkestone (630), Lyminge (633, nunnery and monastery), Reculver (669), Minster-in-Thanet (670), Minster-in-Sheppey (675), and the priory of St. Martin at Dover (696), all belonging to the Benedictine order. Some of these were refounded, and the principal monastic remains now existing are those of the Benedictine priories at Rochester (1089), Folkestone (1095), Dover (1140); the Benedictine nunneries at Malling (time of William Rufus), Minster-in-Sheppey (1130), Higham (founded by King Stephen), and Davington (1153); the Cistercian abbey at Boxley (1146); the Cluniac abbey at Faversham (1147) and priory at Monks Horton (time of Henry II.); the preceptory of Knights Templars at Swingfield (time of Henry II.); the Premonstratensian abbey of St. Radigund's, near Dover (1191); the first house of Dominicans in England at Canterbury (1221); the first Carmelite house in England, at Aylesford (1240); and the priory of Augustinian nuns at Dartford (1355).

Other houses of which there are slight remains are Lesnes abbey, near Erith, and Bilsington priory near Ashford, established in 1178 and 1253 respectively, and both belonging to the Augustinian canons; and the house of Franciscans at Canterbury (1225). But no remains exist of the priories of Augustinian canons at Canterbury (St. Gregory's, 1084), Leeds, near Maidstone (1119), Tonbridge (middle of 12th century), Combwell, near Cranbrook (time of Henry II.); the nunnery of St. Sepulchre at Canterbury (about 1100), and Langdon abbey, near Walmer (1192), both belonging to the Benedictines; the Trinitarian priory of Mottenden near Headcorn, the first house of Crutched Friars in England (1224), where miracle plays were presented in the church by the friars on Trinity Sunday: the Carmelite priories at Sandwich (1272), and Losenham, near Tenterden (1241); and the preceptory of Knights of St. John of Jerusalem at West Peckham near Tonbridge (1408).

Even apart from the cathedral churches of Canterbury and Rochester, the county possesses a number of churches of the highest interest. In the church of Lyminge, apart from the monastic remains, there may be seen portions of the church founded by Aethelburga, and rebuilt, with considerable use of Roman material, in 965 by St. Dunstan. There is similar early work in the church of Paddlesworth Among Norman examples are the

small but important church at Barfreston. The churches of St. Margaret-at-Cliff, Patrixbourne and Darenth, and the tower of New Romney church are notable. Early English churches are Hythe church, SS. Mary and Eanswith, Folkestone, Minster-in-Thanet, Chalk, Faversham and Westwell. Stone church, near Dartford, is a late example of this style, transitional to Decorated; and among Decorated buildings we have Chartham church. Perpendicular churches are numerous, and the fine glass of this period in Nettlestead church may be noticed. The church of Cobham contains one of the richest collections of ancient brasses in England.

Industries.—Among the earliest industries of Kent were the iron-mining in the Weald, and the salt industry, which flourished along the coast in the 10th century. The Domesday survey, besides testifying to the agricultural activity of the county, mentions over 100 salt-works and numerous valuable fisheries, vines at Chart Sutton and Leeds, and cheese at Milton. The Hundred Rolls of the reign of Edward I. frequently refer to wool, and Flemish weavers settled in the Weald in the time of Edward III. Tiles were manufactured at Wye in the 14th century. Valuable timber was afforded by the vast forest of the Weald, but the restrictions imposed on the felling of wood for fuel did serious detriment to the iron-trade, and after the statute of 1558 forbidding the felling of timber for iron-smelting within 14 m. of the coast the industry steadily declined. Cherries are said to have been imported from Flanders and first planted in Kent by Henry VIII., and from this period the culture of fruits (especially apples and cherries) and of hops spread rapidly over the county. Thread-making at Maidstone and silk-weaving at Canterbury existed in the 16th century, and before 1590 one of the first paper-mills in England was set up at Dartford. The statute of 1630 forbidding the exportation of wool followed by the plague of 1665, led to a serious trade depression, while the former enactment resulted in the vast smuggling trade.

The total acreage under crops and grass in 1926 was 682,475, and of this 299,199 ac. was arable land. Wheat and oats each occupied over 37,000 ac., and barley nearly two-thirds as much, potatoes and root crops each half as much, while over 21,000 ac. of clover and rotation grasses were kept for hay. The orchards, found chiefly in the valleys of the Darent and Medway, and on the Tertiary soils between Rochester and Canterbury, had an acreage of 55,760; small fruit occupied 17,864 ac. and hops 15,696 acres. Market gardening is extensively practised in the districts abutting on London. Much of the Weald, which originally was occupied by a forest, is still densely wooded with oaks and beeches. A large extent of woodland consists of ash and chestnut plantations, maintained for the growth of hop poles. Cattle are grazed in considerable numbers on the marsh lands, and dairy farms are numerous in the neighbourhood of London. For the rearing of sheep Kent is one of the chief counties in England. A breed peculiar to the district, known as Kents, is grazed on Romney marsh, but Southdowns are the principal breed raised on the uplands. Bee-keeping is extensively practised. Among the principal modern industries are paper-making, carried on on the banks of the Darent, Medway, Cray and neighbouring streams; engineering, chemical and other works along the Thames; manufactures of bricks, tiles, pottery and cement, especially on the lower Medway and the Swale. A variety of industries is connected with the Government establishments at Chatham and Sheerness. Shipbuilding is prosecuted here, at Gravesend, Dover and other ports. Gunpowder is manufactured near Erith and Faversham.

Deep-sea fishing is largely prosecuted all round the coast. Shrimps, soles and flounders are taken in great numbers along the north coast and off Ramsgate. The principal oyster beds, some of which were known in Roman times, are near Whitstable, Faversham, Milton, Queenborough and Rochester, some being worked by ancient companies or guilds of fishermen. The existence of coal deposits beneath the secondary rocks has been known for a long time, but it was only after the World War that extensive operations were commenced. The area over which coal can be economically worked runs inland from south of Ramsgate to near Canterbury, and thence southward to the coast again east of Folkestone. The development of the coal field is likely to utilize the workable iron deposits of the region, while a market for the coal is at hand in London. The coal field has been carefully surveyed from an economic, historical and social point of view, and a scheme of regional development suggested, by which it is hoped to develop the region industrially, while at the same time preserving its traditional associations and natural beauty.

Communications.—The county is served by the Southern railway, whose lines radiate from London, one to Tunbridge Wells, another to Maidstone and Folkestone, and a network along the north coast to Rochester and on to Canterbury, which is a junction for Thanet and Dover. All these lines are linked up by other cross county lines. Dover, Folkestone and Queenborough are ports for traffic with the Continent. All around the coast are a number of seaside resorts, and Tunbridge Wells is an inland watering place.

The influence of London in converting villages into outer residential suburbs is to be observed at many points, whether seaside, along the Thames or inland. The county is practically without inland water communications, excluding the Thames. The Royal military canal which runs along the inland border of Romney marsh, and connects the Rother with Hythe, was constructed in 1807 as part of a scheme of defence in connection with the martello towers or small forts along the coast.

Administration.—The area of the administrative county is 975,965 ac., with a population of 1,141,666. The municipal boroughs are Bromley, Canterbury (a city and county borough), Chatham, Deal, Dover, Faversham, Folkestone, Gillingham, Gravesend, Hythe, Lydd, Maidstone, Margate, New Romney, Queenborough, Ramsgate, Rochester (a city), Sandwich, Tenterden, Tunbridge Wells. The county is in the south-eastern circuit and has two courts of quarter sessions. The central criminal court has jurisdiction over certain parishes adjacent to London. All those civil parishes within the county of Kent of which any part is within 12 m. of, or of which no part is more than 15 m. from, Charing Cross, are within the metropolitan police district. Kent is mainly in the diocese of Canterbury, but has parts in those of Rochester, Southwark and Chichester. The county (extra-metropolitan) is divided into 11 parliamentary divisions, viz., Ashford, Canterbury, Chislehurst, Dartford, Dover, Faversham, Gravesend, Isle of Thanet, Maidstone, Sevenoaks, Tonbridge, each returning one member; while the parliamentary boroughs of Bromley and Hythe return one member each and Rochester two.

KENT, a city of Portage county, Ohio, U.S.A., on the Cuyahoga river, 11m. N.E. of Akron. It is served by the Baltimore and Ohio, the Erie, and the Wheeling and Lake Erie railways, and by inter-urban motor-coach and trolley lines. The population was 7,070 in 1920 (86% native white) and was estimated locally at 9,500 in 1928. The city has railroad shops and a number of important manufactures (including keyless locks, cotton fabrics, rubber tires, valves, rivets, bolts, screws, flour, clothing and motor coaches) and is the headquarters of the Davey tree experts. On a wooded hillside is the 100ac. campus of the Kent State Normal college (opened in 1913). Kent was founded about 1807, incorporated as a village in 1867 and chartered as a city in 1920.

KENTIGERN, ST., or MUNGO ("dear friend," a name given to him, according to Jocelyn, by St. Servanus), a Briton of Strathclyde, called by the Goidels *In Glaschu*, "the Grey Hound," is said to have been of royal descent. His mother when with child was thrown down from a hill called Dunpelder (Traprain

Law, Haddingtonshire), but survived the fall and escaped by sea to Culross on the farther side of the Firth of Forth, where Kentigern was born. Kentigern lived for some time at Glasgow, near a cemetery ascribed to St. Ninian, and was eventually made bishop of that region by the king and clergy. Subsequently he was opposed by a pagan king called Morken, whose relatives after his death succeeded in forcing the saint to retire from Strathclyde He thereupon took refuge with St. David at Menevia (St. David's), and eventually founded a monastery at Llanelwy (St. Asaph's), for which he received grants from Maelgwn, prince of Gwynedd. After the battle of Ardderyd in 573 in which King Rhydderch, leader of the Christian party in Strathclyde, was victorious, Kentigern was recalled. He fixed his see first at Hoddam in Dumfriesshire, but afterwards returned to Glasgow. He is credited with missionary work in Galloway and north of the Firth of Forth. The meeting of Kentigern and Columba probably took place soon after 584, when the latter began to preach in the neighbourhood of the Tay.

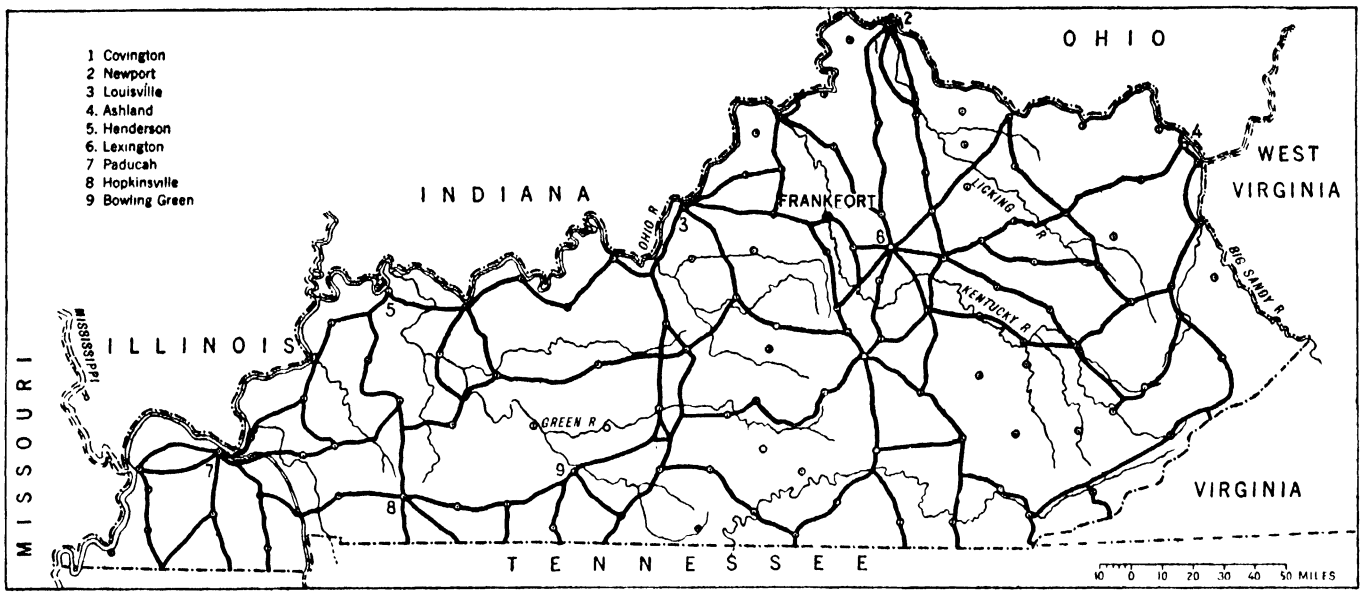
KENTON, a city of Ohio, U.S.A., 60m. N.W. of Columbus, on the Scioto river; the county seat of Hardin county. It is on the Lincoln highway, has a landing field for aeroplanes, and is served by the Erie, the Big Four and the New York Central railways. The population was 7,690 in 1920 (95% native white) and was estimated locally at 8,000 in 1928 Kenton lies on the watershed, at an altitude of 990ft. Large crops, especially onions, are grown roundabout, and the city has important manufacturing industries, including the largest plant in the country making iron toys. Electric cranes, sluice gates, machine tools, candy, metal signs and fertilizers are other products. Kenton was named after Simon Kenton (1755–1836), a famous scout and Indian fighter, who took part in the border warfare, particularly in Kentucky and Ohio, during the Revolution and afterwards. It became the county seat in 1833 and was chartered as a city in 1885.



KENT'S CAVERN, a large limestone cave near Torquay, England, which has yielded some of the earliest evidence of man's co-existence with extinct animals. The Rev. J. McEnery, who investigated the upper deposits (1825–29), was perhaps the first man to proclaim this fact. In 1840 Godwin Austin confirmed McEnery's view; the continuous excavations (1865–80) carried on by Wm. Pengelly on behalf of the British Association completed the proof. The following are the main strata in the cave, in descending order: (1) A superficial deposit of black mould, confined to an area near the main entrances, and containing objects of the Roman, early iron, and bronze ages. Most interesting are sherds of La Tène pottery with incised curvilinear designs in the style of the Glastonbury lake village ware. (2) A floor of granular stalagmite, up to three ft. thick, incorporating remains of the Neolithic period, and also such bones of the extinct cave fauna as lay upon the surface of the more ancient stratum of cave earth. (3) A local deposit of burnt bones, charcoal and ashes (the Black Band), confined to an area adjacent to the northern entrance, and from two to six in. thick. In this prehistoric hearth, and in the cave earth immediately beneath it, three harpoons were found, two of which approximate, in their trapezoidal barbs, to the harpoons found on sites of the Magleinose culture in Northern Europe. Associated with these were flint implements apparently of a very late Aurignacian type. (4) A deposit of unstratified, light-red cave earth, of unknown depth near the entrances, but thinning out towards the interior of the cave. This deposit yielded rich finds of mammoth, rhinoceros, cave bear, and other fauna of the Late Pleistocene period, with hyena and horse predominating, in association with flint implements of the Proto-Solutrian, Aurignacian, and Mousterian periods. (5) A floor of crystalline stalagmite, up to 12ft. thick, resting on (6) a compact breccia composed of bones and occasional pebbles in a matrix of dark red grit derived from the neighbouring hills. The bones were almost only those of the cave bear, associated incongruously with rude flint implements of Chellean type, sometimes lightly rolled, and presumably of earlier date than the bones. The breccia is of unknown thickness near the west end of the cave, but thins out towards the entrances. Remains of at least two additional stalagmite floors at different levels in the cave earth suggest that this latter deposit was laid down during three separate periods of erosion, interrupted by two intervals of calm, the entire process resulting in some confusion of the successive deposits of cave earth. Incorporated in the breccia are blocks of stalagmite indicating the former existence of a more ancient floor, formed upon the surface of a still older deposit. This may still exist somewhere in the cave, rock bottom having been reached over only a small area. To one of these more ancient deposits the remains of the sabre-toothed tiger, discovered in the cave earth, may originally have belonged. The human remains of Palaeolithic date consist of a brachycephalic skull from a fissure near the northern entrance; a portion of an upper jaw, with teeth, from the base of the granular stalagmite; and a fragment of an upper jaw, with three teeth, found ten feet deep in the cave earth. They are all of late Palaeolithic type. Excavations were resumed in 1926 by members of the Torquay Natural History Society, in conjunction with a committee of the British Association. Principal collections are at British Museum, Natural History Museum and Museum of the Natural History Society, Torquay.

(H. G. D.)

KENTUCKY, popularly known as the "Blue Grass State" because of the abundance of luxuriant blue grass found in the central part, but officially styled the Commonwealth of Kentucky, is a south central State of the United States of America. It is situated immediately west of the Allegheny mountains, between 36° 30′ and 39° 6′ N. and 82° and 89° 38′ W. The State is bounded north-west and north-east by the Ohio river, which separates it from Illinois, Indiana and Ohio; east by the Big Sandy river and its east fork, the Tug, which separate Kentucky from West Virginia, and by Virginia; south-east and south by Virginia and Tennessee; and west by the Mississippi river, which separates it from Missouri. It has an area of 40,508 sq m; of this, 417 sq.m., including the entire breadth of the Ohio river, over which the State has jurisdiction, are water surface.

Physical Features.—From mountain heights along its eastern border the surface of Kentucky is principally a much furrowed plain, sloping very gently to the west and declining toward the Ohio river. The whole of the State lies within the Mississippi basin, and within the special division of the Ohio valley. A small area in the south-east lies within the disturbed region of the Alleghenies, in which parallel ridges of folded structure form the Cumberland and the Pine mountains, which have crests from 2,000 to 3,000ft. high. The highest point in the State is Big Black mountain in Harlan county, with an elevation of 4,100 feet The lowest point is on the Mississippi river in Fulton county, with an elevation of 257 feet. The approximate average elevation for the State is 750 feet. The entire eastern quarter of the State, conterminous with the Eastern Kentucky coal-field, is commonly known as the region of the "mountains," but, with the exception of the narrow area just described, it properly belongs to the Allegheny plateau province. This plateau belt is exceedingly rugged, with sharp ridges alternating with narrow valleys which have steep sides, but are seldom more than 1,500ft above the sea. The

MAP OF MAIN ROADS IN KENTUCKY

remainder of that part of the State which lies east of the Tennessee river is divided into the Highland Rim plateau and a lowland basin, eroded in the Highland Rim plateau and known as the Blue Grass region; this region is separated from the Highland Rim plateau by a semicircular escarpment extending from Portsmouth, O., at the mouth of the Scioto river, to the mouth of the Salt river below Louisville; it is the southern part of the Cincinnati Arch. The Highland Rim plateau, lying to the south, east and west of the escarpment, embraces fully one-half of the State, slopes from elevations of 1,000 to 1,200ft. or more in the east to about 500ft. in the north-west, and is generally much less rugged than the Allegheny plateau; a peculiar feature of the southern portion of it is the numerous circular depressions, "sink holes," in the surface and the cavernous region beneath. Kentucky is noted for its caves, the best known of which are Mammoth cave and Colossal cavern. The caves are cut in the beds of limestone (lying immediately below the coal-bearing series) by streams that pass beneath the surface in the "sink holes." Down the steep slopes the escarpment of the Highland Rim plateau drops 200ft. or more to the famous Blue Grass region, in which erosion has developed on limestone a gracefully undulating surface. This Blue Grass region is like a beautiful park, without ragged cliffs, precipitous slopes, or flat marshy bottoms, but marked by rounded hills and dales. Especially within a radius of 20m around Lexington, the country is clothed with an unusually luxuriant vegetation. During spring, autumn and winter in particular, the blue grass (*Poa compressa* and *Poa pratensis*) spreads a mat, green, thick, fine and soft, over much of the country, and it is a good winter pasture; about the middle of June it blooms, and, owing to the hue of its seed vessels, gives the landscape a bluish hue. Another lowland area embraces that small part of the State in the extreme south-west which lies west of the Tennessee river; this belongs to that part of the Coastal Plain region which extends north along the Mississippi river; it has in Kentucky an average elevation of less than 500 feet. Most of the larger rivers of the State have their sources among the mountains or on the Allegheny plateau, and flow more or less circuitously in a general north-western direction into the Ohio. Although deep river channels are common, falls or impassable rapids are rare west of the Allegheny plateau. The Licking, Kentucky, Salt, Green and Tradewater are the chief rivers wholly within the State. The Cumberland, after flowing through the south-east and south-central parts of the State, passes into Tennessee at a point nearly south of Louisville. In the extreme south-west the Cumberland and the Tennessee, with only a short distance between them, cross Kentucky and enter the Ohio river at Smithland and Paducah, respectively. The drainage of the region under which the caverns lie is mostly underground. Some traces of the last glacial period are visible in Boone county.

The soils of Kentucky, except the strips of alluvial land along the banks of the rivers, have been formed from the decay of the underlying rocks. This feature gives the soils a more local character than have those north of the Ohio, where glaciers brought new materials. The best soils are the alluvium in the bottom lands along some of the larger rivers and the soils of the blue or Ordovician limestone found in the Blue Grass region. The soil within a radius of some 20m. around Lexington is especially rich and is not surpassed for endurance. The soil next in fertility, extending over a large area in the central and western part of the State, is the sub-carboniferous limestone, or "cavern limestone," as it is commonly called. The soils of the Highland Rim plateau, as well as of the lowland west of the Tennessee river, vary greatly, but the most common are a clay, containing more or less carbonate of lime, and a sandy loam. On the escarpment around the Blue Grass region the soils are for the most part either cherty or stiff with clay and of inferior quality. On the mountains and on the Allegheny plateau, also, much of the soil is very light and thin.

The climate is somewhat more mild and even than that of the neighbouring States. The mean annual temperature, about 50° on the mountains in the south-east, and 60° west of the Tennessee, is about 55° for the entire State; the thermometer seldom registers as high as 100° or as low as −10°. The mean annual precipitation ranges from about 38in. in the north-east to 50in. in the south, and is about 46in. for the entire State; it is usually distributed evenly throughout the year, and very little is in the form of snow. The prevailing winds blow from the west or south-west, rain-bearing winds blow mostly from the south, and the cold waves come from the north or north-west. In April or May these cold waves often destroy orchard blooms that have started too early, and they have been disastrous to the fruit industry in recent decades.

ADMINISTRATION, ETC.

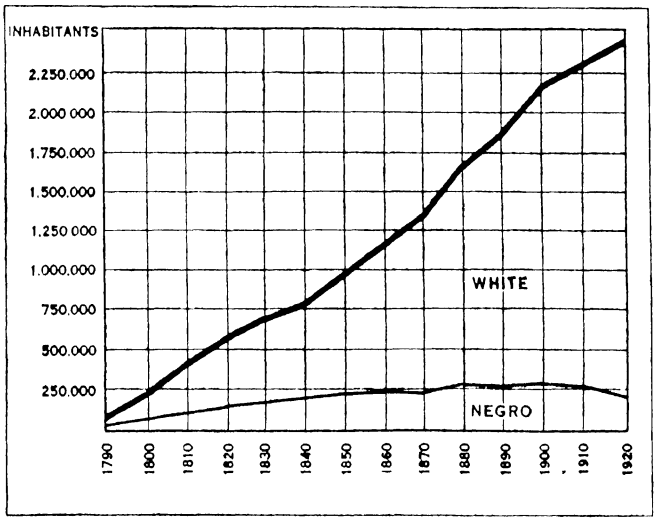
Government.—Kentucky is governed under its fourth Constitution, adopted in 1891. This document presents few features not common to similar instruments of government of the other States; it should be noticed, however, that an unusually large number of officials are elected and that ineligibility for immediate re-election is the rule. A convention to revise the Constitution or to draft a new one meets on the call of two successive legislatures, ratified by a majority of the popular vote, provided that majority be at least one-fourth of the total number of votes cast at the preceding general election. Ordinary amendments are pro-

posed by a three-fifths majority in each house, and are also subject to popular approval. The executive is composed of a governor, a lieutenant-governor, a treasurer, an auditor of public accounts, a register of the land office, a commissioner of agriculture, labour and statistics, a secretary of State, an attorney-general and a superintendent of public instruction. All are chosen by popular vote for four years and are ineligible for immediate re-election. If a vacancy occurs in the office of governor during the first two years a new election is held; if it occurs during the last two years the lieutenant-governor serves out the term. While the governor's control of patronage is not extensive and his veto power weak, he has considerable power in appointing members of important commissions. He may veto any measure, including items in appropriation bills, but the legislature can repass such a measure by a simple majority of the total membership in each house.

Legislative power is vested in a general assembly, which consists of a senate and a house of representatives. Senators are elected for four years, one-half retiring every two years; representatives are elected for two years. There are 38 senators and 100 representatives. The senate sits as a court for the trial of impeachment cases. A majority of either house constitutes a quorum, but ordinary bills, on the third reading, not only must receive a majority of the quorum, but that majority must be at least two-fifths of the total membership of the house. For the enactment of appropriation bills and bills creating a debt, a majority of the total membership in each house is required. All revenue measures must originate in the house of representatives, but the senate may introduce amendments. There are many detailed restrictions on local and special legislation.

The judiciary consists of a court of appeals, circuit courts, quarterly courts, county courts, justice of the peace courts, police courts and fiscal courts. The court of appeals is composed of seven judges, elected one from each appellate district, for a term of eight years. The senior judge presides as chief justice. The counties are grouped into judicial circuits, those containing a population of more than 150,000 constituting separate districts; each district has a judge and a commonwealth's attorney. The county officials are the judge, clerk, attorney, sheriff, gaoler, coroner, surveyor and assessor, each selected for four years

The municipalities are divided into six classes according to population, a classification which permits much special local legislation in spite of the constitutional inhibition.



Population.—The estimated population of the State in 1927 was 2,538,000. The population of cities with over 10,000 inhabitants in 1920 was as follows:

	1927 (est.)	1920
Louisville	320,100	234,891
Covington	58,700	57,121
Lexington	48,100	41,534
Newport	20,317	20,317
Paducah	25,852	24,735
Ashland	24,285	14,720
Owensboro	22,027	17,424
Henderson	12,574	12,169

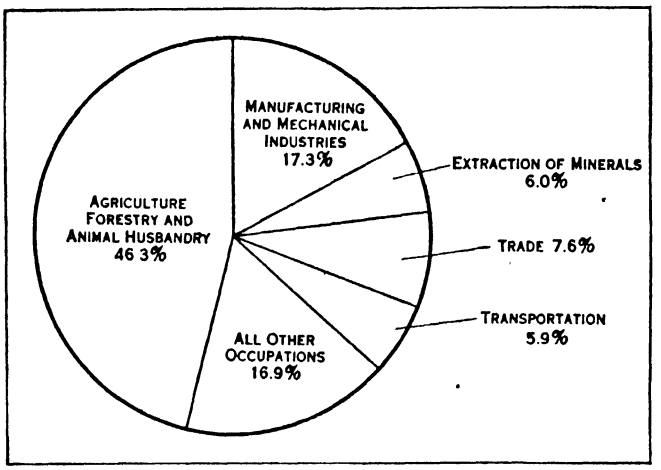
Frankfort, the capital, had a population of 10,465 in 1910, but has since declined below the 10,000 class.

Finance.—In 1926 the budget system created in 1918 was repealed and a new system created. Under this system the budget commission consists of the governor, the auditor of public accounts and the State tax commissioners; the budget officer is the State inspector and examiner. The act also provided for a uniform budget system in each county. The revenue of the State is classified under a number of separate funds. The treasurer's report for the fiscal year ending June 30, 1927, showed the receipts of the various funds to amount to $29,548,222 and the disbursements for the year to be $28,466,144. The three funds showing the greatest disbursements were $12,360,178 from the State road fund; $8,602,952 from the educational fund; $2,077,970 for charities and corrections. The chief sources of revenue were: Real estate, $3,899,650; motor vehicle licences, $4,283,909; tax on gasolene, $5,295,969; and a licence tax on foreign insurance companies, $1,153,975. At the end of the calendar year, 1927, there were $13,357,894 of outstanding treasury warrants, and the cash on hand amounted to $2,528,710. Banks chartered by the State are subject to inspection and regulation by the State banking department, which consists of a commissioner, an assistant commissioner and six examiners.

Education.—Public education in Kentucky is under the general supervision of the State board of education, which is com-

GRAPH OF GROWTH OF POPULATION IN KENTUCKY 1790–1920, SHOWING RELATIVE PROPORTIONS OF WHITE AND NEGRO AT EACH CENSUS

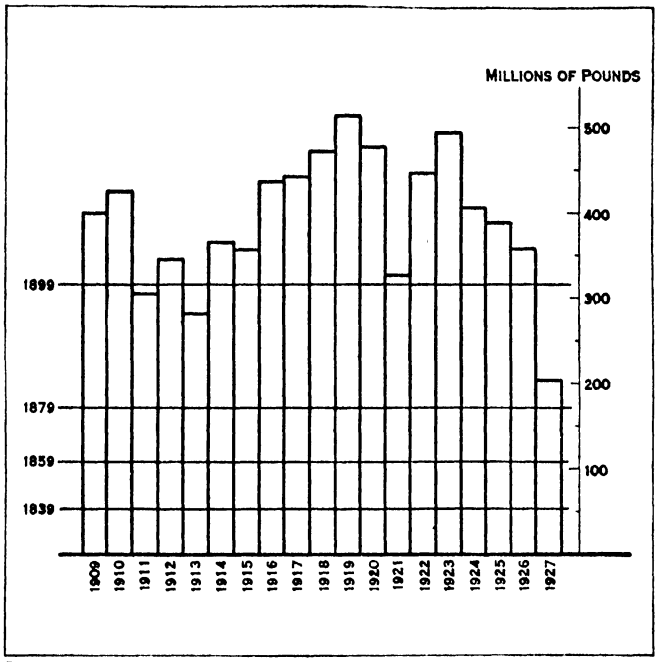
posed of the superintendent of public instruction, the secretary of State and the attorney-general. Until within the present century, public education was supported almost wholly from the State school fund, which was distributed on a per capita basis, and as a result the terms were short and the teachers underpaid. This situation was changed in part by an act of the general assembly in 1908 which provided that each county of the State be a unit for taxation, that the county tax be mandatory and that there be a local sub-district tax According to the report of the State superintendent of public instruction for the year ending June 30, 1927, the total revenue from all sources accruing to the State school fund was $5,498,168. In that year, the State fund allowed a distribution of $8.50 per capita based on enrolment. In the same year $11,798,353 was received from local taxation Money raised by bonds, loans and other sources made the grand total available for public education $23,757,854. The U S. bureau of education reported the population between the ages of five and 17 years, inclusive, in 1924, as 716,060. Of this number 567,782, or 79.3%, were enrolled in the public schools; of these 526,949 were in the kindergarten and elementary schools. In 1927, 56,355 were in the secondary schools In 1924 there were 18,042 children attending private and parochial schools. For the school year 1926–27 there were reported 475 accredited public high schools and 88 private high schools and academies. Some idea of Kentucky's educational progress can be gained from a comparison of figures for 1910 with those for 1924. In this period, illiteracy decreased from 12·1% to 8·4%; the average days attended per year per pupil enrolled increased from 79·6 in 1910 to 119·8 in 1924; the per capita expenditure, based on population aged five to 17 years, increased from $7.98 in 1910 to $24 01 in 1924. School attendance is compulsory. Separate schools are maintained for white and coloured throughout the educational system. A text-book commission, created by an act of the general assembly in 1926, selects and adopts school-books for the entire State and fixes a maximum retail price.



What was formerly the State Agricultural and Mechanical college at Lexington became the State university by legislative enactment (1908) and University of Kentucky (1917); there is no tuition fee except in the college of law. The University has also colleges of liberal arts, education and commerce. The agricultural experiment station and the agricultural extension work are associated with the university. The training of white teachers is pro-

vided for in four normal schools and teachers' colleges, eastern Kentucky State Normal school and Teachers college, at Richmond; western Kentucky State Normal school and Teachers college, at Bowling Green; Murray State Normal school, at Murray; and Morehead State Normal school, at Morehead. The State provides advanced education for the coloured at the Kentucky Normal and Industrial institute, at Frankfort, and the Western Kentucky Industrial college, at Paducah. The private and denominational institutions recognized as colleges or universities are: Asbury college, at Wilmore, Berea college, at Berea; Centre college, at Danville; Georgetown college, at Georgetown; Kentucky Wesleyan college, at Winchester; Kingswood Holiness college, at Kingswood; Ogden college at Bowling Green; St. Mary's college at St. Mary; Simmons university (coloured) at Louisville; Transylvania college, at Lexington; Union college, at Barbourville; and the University of Louisville, at Louisville. In addition to these institutions, there are ten junior colleges and one city normal school (at Louisville).

Charities and Prisons.—The benevolent, charitable, corrective and penal institutions of the State are under the supervision of the State board of charities and corrections, created in 1920 as a bi-partisan board consisting of eight members who serve without pay. Institutions under the control of the State board are, Eastern State hospital, at Lexington; Central State hospital, at Lakeland; Western State hospital, at Hopkinsville; Feeble Minded institute, at Frankfort; the State reformatory, at Frankfort; the State penitentiary, at Eddyville; and a house of reform, with two departments, one for boys and one for girls, at Greendale. Other State institutions of a charitable nature are, the Kentucky Confederate home, at Pewee Valley; Kentucky Children's Home society, at Lyndon; Kentucky Home society for coloured children, at Louisville; a school for the deaf, at Danville; and a school for the blind, at Louisville.

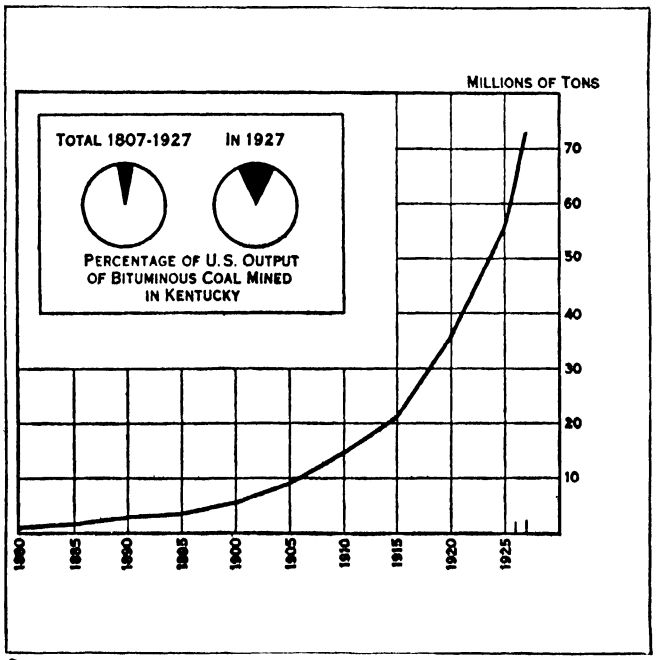


THE INDUSTRIAL SIDE

Industry, Trade and Transportation.—Kentucky is still a rural State, having 73·8% of the population rural in 1920. Agriculture, however, no longer compares favourably with manufactures as a source of wealth. The farm population in 1920, according to the U S. census bureau, was 1,304,862, but by 1925 it had

OCCUPATIONS OF THE 851,122 PERSONS (46·3% OF THE TOTAL POPULATION 10 YEARS OF AGE AND OVER) ENGAGED IN GAINFUL OCCUPATIONS IN 1920

decreased to 1,163,001. The number of farms increased from 259,185 in 1910 to 270,626 in 1920, but decreased to 258,524 in 1925. Improved land has decreased steadily since 1910, despite the efforts of the reclamation service which has expended large sums in the counties bordering on the great rivers and in the western coal area. The number of farm owners increased from 170,332 in 1910 to 179,327 in 1920, but by 1925 had decreased to 175,442. Tenantry shows a corresponding fluctuation, as the number of tenants increased from 87,860 in 1910 to 90,330 in 1920, but decreased to 82,798 in 1925. Field crops in 1920 were valued at $347,338,888; and in 1926 they were estimated to be worth $180,352,000, giving the State the rank of twenty-first among the States of the Union. Indian corn (maize) is the leading agricultural product in acreage, yield and value. In 1926, the 3,069,000ac. devoted to its culture produced 101,277,000bu. worth $65,830,050. The crop second in value is tobacco. Tobacco was introduced into the northern part of the State as early as 1780, and

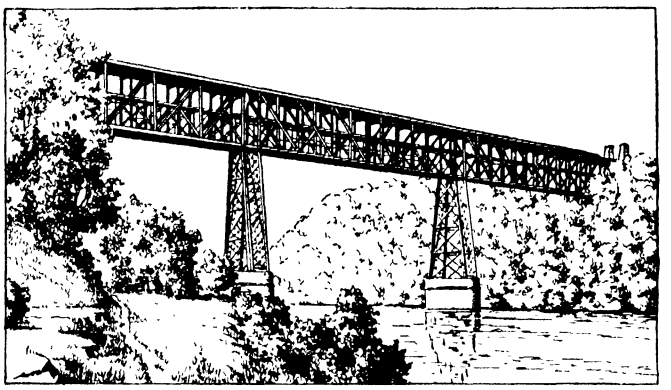


TOBACCO CROP EACH YEAR 1909–1927, ALSO (HORIZONTAL LINES CROSSING FIGURE) IN 1839, 1859, 1879 AND 1899

thence it spread to the west. Toward the close of the 19th century it was introduced in the rich Blue Grass region, where it soon supplanted hemp. The two most important tobacco-growing districts are the Black Patch, in the extreme south-west corner of the State, which, with the adjacent counties in Tennessee, grows a black, heavy leaf, bought extensively by foreign agents, and the Blue Grass region, as far east as Maysville, and the hill country south and east, whose product, the red and white burley, is a fine-fibred light leaf, peculiarly absorbent of liquorice and other ingredients used in the manufacture of sweet chewing tobacco, and hence a particularly valuable crop. There were 426,000ac. devoted to tobacco culture in Kentucky in 1926. The production was 358,568,000lb., which had an estimated value of $42,736,320, the State's yield being exceeded by North Carolina only. Important agricultural products other than Indian corn and tobacco in 1926 were hay valued at $25,484,200; potatoes valued at $7,128,960; wheat valued at $6,348,000; oats valued at $3,363,380; and sweet potatoes and yams valued at $2,203,200. Livestock on Jan. 1, 1926, included 910,000 cattle, worth $30,257,000; 839,000 swine, worth $12,220,000; 751,000 sheep, worth $7,565,000; 305,000 horses, worth $15,125,000; and 304,000 mules, worth $17,572,000. The thoroughbred Kentucky horse has long had a world-wide reputation for speed, and the Blue Grass region, especially Fayette, Bourbon and Woodford counties, is probably the finest horse-breeding region in America and has large breeding farms.

Kentucky's oldest industry of importance was the manufacture of distilled liquors, and the business continued to be of leading rank until the Federal Prohibition Amendment became effective in 1919. Products of her farms and forests continue to be the chief sources of raw materials for the State's manufactures; the iron and steel works about Ashland and the growing petroleum industry, however, may soon take the lead. The total value of manufactured products of the State increased from $212,071,000 in 1914 to $453,936,575 in 1925, or over 114%. In 1925 the State's 1,864 industrial establishments gave employment to 76,580 wage-earners, and had an output valued at $453,936,575. Measured by the value of the products, the industries ranked as follows in

1925: General construction and repair in steam railway repair shops, $34,656,969; flour and other grain-mill products, $29,940,-276; iron and steel produced in steel works and roller mills, $28,772,962; chewing and smoking tobacco and snuff, $23,411,869; slaughtering and meat packing, $19,196,557; lumber and other timber products, $12,579,228; men's clothing, $12,562,749; planing mill products, $11,574,356; petroleum refining, $11,556,903; and foundry and machine shop products $10,760,159. Louisville, the chief manufacturing centre, in 1925 had 669 industries, which gave employment to 37,672 wage-earners and had a product valued at $263,692,639. Other important industrial centres were Newport, Covington, Paducah and Ashland.



Kentucky ranked eighth among the States of the Union in the value of mineral products in 1924, producing 2·58% of the total value for the United States. The State in 1916 ranked first in the production of native asphalt, first in fluor-spar, and third in coal. The principal products in the order of their value were coal, petroleum, clay products and natural gas. The total mineral production in 1926 was valued at $153,279,000; in 1920 the value was $195,920,036. Coal mining was the principal industry, giving employment to about 90% of the persons engaged in mineral production. Bituminous coal output in 1927 was 72,626,000 short tons. The coal producing areas include about 8,000 sq.m. in 22 eastern and south-eastern counties, which are part of the Middle Appalachian coal-field, and approximately 5,000 sq m. in 10 counties in the western part of the State. Approximately 75% of the production was from the eastern district. The industry second in importance was the production of petroleum and natural gas. The most productive pool, Big Sinking, was opened in Lee county; another field appeared in the south-western counties, centring about Allen and Warren; and in 1926 still another in Daviess county. In many locations the drillers opened gas wells which have reduced the State's dependence on West Virginia's

COAL MINED 1880–1927 AND (IN INSERT) PERCENTAGE OF TOTAL U.S. OUTPUT OF BITUMINOUS COAL PRODUCED BY KENTUCKY, FIRST 1807–1927, SECOND THE YEAR 1927

supply; and Mt. Sterling, Winchester, Paris, Lexington, Frankfort and Louisville obtained natural gas. The principal oil refinery is at Louisville. From 1909 to 1919 the capital invested in mines, quarries and wells rose from $26,000,000 to $201,000,000, or 651%; the value of products from $12,000,000 to $98,000,000, or 715%.

The transportation system of Kentucky may be said to date from the marking of a trail through the Cumberland Gap by Daniel Boone in 1775. This trail, later widened and called the Wilderness road, and the Ohio river served as the chief highways of the early settlers. In the early part of the 19th century, the streams and turnpikes were relied upon, and then came the first railway, begun in 1830 and put in operation in 1835. Up to 1880 the railway mileage had increased to only 1,530, but after this date it increased rapidly. In 1927 there were 4,005m. of steam railway and 486m. of electric railway in operation. The principal lines are the Louisville and Nashville, the Chesapeake and Ohio, the Illi-

BRIDGE AT HIGH BRIDGE, KY., THE HIGHEST BRIDGE SPANNING A NAVIGABLE STREAM ON THE AMERICAN CONTINENT

nois Central and the Cincinnati Southern. Most of the lines run south or south-west from Cincinnati and Louisville; during the decade 1910–20, however, the Louisville and Nashville railway constructed 332m. of track into the eastern coal region. The State Highway commission, set up in 1920, expended in 1927 $12,360,-178 on road construction. River boats and pipe lines serve as the chief transport for petroleum products. Hydro-electric plants distribute electricity from Dix river and the falls of the Ohio (Louisville).

HISTORY

Early Days.—The history of Kentucky has features not shared with other States west of the Allegheny mountains. To the Indians it was known as the "Dark and Bloody ground" because of the incessant wars between the Iroquois and the Cherokees for its possession. Each of these savage nations laid claim to this famous hunting territory, and each used every known art of savage warfare to make good its claim. So deadly were these struggles that the first explorers spoke of Kentucky as a beautiful country devoid of inhabitants, with the exception of some Shawnees dwelling along the Ohio and a few Chicksaws living along the Mississippi. Kentucky early attracted the attention of both the French and the English; it was the first region settled in the westward movement and the first State west of the Allegheny mountains admitted into the Union. The first white men to sight the territory were in search of a water passage to the western waters, or the Pacific ocean. It was while on such a quest that La Salle (*q.v.*), in 1669, passed down the Ohio until he came to the falls where the city of Louisville now stands. The next white men to come into the region were Thomas Batts with a party in 1671, acting under the authority of the Tory governor of Virginia, Sir William Berkeley. They too were in search of the river that would lead to the Pacific. For more than half a century after these first adventurers, nothing is heard of Kentucky. It is possible, however, that casual French explorers or English settlers carried away by the Indians traversed the region in the meanwhile. It is almost certain that a Frenchman named Longueril discovered Big Bone Lick in 1739. The next evidence of French interest came in 1749, when Céloron de Bienville, with a following of soldiers and Indians, was sent into the Ohio valley to take formal possession of the country; as evidence that he had done this, he buried lead plates. At this time Virginians were showing renewed interest in the country beyond the mountains, and as a result two land companies were organized and bought up vast tracts of western land. Dr. Thomas Walker (1715–94), as an agent and surveyor of the Loyal Land company, passed through the Cumberland gap in March 1750 and followed down the Cumberland river in search of a suitable place for settle-

ment, but he did not get beyond the mountain region. In Oct. 1750 Christopher Gist, on a similar mission for the Ohio company, set out from the banks of the Potomac and followed an Indian trail which led from Wills creek to the Ohio. In the following spring he explored the country westward from the mouth of the Scioto river. This interest in Kentucky land caused Robert Dinwiddie, one of the stockholders of the Ohio company, when made lieutenant-governor of Virginia in 1752, to display a keen interest in what the French were doing in the Ohio valley. It also in part explains the mission of the youthful George Washington, in 1753, to warn the French of Virginia's claims to the Ohio country. In 1752 John Finley, an Indian trader, descended the Ohio river in a canoe to the present site of Louisville. It was Finley's descriptions that attracted Daniel Boone, and soon after Boone's first visit, in 1767, travellers through the Kentucky region became numerous.

The first permanent English settlement was set up at Harrodsburg in 1774 by James Harrod, and in October of the same year the Ohio Indians, having been defeated by Virginia troops in the battle of Point Pleasant (in what is now West Virginia), signed a treaty by which they surrendered their claims south of the Ohio river. In March 1775 Richard Henderson and some North Carolina land speculators met about 1,200 Cherokee Indians in council on the Watauga river and concluded a treaty with them for the purchase of all the territory south of the Ohio river and between the Kentucky and Cumberland rivers. The purchase was named Transylvania. Within less than a month after the treaty was signed, Boone, under the auspices of the land company, founded a settlement at Boonesborough which became the headquarters of the colony. The title was declared void by the Virginia Government in 1778, Henderson and his associates receiving 200,000ac. in compensation, and all sales made to actual settlers were confirmed.

American Revolution.—During the American Revolution the colonists were neglected by Virginia, and had to defend themselves against the Indians, who were often under British leadership. Boonesborough was attacked in April and July 1777 and Aug. 1778. Bryan's Station, near Lexington, was besieged in Aug. 1782 by about 600 Indians under the notorious Simon Girty, who after raising the siege drew the defenders, numbering fewer than 200, into an ambush. In the battle of Blue Licks which ensued, the Kentuckians lost about 60 killed and seven prisoners. Kentucky county, practically conterminous with the present commonwealth of Kentucky, and embracing all the territory claimed by Virginia south of the Ohio river and west of Big Sandy creek and the ridge of the Cumberland mountains, was one of three counties which were formed out of Fincastle county in 1776. Four years later, this in turn was divided into three counties, Jefferson, Lincoln and Fayette, but the name Kentucky was revived in 1783 and was given to the judicial district which was then organized for these three counties. The American Revolution was followed by an extensive emigration from Virginia, Maryland and North Carolina, which made its way either by the Ohio river from Fort Pitt or—the far greater number—by the Cumberland Gap and the "Wilderness Road," as marked by Daniel Boone in 1775. At least 95% of this population, excluding negro slaves, were of pure English, Scotch or Scotch-Irish descent. The manners, customs and institutions of Virginia were transplanted beyond the mountains. There was the same political rivalry between the slave-holding farmers of the Blue Grass region and the "poor whites" of the mountain districts that there was in Virginia between the tidewater planters and the mountaineers. Between these extremes were the small farmers of the "Barrens" or burned-over lands in Kentucky and of the Piedmont region in Virginia. The aristocratic influences in both States have always been on the Southern and Democratic side; but while they were strong enough in Virginia to lead the State into secession, they were unable to do so in Kentucky.

At the close of the American Revolution the Kentuckians complained because the mother State did not protect them against their enemies and did not give them an adequate system of local government. Nine conventions were held at Danville from 1784 to 1790 to demand separation from Virginia. The Virginia authorities expressed a willingness to grant the demand provided Congress would admit the new district into the Union as a State. The delay, together with the proposal of John Jay, the secretary for foreign affairs and commissioner, to negotiate a commercial treaty with the Spanish envoy, to surrender navigation rights on the lower Mississippi for 25 years in order to remove the one obstacle to the negotiations, aroused so much feeling that Gen. James Wilkinson and a few other leaders began to intrigue, not only for a separation from Virginia, but also from the United States, and for the formation of a close alliance with the Spanish at New Orleans. Although most of the settlers were too loyal to be led into such a plot, they generally agreed that it might have a good effect by bringing pressure to bear upon the Federal Government. Congress passed a preliminary act in Feb. 1791, and the State was formally admitted into the Union on June 1, 1792. In the act of 1776 for dividing Fincastle county, Virginia, the ridge of the Cumberland mountains was named as a part of the east boundary of Kentucky; and now that this ridge had become a part of the boundary between the States of Virginia and Kentucky they, in 1799, appointed a joint commission to run the boundary line on this ridge. A dispute with Tennessee over the southern boundary was settled in a similar manner in 1820. The constitution of 1792 provided for full manhood suffrage first in the nation, and for the election of the governor and of senators by an electoral college. Gen. Isaac Shelby was the first governor.

Troubles and Trials.—The people still continued to have troubles with the Indians and with the Spanish at New Orleans. The Federal Government was slow to act, but its action when taken was effective. The power of the Indians was overthrown by Gen. Anthony Wayne's victory in the battle of Fallen Timbers, fought on Aug. 20, 1794, near the rapids of the Maumee river a few miles above the site of Toledo, O., and the Mississippi question was settled temporarily by the treaty of 1795 and permanently by the purchase of Louisiana in 1803. In 1798–99 the legislature passed the famous Kentucky Resolutions in protest against the Alien and Sedition acts.

For several years the Anti-Federalists or Republicans had contended that the administration at Washington had been exercising powers not warranted by the Constitution, and when Congress had passed the Alien and Sedition laws the leaders of that party seized upon the event as a proper occasion for a spirited public protest, which took shape principally in resolutions passed by the legislatures of Kentucky and Virginia. The original draft of the Kentucky Resolutions of 1798 was prepared by Vice-president Thomas Jefferson, although the fact that he was the author of them was kept from the public until he acknowledged it in 1821. They were introduced in the Kentucky house of representatives by John Breckinridge on Nov. 8, were passed by that body with some amendments but with only one dissenting vote on the 10th, were unanimously concurred in by the senate on the 13th, and were approved by Governor James Garrard on the 16th. The first resolution was a statement of the ultra State-rights view of the (State) relation of the States to the Federal Government, and subsequent resolutions declared the Alien and Sedition laws unconstitutional and therefore "void and of no force," principally on the ground that they provided for an exercise of powers that were reserved to the State.

The resolutions went on to declare that "this Commonwealth is determined, as it doubts not its co-States are, tamely to submit to undelegated and therefore unlimited powers in no man or body of men on earth," and that "these and successive acts of the same character, unless arrested on the threshold, may tend to drive these States into revolution and blood." Copies of the resolutions were sent to the governors of the various States, to be laid before the different State legislatures, and replies were received from Connecticut, Delaware, Massachusetts, New Hampshire, New York, Rhode Island, Vermont and Virginia, but all except that from Virginia were unfavourable. Nevertheless the Kentucky legislature on November 22, 1799, re-affirmed in a new resolution the principles it had laid down in the first series, asserting in this new resolution that the State "does now unequivocally declare its attachment to the Union, and to that compact (the

Constitution), agreeably to its obvious and real intention, and will be among the last to seek its dissolution," but that "the principle and construction contended for by sundry of the State legislatures, that the General Government is the exclusive judge of the extent of the powers delegated to it, stop nothing (short) of *despotism*—since the discretion of those who administer the Government, and not the *Constitution,* would be the measure of their powers," "that the several States who formed that instrument, being sovereign and independent, have the unquestionable right to judge of the infraction," and *"that a nullification by those sovereignties of all unauthorized acts done under color of that instrument is the rightful remedy."* These measures show that the State was Democratic-Republican in its politics and pro-French in its sympathies, and that it was inclined to follow the leadership of that State from which most of its people had come.

THE HOUSE IN WHICH STEPHEN FOSTER WROTE "MY OLD KENTUCKY HOME"

The Constitution of 1799 adopted the system of choosing the governor and senators by popular vote and deprived the Supreme Court of its original jurisdiction in land cases. The Burr conspiracy (1804–06) aroused some excitement in the State. Many would have followed Burr in a filibustering attack upon the Spanish in the south-west, but scarcely any would have approved of a separation of Kentucky from the Federal Union. No battles were fought in Kentucky during the war of 1812, but her troops constituted the greater part of the forces under Gen. William Henry Harrison. They took part in the operations at Ft. Wayne, Ft. Meigs, the river Raisin, the Thomas, and the naval battle of Lake Erie.

The Democratic-Republicans controlled the politics of the State without serious opposition until the conflict in 1820–26, arising from the demands for a more adequate system of currency and for other measures to relieve delinquent debtors, divided the State into what were known as the "Relief" and "Anti-Relief" parties. After nearly all the 46 banks chartered by the legislature in 1818 had been wrecked in the financial panic of 1819, the legislature in 1820 passed a series of laws designed for the benefit of the debtor class, among them one making State bank notes a legal tender for all debts. A decision of the Clark county district court declaring this measure unconstitutional was affirmed by the court of appeals. The legislature in 1824 repealed all of the laws creating the existing court of appeals and then established a new one. This precipitated a bitter campaign between the Anti-Relief or "Old Court" party and the "Relief" or "New Court" party, in which the former was successful. The Old Court party followed the lead of Henry Clay and John Quincy Adams in national politics, and became National Republicans and later Whigs. The New Court party followed Andrew Jackson and Martin Van Buren and became Democrats. The electoral vote of the State was cast for Jackson in 1828 and for Clay in 1832. Clay's conservative influence dominated the politics of the State even after his death in 1852. Kentucky voted the Whig ticket in every presidential election from 1832 until the party made its last campaign in 1852. When the Whigs were destroyed by the slavery issue, some of them immediately became Democrats, but the majority became Americans, or Know-Nothings. They elected the governor in 1855 and almost succeeded in carrying the State for their presidential ticket in 1856.

The Slavery Issue.—In 1860 the people were drawn towards the South by their interest in slavery and by their social relations, and towards the North by business ties and by a national sentiment which was fostered by the Clay traditions. They naturally assumed the leadership in the Constitutional Union movement of 1860, casting the vote of the State for Bell and Everett. After the election of President Lincoln they also led in the movement to secure the adoption of the Crittenden Compromise or some other peaceful solution of the difficulties between the North and the South.

A large majority of the State legislature, however, were Democrats, and in his message to this body, in Jan. 1861, Governor Magoffin, also a Democrat, proposed that a convention be called to determine "the future of Federal and inter-State relations of Kentucky"; later, in reply to the President's call for volunteers, he declared, "Kentucky will furnish no troops for the wicked purpose of subduing her sister Southern States." Under these conditions the Unionists asked only for the maintenance of neutrality, and a resolution to this effect was carried by a bare majority—48 to 47. Some of the secessionists took this as a defeat and left the State immediately to join the Confederate ranks. In the next month there was an election of congressmen, and the anti-secession candidates were chosen in nine out of ten districts. An election in August of one-half the State senate and all of the house of representatives resulted in a Unionist majority in the new legislature of 103 to 35, and in September, after Confederate troops had begun to invade the State, Kentucky formally declared its allegiance to the Union. From Sept. 1861 to the fall of Ft. Donelson in Feb. 1862 that part of Kentucky which is south and west of the Green river was occupied by the Confederate army under Gen. A. S. Johnston, and at Russellville in that district a so-called "sovereignty convention" assembled on Nov. 18. This body, composed mostly of Kentucky men who had joined the Confederate army, passed an ordinance of secession, elected State officers, and sent commissioners to the Confederate Congress, which body voted on Dec. 9 to admit Kentucky into the Confederacy. Throughout the war Kentucky was represented in the Confederate Congress—representatives and senators being elected by Confederate soldiers from the State. The officers of this "provisional government," headed by G. W. Johnson, who had been elected "governor," left the State when Gen. A. S. Johnston withdrew; Johnston himself was killed at Shiloh, but an attempt was subsequently made by Gen. Bragg to install this Government at Frankfort. Gen. Felix K. Zollicoffer (1812–62) entered the State through the Cumberland Gap in September, and later with a Confederate force of about 7,000 men attempted the invasion of central Kentucky, but in Oct. 1861 he met a slight repulse, and on Jan. 19, 1862, in an engagement near Mill Springs with troops under Gen. George H. Thomas, he was killed and his command was utterly routed. In 1862 Gen. Braxton Bragg, in command of the Confederates in eastern Tennessee, eluded Gen. Don Carlos Buell and, entering Kentucky in Aug. 1862, proceeded slowly toward Louisville, hoping to win the State to the Confederate cause and gain recruits for Confederacy in the State. His main army was preceded by a division of about 15,000 men under Gen. Edmund Kirby Smith, who on Aug. 30 defeated a Federal force under Gen. William Nelson near Richmond and threatened Cincinnati. Bragg met with little opposition on his march, but Buell reached Louisville first (Sept. 24), turned on Bragg and forced him to withdraw. On Oct. 8, Buell and Bragg fought an engagement at Perryville which, though tactically indecisive, was a strategic victory for Buell; and thereafter Bragg withdrew entirely from the State into Tennessee. This was the last serious attempt on a large scale by the Confederates to win Kentucky; but in Feb. 1863 one of Gen. John H. Morgan's brigades made a raid on Mt. Sterling and captured it; in March Gen. Pegram made a raid into Pulaski county; in March 1864 Gen. N. B. Forrest assaulted Ft. Anderson at Paducah but failed to capture it and in June Gen. Morgan made an unsuccessful attempt to take Lexington.

Although the Union was supported by the majority of the people, so much feeling was aroused by the emancipation of the slaves without compensation even to loyal owners, the arming of negro troops, the arbitrary imprisonment of citizens and the interference of Federal military officials in purely civil affairs, that the State became strongly Democratic and remained so for many years until 1895. The Emancipation Proclamation of 1863 did not free the slaves of Kentucky, as it applied only to such regions as were in rebellion against the Union; however, slavery was doomed. Many of the slaves, with their families, became free by enlisting in the United States army, and the remainder were freed by the adoption of the XIII. Amendment to the Federal Constitution, Dec. 18, 1865. Amendments XIII., XIV. and XV. were all rejected by

Kentucky. Kentucky suffered much of the depression common to the South and West in the period after the Civil War. In 1878 the legislature demanded the repeal of the Federal law making "greenbacks" redeemable in specie after Jan. 1, 1879, and called upon Congress to make silver the equal of gold in the payment of private and public dues. The continued low price for agricultural products caused many to join the Granger movement and similar agrarian movements of the Middle West. The low price paid for tobacco in the early years of the present century caused the farmers in the two chief producing areas to organize selling "pools" and, if necessary, to use violence to force all the producers to join. Secret organizations known as "night riders" were formed, and under the cover of darkness these men took terrible vengeance upon persons who had disposed of their products independently. In some instances their ravages were extended to railways that had accepted for transportation tobacco not marketed by a pool. After numerous outrages in the "Dark Tobacco" district and a few in the "Burley" region, Governor Willson called out the armed forces of the State, and by the end of 1908 order was again established. Owing to the panic of 1893, distrust of the free silver movement and the expenditure of large campaign funds, the Republicans were successful in the gubernatorial election of 1895 for the first time in the history of the State. Since that time the two major parties have had about equal success in controlling the governor's office. In 1924, for the first time in her history, Kentucky cast all her electoral votes for the Republican Party.

The acts of the general assembly contain many provisions in regard to labour, education and public health. Other progressive laws cover the subjects of tax reform, prisoners, banking, insurance, vital statistics and sanitation. In general, the assembly has welcomed all offers of Federal co-operation in matters of agricultural extension, road-building and public health. Kentucky was the twenty-fourth State to ratify the Federal Woman Suffrage Amendment but in 1926 rejected the proposed Federal Child Labour Amendment.

BIBLIOGRAPHY.—A bibliography of recent works on Kentucky is found in *A List of Books Relating to Kentucky,* issued by the U.S. Library of Congress, Division of Bibliography (1925). A critical bibliography of Kentucky history is found in Robert McNutt McElroy's excellent *Kentucky in the Nation's History* (1909). *Stories of Old Kentucky,* by Martha C. G. Purcell, also has some bibliographical suggestions. An able, though brief, work is N. S. Shaler's *Kentucky: a Pioneer Commonwealth* (1885). A more recent work is the *History of Kentucky,* edited by Charles Kerr (1922). A similar historical and biographical work is the three-volume *History of Kentucky and Kentuckians,* by E. Polk Johnson (1912). Among the histories of the earlier period are: Humphrey Marshall, *The History of Kentucky* and *the Present State of the Country* (1812, 1824), extremely Federalistic in tone; Lewis Collins, *The History of Kentucky* (rev. ed. by R. H. Collins, 1874), a valuable store house of facts, the basis of Shaler's work; Z. F. Smith, *The History of Kentucky* (1886), a work hastily put together; Robert S. Cotterill, *History of Pioneer Kentucky* (1917). E. D. Warfield's *The Kentucky Resolutions of 1798* (2nd ed., 1887), is an excellent monograph. For the Civil War period *see* Ellis M. Coulter, *The Civil War and Readjustment in Kentucky* (1926); "Campaigns in Kentucky and Tennessee" in vol. vii. of *Papers of the Military Historical Society of Massachusetts* (1908); Thomas Speed, *The Union Cause in Kentucky* (1907); Basil W. Duke, *History of Morgan's Cavalry* (1867). There is much valuable historical material in the Register (1903 *seq.*) of the Kentucky Historical Society and in the publications of the Filson Club, of Louisville. Emma Guy Cromwell has compiled a catalogue of *Records, Documents, Papers, etc., of Kentucky Governors, 1792–1926* (1926). For a treatment of early routes to Kentucky, *see* Thomas Speed, *The Wilderness Road* (1886); Archer B. Hulbert, *Boone's Wilderness Road* (1903); and William A. Pusey, *The Wilderness Road to Kentucky* (1921). For administration, consult the *Kentucky Directory; Report of the Efficiency Commission* (1924); *The General Statutes of Kentucky;* and the *Reports* of State officers and boards. For statistics of population, occupations and manufactures consult the *Fourteenth United States Census;* also, the *Agricultural Yearbook* and the biennial *Census of Manufactures.* Life among the "mountain" people of Kentucky is treated by William H. Haney, *The Mountain People of Kentucky* (1906), and William R. Thomas, *Life Among the Hills and Mountains of Kentucky* (1926). Economic topics are considered in: Simeon E. Leland, *Taxation in Kentucky* (1920); Jacob H. Arnold, *A Study of Farming in South-Western Kentucky* (U.S. Department of Agriculture Bulletin, No. 713, 1918); Jacob H. Arnold and Frank Montgomery, *Farming in the Blue Grass Region* (U.S. Department of Agriculture Bulletin, No. 482, 1917); *Handbook* of the State Bureau of Agriculture, Labor and Statistics. For education, see *Public Education in Kentucky,* a report of the Kentucky Education Commission (1921), and two bulletins by the State department of education *History of Education in Kentucky.* (1914) and *Kentucky Rural School Standards* (1923). For descriptions of physical features, see *Reports of the Kentucky Geological Survey* (in 6 series); various publications of the U.S. Geological Survey (consult bibliographies of the survey); and James Lane Allen, *The Blue Grass Region and Other Kentucky Articles* (1900).

KENTUCKY COFFEE-TREE (*Gymnocladus dioica*), a North American tree of the family Leguminosae, called also Kentucky mahogany and nicker-tree, found, though nowhere common, in alluvial woods from western New York through Ontario to South Dakota and southward to Tennessee and Oklahoma. It is a handsome forest tree, 75 to 110 ft. high with a trunk diameter of 2 to 3 ft., bearing large, pinnately compound leaves, 1 to 3 ft. long, composed of numerous ovate leaflets and showy white flowers in terminal clusters, followed by thick, leathery pods (legumes), 6 to 10 in. long. The pods contain large seeds, ¾ in. long, embedded in sweet, reddish pulp, that were formerly used as a substitute for coffee.

KENUZ: *see* BARABRA.

KENYA, a great volcanic mountain in Kenya Colony, just south of the equator in 37° 20′ E. It is one of the highest mountains of Africa, its highest peak reaching an altitude of about 17,040 ft. The central core, which consists of several steep pyramids, is that of a much denuded old volcano. This central core (the highest point) is a nepheline syenite, the sides are of ashes and tuffs and the lavas consist of phonolites, kenytes and olivine basalts. Lavas dip in all directions from the central crystalline core. From the central peaks, ridges radiate outwards, separated by broad valleys, ending upwards in vast cirques. The most important ridges centre in the peak Lenana (16,300 ft.) at the eastern end of the central group, and through it runs the chief water-parting of the mountain, in a north to south direction. Three main valleys, the Hinde, Gorges and Hobley valleys, run down to the east, and four—Mackinder, Hausberg, Teleki and Höhnel—to the west. From the central peaks fifteen glaciers, all lying west of the main divide, descend to the north and south, the two largest being the Lewis and Gregory glaciers, each 1 m. long, which, with the smaller Kolb glacier, lie immediately west of the main divide. Most of the glaciers terminate at an altitude of 14,800–14,900 ft. Glaciation was formerly more extensive, old moraines being observed down to 12,000 feet.

A MERU-MASAI GIRL ON THE SLOPES OF MT. KENYA

In the upper valleys a number of lakes occur, occupying hollows and rock basins in the agglomerates and ashes, fed by springs, and feeding many of the streams that drain the mountain slopes. The largest of these are Lake Höhnel (14,000 ft.); and Lake Michaelson (12,700 ft.?). At a distance from the central core the radiating ridges become less abrupt and descend with a gentle gradient into the level plateau (7,000 ft.). These outer slopes are clothed with dense forest and jungle, composed chiefly of junipers and *Podocarpus,* and between 8,000 and 9,800 ft. of huge bamboos. The forest zone extends to about 10,500 ft., above which is the steeper alpine zone, in which pasturages alternate with rocks and crags. This extends to a general height of about 15,000 ft., but in damp, sheltered valleys the pasturages extend some distance higher. The only trees or shrubs in this zone are the giant *Senecio* (groundsel) and *Lobelia,* and tree-heaths.

Of the fauna of the lower slopes, tracks of elephant, leopard and buffalo have been seen, between 11,500 and 14,500 ft. That of the alpine zone includes two species of dassy (*Procavia*), a coney (*Hyrax*), and a rat (*Otomys*). The bird fauna is of considerable interest, the finest species of the upper zone being an eagle-owl, met with at 14,000 ft. At 11,000 ft. was found a

brown chat, with a good deal of white in the tail. Kenya was first seen, from a distance, by the missionary Ludwig Krapf in 1849; approached from the west by Joseph Thomson in 1883; partially ascended by Count S. Teleki (1889), J. W. Gregory (1893) and Georg Kolb (1896); and its summit reached by H. J. Mackinder in 1899.

See J. W. Gregory, "Geology of Mt. Kenya," *Quarterly Journ. of Geol. Soc.* (1900); *The Rift-Valleys and Geology of East Africa* (1921). H. J. Mackinder, "Journey to the Summit of Mount Kenya," *Geog. Jnl.*, May 1900.

KENYA COLONY (formerly known as British East Africa), a country of East Africa, lying between Tanganyika Territory in the south and Abyssinia in the north. It adjoins Uganda on the west and is bounded east by the Indian ocean and Italian Somaliland. Including the Rudolf province of Uganda, which is administered by Kenya, it has an area of about 225,000 sq. miles. The greater part of Jubaland, formerly part of the colony, was transferred to Italy in 1925. Included in Kenya are the north-eastern shores of Lake Victoria and nearly the whole of Lake Rudolf. Part of the coast lands—from the Tanganyika frontier to Kipini—to a depth of 10 m. inland, together with Mombasa, Lamu and other small islands, are held on lease from the sultan of Zanzibar, and form the Kenya Protectorate as distinct from the Colony. For nearly all purposes, however, the distinction is one in name only. At the census taken in Feb. 1926 the population was returned as:—Natives (estimate) 2,736,000; Arabs, 10,557; other Asiatics (nearly all British Indians), 30,583; Europeans, 12,529.

Topography.—The coast line extends from the mouth of the Umba river in the south to Dick's Head (Ras Kiambone) in the north. It has no deep indentations. From the coast lands the ground rises to a broad zone of high ground which is furrowed by the eastern Rift valley, formed by the subsidence of its floor, and occupied in parts by lakes without outlet. West of the Rift valley the ground sinks to the level of Lake Victoria. In the north a well-defined escarpment marks the frontier with Abyssinia. The Tanganyika and Italian Somaliland frontiers are arbitrary straight lines. The colony takes its name from Mt. Kenya, the second highest mountain in Africa, which dominates the region in which white settlers are most numerous.

The first of the parallel zones—the coast plain or "Temborari"—is generally of insignificant width, varying from 2 to 10 m., except in the valleys of the main rivers. The shore line is broken by bays and branching creeks, often cutting off islands from the mainland. Such are Mvita or Mombasa in 4° 4′ S., and the larger islands of Lamu, Manda and Patta (the Lamu archipelago), between 2° 20′ and 2° S. Beyond the coast plain the country rises in a generally well defined step or steps to an altitude of some 800 ft., forming the wide level plain called "Nyika" (uplands). It contains large waterless areas, such as the Taru desert in the Mombasa district. The next stage in the ascent is marked by an intermittent line of mountains—gneissose or schistose—running generally north-north-west, sometimes in parallel chains, and thought to represent the primitive axis of the continent. Their height varies from 5,000 to 8,000 feet. Farther inland, grassy uplands extend to the eastern edge of the Rift valley, though varied with cultivated ground and forest, the latter between 0° and 0° 40′ S. The most extensive grassy plains are those of Kapte or Kapote and Athi, between 1° and 2° S. The general altitude of these uplands, the surface of which is largely composed of lava, varies from 5,000 to 8,000 feet. This zone includes the volcanic pile of Kenya (17,007 ft.), Sattima (13,214 ft.) and Nandarua (about 12,900 ft.). The Sattima (Settima) range, or Aberdare mountains, has a general elevation of fully 10,000 feet. To the west the fall to the Rift valley is marked by a line of cliffs, of which the best-defined portions are the Kikuyu escarpment (8,000 ft.), just south of 1° S., and the Laikipia escarpment, on the equator.

One of the main watersheds of East Africa runs close to the eastern wall of the Rift valley, separating the basins of inland drainage from the rivers of the east coast, of which the two largest within the colony are the Sabaki and Tana, both separately noticed. The Guaso Nyiro rises in the hills north-west of Kenya and flows in a north-east direction. After a course of over 350 m. the river in about 1° N., 39° 30′ E. enters a marshy expanse known as the Lorian swamp. From the swamp issues an intermittent stream, the Lak Dera, nominally a tributary of the Juba.

The Rift valley, though with a generally level floor, is divided by transverse ridges into a series of basins, each containing a lake without outlet. The southernmost section within the colony is formed by the arid Dogilani plains. At their north end rise the extinct volcanoes of Suswa (7,800 ft.) and Longonot (8,700 ft.), the latter on the ridge dividing off the next basin—that of Lake Naivasha. This is a small fresh-water lake, 6,135 ft. above the sea, measuring some 13 m. each way. Its basin is closed to the north by the ridge of Mt. Buru, beyond which is the basin of the still smaller lakes Nakuro (5,845 ft.) and Elmenteita (5,860 ft.), followed in turn by that of Lakes Hannington and Baringo (*q.v.*). Beyond Baringo the valley is drained north into Lake Sugota, in 2° N., some 35 m. long, while north of this lies the much larger Lake Rudolf (*q.v.*), the valley becoming here somewhat less defined.

On the west of the Rift valley the wall of cliffs is best marked between the Equator and 1° S., where it is known as the Mau escarpment, and between the Equator and 1° N., where the Elgeyo escarpment, finely forested, falls to a longitudinal valley separated from Lake Baringo by the ridge of Kamasia. Opposite Lake Naivasha the Mau escarpment is over 8,000 ft. high. Its crest is covered with dense forest. To the south the woods become more open, and the plateau falls to an open country, drained towards the Dogilani plains. On the west the cultivated districts of Sotik and Lumbwa, broken by wooded heights, fall towards Victoria Nyanza. The Mau plateau reaches a height of 9,000 ft. on the Equator, north of which is the somewhat lower Nandi country, well watered and partly forested. In the treeless plateau of Uasin Gishu, west of Elgeyo, the land again rises to a height of over 8,000 ft., and to the west of this is the great mountain mass of Elgon (*q.v.*). East of Lake Rudolf and south of Lake Stefanie is a large waterless steppe, mainly volcanic in character, from which rise mountain ranges The highest peak is Mt. Kanjora, 6,900 ft. high. South of this arid region, strewn with great lava stones, are the Rendile uplands, affording pasturage for thousands of camels. Running north-west and south-east between Lake Stefanie and the Daua tributary of the Juba, is a mountain range with a steep escarpment towards the south. It is known as the Goro escarpment and at its eastern end it forms the boundary between Kenya and Abyssinia. South-east of it the country is largely level bush-covered plain, mainly waterless.

Geology.—Four regions with distinct physiographical features are distinguished in the parts of Kenya best known: (1) the coastal belt, (2) the belt of gneiss, from the coast belt to the highlands, (3) the volcanic zone of the highlands and Rift valley (4) the lake belt. The underlying formation appears everywhere to be archaean gneiss. The coast belt, which geologically includes the actual coast plain, the foot plateau and the Nyika in part extends inland 50 to 60 m., and consists of sedimentary rocks—raised coral formations, Upper Jurassic shales, and grits and sandstone, with subordinate shales (the Duruma sandstones). Going inland, older and older rocks are found until the gneiss zone is reached. This zone is very extensive; on the line of the Kenya and Uganda railway it extends from mile 57 to mile 283. Coarse grained and well foliated, the gneiss is very uniform in structure. It is composed chiefly of quartz, felspar and hornblende; mica is sometimes present. A bright red sandy soil is formed by the disintegration of the gneiss in its eastern border, which is arid and generally level but with characteristic isolated hills. Farther west the desert condition ceases, and black cotton soil is found in places. A series of mountain ridges—the crests of ancient earth folds—5,000 to 7,000 ft. high and 2,000 to 3,000 ft. above the normal level, run in a north-west to south-west direction. In the third or highland zone, the gneiss is covered by a deep cap of lava, which extends over some 50,000 sq.m. from the southern border north-east to the Abyssinian frontier. Above this lava bed tower the extinct volcanoes of Kilimanjaro, Kenya, Elgon and the Aberdare mountains, while much of the Northern Frontier province con-

sists of lava ridges separated by stretches of stony desert. This highland region is traversed by the eastern Rift valley.

Volcanic activity preceded and followed the subsidence which caused the Rift valley to be formed. The older activity, starting apparently in the Cretaceous age, began with a series of fissure eruptions along the site of what afterwards became the Rift valley and also on both sides of the "valley." From these fissures issued immense and repeated flows of lava, burying the gneiss to varying depths. These fissure eruptions—the welling up of liquid magma—produced no craters. They formed vast plateau plains, such as the Athi and Kapati plains. In the Eocene age came another series of eruptions producing craters, such as that of Mt. Kenya and the Marwenzi crater of Kilimanjaro, and after the Rift valley had been formed there was a further period of volcanic activity, as witness Longonot, in the Rift valley, and apparently Elgon in its present form. Volcanic activity is not yet at an end, as is evidenced by the many steam-vents and hot-springs in the Rift valley, and the eruption of Teleki's volcano (at the south end of Lake Rudolf) at the close of the 19th century. The breaching of the crater wall of Elgon probably let loose the lava bed which covers the Uasin Gishu plateau. On its sides gneiss and granite are exposed. The surface soil in the highland zone is mainly red clay (in the forested areas) or black-cotton. In the central parts of the Rift valley yellow loam is found. The fourth geological zone, the Lake Victoria belt is in parts covered by lava flows, but the gneiss reappears with granite hills and sedimentary rocks. The Kisii highlands are composed of hard sandstone resembling the Waterberg (Transvaal) series.

Climate.—The Equator passes through the centre of Kenya. The greater part of the region north of the Equator has a hot, dry climate, and in some districts, as in the Lake Rudolf area, rain does not fall for years at a time. There are few data for this part, except on the coast, where the climate is hot and damp and the rainfall variable, but rarely more than 15 in. a year. In the southern half of Kenya three climatic zones are recognized, the coast, the highlands and the lake region. The coast zone is hot and damp. February, March and April are the hottest months, when the temperature of Mombasa reaches a mean of 82° F; June and July are the coolest months (76° F at Mombasa). Owing to the humidity, the range of temperature is normally small, with an annual mean of 15° F, but in the same month (March) at Mombasa extremes of 98° F and 60° F have been registered Rainfall varies; at Mombasa January and February are the driest months, and May is the wettest. The yearly average is about 48 inches. Humidity ranges from 89% in April to 74% in December.

The comparatively temperate climate of the highlands has made part of Kenya fit for occupation by whites. Yet a generation of occupation has proved, malaria has still to be combated. In districts 4,500 ft. above sea-level, *e.g.*, Ft. Hall, the mean temperature is about 66° F (but with days when the thermometer registers over 90° F); above 5,000 ft. the heat decreases, the mean in the hot months varying, according to altitude, from 62° F to 69° F, and in the cool months from 55° F to 63° F. The range of temperature is, however, great, reaching to over 40° F. The minimum temperature rarely falls below 38° F, but has fallen in places, *e.g.*, the Eldoma ravine to 30° F. Rainfall in the highlands is heavy, varying from 40 to 100 or more inches a year. There are two rainy seasons: April–June and Oct.–Dec., the driest months being January and July–September. In general, the atmosphere is bracing, with cool breezes, but thick, wet fogs may be experienced in the dry seasons. At Nairobi the mean maximum temperature is 79° F, the mean minimum 56° F. The rainfall is about 32 in. a year. The highlands intercept the rain, thus accounting for the dryness of the country to the north. In the lake region—that is the country bordering Victoria Nyanza, the climate is typically tropical, and resembles that of Uganda (*q.v.*).

Flora and Fauna.—The characteristic trees of the coast zone are the mangrove (which forms dense forests) and the coconut palm. Patches of forest containing sandal-wood, the copal tree and teak also occur along the coast. The lowlands, up to about 3,000 ft., are mostly covered with thorn bush, with dense thickets and forest patches in which are found giant euphorbia, baobab and a flat topped acacia. Rubber vines are found both in the coast and lowland regions. The country from about 3,000 to 9,000 ft. is either grassland or parkland, with acacia forest along the water courses, and papyrus swamps in places. The grassy belt often extends right up to the dense forest, with no transitional phase. The forests, which clothe the mountains between 6,000 and 10,000 ft. are of two kinds: the "rain forest," generally on the eastern and south-eastern slopes, and the "dry forest," usually on the western slopes of the mountains. The rain forests contain the great camphor tree, hard wood trees and yellow wood. The highest zone of these wet forests is marked frequently by a growth of giant bamboos. The characteristic tree of the (relatively) dry forest is the African cedar. The moorland or alpine zone covers regions from 11,000 ft. up to 14,500 feet. Tree-heaths, giant senecious and lobelias characterize this zone.

As to fauna, Kenya is noted for its big game, especially its great herds of antelope and zebra, which roam the plains. Forest and bush animals also abound. The mammals include the lion, leopard, cheetah, giraffe, buffalo and rhinoceros; hartebeest, eland, oryx, bongo, roan, greater and lesser kudu, sable and other antelope and gazelle; the bush pig and the hippopotamus. The elephant is reported to be becoming scarce. The baboon, colobus monkey, squirrels and dormice live in the forests. Other animals found are the ant-bear, the white-tailed mongoose, wild dogs, jackals and the spotted hyena. Domestic animals are the horse, cattle, sheep, goats and, in the northern regions, the camel. Crocodiles, some of them 30 ft. long, are common in the larger rivers and in Victoria Nyanza. There are 40 species of snakes, including the deadly mamba, the Uganda tree-cobra, two kinds of "spitting" cobra and the puff-adder. Centipedes and scorpions, as well as mosquitoes and other insects abound in the coast region and lowlands. The tsetse fly is absent from the highlands. In many districts bees are exceedingly numerous. The birds include the ostrich, stork, bustard and secretary-bird, the tawny eagle, five kinds of vultures, the francolin, guinea fowl, various kinds of spur fowl, and the lesser bustard, the wild pigeon, weaver and hornbill. By the banks of lakes and rivers are to be seen thousands of cranes, pelicans and flamingoes as well as herons, the sacred ibis, and the cormorant. Over 60 species of birds that are migrants to England are found in Kenya.

Inhabitants.—The African races include representatives of various stocks, as the country forms a borderland between the Negro and Hamitic peoples, and contains many tribes of doubtful affinities. The Bantu division of the negroes is represented chiefly in the south, the principal tribes being the Wakamba, Wakikuyu and Wanyika. By the eastern shores of Victoria Nyanza dwell the Kavirondo (*q.v.*), a race formerly remarkable for their complete nudity. Nilotic tribes, including the Nandi (*q.v.*), Lumbwa, Suk and Turkana, are found in the north-west. Of Hamitic strain are the Masai (*q.v.*), a race of cattle-rearers speaking a Nilotic language. A branch of the Masai, which has adopted the settled life of agriculturists, is known as the Wakuafi. The Galla section of the Hamites is represented, among others, by Borani living south of the Goro escarpment (though the true Boran countries are Liban and Dirri in Abyssinian territory), while Somali occupy the country between the Tana and Juba rivers. Of the Somali tribes the Herti dwell near the coast and are more or less stationary. Farther inland is the nomadic tribe of Ogaden Somali. The Gurre, another Somali tribe, occupy the country south of the lower Daua. Primitive hunting tribes are the Wandorobo in the central and southern districts, and scattered tribes of small stature, such as the Midgan and Watta, in other regions. These seem to be survivals of aboriginal tribes of a Bushman or pigmy character, and it has been shown that this part of Africa has been the home of man from remotest antiquity. Remains of a very primitive form of *Homo sapiens* have been found, and evidence of the existence *c.* 2000 B.C. of a Stone age people who were probably in contact with the civilization of Egypt or Mesopotamia.

On the coast are to be found the Swahili (*q.v.*), a Bantu people mixed with Arab and other blood (whose language Ki-Swahili is

largely understood throughout the country). The Arab inhabitants, practically confined to the coast, are of ancient settlement in East Africa, and many have a marked strain of negro blood. Indians have also been long settled on the coast, but the great increase in their numbers dates from the British occupation. The Europeans, nearly all of British or South African origin, have mostly settled in the country since 1902, in which year the whole white population was about 400 (traders, officials and missionaries).

Towns and Communications.—Nairobi, the capital, and Mombasa, the port, are separately noticed. On the mainland, nearly opposite Mombasa, is the settlement of freed slaves named Freretown, after Sir Bartle Frere. Freretown (called by the natives Kisaoni) is the headquarters in East Africa of the Church Missionary Society. It was the residence of the bishop of the diocese of Mombasa, but the bishop's seat has been moved to Nairobi. Lamu (pop. 6,500), on the island of the same name, 150 m. N.E. of Mombasa, is an ancient settlement and the headquarters of the coast Arabs. Here are some Persian and Portuguese ruins, and a large Arab city is buried beneath the sands. Other towns on the coast are Malindi (pop. about 3,000), Patta and Kipini. At Malindi, the "Melind" of *Paradise Lost*, is the pillar erected by Vasco da Gama when he visited the port in 1498. The harbour is very shallow. Of towns founded by the white settlers (besides Nairobi), Naivasha, 64 m. N.N.W. of Nairobi, lies in the Rift valley close to Lake Naivasha, and is 6,230 ft. above the sea. It is the centre of a European agricultural settlement (white pop., 1926, 428). Nakuru (white pop., 1,206; Asiatic, 912); 57 m. by rail N.W. of Naivasha, and finely situated on the shores of a salt lake, is the headquarters of the Kenya Farmers Association. At Eldoret (white pop., 700), on the Uasin Gishu plateau, is a settlement of Dutch-speaking South Africans. Kisumu (white pop., 144), is a port on Lake Victoria, with railway and steamer services; up to 1928 it was the *entrepôt* for the trade of Uganda. Fifteen miles N. of Nairobi is Kikuyu, a noted missionary station; Limuru (7,340 ft. high), 10 m. N. of Kikuyu, has a reputation as a health resort. Other towns founded by the white settlers are Gilgal, Kitale, Thika (centre of the coffee plantations) and Nyeri.

With the outside world and for commercial purposes, communications are almost entirely through Mombasa, with its spacious harbour at Kilindini. It can accommodate ships of the largest size, and is served by many steamship lines with direct and regular services to and from Europe, South Africa, India and other countries. Kenya and Uganda form a unit for transport services. State owned, the railway, harbours and allied services have, since 1921, possessed financial autonomy, and since 1926 have been under a high commissioner of transport (the governor of Kenya). There is one trunk railway, which, starting from Mombasa, runs north-west through the southern part of Kenya and eastern Uganda to the Nile, near its source. Originally the line went to Kisumu on Lake Victoria, whence a steamer service gave connection with Uganda. This was long known as the Uganda railway, and was begun at a time when it was not suspected that any part of Kenya could become "a white man's country." A preliminary survey was executed in 1892, and work was begun in 1896. The distance by rail from Mombasa to Kisumu is 584 m. The line is of metre (3·28 ft.) gauge, the Sudan, and South and Central African lines being of 3 ft. 6 in. gauge. Essentially a mountain line, it has gradients of one in 50 and one in 60. From Mombasa it crosses to the mainland by a bridge half a mile long, and ascends the plateau till it reaches the edge of the Rift valley, 346 m. from its starting point, at the Kikuyu escarpment, where it is 7,600 ft. above the sea. It then descends across ravines bridged by viaducts to the valley floor, dropping to a level of 6,011 ft., and next ascending the opposite (Mau) escarpment to the summit, 8,321 ft. above sea-level. In the remaining 100 m. to Kisumu the level sinks to 3,738 ft., the altitude of Lake Victoria. The railway was built by the British Government at a cost of £5,331,000, or about £9,500 per mile. The first locomotive reached Victoria Nyanza (Lake Victoria) on Dec. 26, 1901; and the permanent way was practically completed by March 1903, when Sir George Whitehouse, the engineer who had been in charge of the construction from the beginning, resigned his post. The railway, by doing away with the carriage of goods by men, gave the final death-blow to the slave trade in that part of East Africa. It also facilitated the continued occupation and development of Uganda, which was, previous to its construction, an almost impossible task, owing to the prohibitive cost of the carriage of goods from the coast. Not only were the two avowed objects of the railway—the destruction of the slave trade and the securing of the British position in Uganda—attained; it was found that the line passed through a region which was suitable for colonization by whites. For several years the existing line served all the needs of the settlers. In 1911–12 a branch line (91 m.) was built to the Magadi soda lake, and a line (32 m.) was built from Nairobi to the Thika river (towards Mt. Kenya). In 1915–16, for military purposes, a railway—92 m. long—was built from Voi via Taveta to Kahe in (then) German East Africa. It linked the Uganda railway to the Tanga railway. This Voi-Kahe line was bought by the Uganda railway in 1923 and reconditioned.

White settlement in the Trans-Nzoia and Uasin Gishu districts, and the sudden development of cotton growing in Uganda, led, in 1921, to the adoption of a bold policy of railway development. From Nakuru (452 m. from Mombasa) a new line was built north to Eldoret on the Uasin Gishu plateau, and thence north and east to the Uganda frontier and on to the Nile at Mbulamuti on the Busoga railway—the distance from Nakuru to the Nile being 350 miles. The line, opened in Jan. 1928, cost about £2,000,000. It at once became the main line; the section Nakuru-Kisumu being henceforth but a branch. Seventy miles from Nakuru, and a little north of the Equator, the new main line reaches an altitude of 9,130 ft., believed to be the highest point of any railway in the British empire. The line sinks at Eldoret, 50 m. farther on, to 7,000 ft., and thence continues to fall to some 3,500 ft. at its terminus. A branch (41 m.) from the new main line to Kitale serves the Trans-Nzoia district; the Thika river line has been extended to Rongai river, west of Mt. Kenya and 140 m. from Nairobi (this line climbs 2,000 ft. in 15 m. by the free use of 3% grades). Other branches have been built, including one in Uganda from Tororo to Soroti (98 m.) serving a rich cotton district. In 1928 there were 1,500 m of railway open in Kenya and Uganda. The whole system is now known as the Kenya and Uganda Railways and Harbours administration.

Road development was slow and communications over the greater part of the colony—all the northern and eastern districts—are still primitive, but motorable roads run from Nairobi to Mombasa, to Tanganyika Territory and to Uganda and the Sudan. The building of roads and the general use, since the World War, of the motor-car, has done much to end the isolation of the white settlers. There are aerodromes at Jinja (Uganda), Kisumu and Nairobi. Efforts to open a regular air service with Khartoum were made. The postal and telegraphic service is well developed, and there is a cable and (since 1928) wireless communication with the outside world.

Government and Revenue.—At the head of the administration is a governor, who is aided by an executive council composed of officials and nominated unofficial members. There is a legislative council consisting (1929) of elected, nominated and ex officio members. The elected members are in a minority, so that ultimate control is in the hands of the Colonial Office, London, to which the governor is responsible. The white settlers and the Indians possess adult suffrage; the Arabs (at their own wish) male adult suffrage only. The franchise is communal, whites, Indians and Arabs having separate voting rolls. For whites the country is divided into 11 single member constituencies; for the Indians the colony and protectorate form a single five-membered constituency; for the Arabs the whole country is also one constituency. The Africans have not the franchise, but one member, chosen from the Christian missionaries, is nominated to represent them. For tribal purposes the chiefs are assisted by councils which, under an ordinance of 1924, possess a large measure of local self government. There is a chief native commissioner, with a department for native affairs under his control. The other

central services include public works, medical, education, lands and agricultural departments. For local government purposes the country is divided into provinces, each with senior, district and resident commissioners. Separate control of the native and settled areas has been in force since 1921. For customs purposes Kenya and Uganda, since April 1917, have formed an administrative unit. The judicature is distinct from the executive.

In the early years of the British administration, expenditure necessary for ordinary services and for opening up the country exceeded revenue, and to balance accounts the tax-payers of the United Kingdom furnished between 1896 and 1913 £2,843,000, in addition to heavy capital expenditure on railways and public works. In 1913–14 the country became self supporting. In that year expenditure was £1,115,000 and revenue £1,123,000. In 1900–01, just before the opening of the Uganda railway, revenue had been £64,000 and expenditure £302,000. In 1906–07, when the railway figures were first included, revenue was £461,000 and expenditure £616,000. In 1920–21, the last year in which the railway returns were included in the ordinary budget, revenue was £2,978,000, expenditure £2,976,000. In 1926 the ordinary revenue was £2,627,000 and expenditure £2,414,000, the railway and harbours revenue in the same year was £2,058,000 and expenditure £1,216,000 (not reckoning interest and loan redemption payments—about £400,000). The 1928 budget figures (ordinary and railway accounts) were: Revenue £5,291,000; expenditure £5,122,000. The chief sources of revenue (railways and harbours apart) are customs and taxes, including a poll tax on all adult males of every race (at the age of 18 in the case of whites). The customs receipts in 1926 were £1,150,000. The public debt, incurred mostly for transport development, was, in 1929, £13,500,000; viz., a 6% loan of £5,000,000 in 1921; a 5% loan of £5,000,000 in 1927, and a 4½% loan of £3,500,000 in May 1928. The loans were raised on the London market.

Economic Conditions.—The prosperity of Kenya depends upon agriculture. In the highlands the white settlers cultivate, chiefly, coffee, maize and sisal. Wheat and barley, potatoes and other vegetables, fruits, sugar-cane, tobacco and other crops are also grown. There are very extensive pasture lands, but stock-raising, except sheep, had not proved very successful up to 1928, though there should be a great future for pastoral industries. All the northern half of the country, though arid, has sufficient vegetation to permit its Somali, Galla and other inhabitants to keep large herds of cattle as well as of camels. Under irrigation much of this northern region would be very fertile. Cotton plantations are successful in the Kavarondo country around Lake Victoria; in the coast lowlands coconut plantations yield copra, and there are also in these coast lands sisal, maize, sugar-cane and cotton areas. There are a great variety of minor crops and products, but the principal crops—for the whole colony—in the order named are coffee, sisal, maize, wheat, coconuts and sugar-cane. Most of the manual labour is done by Africans, but the white man must be prepared to work himself, and farms of over 500 acres require more than one European to manage. The difficulty of getting sufficient labour for such crops as coffee and sisal, which need many hands, led the governor (Sir Edward Grigg) in 1926 to advocate concentration by the white settlers on work which required fewest hands—stock-raising, dairying, mixed farming, wheat, maize, etc.—advice taken only to a certain extent. Plans for closer settlement and the introduction of men with small capital, or even none, were being put into execution in 1928–29. By 1928 over 5,000,000 ac. had been alienated to and occupied by Europeans, but not more than 500,000 ac. were being cultivated, apart from areas used for grazing. Small areas, about 20,000 ac., were being cultivated by Indians in the lowlands.

The native was at first regarded as a negligible economic factor, except as providing manual labour, but under official encouragement and the example of the natives of Uganda and Tanganyika, he became a producer of more than the food crops needed for home consumption. The chief native crops for export are maize, sim-sim, beans, ground-nuts and, in Kavarondo, cotton. The dual policy of developing simultaneously native and white areas—as carried out in Nyasaland and Northern Rhodesia, and also in Tanganyika—was definitely adopted by the Kenya Government in 1924. It provoked criticism from a section of the whites, who considered that it conflicted with their interests. Native production increased, though not so rapidly as in the adjacent territories. The hides and skins and the ground nuts exported came mainly from the reserves, which cover 30 million acres. By 1928 the natives produced about 25% of the total exports, while they take a much larger proportion of the imports. The chief imports are cotton piece-goods; food, drink and tobacco (the natives take 80% of the tobacco); pottery and machinery; motor cars and lorries and bicycles; the last largely used by the natives.

The sylvan resources of the country have not been properly developed and there was, at first, unwise alienation of much of the best forest lands. Great quantities of carbonate of soda are taken from the Magadi soda "lake" (the surface is solid and the soda cut away in huge blocks). There are gold deposits in the Kisii district round Lake Victoria, but the mineral resources are little known.

Practically the whole of the import and export trade of Uganda passes through Mombasa, and as there is a customs union with that protectorate the trade figures do not distinguish between Kenya and Uganda imports and exports, though on analysis they can, in the main, be ascertained. Consideration of economic conditions in Kenya must, however, take account of Uganda, and this is true of other East African territories. They are engaged on similar enterprises; Tanganyika Territory, for example, is the chief producer of sisal and might become a competitor with Kenya for the carrying of Uganda cotton. Tanganyika, too, has areas like Kenya, suitable for white settlement, and like Uganda has cotton interests. Zanzibar is still to some extent an *entrepôt* for the distribution of goods (though in this respect Kenya has become a competitor), and Nyasaland, if not Northern Rhodesia, is in the East African orbit. All these countries, except Zanzibar, have had, since 1922, the same currency—the British shilling being the standard coin; the change from rupees to sterling in Kenya, Uganda and Tanganyika indicating a new orientation. The shilling is, however, divided into 100 cents. A general East Africa currency board is established in London; and to London all these countries turn when raising loans. Obviously, a common policy would have advantages in respect of transport, tariffs, agricultural and mineral development, and in regard to the fight against the tsetse fly and other tropical pests, also in combating leprosy, sleeping sickness and other diseases. After the World War, when Tanganyika Territory (formerly German East Africa) came under British mandate, the desire for economic co-operation became strong and was accompanied by proposals for political union (*see* BRITISH EAST AFRICA). As far as trade and commerce are concerned, organizations representing all the East African territories have been created. A trade commissioner, appointed by the British Government, deals with all the territories under British administration. (Consult the reports issued by the Department of Overseas Trade, London.) As indicating the relative position of the various countries it may be stated that in 1926, out of a total of, in round figures, £31,000,000 as the value of imports to and exports from the British administered East African territories, the share of Kenya and Uganda was £17,000,000 and that of Tanganyika nearly £7,000,000, the remainder being divided between Zanzibar, Nyasaland and Northern Rhodesia.

Up to 1921 an *ad valorem* duty of 10% was imposed in Kenya on almost all imports, with varying duties on certain exports. In 1921–23 a modified protection policy was adopted, with specific duties between 10 and 50% on certain goods, and 10 to 30% *ad valorem* duties on other goods. Export duties were abolished, a uniform tariff was enacted for Kenya and Uganda, which also applied to Tanganyika. Free trade was established in goods, the growth, produce or manufacture of those three countries. There was, however, no uniformity of railway charges, Tanganyika pursuing a somewhat independent policy.

Although a tendency to inflation was noticeable in Kenya after the World War, due in part to the spending of loan money upon

expectations of increased purchasing power and there were periods of acute commercial depression (as in 1922–23), trade showed much elasticity. As between Kenya and Uganda, analyses of the trade figures showed that up to 1926 Kenya took the larger proportion of the imports, and Uganda, owing to its cotton crop, supplied the larger part of the exports. Thereafter, the growth of the maize exports from Kenya began to tell, so that with a "slump" in the Uganda cotton crop, Kenya exports in 1927 exceeded those of Uganda. For 1927 the total imports for home consumption (Kenya and Uganda combined) were £6,767,000, the British share being 44%. The domestic exports, 50% of which went to Great Britain, were £5,597,000:— Kenya £3,086,000; Uganda £2,310,000. (By way of comparison it may be pointed out that in 1896 the Kenya exports were but £73,000 and the imports £176,000.) Conditions in 1928 showed that Kenya Colony was commercially sound, with a capacity for great development.

HISTORY

Before the partition of Africa between European Powers a great part of the coast of East Africa belonged to the dominions of Zanzibar. That sultanate had close ties with India, and in the last quarter of the 19th century British influence was strong at the court of the seyyids or sultans. Much of the trade of the chief ports, Zanzibar, Mombasa and Bagamayo, was in the hands of British and Indian merchants. In 1877 the then ruler, Sultan Bargash, offered to (Sir) William Mackinnon (1823–93), the chairman of the British India Steam Navigation company, a lease for 70 years of all his mainland territories, including, with certain reservations, rights of sovereignty. This was the year (1877) in which H. M. Stanley completed his journey down the Congo, and by revealing the riches of Central Africa set on foot the movement for the partition of the continent. But at the time the British Foreign Office was not converted, and receiving no support from that quarter Mackinnon declined the offer of Bargash. A few years later, when public interest was aroused, H. H. Johnston obtained concessions from chiefs in the Kilimanjaro region. This was early in 1884; at the end of the same year German agents obtained concessions in the same region. The British Government of the day placed no hindrance in the way of German acquisitions, but put forward claims of its own to the hinterland of Mombasa.

Spheres of Interest.—In 1886 a provisional agreement as to spheres of interest was reached between Germany and Great Britain; the agreement of July 1890 defined definitely the boundaries of British and German East Africa respectively. North, the British sphere reached to Abyssinia; on the east it adjoined Italian Somaliland, on which side the river Juba was fixed as the frontier in 1891. Meanwhile the plan of leasing the mainland of Zanzibar had been revived, and in May 1887 Bargash granted to an association formed by Mackinnon a concession for the administration of his mainland territory not included in the German sphere of operations. Subsequently the Benadir ports were leased to Italy, and in the German and Italian spheres the Zanzibar Government sold its sovereign rights. The territory acquired by Mackinnon continued to be held on lease.

Formation of Chartered Company.—By international agreement the mainland territories of the sultan had been defined as extending 10 m. inland from the coast. Mackinnon's association, whose object was to open up the hinterland as well as this 10 m. strip, became the Imperial British East Africa company, and received a royal charter in Sept. 1888. To this company the sultan made a further concession dated Oct. 1888. On the faith of these concessions and the charter a sum of £240,000 was subscribed, and the company received formal charge of its concessions. The path of the company was speedily beset with difficulties, which in the first instance arose out of the aggressions of the German East African company, which had received the lease of the southern part of the Zanzibar mainland, *i.e.*, the coast of what is now Tanganyika Territory. The Germans proved uncomfortable and somewhat unscrupulous neighbours, and claims put forward to certain coast-districts, notably Lamu, included in the British concession, gave much trouble. In conditions of great difficulty the company carried on its work. In 1888 it sent an expedition under F. J. Jackson to the far interior. Jackson reached the Victoria Nyanza, and hearing there that a German party under Karl Peters had run a blockade of the ports and reached Uganda, Jackson also went on to Uganda. Rival treaties were signed; but the Anglo-German agreement of 1890, already mentioned, placed Uganda in the British sphere. The next step taken by the company was to send Capt. F. D. (later Lord) Lugard to Uganda. For events in that country *see* UGANDA. Here it should be noted that the activities of the company in Uganda gravely crippled its resources. To open up its territories the company planned to build a railway from Mombasa to the Victoria Nyanza, an enterprise which Mackinnon rightly held was essential. A preliminary survey was made in 1892. But there was strong opposition in parliament to any aid for railway building from imperial sources, and even to the retention of Uganda, and the company's scheme was wrecked.

Further difficulties now arose which led to the extinction of the company. Its pecuniary interests sustained a severe blow owing to the British Government—which had taken Zanzibar under its protection in Nov. 1890—declaring (June 1892) the dominions of the sultan within the conventional Congo basin free trade zone. The result for the company was that dues were swept away without compensation, and the company was left saddled with the payment of the rent, and with the cost, in addition, of administration, the necessary revenue for which had been derived from the dues thus abolished. Moreover, a scheme of taxation which it drew up failed to gain the approval of the Foreign Office.

In every direction the company's affairs had drifted into an *impasse*. At this crisis Sir William Mackinnon, its guiding spirit, died (June 1893), and after protracted negotiations it was decided that the British Government should purchase the property, rights and assets of the company in East Africa for £250,000. Although the company had proved unprofitable for the shareholders (when its accounts were wound up they disclosed a total deficit of £193,000) it had accomplished a great deal of good work. Mackinnon and his colleagues were largely animated by the desire to suppress slavery and to improve the condition of the natives. With this aim they prohibited the drink traffic, started industrial missions, built roads, and administered impartial justice.

Crown Control.—The formal transfer of the country to the British Crown took place on July 1, 1895, the Foreign Office assuming responsibility for its administration. The territory, hitherto known as "Ibea," from the initials of the company, was now called the East Africa Protectorate, and the chief local official was styled commissioner. Coincident with the transfer of the administration a dispute as to the succession to a chieftainship in the Mazrui, the most important Arab family on the coast, led to a revolt which lasted ten months and involved much hard fighting. This revolt, or rather its suppression, was of more than passing importance. The defeat of the rebels definitely substituted European for Arab influence. Before the rebellion the coast was in reality a protected Arab State; after its suppression, though no legal change was made, British influence was paramount. The Arab population, about 10,000, found it hard to cope with the new conditions.

Construction of Railway.—The country was, before long, to develop in an unexpected manner. It came about through the decision of Lord Salisbury, then prime minister, to build the railway projected by Mackinnon from the coast to Victoria Nyanza, and that at the expense of the British taxpayer. The object was twofold, to provide easy access to the headwaters of the Nile and to deal a heavy blow at the slave trade. The building of the railway from Mombasa was begun in 1896, the first locomotive reaching Victoria Nyanza in Dec. 1901, but it was not until March 1903 that the permanent way was practically completed. It cost the Exchequer £5,331,000. During the building of the railway the energies of the administration were largely absorbed in that great work, and in establishing effective control over the Masai, Somali, and other tribes. The coast lands apart, the protectorate was regarded as valuable chiefly as being the high road to Uganda. But as the railway reached the high plateaux the discovery was

made that there were large areas of land, perhaps as much as 20,000 sq.m., and very sparsely peopled, where the climate was excellent and where the conditions were favourable to European colonization.

Beginning of White Settlement.—The completion of the railway, by affording transport facilities, made it practicable to open the country to settlers. Hitherto the European population had consisted of officials, a few traders, and missionaries; the labours of the last-named class among the natives having already produced good results. The first application for land was made in April 1902 by the East Africa syndicate—a company in which financiers belonging to the Chartered Company of South Africa were interested—which sought a grant of 500 sq.m.; and this was followed by other applications for considerable areas. The settlers had the unusual advantage of coming to a country already provided—and not at their expense—with railway and port facilities. That there were already some thousands of Indians in the protectorate—the railway had been built by Indian coolies—did not at first cause the whites much perturbation. They, the whites, were carving out virgin estates, and at the outset they got the small amount of native labour they needed. During 1903 there arrived in the country hundreds of prospective settlers, chiefly from South Africa—Dutch and British—but including many from England, men of the upper and middle classes. The first settler was Lord Delamere (the 3rd baron) and he became the recognized leader of the immigrant whites. To meet the requirements of the majority of the settlers the administration decided not to entertain any further applications for large areas of land; moreover, some of the best land was used by the Masai for depasturing their vast herds of cattle. In dealing with the applications for land grants a dispute arose between the commissioner, Sir Charles Eliot, and Lord Lansdowne, the secretary of State for foreign affairs. Eliot, an able man, who had been commissioner since 1900, refused to carry out Lord Lansdowne's decisions as to certain applications for land. He resigned his position, and in a public telegram to the prime minister declared Lord Lansdowne's instructions "unjust and impolitic." This was on June 21, 1904; on the same day Sir Donald W. Stewart was appointed to succeed Eliot. (*See* the parliamentary paper, *Correspondence Relating to the Resignation of Sir C. Eliot, Africa No. 4, 1904.*)

Growth of White Settlement.—This quarrel drew public attention in forcible fashion to East Africa; and it raised the question as to whether the land should fall in large areas into the hands of speculators, or be divided into smaller blocks which the individual settler could develop. The second was the proper course; on this both the foreign secretary and the commissioner were agreed, but Lord Lansdowne considered himself bound by a pledge given to the East Africa syndicate.

Sir Donald Stewart (who died in Oct. 1905) induced the Masai, whose grazing rights were threatened, to remove to another district, and a settlement of the land claims was arranged. An offer to the Zionist Association of land for colonization by Jews was declined in Aug. 1905 by that body, after the receipt of a report by a commissioner sent to examine the land (6,000 sq.m.) offered. Meanwhile, in April 1905, the administration of the protectorate had been transferred from the Foreign to the Colonial Office. By the close of 1905 considerably over a million acres of land had been leased or sold by the protectorate authorities—about half of it for grazing purposes. In 1907, to meet the demands of the increasing number of white inhabitants, who had formed a Colonists' Association for the promotion of their interests, a nominated legislative council was established, and on this council representatives of the settlers were given seats. The style of the chief official was also altered, "governor" being substituted for "commissioner." During this period relations with the natives were, on the whole, satisfactory. However, the Nandi, who occupied the southern part of the plateau west of the Mau escarpment, repeatedly raided their less warlike neighbours and committed wholesale thefts from the railway and telegraph lines. In Sept. 1905 an expedition was sent against them which reduced the tribe to submission in the following November, and early in 1906 the Nandi were removed into a reserve.

Complications with Indians and Natives.—By this time the white settlers had begun to experience difficulties with Indians and natives alike. At Nairobi, the new capital in the highlands, Indian traders, small and great, were competing with the Europeans, and elsewhere Indians obtained much of the trade with the natives. The settlers in the highlands engaged in stock-raising and grew coffee, maize, wheat, barley, flax and vegetables. In the lowlands sisal, tobacco and coconut plantations were started. Here, however, the white man was present only as overseer. The settlers were dependent for manual labour on the natives. The bulk of the farm work in the highlands was done by the Kikuyu, a people with a natural aptitude for agriculture. Most of the white farmers treated the native labourer with consideration, and in general, the native, at his unaccustomed work, did good service. Many natives, however, preferred to remain in their reserves, which the Government began to encourage them to develop for their own advantage. Difficulties inevitably arose and were aggravated by the scarcity of labour. The administration, on behalf of the natives, enforced, as early as 1907, regulations which the white settlers regarded as irksome. Hence arose much friction. Meanwhile the Indian problem grew in importance; the census of 1911 showed that there were 11,886 Asiatics in the country as against 3,175 Europeans. Sir Percy Girouard (governor, 1909–12), achieved the somewhat difficult task of working harmoniously with the settlers, whose grievances then were chiefly over the delay in getting land grants, but who were already beginning to claim a share in the government. Sir Percy had also the satisfaction, in 1912, of seeing the country become self-supporting. The next year (1913) was most noticeable for the acute controversy which arose over a missionary conference at Kikuyu, when the bishop of Mombasa (Dr. W. G. Peel) officiated at a communion service in a Presbyterian church at which Anglicans, Presbyterians, Wesleyans and others communicated. Apart from the theological controversy this service aroused, it served to draw attention to the fact that, up to that period, by far the greater part of the work, not only of Christianizing, but of civilizing the natives and giving them industrial as well as literary education, was in the hands of missionaries.

The War Period.—The World War caused a set-back in the economic conditions of the country. The majority of the white male settlers went on active service, and agriculture and stock-raising suffered in consequence. Very heavy demands were also made on the natives, who had to supply carriers, transport oxen and meat to the troops. They responded well to these demands and large numbers of natives joined the combatant ranks. After the war a brief period of revival in trade was followed by a longer period of depression. Maj.-gen. Sir Edward Northey, who took over the governorship on Jan. 31, 1919, had to deal with the difficulties created by a period of change and strain. The white settlers were restive, the Indians were demanding political rights, the natives were in great need of careful guidance—so that on the one hand they should cultivate their reserves and on the other hand supply the labour required for public works and the farms and plantations of Europeans. A currency crisis also arose through the rise in the exchange value of the rupee—the Indian rupee being the legal currency. An ill-advised stabilization of the rupee at 2s., in Feb. 1920, was quickly followed by the introduction of a coinage based on British currency. In May 1921 the shilling (divided into 100 cents) was made the standard coin. Dissatisfaction arose also over the great difficulties encountered in carrying out a scheme launched in 1919 to establish ex-soldiers from Great Britain on the land. By 1924, however, the settlement was, on the whole, a success. Over 700 farms out of 1,000 granted to ex-combatants were being worked.

Change of Status.—During this period of strain the change from a protectorate to a Crown colony was effected (July 1920). The new colony was named after Mount Kenya, the most commanding natural feature of the country. The coast lands which formed part of the sultanate of Zanzibar were not annexed but became the Kenya Protectorate. In 1919 a change in the constitution had introduced, for Europeans, an elective element in the

legislative council, 11 single-member constituencies being created, with adult franchise on a residential qualification. At the same time two members were nominated to represent the Indian community. This discrimination against Indians was deliberate. Sir Edward Northey, the then governor, stated, in July 1919, that "though Indian interests should not be lost sight of, European interests must be paramount." Prolonged agitation followed. The Indians claimed equal rights with Europeans and a common franchise, and they had the strong and unremitting support of the Government of India. The white settlers, to whom the development of the country's resources was very largely due, vehemently contested the claims of the Indians, most of whom were clerks, mechanics, shop assistants, small traders and labourers, though they included professional men and merchants of high standing. The whites further alleged that the Indian influence on the natives was bad. At this time (1921) the white settlers numbered about 9,600 and the Indians over 23,000.

White and Native Interests.—The whole question of policy came under consideration by the British Government, whose decision was given in the Kenya White Paper of July 1923. The most significant part of this decision was that:

> The interests of the African natives must be paramount, and that if, and when, those interests, and the interests of the immigrant races (European and Asiatic) should conflict, the former should prevail. As in the Uganda protectorate, so in the Kenya colony, the principle of trusteeship for the natives, no less than in the mandated territory of Tanganyika, is unassailable.

In respect to the franchise the British Government decided on a communal system of representation—that is, separate electoral rolls for Europeans, Indians and Arabs. The 11 seats on the legislative council for Europeans were retained; five seats on the council were allotted to the Indians and one seat to the Arab community, all on an elective basis; while one member was nominated specially to represent the natives. By means of other nominated members the Government, however, retained control of the council. The franchise apart, the British Government decided against the segregation of Indians in townships, but the practice which had been followed of reserving land in the highlands for Europeans was maintained.

The definite enunciation of the principle that native interests were paramount hardly pleased the European community, though they professed that African and European interests did not clash. To what they called "West Africanization" Lord Delamere and other leaders of the whites were hotly opposed. By that term they meant the policy of making the negro an independent producer and equal partner in development. That, they argued, might be the proper course in countries where white settlement was not possible; in Kenya, they claimed, the African would get his best training by working for and in association with the whites. But in spite of some wild talk the Europeans accepted the British Government's decision. The Indians continued their agitation—which included a refusal to pay the poll tax and to elect members to the council. In Dec. 1924, however, more moderate counsels prevailed and it was decided to accept seats on the council. This easing of the situation was largely due to Sir Robert Coryndon, who became governor in Sept. 1922, and, while a firm upholder of native rights, fully recognized the work done by the Europeans and the services rendered by the Indians. Sir Robert died at Nairobi on Feb. 10, 1925, and was succeeded by Sir Edward Grigg.

In respect to the natives, the administration endeavoured to guide them through their own chiefs and tribal organizations and gradually to teach them the art of government. The efforts of the officials, supported by the missionaries and by many of the white settlers, met with a measure of success. In 1922 they were extended to include, in addition to medical, educational and other services, direct encouragement of stock breeding and agriculture in the reserves. In 1924 a further step was taken in the grant to the tribal councils of a considerable measure of local self-government. The development of the reserves would, many settlers feared, decrease the supply of labour for the whites, though figures showed that the natives working on European farms increased from 53,000 in 1919–20 to 87,000 in 1923–24. Compulsory labour for private persons had been definitely prohibited in 1920. The root of the labour difficulty was that the population was insufficient for the intensive cultivation both of the European farms and the native reserves. To help in meeting this difficulty Sir Edward Grigg advised the Europeans to concentrate on crops and occupations—such as cattle-raising—which required least labour.

Plans for Development.—In 1924 a parliamentary commission, of which W. G. A. Ormsby-Gore was chairman, spent two months in Kenya, one of its main objects being to consider plans for the development of East Africa as a whole. It was followed, in Feb. 1926, by a conference at Nairobi of the governors of all the East African territories. (For federation efforts *see* BRITISH EAST AFRICA.) The parliamentary commission wrote in terms of high praise of the European settlers, "pioneers in a hurry," who desired to build in the highlands "a distinctive type of British civilization" while obtaining "a more complete inter-relation and co-operation between the European and the African than exists either in South or West Africa." The hurry of the pioneers was shown at the general election for the legislative council in 1926, when Lord Delamere and others campaigned—in vain—for an elected European majority in the council, that is the handing over of control to the white settlers. But the Imperial Government announced (July 1927) that it was desired to associate the white community in its trusteeship and control of native affairs. The vigour of the pioneers was manifest in a large increase of the area under cultivation and the readiness to assume financial burdens for railway and other works—a new stage in transport facilities being reached in 1928, when through railway communication between Mombasa and the Nile in Uganda was opened. In that year, too, another British royal commission, under the chairmanship of Sir E. Hilton Young, visited East Africa. It considered, among other things, the question of native reserves in Kenya. If the dual policy of the simultaneous development of native and white areas was to be successful it was essential that the natives should have not only ample reserves, but security of tenure, and to this end a Native Lands Trust bill was introduced into the Kenya legislature, placing the reserves in trust for the natives in perpetuity. There was, in 1927–28, a revival of agitation by the Indian community arising out of proposals for a permanent European majority on the town councils of Nairobi and Mombasa; the administration showed a conciliatory attitude, the proposal was dropped and a satisfactory arrangement reached. A visit of the prince of Wales to Kenya in the last quarter of 1928 evoked many demonstrations of loyalty from all the communities in the Colony.

The large part of Kenya—more than half the total area—not suitable for white settlement, Tanaland, Jubaland and the Northern province, thinly inhabited by Boran, Galla, Somali and other tribes, was little affected by the problems which perplexed the rest of the colony. But these northern and eastern regions, semi-arid, were of much potential value and needed only irrigation to become extremely fertile. The northern district was subject to raids from Abyssinia and to quarrels among the tribes. To make easier the control of the frontier the Rudolf province of Uganda—the district west of the lake of that name, adjoining the Sudan on the north—was taken over by Kenya in 1923. In 1925 (in accordance with a treaty made when Italy entered the World War) the greater part of Jubaland (*q.v.*) was transferred to Italy.

BIBLIOGRAPHY.—The most comprehensive accounts, to the date of issue, are Sir Charles Eliot's *The East Africa Protectorate* (1905) and the *Handbook of Kenya Colony* (1920), a British Admiralty publication. *The Report of the East Africa Commission* (1925) has a special section on Kenya, and the Colonial Office, London, issues an annual *Report* on the colony. The work of the Imperial British East Africa company is authoritatively told in *British East Africa or Ibea*, by P. L. McDermont (new ed., 1895). Another book, valuable for its historical perspective, is *The Foundation of British East Africa*, by J. W. Gregory (1901). Bishop A. R. Tucker's *Eighteen Years in Uganda and East Africa* (1908) contains a summary of missionary labours. Of the works of explorers *Through Masäi Land*, by Joseph Thomson (1886), is specially valuable. For the period since white colonization began *see* Lord Cranworth, *A Colony in the Making* (1913), *Profit and Sport in Brit. E. Africa* (1919), and an article in *United Empire*, vol. xvii. (1926); the Kenya White Paper (Cmd. No. 1,922) of 1923; Norman Leys, *Kenya* (1924); Maj. A. Church, *East Africa: A New Dominion* (1927); W. McGregor Ross, *Kenya from Within* (1927). (F. R. C.)

KENYAHS. The Kenyahs, a Borneo tribe, are quick in thought and action, spendthrifts rather than savers, genial, hospitable, pugnacious without being bloodthirsty. Less reserved than the Kayans, they are adaptable and lively, very loyal, and very ready to follow a leader. Their countenances are open and well-featured, with a very fair yellow skin and wavy hair. Their legs are comparatively short, and their speech is a marked staccato.

The Kenyahs are found generally in the same regions as the Kayans, and have spread over Borneo from the same centre, Apo Kayan. It would almost seem as if they have been morally dominated by the Kayans and had an alliance forced upon them. They follow the Kayans in mode of life and in the arts, and very often improve upon their pattern. As a tribe they are not such great house-builders, iron-workers, or carvers as the Kayans, but the best Kenyah work is both better finished and more durable than the Kayan product. The Kenyah smelts his own steel from iron-ore which, at least until recently, he obtained from river-beds; from this he fashions a sword, knife, or adze, not indeed so artistic or so carefully chased as Kayan work, but of the highest temper. As regards carving, the best Kenyah work is on sword handles made from the antlers of a stag, and is most delicately and beautifully executed.

Above all, the Kenyah is a born boatman. His short legs and long body fit him for the work of paddling or poling, and on his own rivers he is able and willing to go anywhere and do anything. (*See* BORNEO.)

KENYON, SIR FREDERIC GEORGE (1863–), British scholar, was born in London on Jan. 15, 1863. Educated at Winchester and at New College, Oxford, he became a fellow of Magdalen College, Oxford, in 1888. The following year he was appointed an assistant in the British Museum, and became in 1898 assistant keeper of MSS. In 1909 he was appointed director and principal librarian. He held many academic and other honours, including the K.C.B. (1912) and the G B E. (1925).

Among his other published works are three editions of Aristotle's *Constitution of Athens* (1891, 1904, 1920); *Classical Texts from Papyri in the British Museum* (1891); *Catalogue of Greek Papyri in the British Museum* (1893, 1898, 1907); *Our Bible and the Ancient Manuscripts* (1895); *Palaeography of Greek Papyri* (1899); *Handbook to the Textual Criticism of the New Testament* (1901–12).

KENYON, LLOYD KENYON, 1ST BARON (1732–1802), lord chief-justice of England, was born at Gredington, Flintshire, on Oct. 5, 1732. Educated at Ruthin grammar school, he was in his 15th year articled to an attorney at Nantwich, Cheshire. In 1750 he entered at Lincoln's Inn, London, and in 1756 was called to the bar. As for several years he was almost unemployed, he utilized his leisure in taking notes of the cases argued in the court of king's bench, which he afterwards published. In 1780 he was made king's counsel He showed conspicuous ability in the cross-examination of the witnesses at the trial of Lord George Gordon, but his speech was so tactless that the verdict of acquittal was really due to the brilliant effort of Erskine, the junior counsel. This want of tact, indeed, often betrayed Kenyon into striking blunders; as an advocate he was, moreover, deficient in ability of statement; and his position was achieved chiefly by hard work, a good knowledge of law and several lucky friendships.

Through the influence of Lord Thurlow, Kenyon in 1780 entered the House of Commons as member for Hindon, and in 1782 he was appointed attorney-general in Lord Buckingham's administration, an office which he continued to hold under Pitt. In 1784 he received the mastership of the rolls, and was created a baronet. In 1788 he was appointed lord chief justice as successor to Lord Mansfield, and the same year was raised to the peerage as Baron Kenyon of Gredington. As he had made many enemies, his elevation was by no means popular with the bar; but on the bench, in spite of his capricious and choleric temper, he proved himself not only an able lawyer, but a judge of rare and inflexible impartiality. He died at Bath, on April 4, 1802. Kenyon's contribution to the development of English law was a negative one. After the almost excessively progressive rationalizing policy of Mansfield, Kenyon in the king's bench and Eldon in the chancery initiated a period of conservatism, and the period of judicial adaptation of the law to modern conditions comes to an end, being replaced by the legislative reforms of the 19th century.

See *Life* by Hon. G. T. Kenyon, 1873.

KEOKUK, a city of Lee county, Iowa, U.S.A., in the south-eastern corner of the State, on the Mississippi river, at the mouth of the Des Moines. It is on Federal highways 61 and 161, and is served by the Burlington, the Rock Island, the Toledo, Peoria and Western, and the Wabash railways, and by river steamers and barges. The population in 1925 (State census) was 14,501. Keokuk is at the foot of the Des Moines rapids in the Mississippi river, around which a navigable canal (opened 1877) was constructed by the Federal Government. Here was built by the Mississippi River Power company (1910–13) one of the largest hydro-electric power plants in the world, generating 200,000 horse power. The dam proper is nearly a mile long, set in a channel cut several feet into the hard limestone bed of the river. The water wheels are four times the size of the largest previously made. As part of the conditions imposed on the company it built and transferred to the United States a lock larger than any at Panama, and a drydock practically the size of the one at the Brooklyn navy yard. Over 1,200 transactions were involved in acquiring the land submerged by the lake (65 sq m.) above the dam. Keokuk has a large wholesale trade and numerous and varied manufacturing industries. There is a national cemetery here, containing (1927) 999 graves. The city was named after Keokuk, a chief of the Sauk and Foxes (1780–1848) who remained peaceful during the Black Hawk War, and whose grave is in Rand park. The word meant "the watchful" or "he who moves alertly." The first house on the site of the city was built in 1820, but there was no further settlement until 1836. The town was laid out in 1837, chartered as a city in 1848, and in 1910 adopted a commission form of government.

KEONJHAR, a feudatory state of India, in the province of Bihar and Orissa; area, 3,096 sq m.; pop. (1921), 379,496; estimated revenue, Rs. 925,000. Part of it consists of rugged hills, rising to more than 3,000 ft. above sea-level. There were rebellions of the Bhuiyas and other aboriginal tribes in 1868 and 1891. The state is believed to possess great mineral wealth, notably in iron ore; the Tata Iron and Steel Co. holds a concession in it, and prospecting operations have been carried on by other companies. The trade in timber is also of some value.

KEONTHAL, a hill state in the Punjab, India, with an area of 116 sq.m., pop. (1921), 25,599; estimated revenue, £9,700. The chief, a Rajput, received the title of raja in 1857. He exercises rights of lordship over the petty states of Kothi, Theog, Madhan, Ghund and Ratesh.

KEPLER, JOHANN (1571–1630), German astronomer, was born on Dec. 27, 1571, at Weil, Württemberg. He was the eldest child of an ill-assorted union. His father, Henry Kepler, was a reckless soldier of fortune; his mother, Catherine Guldenmann, the daughter of the burgomaster of Eltingen, was undisciplined and ill-educated. The misfortune and misconduct of his parents were not the only troubles of Kepler's childhood. He recovered from small-pox in his fourth year with crippled hands and eyesight permanently impaired. His schooling began at Leonberg in 1577. Bodily infirmity, combined with mental aptitude, were eventually considered to indicate a theological vocation; he was, in 1584, placed at the seminary of Adelberg, and thence removed, two years later, to that of Maulbronn. A brilliant examination for the degree of bachelor procured him, in 1588, admittance on the foundation to the university of Tübingen, where he learned Copernican principles from the private instructions of his teacher and life-long friend, Michael Maestlin. But it was with extreme reluctance that he turned aside from the career of the ministry to accept, early in 1594, the vacant chair of that science at Gratz.

Kepler found that the first duties required of him were of an astrological nature, and set himself to master the rules of the art

as laid down by Ptolemy and Cardan. He, moreover, sought in the events of his own life a verification of the theory of planetary influences; and it is to this practice that we owe the summary record of each year's occurrences which, continued almost to his death, affords for his biography a slight but sure foundation. He was convinced that for the actual disposition of the solar system some abstract intelligible reason must exist, and this, after much meditation, he believed himself to have found in relation between the "five regular solids" and the number and distances of the planets. His views, published in *Prodromus Dissertationum Cosmographicarum seu Mysterium Cosmographicum* (Tübingen, 1596) procured him much fame, and a friendly correspondence with the two most eminent astronomers of the time, Tycho Brahe and Galileo.

Kepler met at Gratz, Barbara von Mühleck, a wealthy heiress, and married her on April 27, 1597. Religious disturbances caused Kepler to leave Gratz, and to accept Tycho Brahe's offer to become assistant in his observatory near Prague. By Tycho's unexpected death (Oct. 24, 1601) a brilliant career seemed to be thrown open to Kepler. The emperor Rudolph II. immediately appointed him to succeed his patron as imperial mathematician, although at a reduced salary of 500 florins; the invaluable treasure of Tycho's observations was placed at his disposal; and the laborious but congenial task was entrusted to him of completing the tables to which Tycho had already affixed the title of *Rudolphine*. The first works executed by him at Prague were, nevertheless, a homage to the astrological proclivities of the emperor. In *De fundamentis astrologiae certioribus* (Prague, 1602) he declared his purpose of preserving and purifying the grain of truth which he believed the science to contain. He drew the horoscopes of the emperor and Wallenstein as well as of a host of lesser magnates; he made necessity his excuse for a compromise with superstition. "Nature," he wrote, "which has conferred upon every animal the means of subsistence, has given astrology as an adjunct and ally to astronomy." He dedicated to the emperor in 1603 a treatise on the "great conjunction" of that year (*Judicium de trigono igneo*); and he published his observations on a brilliant star which appeared suddenly (Sept. 30, 1604), and remained visible for seventeen months, in *De stella nova in pede Serpentarii* (Prague, 1606).

The main task of his life was not meanwhile neglected. This was nothing less than the foundation of a new astronomy, in which physical cause should replace arbitrary hypothesis. A preliminary study of optics led to the publication, in 1604, of his *Astronomiae pars optica*, containing important discoveries in the theory of vision, and a notable approximation towards the true law of refraction. From the time of his first introduction to Tycho he had devoted himself to the investigation of the orbit of Mars, which, on account of its relatively large eccentricity, had always been especially recalcitrant to theory, and the results appeared in *Astronomia nova αἰτιολογητός, seu Physica coelestis tradita commentariis de motibus stellae Martis* (Prague, 1609). In this, the most memorable of Kepler's multifarious writings, two of the cardinal principles of modern astronomy—the laws of elliptical orbits and of equal areas—were established (*see* ASTRONOMY: *History*); important truths relating to gravity were enunciated, and the tides ascribed to the influence of lunar attraction; while an attempt to explain the planetary revolutions in the then backward condition of mechanical knowledge produced a theory of vortices closely resembling that afterwards adopted by Descartes. Having been provided in 1610 with one of the new Galilean instruments, Kepler began to observe the wonders revealed by it. In his *Dioptrice* (Augsburg, 1611), he expounded the theory of refraction by lenses, and suggested the principle of the "astronomical" or inverting telescope. Indeed the work may be said to have founded the branch of science to which it gave its name.

On May 23, 1611, Matthias, brother of the emperor, assumed the Bohemian crown in Prague, compelling Rudolph to take refuge in the citadel, where he died early in 1612. Kepler's fidelity in remaining with him to the last did not deprive him of the favour of his successor. Payment of arrears was not, however, in the condition of the imperial finances, to be hoped for; and he was glad, while retaining his position as court astronomer, to accept (in 1612) the office of mathematician to the states of Upper Austria. In 1613 he appeared with the emperor Matthias before the diet of Ratisbon to advocate the introduction into Germany of the Gregorian calendar; but the attempt was for the time frustrated by anti-papal prejudice. About this period he published several essays in which he sought to prove that the birth of Christ took place five years earlier than the commonly accepted date. His wife died in 1611, and in 1613 he married Susanna Reutlinger, a poor orphan girl.

The abundant vintage of 1613 drew his attention to the defective methods in use for estimating the cubical contents of vessels, and his essay on the subject (*Nova Stereometria Doliorum*, Linz, 1615) entitles him to rank among those who prepared the discovery of the infinitesimal calculus. His observations on the three comets of 1618 were published in *De Cometis*, contemporaneously with *De Harmonice Mundi* (Augsburg, 1619), of which the first lineaments had been traced twenty years previously at Gratz. This extraordinary production is memorable as having announced the discovery of the "third law"—that of the connection between the planetary periods and distances. But the main purport of the treatise was the exposition of a system of celestial harmonies depending on the various and varying velocities of the several planets, of which the sentient soul animating the sun was the solitary auditor. The work was dedicated to James I. who invited Kepler to England, but, notwithstanding the distracted state of his own country, he refused to abandon it.

The insurmountable difficulties presented by the lunar theory forced Kepler, after much fruitless labour, to abandon his design of comprehending the whole scheme of the heavens in one great work. The *Epitome Astronomiae Copernicanae* (Linz and Frankfort, 1618–1621), a lucid and attractive textbook of Copernican science, was remarkable for the prominence given to "physical astronomy," as well as for the extension to the Jovian system of the laws recently discovered to regulate the motions of the planets. The first of a series of ephemerides, calculated on these principles, was published by him at Linz in 1617; and in that for 1620, dedicated to Napier of Merchiston (*q.v.*), he for the first time employed logarithms. This important invention was eagerly welcomed by him, and its theory formed the subject of a treatise entitled *Chilias Logarithorum*, printed in 1624, but circulated in manuscript three years earlier, which largely contributed to bring the new method into general use in Germany.

His studies were interrupted by family trouble. In 1620 his mother was arrested on a formal charge of witchcraft. Kepler immediately hastened to Württemberg, and owing to his exertions she was acquitted after having suffered thirteen months' imprisonment, and endured with undaunted courage the formidable ordeal of "territion," or examination under the imminent threat of torture. She survived her release only a few months, dying in 1622.

Kepler's whole attention was now devoted to the production of the new tables. But financial difficulties, combined with civil and religious convulsions, caused delay. From June 24 to Aug. 29, Linz was besieged, and its inhabitants reduced to the utmost straits by bands of insurgent peasants. In 1626 he obtained permission to transfer his types to Ulm, where, in Sept. 1627, the *Rudolphine Tables* were at length given to the world. Although by no means free from errors, their value appears from the fact that they ranked for a century as the best aid to astronomy. Appended were tables of logarithms and of refraction, together with Tycho's catalogue of 777 stars, enlarged by Kepler to 1,005. In July 1628 Kepler went with his family to Sagan in Silesia, where he applied himself to the printing of his ephemerides up to the year 1636, and whence he issued, in 1629, a *Notice to the Curious in Things Celestial*, warning astronomers of approaching transits. That of Mercury was actually seen by Gassendi in Paris on Nov. 7, 1631 (being the first passage of a planet across the sun ever observed); that of Venus, predicted for Dec. 6, following, was invisible in western Europe. Kepler died at Ratisbon on Nov. 15 (N.S.), 1630.

Kepler's demonstration that the planes of all the planetary orbits pass through the centre of the sun, coupled with his clear recognition of the sun as the moving power of the system, entitles him to rank as the founder of physical astronomy. But the relations

imagined by him of planetary movements and distances to musical intervals and geometrical constructions seemed to himself discoveries no less admirable than the achievements which have secured his lasting fame.

Kepler's extensive literary remains, purchased by the empress Catherine II. in 1724 from some Frankfort merchants, and long inaccessibly deposited in the observatory of Pulkowa, were fully brought to light, under the able editorship of Dr. Ch. Frisch, in the first complete edition of his works. This important publication (*Joannis Kepleri opera omnia*, Frankfort, 1858–1871, 8 vols. 8vo) contains, besides the works already enumerated and several minor treatises, a posthumous scientific satire entitled *Joh. Keppleri Somnium* (first printed in 1634) and a vast mass of his correspondence. A careful biography is appended, founded mainly on his private notes and other authentic documents. His correspondence with Herwart von Hohenburg, unearthed by C. Anschütz at Munich was printed at Prague in 1886.

KEPPEL, AUGUSTUS KEPPEL, VISCOUNT (1725–1786), British admiral, second son of the 2nd earl of Albermarle, was born on April 25, 1725. He entered the navy, and at the age of 15 went round the world with Anson in the "Centurion." After the peace of Aix-la-Chapelle (1748) he was sent on a mission to persuade the dey of Algiers to put down piracy, and succeeded in making a treaty with him. During the Seven Years' War he saw constant service. In 1757 he was a member of the court-martial which condemned Admiral Byng, and actively endeavoured to secure his pardon. In 1762 he went with Sir George Pocock in the expedition which took Havana, and secured £25,000 of prize money. He became rear-admiral in Oct. 1762, a member of the Admiralty Board (July 1765–Nov. 1766), and vice-admiral in Oct. 1770. The most debated period of his life belongs to the opening years of the War of American Independence. He was a strong supporter of the Whigs, led by Rockingham and Richmond, and at that time excluded from power by George III. As M.P. for Windsor (1780), he was a steady opponent of the "King's Friends." When therefore he fought against France (1778) in command of the Western Squadron, he believed that Lord Sandwich, then first lord of the admiralty, would be glad to see his defeat. Unfortunately Sir Hugh Palliser, a member of the Admiralty board, whom he therefore held partly responsible for the condition of the navy, went to sea with him in a subordinate command. He believed his failure in the battle with the French (July 27, 1778), due in reality partly to his own incapacity, and partly to Palliser's disregard of his orders, to be a deliberate betrayal. He praised Sir Hugh in public, but attacked him in private, and a campaign of calumny was begun in the press which resulted in the trial and acquittal first of Keppel and then of Palliser, for neglect of duty. Keppel was ordered to strike his flag in March 1779. When Lord North's ministry fell in 1782 he became first lord, and was created Viscount Keppel and Baron Elden, but his career in office was not distinguished. He died on Oct. 2, 1786. His portrait was six times painted by Sir Joshua Reynolds. The copy which belonged originally to Burke is now in the National Gallery.

See T. Keppel, *Life of Keppel* (1842).

KEPPEL, SIR HENRY (1809–1904), British admiral, son of the 4th earl of Albemarle and of his wife Elizabeth, daughter of Lord de Clifford, was born on June 14, 1809, and entered the navy from the old naval academy of Portsmouth in 1822. His family connections secured him rapid promotion. He became lieutenant in 1829 and commander in 1833. His first command in the "Childers" brig (16) was largely passed on the coast of Spain, then in the midst of the convulsions of the Carlist war. Captain Keppel was then engaged with the squadron stationed on the west coast of Africa to suppress the slave trade. In 1837 he was promoted post captain, and appointed in 1841 to the "Dido" for service in China and against the Malay pirates, a service which he repeated in 1847, when in command of H.M.S. "Maeander."

In 1853 Keppel was appointed to the command of the "St. Jean d'Acre" of 101 guns for service in the Crimean War. He commanded the naval brigade landed to co-operate in the siege of Sevastopol. After the Crimean War he was again sent out to China, this time in command of the "Raleigh," as commodore to serve under Sir M. Seymour. The "Raleigh" was lost on an uncharted rock near Hong-Kong, but three small vessels were named to act as her tenders, and Commodore Keppel commanded in them, and with the crew of the "Raleigh," in the action with the Chinese at Fatshan Creek (June 1, 1857). He held successive commands till his retirement from the active list in 1879, two years after he attained the rank of Admiral of the Fleet. He died at the age of 95 on Jan. 17, 1904.

See his *A Sailor's Life under Four Sovereigns* (1899).

KER, JOHN (1673–1726), Scottish spy, whose original name was Crawfurd, was secretly employed both by the Jacobites and by the English government. In 1709 he obtained money in London from both sides by promises or threats, as the case demanded, to reveal Godolphin's relations with the Jacobites He was in Vienna in 1713, and then in touch with the Electress Sophia, and claimed to have assisted in procuring the accession of George I. to the English crown. He died in prison for debt on July 8, 1726.

See his *Memoirs* (1726–27), in particular the "preface" to part i.; George Lockhart, *The Lockhart Papers* (2 vols., 1817); Nathaniel Hooke, *Correspondence*, ed. W. D. Macray (Roxburghe Club, 2 vols., 1870).

KER, WILLIAM PATON (1855–1923), British man of letters, was born at Glasgow on Aug. 30, 1855. He studied at Glasgow university and Balliol college, Oxford. He was elected fellow of All Souls college in 1879, professor of English literature and history at Cardiff in 1883 and of English literature at University college, London, in 1889, a post which he held until 1922. In 1920 he was elected professor of poetry at Oxford. Ker's principal work was done on mediaeval literature. His works include: *Epic and Romance* (1897); *The Dark Ages* (1904); *Essays on Mediaeval Literature* (1905); *Sturla the Historian* (1907); *The Art of Poetry* (1923); and posthumously collected essays and lectures (1925). Ker was a singularly inspiring teacher and a scholar of wide and humane sympathies. He died suddenly in the Alps, at Macugnaga on July 17, 1923, and was buried there.

KERAK (anc. KĪR MOAB, or KIR HARESETH or KIR HERES), a town in Trans-Jordania, 10 m. E. of the southern shore of the Dead sea peninsula, El-Lisān, and about 3,000 ft. above sea level. Kir was destroyed by a Hebrew-Edonite coalition (2 Kings iii. 25), and railed at several times by Isaiah. It became in Christian times the see of an archbishopric suffragan to Petra. The crusaders fortified it (1136), calling it Crac. It yielded to Saladin after a long and desperate struggle in 1188. The fortifications were reconstructed by Bibars (13th century). After enjoying a semi-independence under the Turks it was taken by Ibrahim Pasha in 1832. The Turks taking advantage of a rebellion here in 1893 established a garrison. During the World War it came within the field of operations and suffered bombardment. The modern town of Kerak is a jumble of flat, mud-roofed houses, and is surrounded by a wall breached in several places. The castle, one of the most beautiful erected by the Franks, is in a good state of preservation. The entrance to the town was formerly through tunnels cut in the rocky substratum. Its mosque was, like so many others elsewhere, formerly a church. Recently (1926) a water-supply was installed by the Trans-Jordanian Government which has also buttressed its castle against collapse. (E. Ro.)

KERALA or **CHERA,** the name of one of the three ancient Dravidian kingdoms of the Tamil country of southern India, the other two being the Chola and the Pandya. Its original territory comprised the country now contained in the Malabar district, with Travancore and Cochin, and later the country included in

the Coimbatore district and a part of Salem. The earliest references to this kingdom appear in the edicts of Asoka, where it is called *Keralaputra* (*i.e.*, son of Kerala). Of the political history of the Kerala kingdom nothing is known beyond a list of rajas compiled from inscriptions, until in the 10th century the struggle began with the Cholas, by whom it was conquered and held till their overthrow by the Mohammedans in 1310. These in their turn were driven out by a Hindu confederation headed by the chiefs of Vijayanagar, and Kerala was absorbed in the Vijayanagar empire until its destruction by the Mohammedans in 1565. For about 80 years it seems to have preserved a precarious independence under the naiks of Madura, but in 1640 was conquered by the Adil Shah dynasty of Bijapur and in 1652 seized by the king of Mysore.

See V. A. Smith, *Early Hist. of India*, revised by S. M. Edwardes (1924); the *Cambridge History of India*, ed. Prof. E. J. Rapson (1922 *et seq.*).

KERASUND (anc. *Choerades, Pharnacia, Cerasus*), the capital of a vilayet on the north coast of Asia Minor, and the port—an exposed roadstead—of Kara-Hissar Sharki, with which it is connected by a carriage road. Pop. (1927) 93,268. The town is situated on a rocky promontory, crowned by a Byzantine fortress, and has a growing trade. It exports filberts (for which product it is the centre), walnuts, hides and timber. Cerasus was the place from which the wild cherry was introduced into Italy by Lucullus and so to Europe (hence Fr. *cerise*, "cherry").

KERB MARKET: *see* CURB MARKET.

KERCH or KERTCH, a seaport of the Crimean A.S.S.R on the Strait of Kerch or Yenikale in 45° 21′ N. and 36° 28′ E. Pop. (1926) 34,090. It stands on the site of the ancient *Panticapaeum*, and, like most towns built by the ancient Greek colonists in this part of the world, occupies a beautiful situation, clustering round the foot and climbing up the sides of the hill (called after Mithridates) on which stood the ancient citadel or acropolis The town is a railway terminus and seaport. The Kerch channel is 300 ft. wide and has been dredged to a depth of 17 ft. From April to August steamers drawing 16½ ft. of water can cross the bar, but from Sept. 1 to the close of navigation only vessels of 12½ ft. draught can pass. There are six quays. On the north-west side of the Shiroki mole the walls of a basin for a floating dock have been completed; when dredged it will have a depth of 32 ft. The old Genoese mole has been reconstructed, and protection for sailing vessels against the north-east winds has thus been afforded. The chief exports are wheat, barley, linseed, flour, wool and iron goods depending on the local iron mines opened in 1895. Asphalt, fish and jam preserves, tobacco and flour are produced in the town, which also has a considerable fishing industry. Its mineral mud baths, one in the town itself, and one near Lake Chokrak, 9 m distant, are increasingly frequented. About six miles north-east is the former Turkish fortress of Yenikale. The church of St. John the Baptist, founded in 717, is a good example of the early Byzantine style. That of Alexander Nevsky was formerly the Kerch museum of antiquities, founded in 1825. The more valuable objects were subsequently removed to the Hermitage at St. Petersburg.

The Greek colony of Panticapaeum was founded about the middle of the 6th century B.C., by the town of Miletus. From about 438 B.C. till the conquest of this region by Mithridates the Great, king of Pontus, about 100 B.C., the town and territory formed the kingdom of the (Cimmerian) Bosporus, ruled over by an independent dynasty. Phanaces, the son of Mithridates, became the founder of a new line under the protection of the Romans, which continued to exist till the middle of the 4th century A.D., and extended its power over the maritime parts of Tauris. After that the town—which had already begun to be known as Bospora—passed successively into the hands of the Eastern empire, of the Khazars, and of various barbarian tribes. In 1318, the Tatars, who had come into possession in the previous century, ceded the town to the Genoese, who soon raised it into new importance as a commercial centre. They usually called the place Cerchio, a corruption of the Russian name Kertchev (whence Kerch), which appears in the 11th century inscription of Tmutarakan (a Russian principality at the north foot of the Caucasus). Under the Turks, whose rule dates from the end of the 15th century, Kerch was a military port; and as such it played a part in the Russo-Turkish wars. Captured by the Russians under Dolgorukov in 1771, it was ceded to them along with Yenikale by the peace of Kuchuk-Kainarji, and it became a centre of Russian naval activity. Its importance was greatly impaired by the rise of Odessa and Taganrog; and in 1820 the fortress was dismantled. Kerch suffered severely during the Crimean War.

Archaeologically Kerch is of particular interest, the *kurgans* or sepulchral mounds of the town and vicinity having yielded since 1825 a rich variety of beautiful works of art. In the Altun or Zolotai-oba (Golden Mound) was found a great stone vault similar in style to an Egyptian pyramid; and within, among many objects of minor note, were golden dishes adorned with griffins and beautful arabesques. In the Kul-oba, or Mound of Cinders (opened in 1830–1831), was a similar tomb, in which were found what would appear to be the remains of one of the kings of Bosporus, of his queen, his horse and his groom. The ornaments and furniture were of the most costly kind; the king's bow and buckler were of gold; his very whip intertwined with gold; the queen had golden diadems, necklace and breast-jewels, and at her feet lay a golden vase. In the Pavlovski kurgan (opened in 1858) was the tomb of a Greek lady, containing among other articles of dress and decoration a pair of fine leather boots (a unique discovery) and a beautiful vase on which is painted the return of Persephone from Hades and the setting out of Triptolemus for Attica. In a neighbouring tomb was what is believed to be "the oldest Greek mural painting which has come down to us," dating probably from the 4th century B.C. Among the minor objects discovered in the kurgans perhaps the most noteworthy are the fragments of engraved boxwood, the only examples known of the art taught by the Sicyonian painter Pamphilus.

Very important finds of old Greek art continue to be made in the neighbourhood, as well as at Tamañ, on the east side of the Strait of Kerch. The catacombs on the northern slope of Mithridates hill, of which nearly 200 have been explored since 1859, possess considerable interest, not only for the relics of old Greek art which some of them contain (although most were plundered in earlier times), but especially as material for the history and ethnography of the Cimmerian Bosporus. In 1890 the first Christian catacomb bearing a distinct date (491) was discovered. Its walls were covered with Greek inscriptions and crosses.

KERENSKY (kā′rĕns-kĭ), **ALEXANDER FEODOROVICH** (1881–), Russian politician, born at Simbirsk, studied at the University of St. Petersburg, where he took his degree in law, and afterwards joined the St. Petersburg bar. In 1912 he was elected to the Fourth Duma and joined the Labour Group. He was in reality an adherent of the Social Revolutionary party, but as it was impossible in those days to enter the Duma under this flag he chose the Group of Toil (Labour) in preference to the Social Democrats, whom he considered to be too pedantic and distant from the people. As a member of the Duma he made his mark as an eloquent speaker. (*See* RUSSIA.)

When the first Provisional Government was formed after the Feb. 1917 revolution Kerensky took the portfolio of Minister of Justice. Later, on Guchkov's resignation he became War Minister on May 5, and set to work to reorganise the demoralised army. He had a temporary and partial success, reintroducing the death

penalty, himself visiting the front, and effecting a brief offensive in June. On July 25th he succeeded Prince Lvov as Prime Minister of the 2nd Provisional Government, holding this office until the outbreak of the Bolshevik revolution. But he was unable to rally a war-weary population to his support, and caught between the two forces of militaristic reaction and Bolshevik revolution, his government was marked by vacillation and indecision. He fled from Petrograd on the eve of the October revolution, and attempted to march with armed forces on the capital, but was defeated. For a time he was associated with attempts to recover Russia from the Bolsheviks, but finally retired to Paris.

See his books, *The Prelude to Bolshevism* (1919), and *The Catastrophe* (1927).

KERGUELEN or **DESOLATION ISLAND** or **LAND,** an island in the Southern Ocean, to the S.E. of the Cape of Good Hope, and S.W. of Australia, about 2,000 m. S.E. of Madagascar. Kerguelen lies between 48° 39′ and 49° 44′ S. and 68° 42′ and 70° 35′ E. Its extreme length is about 85 m., but the area is only about 1,400 sq.m. The island is throughout mountainous, presenting from the sea in some directions the appearance of a series of jagged peaks. The various ridges and mountain masses are separated by steep-sided valleys, which run down to the sea, forming deep fjords, so that no part of the interior is more than 12 m. from the sea. The chief summits are Mounts Ross (6,120 ft.), Richards (4,000), Crozier (3,251), Wyville Thomson (3,160), Hooker (2,600), Moseley (2,400). The coast-line is extremely irregular, and the fjords, at least on the north, east and south, form a series of well-sheltered harbours. As the prevailing winds are westerly, the safest anchorage is on the north-east. Christmas Harbour on the north and Royal Sound on the south are noble harbours, the latter with a labyrinth of islets interspersed over upwards of 20 m. of land-locked waters. The scenery is generally magnificent. A district of considerable extent in the centre of the island is occupied by snowfields, whence glaciers descend east and west to the sea. The whole island, exclusive of the snowfields, abounds in freshwater lakes and pools in the hills and lower ground. Hidden deep mud holes are frequent.

Kerguelen Island is of undoubted volcanic origin, the prevailing rock being basaltic lavas, intersected occasionally by dykes, and an active volcano and hot springs are said to exist in the south-west of the island. Judging from the abundant fossil remains of trees, the island must have been thickly clothed with woods and other vegetation, of which it has no doubt been denuded by volcanic action and submergence, and possibly by changes of climate. It presents evidences of having been subjected to powerful glaciation. The soundings made by the "Challenger" and "Gazelle" and the affinities which in certain respects exist between the islands, seem to point to the existence at one time of an extensive land area in this quarter, of which Kerguelen, Prince Edward's Islands, the Crozets, St. Paul and Amsterdam are the remains. The Kerguelen plateau rises in many parts to within 1,500 fathoms of the surface of the sea. Beds of coal and of red earth are found in some places. The summits of the flat-topped hills about Betsy Cove, in the south-east of the island, are formed of caps of basalt.

According to Sir J. D. Hooker the vegetation of Kerguelen Island is of great antiquity and may have originally reached it from the American continent; it has no affinities with Africa. The present climate is not favourable to permanent vegetation; the island lies within the belt of rain at all seasons of the year, and is reached by no drying winds; its temperature is kept down by the surrounding vast expanse of sea, and it lies within the line of the cold Antarctic drift. The temperature, however, is equable. The mean annual temperature is about 39° F, while the summer temperature has been observed to approach 70°. Tempests and squalls are frequent, and the weather is rarely calm. On the lower slopes of the mountains a rank vegetation exists, which, from the conditions mentioned, is constantly saturated with moisture. Several of the marine and many species of freshwater algae are peculiar to the island. The characteristic feature of the vegetation, the Kerguelen's Land cabbage, was formerly abundant, but has been greatly reduced by rabbits introduced to the island. Penguins and sea birds of various kinds are abundant; a teal (*Querquedula Eatoni*) peculiar to Kerguelen and the Crozets is also found in considerable numbers. There is a considerable variety of insects, many of them with remarkable peculiarities of structure, and with a predominance of forms incapable of flying.

The island was discovered by the French navigator, Yves Joseph de Kerguelen-Trémarec, a Breton noble (1745–1797), on the 13th of February 1772, and partly surveyed by him in the following year. He was one of those explorers who had been attracted by the belief in a rich southern land, and this island, the South France of his first discovery, was afterwards called by him Desolation Land in his disappointment. Captain Cook visited the island in 1776, and, among other expeditions, the "Challenger" spent some time here. It was occupied in 1874–75 by the expeditions sent to observe the transit of Venus. Projects for more permanent settlement have frequently been brought forward. In Jan. 1893 Kerguelen was annexed by France, and its commercial exploitation was assigned to a private company.

See Y. J. de Kerguelen-Trémarec, *Relation de deux voyages dans les mers australes* (Paris, 1782); Narratives of the Voyages of Captain Cook and the "Challenger" Expedition; *Phil. Trans.*, vol. 168, containing account of the collections made in Kerguelen by the British transit of Venus expedition in 1874–75; Lieutard, "Mission aux îles Kerguelen," etc., *Annales hydrographiques* (Paris, 1893).

KERGUELEN'S LAND CABBAGE, in botany, *Pringlea antiscorbutica* (family Cruciferae), a plant resembling in habit, and belonging to the same family as, the common cabbage (*Brassica oleracea*). The cabbage-like heads of leaves abound in a pale yellow highly pungent essential oil, which gives the plant a peculiar flavour but renders it extremely wholesome. It was discovered by Captain Cook during his first voyage, but the first account of it was published by (Sir) Joseph Hooker in *The Botany of the Antarctic Voyage* of the "Erebus" and "Terror" in 1839–1843. During the stay of the latter expedition on the island, daily use was made of this vegetable either cooked by itself or boiled with the ship's beef, pork or pea-soup. Hooker observes of it, "This is perhaps the most interesting plant procured during the whole of the voyage performed in the Antarctic Sea, growing as it does upon an island the remotest of any from a continent, and yielding, besides this esculent, only seventeen other flowering plants" Though belonging to a family of insect-pollinated plants it has become modified for wind pollination, having projecting stamens and long thread-like projections on the stigma. This peculiarity is apparently an adaptation to the absence from the island of winged insects.

KERKRADE, a town of Holland, in the province of Limburg, upon the German frontier. Pop. (1927), 32,401. It is the centre of a coal-mining district which is in process of development.

KERKUK: *see* KIRKUK

KERMADEC, a small group of hilly islands in the Pacific, about 30° S, 178° W., named from D'Entrecasteaux's captain, Huon Kermadec, in 1791. They are British possessions and now uninhabited. The largest of the group is Raoul or Sunday Island, 20 m. in circumference, 1,600 ft. high, and thickly wooded. The flora and fauna belong for the most part to those of New Zealand, on which colony the islands are also politically dependent, having been annexed in 1887. (*See* PACIFIC ISLANDS.)

KERMAN, a large province (ancient *Karmania*) and town of Persia. The province, which for administrative purposes includes Persian Baluchistan (*q.v.*) and Makran, is bounded north by the Qainat district of Khurasan and Yazd, west by Fars, east by British Baluchistan, while south it extends to the Arabian sea. Situated to the south-west of the great Central Iranian desert, Dasht-i-Lut, the province is terminated in the east by steppes, while from the direction of Yazd and Fars, it is bordered by desert and uncultivated land. The chief feature which distinguishes Kerman from Fars and the country north-west and west is that the cultivated part of Fars is an uninterrupted territory, while Kerman consists rather of a number of fertile areas, widely separated by desert tracts, through which the villages and settlements are scattered.

Divisions.—Geographically Kerman falls under five districts:

that of Kerman to the north, Sirjan to the west, Jiruft in the south and the two districts of Bam and Narmasir in the east. Chains of mountains stretch across much of the province from north-west to south-east. To the north is found the highest range which forms a part of the Kuh Rud and has peaks to the north-west of Bam, with an altitude of nearly 15,000 ft. This chain separates the district of Kerman from that of Sirjan; its continuation towards the south-east being the Jabal Bariz or Parîz. There are other parallel but less elevated chains to the south-west. Snow lies on these mountains for a considerable part of the year. Kerman has no important rivers: the cultivated areas receive their water from the mountains and from the most important stream, the Khalil Rud, which flows across the Jiruft district and empties itself into the Jaz Murian Hamun (or sweet-water lake) without reaching the sea.

Desert Areas.—The true desert of Kerman lies mainly in the north and north-east, where it merges into the great desert or "Lut" (a word meaning bare, void of vegetation) which itself stretches into Khurasan. The Kerman desert tracts differ from the *Kavir* of central Persia mainly in three respects: they are less saline, are drier and more sandy, and present in some places tracts of 80–100 miles almost absolutely destitute of vegetation. Yet they are crossed by well-known tracks, Kerman lying across the great roads leading from Fars to Seistan, Khurasan, and India and on the route for commerce and pilgrimage which leads from Bandar Abbas to the north-east of Persia and beyond. These sandy wastes are said to be continually encroaching on the fertile tracts even in the Narmasir district which is being invaded by the sands of the desolate plains extending towards Bam. A feature of the country are the *Kefeh,* or salt swamps, which occur in isolated depressions, but nowhere in Kerman of so great extent as are the great *Kavir* farther north. The desert of Kerman lies about 1,000 ft. above the sea, apparently on much the same level as the Lut from which it cannot be geographically dissociated.

Climate and Products.—The climate of Kerman varies much with the latitude and the relief of the land but has the reputation of being unhealthy, because the cool air from the hills is usually attended by chills and agues; but many of the upland valleys enjoy a genial and healthy climate.

At the present day the desert part of Kerman is probably more extensive than in ancient times, for, according to the historian Mustawfi, there were still forests affording cover for the larger beasts of prey in the first centuries of Islam. Now there are almost no trees, except date palms in great numbers around the villages and towns. Irrigation is very laboriously practised by the subterranean water channel or *kanat.* The principal products are wheat, barley and opium. The higher regions, or *sardsir,* produce in autumn millet, cotton and beet-root; in the *garmsir,* or warm region, rice and maize are cultivated in summer. Henna is produced around the towns of Bam and Khabis, and all sorts of fruits are found in abundance, the dates from the southern districts being noted. The chief animal products are wool and *kurk,* the soft under-hair of goats, the latter being used in the manufacture of Kerman shawls, which in delicacy of texture yield only to those of Kashmir, while often surpassing them in colour and design. Bandar Abbas is the natural outlet of Kerman, but since shipping has shown a preference for Bushire the trade of Kerman in this direction has greatly fallen off. The four main roads from the interior to the coast at Bandar Abbas are still only rough tracks, which are sometimes insecure.

Population.—The inhabitants of Kerman are described in general as of a dark brown colour and slight physique. As regards the settled population, it seems to be mainly of Iranian stock, while the nomads, who form a strong minority are probably the descendants of the Arab, Turkish and Kurd invaders. The total population of the province was estimated at 750,000 in 1900 among whom is a numerous community of Zoroastrians. The total revenue of the province amounted to 4,957,887 krans (£ St.=45 krans) in 1926–27.

Kerman, the administrative headquarters, 30° 17′ N., 56° 59′ E., is situated at the meeting point of three valleys at an altitude of 5,680 ft. The surroundings of the town consist almost exclusively of steppe with very little cultivated land. The population was estimated at 41,170 in 1878, 49,120 in 1900 and 60,000 in 1914. The majority are Shi'is, next come Shaikhis (6,000), Babis (3,000), Zoroastrians (1,600) and a small community of Jews.

Town of Kerman.—The town is surrounded by a wall of baked clay 30 ft. high still in fair repair, with four gates, and there is a quarter outside the town known as Mahalla-i-Gabr peopled by Zoroastrians. The citadel is situated on the western side and the most ancient mosque, the Masjid-i-Malik built by the Seljuk Turan Shah (1084–1096), has been recently restored. In the plain to the east and south are large numbers of remains of buildings of archaeological interest. Destroyed by an earthquake in 1794, Kerman was rebuilt by Fath Ali Shah, but only began to prosper towards the middle of the 19th century. It owes its industrial reputation to its shawls, but this industry has been surpassed by that of carpet making in wool and silk, the annual output of which was estimated at not less than £120,000. Other important industries are the manufacture of felt and brass-work.

There is a British consulate at Kerman, an agency of the Imperial Bank of Persia was opened in 1904, and there is a telephone service. The town is connected by a road suitable for motor traffic with Yazd and Isfahan (400 m.). Another important road is that to Duzdab which is practicable for wheel traffic in 25–30 days and by this route are exported nearly all the Kerman carpets. The average maximum temperature in June is recorded at 100·8° F and the average minimum in January 26°; the annual rainfall as far as records are available is 4·7 inches, the wettest month being December.

C.)

KERMANSHAH, a province and town of Persia. The province is situated west of Hamadan, north of Burujird (Luristan), south of Kurdistan, and extends to the frontier of 'Iraq. It is one of the richest parts of Persia, producing wheat, maize, rice, clover, castor-oil, fruits and opium, while the hills have fertile pastures. The inhabitants are for the most part Kurds, but in the south of the province there are tribes of Lurs The district is rich in monuments of the Achaemenids and Sasanians, such as the Taq-i-Bustan sculptures, 3 m. E. of the town of Kermanshah. The revenue amounted to 11,309,524 krans in 1926–27 (£ St.=45 krans).

The administrative headquarters of the province is Kermanshah (or Kermanshahan), situated in 34° 20′ N. and 47° E., in a very fertile plain at an elevation of about 4,860 feet, near the Qara Su, an upper reach of the Kerkha river. The population was estimated (1905) at 60,000, mostly Kurds, then Persians, Turks, Jews and a few Christians. Kermanshah owes its prosperity to its situation on a line of great transit trade, forming the principal entrance into Persia, through which the commerce of Baghdad (distant 250 m.) passes via the railhead at Khaniqin near the 'Iraq frontier and thence by motor road to Hamadan, Kazvin and Tehran. It is also a busy local distributing centre for grain, fruits, gum and opium. There is very little local industry, the making of carpets having died out. The ramparts have fallen into ruin; the most striking building is the arsenal which includes also the residence of the governor. In 1915 the town was occupied by the Turks.

See A. V. Williams Jackson, *Persia past and present* (1906); F. Hale, *From Persian Uplands* (1920); H. L. Rabino, Kermanschah, *Rev. du Monde Mussulman,* 1920, XXXVIII., pp. 1–40.

KERMES is the most ancient dyestuff on record, for its use was known in the time of Moses and it is mentioned in Scripture by its Hebrew name "tola" or "tolaschani." The word "scarlet," so frequently found therein, refers without doubt to the colour produced by dyeing with this material. According to Tychsen (Bancroft, *Philosophy of Permanent Colours*, I., 394) "the scarlet or kermes dye was known in the East in the earliest ages before Moses, and was a discovery of Phoenicians in Palestine, but certainly not of the small wandering Hebrew tribes." Under the name of "coccus" it is frequently referred to by Greek and Latin writers. Kermes consists of a wingless female insect which is found on the leaves of the oak kermes (*Quercus coccifera*), a tree which abounds in southern Europe. As soon as their eggs are about to be hatched these insects are collected, killed by exposure to the vapour of hot vinegar and dried, when they appear as reddish brown grains. Before the advent of cochineal, this material was extensively employed throughout Europe, and the red colour which is found on many ancient tapestries is to be ascribed to its use. Though similar to cochineal in dyeing property, it contains much less colouring matter, for according to Bancroft 10 to 12lb. of kermes are necessary to produce the effect of 1lb. of cochineal. It is now obsolete as a dyestuff, and is merely of historical interest. The colouring matter of Kermes is *Kermesic acid*, $C_{14}H_{12}O_8$, a compound closely allied to the carminic acid of cochineal (*q.v.*).

KERMESSE (also KERMIS and KIRMESS), originally the mass said on the anniversary of the foundation of a church and in honour of the patron, the word being equivalent to "Kirkmass." Such celebrations were regularly held in the Low Countries and also in northern France, and were accompanied by feasting, dancing and sports of all kinds. The Brussels Kermesse is still marked by a procession in which the effigies of the Mannikin and mediaeval heroes are carried. They still survive, but are now practically nothing more than country fairs and the old allegorical representations are uncommon. The word Kermesse (generally in the form "Kirmess") is often applied in the United States to any entertainment, especially one organized in the interest of charity.

See Demetrius C. Boulger, *Belgian Life in Town and Country* (1904).

KERN, JAN HENDRIK (1833–1917), Dutch Orientalist, was born in Java of Dutch parents on the 6th of April 1833. He studied at Utrecht, Leiden and Berlin, where he was a pupil of the Sanskrit scholar, Albrecht Weber. After some years spent as professor of Greek at Maestricht, he became professor of Sanskrit at Benares in 1863, and in 1865 at Leiden. His studies included the Malay languages as well as Sanskrit. His chief work is *Geschiedenis van het Buddhisme in Indië* (Haarlem, 2 vols., 1881–1883); in English he wrote a translation (Oxford, 1884) of the *Saddharma Pundarika* and a *Manual of Indian Buddhism* (Strassburg, 1896) for Bühler Kielhorn's *Grundriss der indo-arischen Philologie*.

KERNER, JUSTINUS ANDREAS CHRISTIAN (1786–1862), German poet and medical writer, was born on Sept. 18, 1786, at Ludwigsburg, Württemberg. He studied medicine at Tübingen, and settled as a practising physician in Wildbad. Here he completed his *Reiseschatten von dem Schattenspieler Luchs* (1811), in which his own experiences are described with caustic humour. With Uhland and Schwab he produced the *Poetischer Almanach für 1812*, which was followed by the *Deutscher Dichterwald* (1813), and in these some of Kerner's best poems were published. In 1815 he became district medical officer (*Oberamtsarzt*) in Gaildorf, and in 1818 was transferred to Weinsberg, where he spent the rest of his life. His house became the Mecca of literary pilgrims. Hospitable welcome was extended to all, from the journeyman artisan to crowned heads. Gustavus IV. of Sweden came there with a knapsack on his back. The poets, Count Christian Friedrich Alexander von Württemberg (1801–44) and Lenau (*q.v.*), were frequent guests. In 1826 arrived Friederike Hauffe (1801–29), the daughter of a forester in Prevorst, a somnambulist and clairvoyante, who forms the subject of Kerner's famous work *Die Seherin von Prevorst, Eröffnungen über das innere Leben des Menschen und über das Hineinragen einer Geisterwelt in die unsere* (1829; 6th ed., 1892). His practical works include *Gedichte* (1826); *Der letzte Blütenstrauss* (1852), and *Winterblüten* (1859).

Kerner also wrote popular medical books dealing with animal magnetism, a treatise on the influence of sebacic acid on animal organisms, *Das Fettgift oder die Fettsäure und ihre Wirkungen auf den tierischen Organismus* (1822); a description of Wildbad and its healing waters, *Das Wildbad im Königreich Württemberg* (1813), and a vivid account of his childhood in *Bilderbuch aus meiner Knabenzeit* (1859). In 1851 failing eyesight compelled his retirement. He died on Feb. 21, 1862, at Weinsberg.

Kerner's *Ausgewählte poetische Werke* appeared in 2 vols. (1878); *Samtliche poetische Werke*, ed. by J. Gaismaier, 4 vols. (1905); a selection of his poems will also be found in Reclam's *Universalbibliothek* (1898). His correspondence was edited by his son in 1897. *See* also A. Watts, *Life and Works of Kerner* (1884); T. Kerner, *Das Kernerhaus und seine Gaste* (1894).

KEROSENE, a term used to describe mineral oil prepared for illuminating purposes. It is chiefly distilled from petroleum, and has a flash-point high enough (150°C.) to make its use safe for ordinary domestic and other employment. In Great Britain it is commonly called paraffin-oil or American paraffin-oil, the original "paraffin-oil" being prepared by the distillation of shale. (*See* PARAFFIN OIL; PETROLEUM.)

KERR, JOHN (1824–1907), Scottish physicist, was born at Ardrossan on Dec. 17, 1824. He was a divinity student at Glasgow but was influenced by William Thomson, who was then professor of natural philosophy, to study the mathematical theories of electricity and magnetism. Later, when William Thomson started a physical laboratory, Kerr was one of the early workers. In 1857 he was appointed lecturer in mathematics in the Free Church training college for teachers, Glasgow; he retired from this post in 1901. Kerr devoted the rest of his life to scientific work; he died at Glasgow on Aug. 18, 1907 In 1875 he published his first paper on the phenomenon of double refraction in dielectrics in a strong electric field; he showed that they behaved like uniaxial crystals with axes along the lines of force. This was followed by other papers on the same topic. Another phenomenon first observed by Kerr is called by his name and deals with the reflection of plane polarized light from the pole of an electromagnet. He showed that the reflected ray has a component polarized in a plane perpendicular to the ordinary reflected ray. Kerr was a fellow of the Royal Society and was awarded a Royal medal in 1898. He was the author of *An Elementary Treatise on Rational Mechanics*.

KERR, WALTER TALBOT, G.C.B. (1839–1928), British admiral, 4th son of the 7th Marquis of Lothian, was born at Newbattle Abbey, Scotland on Sept. 28, 1839. He was educated at Radley College, and entered the navy in 1853, serving in the Baltic expeditions of 1854–55, with the naval brigade formed by Captain Peel's ship's company, throughout the Indian Mutiny and at the siege and capture of Lucknow. After further service in the Channel and in China, he was promoted commander on April 3, 1868, and captain in 1872. In 1889 he became rear-admiral, and served in the Mediterranean until March 1892. He was second sea lord (1894–1895), vice-admiral commanding the Channel Squadron (1895–97), and first sea lord (1899–1904). Fisher was his second sea lord from 1902–03, and Kerr gave great encouragement to the reform of the system of naval education advocated by Fisher, which resulted in the opening of Osborne and Dartmouth Colleges. Kerr received a special promotion as Admiral of the Fleet (additional) on June 16, 1904. He was made G.C B. in 1902, and retired in October 1904. He died in 1928 at Melbourne Hall, Derby

KERRY, a county of Ireland in the province of Munster, bounded west by the Atlantic ocean, north by the estuary of the Shannon, which separates it from Clare, east by Limerick and Cork, and south-east by Cork. The area is 1,159,356 ac., or 1,811 sq.m., the county being the fifth of the Irish counties in extent. Pop. (1926) 150,865.

On the north and east are Carboniferous shales and sandstones, reaching unproductive coal-measures east of Listowel and on the

Glanruddery mountains. The Carboniferous limestone fringes these beds and is cut off by the sea at Knockaneen bay, Tralee and Castlemaine. In the south-west, Hercynian trend lines are well marked. Dingle bay, Kenmare river, Bantry bay and Dunmanus bay are narrow steep-sided inlets occupying synclinal troughs of Carboniferous limestone between ribs of Old Red Sandstone. Maggillicuddy's Reeks reach a height of 3,414 ft. in Carntual (Carrantuohill); in the Dingle promontory Brandon mountain attains a height of 3,127 ft. Formerly the mountains were well wooded with fir, birch and yew, which were, however, extensively used as fuel for iron-smelting. Constant pasturage of cattle prevents the growth of young trees. There is extensive evidence of glaciation. The principal rivers are the Blackwater, which, rising in the Dunkerran mountains, forms for a few miles the boundary line between Kerry and Cork, and then passes to the latter county; the Ruaughty, which falls into the head of the Kenmare river; the Inny and Ferta, which flow westward, the one into Ballinskellig bay and the other into Valencia harbour; the Flesk, which flows northward through the lower lake of Killarney, after which it takes the name of Laune, and flows north-westward to Dingle bay; the Caragh which rises in the mountains of Dunkerran and after forming several lakes falls into Castlemaine harbour; the Maine, which flows from Castle island and south-westward to the sea at Castlemaine harbour, receiving the northern Flesk, which rises in the mountains that divide Cork from Kerry; and the Feale, Gale and Brick, the junction of which forms the Cashin, a short tidal river which flows into the estuary of the Shannon. The principal lakes, other than the lakes of Killarney (*q v.*), are Lough Currane (Waterville lake) near Ballinskellig, and Lough Caragh near Castlemaine harbour.

Ciar, with his tribe, the Ciarraidhe, is stated to have inhabited about the beginning of the Christian era the territory lying between Tralee and the Shannon. That portion lying south of the Maine was at a later period included in the kingdom of Desmond (*q.v.*). Kerry suffered frequently from invasions of the Danes in the 9th and 10th centuries, until they were finally overthrown at the battle of Clontarf in 1014. In 1172 Dermot MacCarthy king of Cork and Desmond, submitted to Henry II. on certain conditions, but was nevertheless gradually compelled to retire within the limits of Kerry, which is one of the areas generally considered to have been made shire ground by King John. In 1579–1580 Spaniards landed at Limerick harbour, near Dingle, and erected a fortress, which was destroyed by the English in 1580. In 1652 a rebellion in Kerry was completely subdued, and a large number of estates were confiscated. There are remains of a round tower at Aghadoe, near Killarney, and another, one of the most perfect specimens in Ireland, 92 ft. high, at Rattoe, near Ballybunion. On a hill to the north of Kenmare river is Staigue Fort. There are several stone cells in the principal Skellig island, and former monastic remains have been swept away by the sea. The principal groups of sepulchral stones are those on the Tomie mountains, a stone fort at Cahersiveen, a stone circle with cromlech in the parish of Tuosist, and inscribed stones near Dingle. Notable monastic ruins are those of Innisfallen, founded by St. Finian, a disciple of St. Columba, and the remains of Muckross Abbey, founded by the Franciscans.

Ruined churches of interest are at Aghadoe, Kilcrohane, Lough Currane, Derrynane and Muckross. Ardfert cathedral, founded probably in 1253, was partly destroyed during the Cromwellian wars, but was restored in 1831. The climate is very moist and unsuitable for the growth of cereals, but it is so mild even in winter that arbutus and other trees indigenous to warm climates grow in the open air, and several flowering plants are found which are unknown in England. In the northern parts the land is generally coarse and poor, except in the valleys, where a rich soil has been formed by rocky deposits. In the Old Red Sandstone valleys there are many very fertile regions, and some districts now covered by bog admit of easy reclamation. Dairy-farming is very largely followed. The Kerry breed of cattle—small black or red animals, with small upturned horns—are in considerable demand. Goats share with sheep the higher mountain pasture.

The linen trade in Kerry is now nearly extinct, the chief manufacture being that of coarse woollens and linens for home use. At Killarney a variety of articles are made from the wood of the arbutus. A considerable trade in agricultural produce is carried on at Tralee, Dingle and Kenmare, and in slate and stone at Valencia. A copper mine was formerly worked at Muckross, near Killarney, in which cobalt ores also occurred. The deep-sea and coast fisheries are prosperous; the centres of the two fishery districts are Valencia and Dingle. Kenmare and Killarney are centres for salmon-fishing. There are chalybeate mineral springs near Killarney, near Valencia island, and near the mouth of the Inny; sulphurous chalybeate springs near Dingle, Castlemaine and Tralee; and a saline spring at Magherybeg in Corkaguiney. Killarney is an inland tourist centre. Among the coast resorts are Derrynane, at the mouth of Kenmare bay, Glenbeigh on Dingle bay, Parknasilla on Kenmare bay, Waterville (an Atlantic telegraph station) between Ballinskellig bay and Lough Currane, and Tarbert, a small coast town on the Shannon estuary. The Great Southern railway traverses the centre of the county, touching Killarney, Tralee and Listowell. Branches are from Headford to Kenmare; Farranfore to Killorglin, Cahersiveen and Valencia harbour, Tralee to Fenit and to Castlegregory, and Tralee to Dingle. The only inland branch is from Tralee to Castle island. The county of Kerry returns seven members to Dail Eireann.

KERSAINT, ARMAND GUY SIMON DE COETNEMPREN, Comte de (1742–1793), French sailor and politician, was born at Paris on July 29, 1742. Entering the navy in 1755, in 1782 he became a captain. At that time the officers of the French navy were divided into the reds or nobles, and the blues or *roturiers*. At the outbreak of the Revolution, Kersaint took the side of the latter, and in a pamphlet entitled *Le Bon Sens* attacked feudal privileges. On Jan. 1, 1793 Count Kersaint was appointed vice-admiral. He devoted himself to questions of national defence, prepared a report on the English political system and the navy, and caused a decree to be passed for the formation of a committee of general defence, which after many modifications became the Committee of Public Safety. He entered the ranks of the Girondins, but resigned his seat in the Convention on Jan. 20. After the death of the king he denounced the September massacres, but when called upon to justify his attitude confined himself to attacking Marat, who was at the time all-powerful. He was arrested on Sept. 23. He was executed on Dec. 4, 1793.

See Kersaint, *Le Bon Sens* (1789); the *Rubicon* (1789); *Considérations sur la force publique et l'institution des gardes nationales* (1789); *Lettre à Mirabeau* (1791); *Moyens présentés à l'Assemblée nationale pour rétablir la paix et l'ordre dans les colonies;* also E. Chevalier, *Histoire de la Marine française sous la première République;* E. Charavay, *L'Assemblée électorale de Paris en 1790 et 1791* (1890); and Agénor Bardoux, *La Duchesse de Duras* (1898).

KERVYN DE LETTENHOVE, CONSTANTINE BRUNO, Baron (1817–1891), Belgian historian, was born and died at Saint-Michel-les-Bruges. He was a member of the Catholic Constitutional party and sat in the Chamber as member for Eecloo. He was a member (1870) of the short-lived Anethan cabinet. His first important work was a book on Froissart (Brussels, 1855), crowned by the French Academy. He edited a series of chronicles—*Chroniques relatives à l'histoire de la Belgique sous la domination des ducs de Bourgogne* (Brussels, 1870–1873), and *Rélations politiques des Pays Bas et de l'Angleterre sous le regne de Philippe II.* (Brussels, 1882–1892).

KESHUB CHUNDER SEN (Keshava Chandra Sena) (1838–1884), Indian religious reformer, was born of a high-caste family at Calcutta in 1838. He was educated at one of the Calcutta colleges, and became a clerk in the Bank of Bengal, but resigned his post to devote himself exclusively to literature and philosophy. As early as 1857 he joined the Brahma Samaj, a religious association aiming at the reformation of Hinduism. In 1862 he helped to found the Albert College, and started the *Indian Mirror,* a weekly journal in which social and moral subjects were discussed. In 1863 he wrote *The Brahma Samaj Vindicated.* The steady development of his reforming zeal led to a split in the society, which broke into two sections, Chunder Sen putting himself at the head of the reform movement, which took the name "Brahma Samaj of India," and tried to propagate its doctrines by missionary enterprise. Its tenets at this time

were the following: (1) The wide universe is the temple of God. (2) Wisdom is the pure land of pilgrimage. (3) Truth is the everlasting scripture. (4) Faith is the root of all religions. (5) Love is the true spiritual culture. (6) The destruction of selfishness is the true asceticism. In 1866 he delivered an address on "Jesus Christ, Europe and Asia," which led to the false impression that he was about to embrace Christianity. In 1870 he paid a visit to England where he was warmly welcomed. His own impression of Christianity in England was somewhat disappointing. It appeared to him too sectarian and narrow, too muscular and hard, even. Christian life, in England, he considered more materialistic and outward than spiritual and inward.

After his return to India, Chunder Sen developed a tendency towards mysticism and a greater leaning to the spiritual teaching of the Indian philosophies, as well as a somewhat despotic attitude towards the Samaj. He gave his child daughter in marriage to the raja of Kuch Behar; he revived the performance of mystical plays, and himself took part in one. These changes alienated many followers, who deserted his standard and founded the Sadhārana (General) Brahma Samaj (1878). Chunder Sen did what he could to reinvigorate his own section by a new infusion of Christian ideas and phrases. During the intervals of his last illness he wrote *The New Samhita, or the Sacred Laws of the Aryans of the New Dispensation.* He died in January 1884, leaving many bitter enemies and many warm friends.

See the article BRAHMA SAMAJ; also P. Mozoomdar, *Life and Teachings of Keshub Chunder Sen* (1888).

KESTREL or WINDHOVER, one of the falcons (*Falco tinnunculus*), and the commonest bird of prey in the British Isles. It is distributed over all Europe and most of Asia and Africa, north of Guinea and Mombasa. It feeds largely on mice, beetles and grasshoppers, for which it searches while hanging stationary in the air, maintaining its position by rapid wing-beats. The plumage is reddish-brown above and grey below. It breeds in the deserted nest of a crow or pie or in holes in rocks or ruins, laying four or five eggs which are mottled all over with dark red-brown. The American "sparrow-hawk" (*F. sparverius*) is a beautiful little bird with many geographical races throughout the New World. Numerous other species occur all over the world except in New Zealand, where, however, there is an allied genus, *Hieracidea,* including the "bush-hawk," a very courageous bird.

KESWICK, market town, urban district, Penrith and Cockermouth parliamentary division, Cumberland, England, 299 m. N.W. of London, on the L.M.S. railway. Pop. (1921), 5,555. In the northern part of the Lake District, it stands in the beautiful valley of the Greta, with Skiddaw on the north and Derwentwater on the south. It is much frequented by visitors and contains many residences of Lancashire and Yorkshire business men. The town hall contains a museum; Fitz park was opened in 1887, and Greta Hall (the residence of Southey) is at Crosthwaite. The manufacture of lead pencils, from locally mined plumbago, and the potting of char, a fish caught in the lakes, are the chief industries.

KESWICK CONVENTION, an annual summer reunion which was held at the above town for the main purpose of "promoting practical holiness" by meetings for prayer, discussion and personal intercourse. The convention, which met first in 1875, had no denominational limits, but was largely supported by the "Evangelical" section of the Church of England.

In the *History of the C.M.S.,* vol. iii. (by Eugene Stock), the missionary influence of the "Keswick men" in Cambridge and elsewhere may be readily traced. *See* also *The Keswick Convention: its Message, its Method and its Men,* edited by C. F. Harford (1906).

KET (or KETT), **ROBERT** (d. 1549), English rebel, is usually called a tanner, but he certainly held the manor of Wymondham in Norfolk. With his brother William he led the men of Wymondham in their quarrel with a certain Flowerden, and he headed the men of Norfolk when they rose in rebellion in 1549 owing to the hardships inflicted by the extensive enclosures of common lands and by the general policy of the protector Somerset. A feast held at Wymondham in July 1549 developed into a riot and gave the signal for the outbreak. Leading his followers to Norwich, Ket formed a camp on Mousehold heath, where he is said to have commanded 16,000 men, introduced a regular system of discipline, administered justice and blockaded the city. He refused the royal offer of an amnesty on the ground that innocent and just men had no need of pardon, and on Aug. 1, 1549 attacked and took possession of Norwich. John Dudley, earl of Warwick, marched against the rebels, and forced his way into the city, driving its defenders before him. Strengthened by the arrival of some foreign mercenaries, he attacked the main body of the rebels at Dussindale on Aug. 27. Ket's men were easily routed by the trained soldiery, and Robert and William Ket were seized and taken to London, where they were condemned to death for treason. Both were executed early in Dec. 1549.

See F. W. Russell, *Kett's Rebellion* (1859).

KETCH, JOHN (d. 1686), English executioner, who as "Jack Ketch" gave the nickname for nearly two centuries to his successors, is believed to have been appointed public hangman in the year 1663. The first recorded mention of him is in *The Plotters Ballad, being Jack Ketch's incomparable Receipt for the Cure of Traytorous Recusants and Wholesome Physick for a Popish Contagion,* a broadside published in December 1672. The execution of William, Lord Russell, on July 21, 1683 was carried out by him in a clumsy way, and a pamphlet is extant which contains his "Apologie," in which he alleges that the prisoner did not "dispose himself as was most suitable" and that he was interrupted while taking aim He died in 1686.

KETCH, a two-masted fore-and-aft rigged type of sailing vessel now used chiefly for fishing.

KETCHIKAN, situated near the southern tip of south-east Alaska or the "Panhandle" in 55° 20′ N. and 131° 38′ W., some 600 m. north-west from Seattle, via the inside passage, is the chief port of entry for the business of the Territory. It is the only town of considerable importance which suffered no diminution in population during the period of the World War. Pop. (1920) 2,458 (conservatively estimated in 1928 at above 5,000) with quite the largest assessed valuation of any town in the Territory. The principal industries of Ketchikan are halibut-fishing, king salmon trolling, fox-farming, mining (lode), timber and salmon-canning. Of these industries, halibut-fishing takes the lead. It is the outfitting centre for probably the largest fleet of halibut-fishing vessels in the world. The catch, running into many millions of pounds annually, is taken care of temporarily in large cold storage plants or shipped fresh to Southern and Eastern markets.

KETENES, in chemistry, a class of organic compounds containing the carbonyl group, CO, combined with either methylene, CH_2, or its homologues, RCH and R_2C, where R may be either an alkyl or an aryl radical (*see* CHEMISTRY, *Organic;* for other carbonyl compounds *see* ALDEHYDES and KETONES).

Ketene, $CH_2{:}CO$, the prototype of the series, is a colourless gas at ordinary temperature, having a penetrating odour. It has been condensed to a liquid and even solidified (melting point −151° C, boiling point −56° C). It was discovered in 1907 by N. T. M. Wilsmore among the gaseous products formed when a platinum wire is heated electrically under the surface of acetic anhydride, and was subsequently obtained by H. Staudinger (1908) by the action of zinc on bromoacetyl bromide. The latter chemist and O. Kupfer also obtained ketene by passing carbon monoxide and diazomethane, $CH_2{:}N_2$, through a quartz tube at 400–500° C.

Ketene is a remarkably active chemical substance and its production on a commercial scale would facilitate the production of many important organic chemicals (H. Dreyfus, Eng. Pat. 262,364; D. A. Nightingale, U.S.P., 1,602,699). It reacts with hydrogen chloride, ammonia and aniline, yielding respectively acetyl chloride, acetamide and acetanilide. It acetylates hydroxylated compounds by direct addition, the primary alcohols being most readily attacked, the tertiary alcohols and phenols least readily. When kept for some time, ketene polymerizes to a liquid dimeride $(CH_2{:}CO)_2$, boiling at 126–127° C, which combines with water to form acetoacetic acid and with aniline to yield acetoacetanilide, which is technically important as an intermediate

in colour making. At 600° C, ketene decomposes into carbon monoxide and ethylene.

The homologues of ketene are divisible into two classes: (*a*) aldoketenes, (*b*) ketoketenes. The aldo-group includes ketene itself, its monoalkyl derivatives RHC:CO and carbon suboxide (*see* CARBON COMPOUNDS). They are colourless, do not undergo autoxidation and are polymerized by pyridine. The keto-group consists of the dialkyl and diaryl ketenes, $R_2C:CO$. These derivatives are coloured, undergo autoxidation and form additive compounds with tertiary bases, *e.g.*, pyridine, quinoline and acridine.

See H. Staudinger, *Die Ketene* (Stuttgart, 1912); M. Sommelet, "Les Cétènes," *Les Actualités de Chimie Contemporaine* (Paris, 1922).

(G. T. M.)

KETONES, in chemistry, organic compounds containing the carbonyl group CO and having the general formula R·CO·R′, where R and R′ are alkyl or aryl groups (*see* CHEMISTRY: *Organic*). If the groups R and R′ are identical, the ketone is called a *simple* ketone, of which the best known and simplest example is acetone (*q.v.*), used in large amounts during the World War as a solvent in the manufacture of the explosive cordite. If the groups R and R′ are different, a *mixed* ketone results, and of this class acetophenone (*q.v.*), $CH_3·CO·C_6H_5$, may be cited as a typical representative. It is used as a soporific under the name of "hypnone."

The Aliphatic Ketones.—This group of ketones is derived from the fatty acids of the acetic acid series. The lower members are liquids and are lighter than water; the higher members containing C_{12} and upwards are solid. (For the initial member of the series *see* ACETONE.) *Methyl ethyl ketone,* $CH_3·CO·C_2H_5$, the simplest of the mixed ketones, occurs in crude wood spirit and is also prepared by distilling a mixture of calcium acetate and propionate; it is a pungent liquid boiling at 81° C. This ketone is employed in the preparation of dimethylglyoxime, a useful analytical reagent for nickel (*q.v.*). *Pinacolin,* or methyl tertiary-butyl ketone, $CH_3·CO·C(CH_3)_3$, a liquid boiling at 106° C and having a camphoraceous odour, is produced by the action of dilute sulphuric acid on pinacol (*see* GLYCOLS), this peculiar rearrangement being known as the "pinacone reaction." *Methyl nonyl ketone,* $CH_3·CO·(CH_2)_8·CH_3$ (m.p. 13·5° C, b.p. 232° C), is the main constituent of oil of rue, which also contains methyl heptyl ketone, $CH_3·CO·(CH_2)_6·CH_3$ (m.p. −17° C, b.p., 195° C).

General Methods of Preparation.—(1) From secondary alcohols, either by oxidation or by thermal dehydrogenation in the presence of catalysts, such as heated reduced copper: $(CH_3)_2CHOH - 2H = (CH_3)_2CO$. (2) Dry distillation of calcium salts of fatty acids. This process works very well under reduced pressure in the production of methyl ketones containing large alkyl groups; thus calcium stearate distilled with excess of calcium acetate gives methyl heptadecyl ketone, $CH_3·CO·(CH_2)_{16}·CH_3$ (white leaflets, m.p. 55·5° C), together with some acetone, which is readily removed. (3) The catalytic decomposition of fatty acids over thoria or zirconia at 400° C, or over manganous oxide at 450° C. Either simple or mixed ketones may be thus prepared. (4) Hydration of homologues of acetylene, preferably in presence of sulphuric acid or of mercuric salts, $C_6H_5·C{\vdots}CH + H_2O = CH_3·CO·C_6H_5$. (5) The interaction of Grignard reagents (*q.v.*) and nitriles; *e.g.*, acetonitrile, $CH_3·C{\vdots}N$, and magnesium ethyl iodide, $I·Mg·C_2H_5$, give an additive compound, $CH_3·C(C_2H_5):N·MgI$, which on treatment with water yields methyl ethyl ketone. (6) The Friedel and Crafts reaction is applicable to ketones containing one or two aromatic radicals, *e.g.*, carbonyl chloride with benzene (2 mol.) gives benzophenone, $C_6H_5·CO·C_6H_5$; acetyl chloride with benzene gives acetophenone. This reaction has been extended by J. F. Norris and H. E. Couch (1920) to condensations with open-chain unsaturated compounds. Ethylene and benzoyl chloride in presence of aluminium chloride furnish phenyl vinyl ketone, $C_6H_5·CO·C_3H_5$, as a yellow oil.

General Reactions. (1) *Oxidation and Reduction.*—Ketones are more resistant than aldehydes to oxidizing agents. They do not readily reduce ammoniacal silver nitrate. They are, however, attacked by chromic acid, generally giving rise to a mixture of two or more carboxylic acids. The process is used in descending the series of higher fatty acids; thus methyl heptadecyl ketone (*v. supra*) gives margaric acid, $C_{16}H_{33}·CO_2H$, together with acetic acid. Ketones are reduced by aluminium, sodium or zinc amalgams to mixtures of secondary alcohols and pinacols (*see* GLYCOLS).

(2) *Addition Products.*—Such products are formed less readily by ketones than by aldehydes. Water and the alcohols do not combine with ketones, but the latter and the mercaptans form addition compounds, the mercaptols, such as $(CH_3)_2C(SC_2H_5)_2$ from acetone and ethyl mercaptan. This mercaptol on oxidation furnishes the drug sulphonal. Grignard reagents (*q.v.*) add on to ketones, and the products when decomposed by water give rise to tertiary alcohols. Hydrogen cyanide and ketones give rise to nitriles hydrolysable to hydroxycarboxylic acids, and ketones containing the group $CH_3·CO$ unite with sodium hydrogen sulphite yielding bisulphite compounds from which the ketone can be regenerated by aqueous sodium carbonate.

(3) *Condensation Products.*—Ketones condense with hydroxylamine, giving ketoximes although not always so readily as aldehydes give aldoximes. With a mixed ketone, R·CO·R′, two oximes, R·CR′:NOH, are obtained, the isomerism of which is usually explained by assuming a different spatial arrangement of the groups R, R′ and OH about the doubly-linked residue :C:N· (Hantzsch and Werner, 1890). In studying the stereoisomeric oximes (*see* STEREOCHEMISTRY), considerable use has been made of a characteristic chemical change undergone by ketoximes, known as the Beckmann rearrangement (1886), which results in each of these isomeric oximes, R·CR′:NOH, changing into the corresponding amide, R·CO·NHR′ or R′CO·NHR (*see* OXIMES). This change is effected by phosphorus pentachloride, benzenesulphonyl chloride or warm concentrated sulphuric acid. Ketones condense with phenylhydrazine and other hydrazines to yield characteristic hydrazones which are useful for the purposes of isolation and identification.

Diketones.—Compounds containing in their molecules two ketonic groups are termed diketones, and the group is divisible into sub-groups depending on whether the two carbonyl groups are adjacent or separated by one or more carbon atoms.

Diacetyl, $CH_3·CO·CO·CH_3$, the simplest member of the 1:2- or α-diketones, is a yellowish-green liquid boiling at 88° C and of specific gravity 0·9734 at 22° C. It is found in the aqueous distillates of many essential oils, for example, bay, cedarwood, iris and sandalwood oils, to which it communicates its colour and quinone-like odour. Diacetyl polymerizes to a trimeric form, and with warm alkali it condenses to form *para*-xyloquinone. Diacetyl is made from methyl ethyl ketone by treatment of this ketone with amyl nitrite and subsequent hydrolysis of the resulting diacetyl-monoxime with dilute sulphuric acid. Diacetyldioxime or dimethylglyoxime is prepared by acting on methyl ethyl ketone successively with amyl nitrite in presence of hydrogen chloride and with hydroxylamine chloride. The dioxime separates from alcohol in colourless crystals melting with partial sublimation at 245–246° C; it is insoluble in water, but dissolves readily in alcohol or ether.

Acetylacetone, the simplest member of the 1:3- or β-diketones, is a colourless pungent liquid boiling at 139° C. It is soluble in eight parts of water and miscible in all proportions with alcohol, ether or chloroform. It is regarded as an equilibrium mixture of two isomeric forms, $CH_3·CO·CH_2·CO·CH_3$ and $CH_3·C(OH):CH·CO·CH_3$, the latter predominating. Acetylacetone is prepared by adding successively ethyl acetate and acetone to sodium wire under dry ether. The mixture is left for some hours in a freezing mixture and then acidified, the β-diketone being isolated in the form of its copper derivative. The metallic derivatives of acetylacetone have remarkable properties; they are usually insoluble in water but soluble in organic media, they are generally non-ionized, and are sometimes volatile without decomposition. The condensation products of acetylacetone with the chlorides of non-metals are also of interest (*cf.* Beilstein's *Handbuch der Organischen Chemie,* 4th ed., 1918, vol. 1, pp. 781–4).

Acetonylacetone, the lowest member of the 1:4- or γ-diketone class, is a colourless liquid, boiling at 194° C and solidifying to

leaflets which melt at −9° C. It is miscible in all proportions with water, alcohol or ether. In its preparation, 2 mols. of ethyl sodioacetoacetate are condensed together by means of iodine and the resulting diethyl diacetylsuccinate is hydrolysed with warm dilute caustic soda. Acetonylacetone is chiefly of interest when it reacts in its dienolic form, $HO{\cdot}C(CH_3){:}CH{-}CH{:}C(CH_3){\cdot}OH$, with fuming hydrochloric acid, zinc chloride or acetic anhydride to yield dimethylfuran (*see* FURFURAL), with phosphorus pentasulphide to give dimethylthiophen, and with ammonia to furnish dimethylpyrrole. These reactions afford general methods for passing from open-chain to cyclic organic compounds.

For a comprehensive essay on ketones *see* T. E. Thorpe, *Dictionary of Applied Chemistry* (1922, vol. iii.). (G. T. M.)

KETTELER, WILHELM EMMANUEL, BARON VON (1811–1877), German theologian and politician, was born at Münster on Dec. 25, 1811. In 1863 he defended Socialist views in his *Die Arbeitfrage und das Christenthum.* At the Vatican Council he strongly opposed the promulgation of the dogma of papal infallibility on the ground that such promulgation was inopportune. But he soon deserted his anti-Infallibilist colleagues, and submitted to the decrees in Aug. 1870. He was the warmest opponent of the State in the *Kulturkampf* provoked by Bismarck after the publication of the Vatican decrees, and was a leader in the revolt which compelled Bismarck to retract his policy. Ketteler even forbade his clergy in 1874 to take part in celebrating the anniversary of Sedan, and declared the Rhine to be a "Catholic river." He died at Burghausen, on July 13, 1877.

KETTERING, market town, urban district, Kettering parliamentary division, Northamptonshire, England, 72 m. N.W. from London by the L.M.S. railway. Pop. (1921) 29,701. The church of SS. Peter and Paul, mainly Perpendicular, has a lofty ornate tower and spire.

KETTLEDRUM, the only kind of drum (*q.v.*) having a definite musical pitch. The kettledrum consists of a hemispherical pan of copper, brass or silver, over which a piece of vellum is stretched tightly by means of screws working on an iron ring, which fits closely round the head of the drum. In the bottom of the pan is a small vent-hole, which prevents the head from being rent by the concussion of air. The vellum head may be slackened or tightened at will to produce any one of the notes within its compass of half an octave. Each kettledrum gives but one note at a time, and as it takes some little time to alter all the screws, two or three kettledrums, sometimes more, each tuned to a different note, are used in an orchestra or band. The compass of the kettledrums collectively is not much more than an octave, from F below the bass stave upwards. When there are but two drums they are generally tuned to the tonic and dominant or to the tonic and subdominant. It is generally stated that Beethoven was the first to treat the kettledrum as a solo instrument, but in *Dido,* an opera by C. Graupner performed at the Hamburg Opera House in 1707, there is a short solo for the kettledrum. The opening of the violin concerto and the scherzo of the ninth symphony may be recalled as two typical examples of Beethoven's use of the kettledrum.

The origin of the kettledrum is remote and must be sought in the East. The Romans knew the instrument well, as also did the Greeks, though the latter regarded it merely as a warlike instrument of barbarians. Thus Plutarch mentions that the Parthians, in order to frighten their enemies, in offering battle used not the horn or *tuba,* but hollow vessels covered with a skin, on which they beat, making a terrifying noise.

KEUPER: *see* TRIASSIC SYSTEM

KEW, a suburb of London in Surrey, England, on the Thames, 6 m. W.S.W. of Hyde Park Corner, London. Pop. (1925) 4,362. The name first occurs in a document of the reign of Henry VII., where it is spelt Kayhough. The church of St. Anne (1714) is the burial place of Thomas Gainsborough the artist. The old village was chiefly a row of houses on the north side of a green, to the south of which is the church and churchyard and at the west the principal entrance to Kew Gardens. From remains found in the river near Kew bridge it has been conjectured that the village marks the site of an old British settlement.

The free school originally endowed by Lady Capel in 1721 received special benefactions from George IV., and the title of "the king's free school."

The estate of Kew House which was pulled down in 1802 came into the possession of Lord Capel about the end of the 17th century. Dutch House, close to Kew House, was sold by Robert Dudley, earl of Leicester, to Sir Hugh Portman, a Dutch merchant, late in the 16th century, and in 1781 was purchased by George III. as a nursery for the royal children. It is a plain brick structure, now known as Kew Palace.

The Royal Botanic Gardens of Kew originated in the exotic garden formed by Lord Capel and extended by the widow of Frederick, prince of Wales, and by George III., aided by the skill of William Aiton and of Sir Joseph Banks. In 1840 the gardens were adopted as a national establishment. The gardens originally of 11 ac., were subsequently increased to 75 acres. The pleasure grounds adjoining extend to 270 acres. There are extensive conservatories, botanical museums, including the herbarium and a library. A Chinese pagoda was erected in 1761. In the neighbouring Richmond Old Park is Kew Observatory.

KEWANEE, a city of Henry county, Ill., U.S.A., 131m. W. by S. of Chicago, on Federal highway 34 and the main line of the Burlington Route. It is served also by the Kewanee and Galva (electric) railway, connecting with the Rock Island. The population was 16,026 in 1920 (20% foreign-born white), and was estimated locally at over 20,000 in 1928. It has important manufacturing industries, with an output in 1925 valued at $16,250,103. Coal is mined in the county. Kewanee was founded in 1836 by settlers from Wethersfield, Conn., and was chartered as a city in 1897.

KEY, SIR ASTLEY COOPER (1821–1888), English admiral, son of C. A. Key, surgeon, was born in London and entered the navy in 1833. After a long period of active service afloat he held important dockyard appointments, and in 1872 became president of the projected Royal Naval College at Greenwich, which he organized. He was first naval lord of the admiralty from 1879 to 1885, and died at Maidenhead on March 3, 1888.

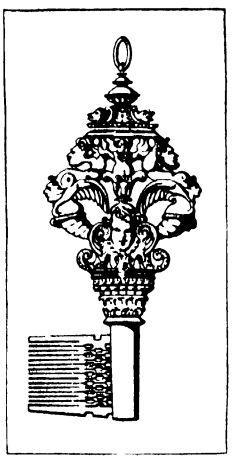
See P. H. Colomb, *Memoirs of Sir A. C. Key* (1898).

KEY, ELLEN (1849–1926), Swedish author, was born Dec. 11, 1849 at Sundsholm, the daughter of Emil Key (1822–92), one of the leaders of the peasant party and a well-known historian, and of Countess Sophia Posse. She early showed a keen interest in religious, literary and political affairs and lectured on various subjects in her native village. In 1868 her father became a member of the Riksdag, and the family accordingly moved to Stockholm. It was then that she started to contribute to the feminist periodical *Idun.* In 1879, owing to family misfortune, she was forced to adopt the teaching profession. She also established lecture courses for young women, and in 1903 went abroad on a number of lecturing tours. Her works are chiefly concerned with the welfare of women and children. The *Century of the Child* (1900), and her views on love and marriage, led to much controversy. She died in April 1926. Her works include *Tankebilder,* "Ideas" (2 vol., 1898); *Lifslinjer,* Eng. trans. "Lines of Life" (3 vol., 1903–06), and biographies of Anna Charlotta Leffler and Rachel von Varnhagen

See G. Brandes in vol. iv. of her collected works (1903); G. Monod in *La Revue Bleue* (1907); E. Faguet in *La Revue Latine* (1907); J. Landquist, *Ellen Key* (1909).

KEY, FRANCIS SCOTT (1779–1843), American lawyer and author of the national anthem, "The Star-Spangled Banner," was born in Frederick co., Md., Aug. 1, 1779. He graduated at St. John's College, studied law, and in 1801 began practice at Fredericktown, Md. A few years later he moved to Washington, where he was district attorney for three successive terms, 1833–41. In 1814 Key visited the British fleet in Chesapeake Bay in an attempt to secure the release of a friend who had been captured. He was detained during the shelling of Fort McHenry, one of the forts defending Baltimore. During the night of the bombardment Key's anxiety was at high pitch and when in the morning he discerned the American flag still flying over the fortress he gave vent to his feelings in "The Star-Spangled Banner." The song immediately became popular, was later adopted by the Army and

Navy as the national anthem, and, although it has not received the official sanction of Congress, is usually regarded as such. He died at Baltimore, Md., on Jan. 11, 1843.



KEY, THOMAS HEWITT (1799–1875), English classical scholar, was born in London and educated at St. John's and Trinity colleges, Cambridge. From 1825 to 1827 he was professor of mathematics in the University of Virginia, and in 1828 was appointed professor of Latin in the newly founded University of London. From 1832 till his death he was headmaster of University College school (first with a colleague and later alone). Key introduced the crude form (the uninflected form or stem of words) system, in general use among Sanskrit grammarians, into the teaching of classics. This system was embodied in his *Latin Grammar* (1846). In *Language, its Origin and Development* (1874), he upholds the onomatopoeic theory. He was a member of the Royal Society and president of the Philological Society.

See *Proceedings of the Royal Society* (1876), vol. xxiv.; R. Ellis in the *Academy* (Dec. 4, 1875); J. P. Hicks, *T. Hewitt Key* (1893).

KEY, an instrument of metal used for the opening and closing of a lock (*see* LOCK). Until the 14th century bronze was most commonly used. The terminals of the stem of the keys were frequently decorated, the "bow" or loop taking the form sometimes of a trefoil, with figures inscribed within it; this decoration increased in the 16th century, the terminals being made in the shape of animals and other figures. More elaborate ceremonial keys were used by court officials; a series of chamberlains' keys used during the 18th and 19th centuries in several courts in Europe is in the British Museum. The terminals are decorated with crowns, royal monograms and ciphers.

The word "key" is by analogy applied to things regarded as means for the opening or closing of anything, for the making clear of that which is hidden. Thus it is used of an interpretation as to the arrangement of the letters or words of a cipher, of a solution of mathematical or other problems, or of a translation of exercises or books, etc., from a foreign language. The term is also used figuratively of a place of commanding strategic position. Thus Gibraltar is called the "Key of the Mediterranean."

The word is also frequently applied to many mechanical contrivances for unfastening or loosening a valve, nut, bolt, etc., such as a spanner or wrench; to the instruments used in tuning a pianoforte or harp or in winding clocks or watches, and to appliances which serve to fasten together distinct parts of a structure, as the "keystone" of an arch, or a small metal instrument, shaped like a U, used to secure the bands in the process of sewing in bookbinding.

STROZZI KEY TO THE APARTMENTS OF HENRI III., A FINE SPECIMEN OF RENAISSANCE ART IN IRONWORK

In music the term "key" has two meanings, the more important having reference to the mode (major or minor) in which a composition is written and the degree of the scale on which it is based (*see* MUSIC). The term is further applied in the case of certain wind instruments, particularly of the wood-wind type, to the levers which open and close valves in order to produce various notes, and in that of keyboard instruments, such as the organ or the pianoforte, to the external parts, constituting the keyboard, of the levers which operate the sound-producing mechanism (*see* KEYBOARD); hence the term is used of the parts pressed by the finger in typewriters and in telegraphic instruments.

A key is the insignia of the office of chamberlain in a royal household (*see* CHAMBERLAIN and LORD CHAMBERLAIN). The "power of the keys" (*clavium potestas*) in ecclesiastical usage represents the authority given by Christ to Peter by the words, "I will give unto thee the keys of the kingdom of heaven" (Matt. xvi. 19). This power is claimed by the Roman Catholic Church to have been transmitted to the Popes as the successors of St. Peter.

"Key" was formerly the common spelling of "quay," a wharf, and is still found in America for "cay," an island reef or sandbank off the coast of Florida (*see* QUAY).

The origin of the name Keys or House of Keys, the lower branch of the legislature of the Isle of Man, is obscure, but it is supposed to be an application of the word "key" by English and not Manx-speaking people.

KEYBOARD or **MANUAL.** The two principal types of keyboard instruments to-day are the organ and the piano. Their keyboards, although similarly constructed, differ widely in scope and capabilities, that of the former being purely mechanical in its action and unlike that of the pianoforte, therefore, in the case of which the touch and force employed affect the quality of the sound produced. The first instrument provided with a keyboard was the organ. The earliest contrivance for opening the pipes was the simple slider, unprovided with a key or touch-piece and working in a groove like the lid of a box, which was merely pushed in or drawn out. The earliest trace of a keyboard with balanced keys which we possess is contained in Hero's description of the hydraulic organ said to have been invented by Ctesibius of Alexandria in the 2nd century B.C., in the case of which the sliders were pushed forward by a key and drawn back again when the key was released by a flexible strip of horn. Subsequently for many centuries all trace of this important development disappears, sliders of all kinds with and without handles doing duty for keys until the 12th or 13th century, when we find the small portative organs furnished with narrow keys which appear to have been balanced. During the same period keys were applied for the first time to stringed instruments in the organistrum (*q.v.*) and the hurdy-gurdy (*q.v.*) and a little later to the clavichordium and clavicymbalum and other precursors of the pianoforte. The exact date at which our chromatic keyboard came into use has not been discovered, but it existed in the 15th century and may be studied in the picture of St. Cecilia playing the organ, on the Ghent altarpiece painted by the brothers Hubert and Jan van Eyck. Praetorius distinctly states that the large Halberstadt organ had the keyboard which he illustrates from the outset and reproduces the inscription asserting that the organ was built in 1361 by the priest Nicolas Fabri and was renovated in 1495 by Gregorius Kleng. The keyboard of this organ has the arrangement of the present day with raised black notes; it is not improbable that Praetorius' statement was correct, for Germany and the Netherlands led the van in organ-building during the middle ages.

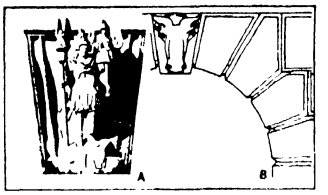
In modern times many keyboards designed on novel lines and claiming to possess various advantages have been introduced. Of these one of the best known and most important is the double keyboard associated with the Duplex-Coupler pianoforte of Emanuel Moór, whereby the most remarkable results (in the facilitation of execution, enlargement of the instrument's resources and so on) are undoubtedly secured. But, as in the analogous case of improved methods of notation, it is vastly easier to invent a new and improved keyboard than to secure its general acceptance and adoption

KEYES, SIR ROGER JOHN BROWNLOW, 1ST BART. cr. 1919 (1872–), British admiral, was born Oct. 4, 1872 and entered the navy in 1885. He took part in the Vitu expedition in 1890 and for his service in China in 1900 was promoted commander. From 1905 to 1907 he served as naval attaché at Rome, Vienna, Athens and Constantinople, and in 1912 was appointed commodore in charge of the submarine service. During the World War he took part in the battle of Heligoland Bight, Aug. 1914, and in the Cuxhaven raid. In 1915 he became chief of staff to Admiral de Robeck, in command of the Eastern Mediterranean Squadron in the Dardanelles. He was promoted rear-admiral in 1917, appointed director of plans at the Admiralty and later took command of the Dover Patrol. In this capacity he directed the naval raid on Zeebrugge and Ostend, April 23, 1918. He commanded the battle cruiser squadron of the Atlantic Fleet from 1919 until 1921 when he was promoted vice-admiral and became deputy-chief of the naval staff. In 1925 he was appointed commander-in-chief of the Mediterranean Station. Keyes, who held

many honors, was promoted full admiral in 1926, and was appointed commander-in-chief of the Portsmouth station in 1928.

KEY INDUSTRIES. In Great Britain this term came into familiar use in the World War to describe certain industries which were revealed by the exigencies of the war operations to be essential to the prosecution of great or essential industries, and in which British industry was found to be deficient. (*See* FREE TRADE; IMPERIAL PREFERENCE.)

KEYNES, JOHN MAYNARD (1883–), British economist, was born at Cambridge, June 5, 1883, the son of John Neville Keynes, registrar of Cambridge University. Educated at Eton and King's College, Cambridge, where he was 12th Wrangler (1905), and president of the Union Society (1905), he entered the civil service in 1906 and from 1906 to 1908 served at the India Office. He was a member of the royal commission on Indian finance and currency 1913–4, and in 1915 he joined the Treasury, where during the World War he did important work in connection with loans to the Allies. At the Paris Peace Conference he was the chief representative of the Treasury and deputised for the Chancellor of the Exchequer on the Supreme Economic Council, Jan.–June 1919. He advocated certain principles which he considered should be applied to the financial and reparation clauses of the Peace Treaty with Germany and when they were rejected he signified his disagreement with the treaty by resigning in June 1919, and published in the same year his famous *The Economic Consequences of the Peace*. He was made fellow and subsequently bursar of King's College, Cambridge In 1924, he became chairman of *The Nation*, Ltd. In 1925 he married Lydia Lopokova, the famous Russian dancer.



His works include *Indian Currency and Finance* (1913); *A Treatise on Probability* (1921); *A Revision of the Treaty* (1922); *A Tract on Monetary Reform* (1923); *A Short View of Russia* (1925); and *The End of Laissez-faire* (1926).

KEYPORT, borough, Monmouth county, New Jersey, U.S.A., on Raritan bay, 23 m. S.S.W. of New York city. It is served by the Central railroad of New Jersey and by steamboats. The population was 4,415 in 1920 (86% native white). It is a summer resort and has a coasting trade.

KEYSER, a city of north-eastern West Virginia, U.S.A., 125m. N.W. of Washington, on the Potomac river; the county seat of Mineral county. It is served by the Baltimore and Ohio and the Western Maryland railways. The population was 6,003 in 1920 (94% native white). It is in a fruit and stock-raising region, has railroad shops and other manufacturing industries, and is the seat of the Potomac State school, a junior college. A village called Paddytown, and later New Creek, grew up here early in the 19th century. When in 1873 the Baltimore and Ohio railroad chose it for the location of repair shops, the town was incorporated. It was chartered as a city in 1913.

KEYSERLING, HERMANN, COUNT (1880–), German philosopher, was born at Könno in Livonia on July 20, 1880, of a noble family. He studied natural sciences in Russia, Switzerland and Germany, and lived for a time in Paris, where he wrote criticism of art and philosophical essays. His first literary works were *Das Gefüge der Welt* (1906) and *Unsterblichkeit* (1907). During the years 1907–11 he travelled in Europe and in 1911–12 round the world, when he acquired that appreciation of Oriental philosophy which, blended with his scientific and political studies, goes to make up his strongly individual philosophical attitude. In 1910, the *Prolegomena zur Naturphilosophie* appeared, and he then turned his attention to the study of metaphysics. In 1919 he married the granddaughter of Prince Bismarck. His principal work is *Das Reisetagebuch eines Philosophen* (1919, English *The Travel Diary of a Philosopher*, 1925), which was followed by *Die Philosophie als Kunst* (1920), *Schöpferische Erkenntniss* (1922) and *Wiedergeburt* (1927). He also founded the "School of Wisdom" at Darmstadt. *See* H. Keyserling, *Der Weg zur Vollendung* (Darmstadt, 1919).

KEYSTONE, the central stone of an arch (*q.v.*); although of no more structural importance than any of the other voussoirs or wedge-shaped stones of which the arch is built, its position at the centre makes it a unit that can be advantageously accented. Thus, in Etruscan, Roman and Renaissance work, it is frequently projected beyond the face of the rest of the arch, and decorated with S-scrolls, masques or figures. In Gothic architecture, the pointed arch is usually built with a joint at the centre, so that no keystone exists. In vault ribs, however, keystones decorated with bosses (*see* Boss) often occur where two ribs intersect. The keystone serves as the popular symbol of the State of Pennsylvania in the United States.

KEYSTONES: (A) FROM THE ARCH OF SEPTIMIUS SEVERUS, (B) PORTION OF A TYPICAL ROMAN ARCH WITH KEYSTONE

KEY WEST (Span. *Cayo Hueso*, bone reef), a city of Florida, U.S.A., on a small coral island 60m. S.W. of Cape Sable, the most southerly point of the mainland; a port of entry and the county seat of Monroe county. It is served by the Florida East Coast railway, a railroad car ferry to Havana, and steamers to Gulf and Atlantic coast ports; and has landing fields for aeroplanes and seaplanes. The population in 1925 (State census) was 13,701. Jasmine, almond, banana, cork, coconut palm and oleander trees flourish in the sub-tropical climate. Key West is a winter resort; a naval station, submarine base and army post; and has sponge and turtle fisheries and a large cigar industry. The traffic of the port in 1925 amounted to 654,218 tons, valued at $65,063,022. The harbour is defended by Ft. Taylor, built in 1846, and greatly improved and modernized after the Spanish-American War. The manufacture of cigars was introduced by Cubans who came to the island in 1869, after an unsuccessful attempt at a revolution. Immigrants from the Bahamas (sponge fishers) are another important element in the population. There are relics of early European occupation of Key West which suggest that the island was a resort of pirates. It was settled about 1822. In the Seminole War and the War with Mexico it had military importance.

KHABAROVSK, a town in the Far Eastern Area of the Russian S.F.S.R., in 48° 40′ N., 135° 5′ E., situated on a cliff 315 ft. high, on the right bank of the Amur, 29 m. below its confluence with the Ussuri. The river is frozen from December to April and ice is often heaped up to a height of 20 feet. Its river front is three miles long and the town extends along three low hills, separated by two little streams. Wooden stairs lead from one hill to another. Many buildings are wooden, and the streets are unpaved and muddy. There is a large cathedral, a monument to Count Muraviev-Amurski, a branch of the Russian Geographical Society with a museum, and technical and other schools. The town has increased in importance since the construction of the railway and its population (1926) was 43,567, mainly Russians, Koreans and Chinese. It is an entrepôt for goods coming down the Ussuri and its tributary, the Sungacha, and is a collecting centre for the fur trade. Its industries include tanning, furdressing, brewing and distilling, tobacco making and the manufacture of small ironware. It has wind-driven flour mills. There is a civic water and electricity supply and a wireless station. The town is named after the 17th century Russian merchant and explorer, Khabarovsk, who erected a fort on the present site in 1652. The Russians under Count Muraviev settled here in 1858. The town suffered severely during the anarchy following the 1917 revolution. When the Far Eastern Area was incorporated as a unit of the Russian S.F.S.R., Khabarovsk was made the administrative centre, and its trade recovered rapidly.

KHAIRAGARH, a feudatory State in the Central Provinces of India. Area 930 sq.m.; pop. (1921) 124,008. It lies to the west of Nandgaon State and between it and the Bhandara district. The chief, who is descended from an old Gond royal family, received the title of raja as an hereditary distinction in 1898. The State includes a fertile plain yielding rice and some cotton and wheat. Its prosperity has been greatly promoted by the Bengal-Nagpur railway, which has a station at Dongargarh, the largest town (population 7,126), connected by road with Khairagarh town (population 4,645), the residence of the raja.

KHAIREDDIN (d. 1890), Turkish statesman, was of Cir-

cassian race, but nothing is known about his birth and parentage. In early boyhood he was sold by a Tunisian slave-dealer to Hamuda Pasha, then bey of Tunis, who gave him his freedom and a French education. He advised the three beys—Ahmet (1837), Mohammed (1855) and Sadok (1859)—in the liberal measures which distinguished their successive reigns. He later left Tunis, and entered the service of the sultan Abdul Hamid, who gave him a seat on the Turkish Reform Commission then sitting at Tophane. Early in 1879 the sultan appointed him grand vizier, and he prepared a scheme of constitutional government, but Abdul Hamid refused to have anything to do with it. Khaireddin resigned on July 28, 1879. More than once the sultan offered him anew the grand vizierate, but Khaireddin persistently refused it. He died on Jan. 30, 1890, practically a prisoner in his own house.

KHAIRPUR, a native state of India, in the Sind province of Bombay. Area, 6,050 sq.m.; pop. 193,152; estimated revenue, £90,000. A small ridge of limestone hills passes through the northern part of the state, being a continuation of a ridge known as the Ghar, running southwards from Rohri. The state is watered by five canals drawn off from the Indus, besides the Eastern Nara, a canal which follows an old bed of the Indus. (*See* also INDIAN DESERT.)

KHAIRPUR town is situated on a canal 15 m. E. of the Indus, with a railway station, 20 m. S. of Sukkur, on the Kotri-Rohri branch of the North-western railway, which here crosses a corner of the state. Pop. (1921) 15,740. There are manufactures of cloth, carpets, goldsmiths' work and arms, and an export trade in indigo, grain and oilseeds.

The chief, or mir, of Khairpur belongs to a Baluch family, known as the Talpur, which rose on the fall of the Kalhora dynasty of Sind. About 1813, during the troubles in Kabul incidental to the establishment of the Barakzai dynasty, the mirs were able to withhold the tribute which up to that date had been somewhat irregularly paid to the rulers of Afghanistan. In 1832 the individuality of the Khairpur state was recognized by the British government in a treaty under which the use of the river Indus and the roads of Sind were secured. When the first Kabul expedition was decided on, the mir of Khairpur, Ali Murad, cordially supported the British policy; and the result was that, after the battles of Meeanee and Daba had put the whole of Sind at the disposal of the British, Khairpur was the only state allowed to retain its political existence under the protection of the paramount power.

KHAJRAHO, a village of Central India, in the state of Chhatarpur, famous for its old temples. It is believed to have been the capital of the ancient kingdom of Jijhoti, corresponding with modern Bundelkhand. The temples consist of three groups: Saiva, Vaishnav and Jain, almost all built in the 10th and 11th centuries. They are covered outside and inside with elaborate sculptures, and also bear valuable inscriptions.

KHAKI, originally a dust-coloured fabric, of the character of canvas, drill or holland, used by the British and native armies in India (from Urdu *khak*, dust). It seems to have been first worn by the Guides, a mixed regiment of frontier troops, in 1848, and to have spread to other regiments during the following years. Some at any rate of the British troops had uniforms of khaki during the Indian Mutiny (1857–58), and thereafter drill or holland (generally called "khaki," whatever its colour) became the almost universal dress of British and native troops in Asia and Africa. During the South African War of 1899–1902, drill of a sandy shade of brown was worn by all troops sent out from Great Britain and the Colonies. Khaki drill, however, proved unsuitable material for the cold weather in the uplands of South Africa, and after a time the troops were supplied with dust-coloured serge uniforms. Since 1900 all drab and green-grey uniforms have been commonly designated khaki.

KHALIFA (ċhah'lī-fah), **THE.** ABDULLAH ET TAAISHA (Sayyid Abdullah ibn Sayyid Mohammed) (1846–1899), successor of the mahdi Mohammed Ahmed, born in 1846 in the S.-W. part of Darfur, was a member of the Taaisha section of the Baggara Arabs. The mahdi on his deathbed (1885) solemnly named him his successor; and for thirteen years Abdullah ruled over what had been the Egyptian Sudan. Khartoum was deserted by his orders, and Omdurman, at first intended as a temporary camp, was made his capital. At length the progress of Kitchener's expedition compelled him to give battle to the Anglo-Egyptian forces near Omdurman, where on Sept. 2, 1898 his army, fighting with desperate courage, was almost annihilated. The khalifa fled to Kordofan with the remnant of his host. On Nov. 25, 1899 he gave battle to a force under Wingate, and was slain at Om Debreikat. (*See* KHARTOUM; SUDAN.)

Personal sketches of the khalifa are given in Slatin Pasha's *Fire and Sword in the Sudan* (London, 1896), and in Father Ohrwalder's *Ten Years in the Mahdi's Camp* (London, 1892). *See* also Sir F. R. Wingate's *Mahdiism and the Egyptian Sudan* (1891).

KHALĪL IBN AḤMAD (ABŪ 'ABDURRAHMĀN UL-KHALĪL IBN AḤMAD IBN 'AMR IBN TAMĪM) (718–791), Arabian philologist, was a native of Oman. He wrote the first Arabic dictionary and first classified the Arabic metres and laid down their rules. The dictionary known as the *Kitāb-ul-'Ain* is ascribed, at least in its inception, to Khalīl. The words were arranged in conformity with the position of the vocal organs, beginning with *'Ain* and ending with *Ya*.

Various grammatical works are ascribed to Khalīl, but their authenticity seems doubtful; *cf.* C. Brockelmann, *Gesch. der arabischen Literatur*, i. (Weimar, 1898).

KHALKHAS, a Mongoloid people mainly concentrated in the northern steppes of Mongolia near their kinsmen, the Buriats. They have yellowish skin, the Mongolian eyefold, a broad flat face, high cheekbones and lank black hair. Their territory is divided into four khanates of Tushetu (Tushiyetu), Tsetien (Setzen), Sai'noi'm (Sain Noyan) and Jesaktu (Jassaktu). For divisions of the Khalkhas and neighbouring tribes *see* Neville Whymant, *A Mongolian Grammar*, Appendix (1926).

KHAM (K'ANG, CHWANBEN), a province of China, including the greater part of eastern Tibet, traversed by the southward courses of feeders of the Yangtsekiang and the Mekong, and bounded on the south-west by the southward course of the Brahmaputra. It has been constructed out of parts of Szechwan and Tibet and its chief city of Batang or Pa-t'ang or Baqnfu, in a rich plain with several lamaseries, a route centre of some importance. The town of Chamdo (Tchamdo) in the north, with a large number of lamas, is also a route centre with some commerce, and an estimated population of 7,000. The province is said to have some 300,000 inhabitants, and has been, to a certain extent, in dispute between China and Tibet.

KHAMGAON, a town of India in the Buldana district of Berar and an important cotton centre. Pop. 19,962. (*See* BULDANA.)

KHAMSIN, a hot, dry, dust-laden, southerly wind blowing in Egypt usually in late spring and popularly supposed to last for 50 days, *khamsin* being the Arabic word for "fifty." But this only an approximation.

KHAMTI, a branch of the Shan (*q.v.*) race inhabiting an isolated area in north-east Assam and Hkamtilong in Burma. They are Buddhists by religion, expert elephant-catchers and artisans in metal. They erect stepped pyramidal tumuli over the graves of the dead.

See Dalton, *Ethnology of Bengal* (1872).

KHAN (ċhahn), a title of respect in Mohammedan countries (Persian and Arabic *Khān*). It is a contracted form of *khāqān* (*khakan*), a word equivalent to sovereign, used among the Mongol and Turkī nomad hordes. The title khan was assumed by Jenghis when he became supreme ruler of the Mongols; his successors became known in Europe as the Great Khans (sometimes as the Chams, etc.) of Tatary or Cathay. Khan is still applied to semi-independent rulers, such as the khan of Kalat in Baluchistan. The meaning of the term has also extended downwards, until in Persia and Afghanistan it has become an affix to the name of any Mohammedan gentleman. The title of Khan Bahadur is conferred by the British Government on Mohammedans and also on Parsees.

KHANDESH, EAST and **WEST,** two districts of British India, in the central division of Bombay, formed in 1906 by the division of the old district of Khandesh. Their areas are respec-

tively 4,551 sq.m. and 6,401 sq.m., and the population on these areas in 1921 was 1,075,837 and 641,847. The headquarters of East Khandesh are at Jalgaon, and those of West Khandesh at Dhulia.

The Tapti river flows through both districts from east to west and divides each into two unequal parts. Of these the larger lie towards the south, and are drained by the rivers Girna, Bori and Panjhra. Northwards beyond the alluvial plain, which contains some of the richest tracts in Khandesh, the land rises towards the Satpura hills. In the centre and east the country is level, save for some low ranges of barren hills, and is mostly arid and unfertile. Towards the north and west, the plain rises into a difficult rugged country, thickly wooded, and inhabited by wild tribes of Bhils. The drainage of the district centres in the Tapti, which receives thirteen principal tributaries in its course through Khandesh. None of the rivers is navigable, and the Tapti flows in too deep a bed to be useful for irrigation. The district on the whole, however, is fairly well supplied with surface water. A large area is under forest; but the jungles have been denuded of most of their valuable timber. Wild beasts are numerous. Of the aboriginal tribes the Bhils, formerly wild and lawless, are the most important. Since the introduction of British rule they have largely taken to an orderly life. The principal crops are millets, cotton, pulse, wheat and oilseeds, and cotton is the chief export. East Khandesh is now a prosperous cotton-growing district. West Khandesh is much less developed. There are factories for ginning and pressing cotton, and several cotton-mills. The eastern district is traversed by the Great Indian Peninsula railway, which branches at Bhusawal (an important railway centre) towards Jubbulpore and Nagpur. Both districts are crossed by the Tapti Valley line from Surat.

KHANDWA, a town of British India in the Nimar district of the Central Provinces, of which it is the headquarters, 353 m. north-east of Bombay by rail. Khandwa is an ancient town with Jain and other temples. It is an important railway junction where the Malwa line from Indore meets the main line of the Great Indian Peninsular. There are factories for ginning and pressing cotton and raw cotton is largely exported. Its population has expanded from 14,606 in 1872 to 26,802 in 1921.

KHANSĀ (Tumāḍīr bint 'Amr, known as al-Khansā) (d. *c.* 645), Arabian poetess of the tribe Sulaim, a branch of Qais. Before the time of Islam she lost her brothers Ṣakhr and Moawiya in battle. Her elegies written on these brothers and on her father made her the most famous poetess of her time. With her tribe she accepted Islam somewhat late, but persisted in wearing the heathen sign of mourning, against the precepts of Islam. When her four sons were slain in the battle of Kadisīya, Omar wrote her a letter congratulating her on their heroic end and assigned her a pension. Her daughter 'Amra also wrote poetry. (*See* ARABIC LITERATURE: *Poetry.*)

Her *dīwan* has been edited by L. Cheikho (Beirut, 1895) and translated into French by De Coppier (Beirut, 1889). *Cf.* T. Nöldeke's *Beiträge zur Kenntniss der Poesie der alten Araber* (Hanover, 1864), and the *Kitāb ul-Aghāni,* xiii. 136–147.

KHARAGHODA (ċhah-rah-ghō'ḍa), a village of British India, in the Ahmedabad district of Bombay, on the Little Ran of Cutch, the terminus of a branch railway. Here are the large government factory of salt (Baragra salt) and works for recovering magnesium chloride.

KHARGA (WAHA EL-KHARGA, the outer oasis), the largest of the Egyptian oases, and hence frequently called the Great Oasis. It lies in the Libyan desert between 24° and 26° N. and 30° and 31° E., the chief town, also called Kharga, being 435 m. by rail S. by W. of Cairo. It is reached by a narrow-gauge line (opened in 1908) from Kharga junction, a station on the Nile valley line near Farshut. The oasis consists of a depression in the desert some 1,800 sq.m. in extent, and is about 100 m. long north to south and from 12 to 50 broad east to west. The inhabitants are of Berber stock. Administratively the oasis forms part of the mudiria of Assiut. It is practically rainless, and there is not now a single natural flowing spring. There are, however, numerous wells tapping the porous sandstone which underlies a great part of the Libyan desert. The oasis contains many groves of date palms; the dom palm, tamarisk, acacia and wild senna are also found. Rice, barley and wheat are the chief cereals cultivated, and lucerne for fodder. Besides agriculture the only industry is basket and mat making—from palm leaves and fibre. Since 1906 extensive boring and land reclamation works have been undertaken in the oasis.

The name of the oasis appears in hieroglyphics as *Kenem,* and that of its capital as *Hebi* (the plough). In Pharaonic times it supported a large population, but the numerous ruins are mostly of later date. The principal ruin, a temple of Amen, built under Darius, is of sandstone, 142 ft. long by 63 ft. broad and 30 ft. in height. On the eastern escarpment of the oasis on the way to Girga are the remains of a large Roman fort with twelve bastions. On the road to Assiut is a fine Roman columbarium or dove-cote. Next to the great temple the most interesting ruin in the oasis is, however, the necropolis, a burial-place of the early Christians, placed on a hill 3 m. N. of the town of Kharga. There are some two hundred rectangular tomb buildings, most of them with a chamber in which the mummy was placed, the Egyptian Christians at first continuing this method of preserving the bodies of their dead. The chapel is basilican; in it and in another building in the necropolis are crude frescoes of biblical subjects.

Kharga town is picturesquely situated amid palm groves. The houses are of sun-dried bricks, the streets narrow and winding and for the most part roofed over, the roofs carrying upper storeys. Some of the streets are cut through the solid rock. Kharga is usually identified with the city of Oasis mentioned by Herodotus as being seven days' journey from Thebes and called in Greek the Island of the Blessed. The oasis was traversed by the army of Cambyses when on its way to the oasis of Ammon (Siwa), the army perishing in the desert before reaching its destination. During the Roman period, as it had also been in Pharaonic times, Kharga was used as a place of banishment, the most notable exile being Nestorius, sent thither after his condemnation by the council of Ephesus.

KHARKOV (ċhar'kŏv) (Ukrainian *Kharkiv*), the administrative centre of the Ukrainian S.S.R., at the junction of two small rivers, the Lopan and Kharkov, which are not navigable, in 50° N., 36° 13′ E. The town was founded in 1654 as a fort of the Free Ukraine (*i.e.,* free from Polish domination) and was an outpost of Moscow in its struggle with the Tatars. The Cossacks of Kharkov remained faithful to the Tsar during the rebellions of the 17th century and received many privileges in return, Kharkov becoming the administrative centre of the Ukraine in 1765.

In the latter half of the 19th century, industrial development in the Donetz coal field and the Krivoi Rog iron district, led to rapid growth and the building of railways, six of which radiate from Kharkov and compensate for the absence of navigable waterways. Air services now run weekly to Moscow, Kiev and Odessa and there are air routes going via Grozny and Baku to Teheran and via Batum and Tiflis to Baku. The industrial progress of the town was interrupted by war conditions from 1914 onwards and especially by the civil war of 1917–20, during which the town was successively occupied by the Germans, the Ukrainian Nationalists, the Red army, Denikin's troops and was finally captured by the Red army in 1920, and declared the capital of the Ukrainian S.S.R. The Kharkov Kreshtenskaya fair was re-opened in 1923 and is a centre for the agricultural, peasant and metallurgical industries of the Ukraine. The manufactures of Kharkov are mainly metallurgical, smelting, engine building, the manufacture of machinery and agricultural implements, bicycles, electrical fittings, etc. Ropes, chemicals and wooden wares are made, and various chemical extracts from coal. The town is the headquarters of the Donetz State Coal trust, and of the Southern Machinery and Metallurgical trusts. Recently established industries are those connected with the growing air traffic, the manufacture of elevators, tractors, and hydro-electric generators.

The former university is now an Institute of People's Education, and there is an important agricultural and economic institute, and exhibitions of agricultural implements and methods are held in two museums, with sections on field culture, land surveying, cattle

breeding, forestry and fire prevention. Pop. (1926) 409,505.

KHAROSTHI AND BRAHMI, two alphabets of India. Kharosthi was a local alphabet of Aramaic origin, introduced after the Conquests of Darius.

The Brahmi alphabet developed characteristic forms in India where writing can be proved to have been in use since 600 B.C.

KHARPUT, the most important town in the Kharput (or Mamuret el-Aziz) vilayet of Asia Minor, situated at an altitude of 4,350 ft., a few miles south of the Murad Su or Eastern Euphrates, and almost as near the source of the Tigris, on the Samsun-Sivas-Diarbekr road. Pop. (1927) 80,597. The town is built on a hill terrace about 1,000 ft. above a well-watered plain of exceptional fertility which lies to the south and supports a large population. The vilayet has much mineral wealth and fertile soil.

KHARTOUM, the capital of the Anglo-Egyptian Sudan, on the left bank of the Blue Nile immediately above its junction with the White Nile in 15° 36′ N., 32° 32′ E., and 1,252 ft. above the sea. It is 432 m. by rail S.W. of Port Sudan, on the Red Sea, and 1,345 m. S. of Cairo by rail and steamer. Pop. (1926) with suburbs, but excluding Omdurman, 45,116.

The city, laid out on a plan drawn up by Lord Kitchener in 1898, has a picturesque aspect with its numerous handsome stone and brick buildings surrounded by gardens and its groves of palms and other trees. The river esplanade, 2 m. long, contains the chief buildings. Parallel with it is Khedive Avenue, of equal length. The rest of the city is in squares, the streets forming the design of the union jack. In the centre of the esplanade is the governor-general's palace, occupying the site of the palace destroyed by the Mahdists in 1885. It is a three-storeyed building with arcaded verandas and a fine staircase leading to a loggia on the first floor. Here a tablet indicates the spot in the old palace where General Gordon fell. In front of the southern façade, which looks on to Khedive Avenue, is a bronze statue of General Gordon seated on a camel, a copy of the statue by Onslow Ford at Chatham, England.

Government offices and private villas are on either side of the palace, and beyond, on the east, are the Sudan Club, the military hospital, and the Gordon Memorial College. At the western end of the esplanade are the zoological gardens, the chief hotel, the Coptic church and the Mudiria House (residence of the governor of Khartoum). Running south from Khedive Avenue at the spot where the Gordon statue stands, is Victoria Avenue, leading to Abbas Square, in the centre of which is the great mosque with two minarets. On the north-east side of the square are the public markets. The Anglican Cathedral, the principal banks and business houses, are in Khedive Avenue. There are Maronite and Greek churches, an Austrian Roman Catholic mission, a large and well-equipped civil hospital and a museum for Sudan archaeology. A system of electric tramways, completed in 1928, serves the city as well as Khartoum North and Omdurman.

On the right (northern) bank of the Blue Nile is the suburb of Khartoum North, where is the principal railway station. It is joined to the city by a bridge (completed 1910) containing a roadway and the railway. The steamers for the White and the Blue Nile start from the quay along the esplanade. West of the zoological gardens is the point of junction of the Blue and White Niles and here is the bridge, completed in 1928, to Omdurman (*q.v.*) on the west bank of the White Nile a mile below Khartoum.

From its geographical position Khartoum is admirably adapted as a commercial and political centre. It is the great entrepôt for the trade of the Anglo-Egyptian Sudan. By the Nile waterways there is easy transport from the southern and western equatorial provinces and from Sennar and other eastern districts. Through Omdurman come the exports of Kordofan and Darfur, while by the Red Sea railway there is access to the markets of the world.

The population is heterogeneous. The official class is composed chiefly of Europeans, but had a large leaven of Egyptians until the latter were repatriated after the disturbances of 1924. The traders are mostly Greeks, Syrians and Copts, while many tribes of the Sudan are represented in the negro and Arab inhabitants.

In 1822 the Egyptians established a permanent camp here and out of this grew the city, which in 1830 was chosen as the capital of the Sudanese possessions of Egypt. It got its name from the resemblance of the promontory at the confluence of the two Niles to an elephant's trunk, the meaning of *khartum* in the dialect of Arabic spoken in the locality. The city rapidly acquired importance as the Sudan was opened up by travellers and traders, becoming, besides the seat of much legitimate commerce, a great slave mart. In 1884, at the time of the Mahdist rising, General Gordon was sent to Khartoum to arrange for the evacuation by the Egyptians of the Sudan. At Khartoum he was besieged by the Mahdists, whose headquarters were at Omdurman. Khartoum was captured and Gordon killed on Jan. 26, 1885. Nearly every building in Khartoum was destroyed by the mahdists and the city abandoned in favour of Omdurman, which place remained the headquarters of the mahdi's successor, the khalifa Abdullah, till September 1898, when it was taken by the Anglo-Egyptian forces under General (afterwards Lord) Kitchener, and the seat of government again transferred to Khartoum. In 1899 the railway from Wadi Halfa was completed to Khartoum, and in 1906 through communication by rail was established with the Red Sea.

KHASI AND JAINTIA HILLS, a district of British India, in the Surma valley and the Hill Districts division of Assam. It occupies the central plateau between the valleys of the Brahmaputra and the Surma. Area, 6,022 sq.m.; pop. (1921) 243,263.

The district consists of a succession of steep ridges, running east and west, with elevated table-lands between. On the southern side, towards Sylhet, the mountains rise precipitously from the valley of the Surma and form a plateau 4,000 to 6,000 ft. above sea-level. Here is situated the station of Shillong, 4,900 ft. above the sea; behind lies the Shillong range, of which the highest peak rises to 6,450 feet. On the north side, towards Kamrup, are two similar plateaux of lower elevation. The general appearance of all these table-lands is that of undulating grassy downs. At 3,000 ft. elevation the indigenous pine (not found in the Himalayas or elsewhere) predominates and forms almost pure pine forests. The highest ridges are clothed with magnificent clumps of timber trees, chiefly oaks, chestnuts, magnolias. The flora is, in the opinion of Sir Joseph Hooker, the richest in India, in the extent and number of fine plants; of orchids alone there are 250 kinds.

Oranges, betel-nuts and pineapples are a source of wealth to the Khasis. The orange groves supply the greater part of Bengal and Assam; the pineapple is almost like a weed in the profusion of its growth. Potatoes are cultivated and exported on a large scale. Iron ore exists in the central plateau, where the remains of smelting furnaces may be seen for miles below Cherrapunji. The industry has almost died out owing to the competition of English iron and the exhaustion of local supplies of fuel. Vast deposits of limestone are found and quarried on the southern face of the hills. Coal of fair quality crops out at several places.

The Khasi hills were conquered by the British in 1833 but the people were left in semi-independence under their own chiefs. The Lushais still live in primitive communities under elective chiefs in political subordination to the British Government. Shillong and a few villages are under direct British government. The remainder are grouped in 25 petty States, each under a chief, called a Siem, with a Darbar or Council. The chiefs and Darbars exercise independent jurisdiction but heinous offences and cases in which subjects of different States are concerned are tried by the district authorities.

The Jaintia hills are British territory; they used to form a petty Hindu principality which was annexed in 1835, the rajah having kidnapped British subjects and sacrificed them to Kali. The inhabitants are called Syntengs.

The headquarters of the district were transferred in 1864 from Cherrapunji to Shillong, which was afterwards made the capital of the province of Assam. A good road runs north from Cherrapunji, through Shillong to Gauhati on the Brahmaputra; total length 97 m. The district was the focus of the great earthquake of 1897, which not only destroyed every permanent building, but broke up the roads and caused many landslips. The Welsh Presbyterian mission has been an agent of civilization in the district since 1841. Besides its evangelistic efforts, which have had much

success, it has done valuable educational and medical work. One-sixth of the population is now Christian. (L. S. O'M.)

The Khasi People.—The Khasis are of short stature, mesaticephalic, hair sometimes straight, sometimes curly, light complexion, platyrrhine nose, of mixed origin (*see* ASIA: *Ethnology*), but speaking a Mon-Khmer language. The use of shouldered iron hoes and of long two-handled iron swords also suggests a Khmer culture. Iron is dug and smelted. Menhirs and table-stones as cenotaphs, generally speaking, of male and female ancestors respectively were until recently freely erected and are often of great size, a menhir at Nartiang measuring 26 ft. above ground and a table-stone at Laitlyngkot $28\frac{1}{2}$ x $13\frac{3}{4}$ x $1\frac{5}{8}$ ft. Menhirs are sometimes capped with a round stone and occasionally carved. They may be compared to the stones at Dimapur in the Naga hills and to certain types in Chota Nagpur, and are probably phallic in original intention. Ideas of ancestor worship are strong, but there is a belief also in a Creator or Creatrix. Tabu exists, also divination by egg-breaking. Property passes by the female line and is always inherited by the youngest daughter, and the social organization is by matrilineal exogamous clans some of which are eponymous while the names of some suggest a totemistic origin. Public affairs, however, are a purely male province. Their political organization is into a number of variously constituted states administered by chiefs called *Siems* in some cases hereditary, in others elective, where the hereditary principle obtains the succession goes to the youngest daughter's eldest son. The dead are burnt and the uncalcined bones placed in small stone cairns. Periodically the bones from these cairns are collected with ceremony and placed in a family burial cromlech, different cromlechs being used for the bones of males and of females. The bones and ashes are in some villages put into a hollowed erect post as an intermediate resting-place, and the Siem of Cherra is pickled, and can only be burnt by his successor after accession. Head-hunting used to be practised and the head placed on a table-stone. Remnants of human sacrifice and snake-worship survive in the cult of the Thlen, a phantom serpent whose cult is hereditary in certain families and requires the offering of a human life. Human victims were also regularly sacrificed in the Synteng Kingdom of Jaintia, and these sacrifices were accompanied by a form of ceremonial cannibalism.

See P. R. Gurdon, *The Khasis* (1914). (J. H. H.)

KHASKOVO (also *Chaskoi, Haskoi, Khaskioi, Chaskovo, Haskovo, Khaskoy*), a town of southern Bulgaria; 45 m. E.S.E. of Philippopolis. Pop. (1926) 26,316. The town has a station 7 m. N. on the Philippopolis-Adrianople section of the Belgrade-Constantinople railway. Carpets and woollen goods are manufactured, and in the surrounding country tobacco and silk are produced.

KHAZARS (known also as Chozars, *Akatziroi,* Khazirs, Khwalisses, and Ugri Bielii), an ancient people who occupied a prominent place amongst the secondary powers of the Byzantine state-system. They were the organizers of the transit between the Black Sea and the Caspian, the universal carriers between East and West. The area under their control varied greatly, but the normal Khazaria may be taken as the area between the Caucasus, the Volga, and the Don, with the outlying province of the Crimea (Little Khazaria).

History.—Amidst the white race of the steppe the Khazars can be first historically distinguished at the end of the 2nd century A.D. They burst into Armenia with the Barsileens, A.D. 198. They were repulsed and attacked in turn. The pressure of the nomads of the steppe, the quest of plunder or revenge, these seem the only motives of these early expeditions; but in the long struggle between the Roman and Persian empires, of which Armenia was often the battlefield, and eventually the prize, the attitude of the Khazars assumed political importance. Armenia inclined to the civilization and ere long to the Christianity of Rome, whilst her Arsacid princes maintained an inveterate feud with the Sassanids of Persia. It became, therefore, the policy of the Persian kings to call in the Khazars in every collision with the empire (200–350). During the 4th century, however, the growing power of Persia culminated in the annexation of eastern Armenia. The Khazars, endangered by so powerful a neighbour, passed from under Persian influence into that remote alliance with Byzantium which thenceforth characterized their policy, and they aided Julian in his invasion of Persia (363). Simultaneously with the approach of Persia to the Caucasus the terrible empire of the Huns sprang up among the Ugrians of the northern steppes. The Khazars, straitened on every side, remained passive till the danger culminated in the accession of Attila (434). The emperor, Theodosius, sent envoys to bribe the Khazars (Ἀκάτζιροι) to divert the Huns from the empire by an attack upon their flank. But there was a Hunnic party amongst the Khazar chiefs. The design was betrayed to Attila, and he extinguished the independence of the nation in a moment. Khazaria became the appanage of his eldest son and the centre of government amongst the eastern subjects of the Hun (448). Even the iron rule of Attila was preferable to the time of anarchy that succeeded it. Upon his death (454) the wild immigration which he had arrested revived. The Khazars and the Sarogours (*i.e.*, White Ogors, possibly the Barsileens of the Volga delta) were swept along in a flood of mixed Tartar peoples which the conquests of the Avars had set in motion. The Khazars and their companions broke through the Persian defences of the Caucasus. They appropriated the territory up to the Kur and the Aras and roamed at large through Iberia, Georgia and Armenia. The Persian king implored the emperor, Leo I., to help him defend Asia Minor at the Caucasus (457), but Rome was herself too hard pressed, nor was it for 50 years that the Khazars were driven back and the Pass of Derbent fortified against them (*c.* 507).

Throughout the 6th century Khazaria was the mere highway for the wild hordes to whom the Huns had opened the passage into Europe, and the Khazars took refuge (like the Venetians from Attila) amongst the 70 mouths of the Volga. The pressure of the Turks in Asia precipitated the Avars upon the West. The conquering Turks followed in their footsteps (560–80). They beat down all opposition, wrested even Bosporus in the Crimea from the empire, and by the annihilation of the Ephthalites completed the ruin of the White Race of the plains from the Oxus to the Don. The empires of Turks and Avars, however, ran swiftly their barbaric course, and the Khazars arose out of the chaos to more than their ancient renown. They issued from the land of Barsilia, and extended their rule over the Bulgarian hordes left masterless by the Turks, compelling the more stubborn to migrate to the Danube (641). The agricultural Slavs of the Dnieper and the Oka were reduced to tribute, and before the end of the 7th century the Khazars had annexed the Crimea, had won complete command of the Sea of Azov, and, seizing upon the narrow neck which separates the Volga from the Don, had organized the portage which has continued since an important link in the traffic between Asia and Europe. The alliance with Byzantium was revived. Simultaneously, and no doubt in concert, with the Byzantine campaign against Persia (589), the Khazars had reappeared in Armenia, though it was not till 625 that they appear as Khazars in the Byzantine annals. They are then described as "Turks from the East," a powerful nation which held the coasts of the Caspian and the Euxine, and took tribute of the Viatitsh, the Severians, and the Polyane. The khakan, enticed by the promise of an imperial princess, furnished Heraclius with 40,000 men for his Persian war, who shared in the victory over Chosroes.

Meanwhile the Muslim empire had arisen. The Persian empire was struck down (637), and the Muslims poured into Armenia. The khakan, who had defied the summons sent him by the invaders, now aided the Byzantine patrician in the defence of Armenia. The allies were defeated, and the Muslims undertook the subjugation of Khazaria (651). Eighty years of warfare followed, but in the end the Muslims prevailed. The khakan and his chieftains were captured and compelled to embrace Islam (737), and till the decay of the Mohammedan empire Khazaria, with all the other countries of the Caucasus, paid an annual tribute of children and of corn (737–861). Nevertheless, though overpowered in the end, the Khazars had protected the plains of Europe from the Mohammedans and made the Caucasus the limit of their conquests.

In the interval between the decline of the Mohammedan empire and the rise of Russia, the Khazars reached the zenith of their power. The merchants of Byzantium, Armenia and Bagh-

dad met in the markets of Itil (whither, since the raids of the Mohammedans, the capital had been transferred from Semender) and traded for the wax, furs, leather, and honey that came down the Volga. So important was this traffic held at Constantinople that, when the portage to the Don was endangered by the irruption of a fresh horde of Turks (the Petchenegs), the emperor, Theophilus, himself despatched the materials and workmen to build for the Khazars a fortress impregnable to their forays (834). Famous as the one stone structure in that stoneless region, the post became known far and wide amongst the hordes of the steppe as Sar-kel or the White Abode. Merchants from every nation found protection and good faith in the Khazar cities. The Jews, expelled from Constantinople, sought a home amongst them, developed the Khazar trade, and contended with Mohammedans and Christians for the theological allegiance of the Pagan people. The dynasty accepted Judaism (*c.* 740), but there was equal tolerance for all, and each man was held amenable to the authorized code, and to the official judges of his own faith. At the Byzantine court the khakan was held in high honour. The emperor, Justinian Rhinotmetus, took refuge with him during his exile and married his daughter (702). Justinian's rival, Vardanes, in turn sought an asylum in Khazaria, and in Leo IV. (775) the grandson of a Khazar sovereign ascended the Byzantine throne. Khazar troops were amongst the bodyguard of the imperial court; they fought for Leo VI. against Simeon of Bulgaria; and the khakan was honoured in diplomatic intercourse with the seal of three solidi, which marked him as a potentate of the first rank, above even the pope and the Carolingian monarchs. Indeed, his dominion became an object of uneasiness to the jealous statecraft of Byzantium, and Constantine Porphyrogenitus, writing for his son's instruction in the government, carefully enumerates the Alans, the Petchenegs, the Uzes, and the Bulgarians as the forces he must rely on to restrain it.

It was, however, from a power that Constantine did not consider, that the overthrow of the Khazars came. The arrival of the Varangians amidst the scattered Slavs (862) had united them into a nation. The advance of the Petchenegs from the East gave the Russians their opportunity. Before the onset of those fierce invaders the precarious suzerainty of the khakan broke up. By calling in the Uzes, the Khazars did, indeed, dislodge the Petchenegs from the position they had seized in the heart of the kingdom, between the Volga and the Don, but only to drive them inwards to the Dnieper. The Hungarians, severed from their kindred and their rulers, migrated to the Carpathians, whilst Oleg, the Russ prince of Kiev, passed through the Slav tribes of the Dnieper basin with the cry "Pay nothing to the Khazars" (884). The kingdom dwindled rapidly to its ancient limits between the Caucasus, the Volga, and the Don, whilst the Russian traders of Novgorod and Kiev supplanted the Khazars as the carriers between Constantinople and the North. When Ibn Faḍlān visited Khazaria 40 years later, Itil was even then a great city, with baths and market places and 30 mosques. But there was no domestic product or manufacture; the kingdom depended solely upon the now precarious transit dues, and administration was in the hands of a major domus also called khakan. At the assault of Swiatoslav of Kiev the rotten fabric crumbled into dust. His troops were equally at home on land and water. Sarkel, Itil, and Semender surrendered to him (965–969). He pushed his conquests to the Caucasus and established Russian colonies upon the Sea of Azov. The principality of Tmutarakan, founded by his grandson, Mstislav (988), replaced the kingdom of Khazaria, the last trace of which was extinguished by a joint expedition of Russians and Byzantines (1016).

Krauss, "Zur Geschichte der Chazaren," in *Revue orientale pour les études Ourals-altaïques* (1900).

KHEDIVE, a Persian word meaning prince or sovereign, granted as a title by the sultan of Turkey in 1867 to his viceroy in Egypt, Ismail. The title was abandoned on the assumption of the style of "sultan" by Husein Kamel in 1914.

KHERI, a district of British India, in the Lucknow division of the United Provinces, which takes its name from a small town with a railway station 81 m. N.W. of Lucknow. The area of the district is 2,976 sq.m., and its population in 1921 was 913,475. It consists of a series of fairly elevated plateaus, separated by rivers flowing from the north-west, each bordered by alluvial land. North of the river Ule, flow two rivers, the Kauriala and Chauka, changing their courses constantly, so that the surface is seamed with deserted river beds much below the level of the surrounding country. The vegetation is very dense, and the stagnant waters are the cause of endemic fevers. South of the Ul, the scene changes. Between every two rivers or tributaries stretches a plain, considerably less elevated than the tract to the north. There is very little slope in any of these plains for many miles, and marshes are formed, from which emerge the headwaters of many secondary streams, which in the rains become dangerous torrents, and frequently cause devastating floods. Several large lakes exist, some formed by the ancient channels of the northern rivers, being fine sheets of water, fringed in places with magnificent groves. The whole north of the district is covered with vast forests, of which a considerable portion are government reserves. *Sāl* occupies about two-thirds of the forest area. The district is traversed by a branch of the Oudh and Rohilkhand railway from Lucknow to Bareilly.

KHERSON, a port of the Ukrainian S.S.R., on a hill above the right bank of the Dnieper, about 19 m. from its mouth in 46° 37′ N., 32° 37′ E. Pop. (1926) 57,376. The river is being dredged to a minimum depth of 21 ft., and a new harbour is in course of construction in which there will be accommodation for 18 steamers. There are 10 floating grain elevators, and a floating dock lifting 2,000 tons. Goods are mostly shipped from barges by floating elevators in the stream. Winter is severe and the port is closed for navigation from December till early March. The exports are mainly grain and timber, and the imports general merchandise for local needs. It has flourmills, and breweries and manufactures machinery. Its only railway link is via Nikolayev. The name was given to the town from the supposition that it was on the site of the former Chersonesus Heracleotica, a Greek city founded by the Dorians of Heraclea. Kherson was founded by Potemkin in 1778 as a naval station and seaport and by 1786 it had grown to be a place of 10,000 inhabitants. Near Kherson lie the remains of John Howard, the English philanthropist, who died here in 1790.

KHEVENHÜLLER, LUDWIG ANDREAS (1683–1744), Austrian field-marshal, Count of Aschelberg-Frankenburg, first saw active service under Prince Eugène in the War of the Spanish Succession, and by 1716 had risen to the command of Prince Eugène's own regiment of dragoons. He distinguished himself greatly at the battles of Peterwardein and Belgrade, and became in 1723 major-general of cavalry, in 1726 proprietary colonel of a regiment and in 1733 lieutenant field marshal. In the War of the Polish Succession (1734) he was present at several actions, and for a time commanded the army in Italy. In 1737 he was made field marshal. His chief exploit in the Turkish War, which soon followed his promotion, was at Radojevatz (Sept. 1737), where he cut his way through a greatly superior Turkish army. In the War of the Austrian Succession he was commander-in-chief of the Army of the Danube, which he led brilliantly against the French and Bavarians in 1742, overrunning Bavaria and capturing Munich in the following campaigns; though placed under Prince Charles of Lorraine he showed equal skill. He died suddenly at Vienna, Jan. 26, 1744.

He was the author of various instructional works for officers and soldiers (*Des G.F.M. Grafen v. Khevenhüller Observationspunkte für*

sein Dragoner-regiment (1734 and 1748) and a *règlement* for the infantry (1737), and of an important work on war in general, *Kurzer Begriff aller militärischen Operationen* (Vienna, 1756; French version, *Maximes de guerre*, Paris, 1771).

KHEVSURS, a people of the Caucasus, kinsfolk of the Georgians. They live in scattered groups in East Georgia to the north and north-west of Mount Borbalo. Their name is Georgian and means "People of the Valleys." For the most part nomadic, they are still in a semi-barbarous state. In complexion and colour of hair and eyes they vary greatly. They are fond of fighting, and still wear armour of the true mediaeval type, when the law of vendetta, which is sacred among them as among most Caucasian peoples, compels them to seek or avoid their enemy.

Many curious customs still prevail among the Khevsurs, as for instance the imprisonment of the woman during childbirth in a lonely hut, round which the husband parades, firing off his musket at intervals. After delivery, food is surreptitiously brought the mother, who is kept in her prison a month, after which the hut is burnt. The boys are usually named after some wild animal, *e.g.*, bear or wolf, while the girls' names are romantic, such as Daughter of the Sun, Sun of my Heart. Children are betrothed by parents. Divorce is common, and some Khevsurs are polygamous. Formerly no Khevsur might die in a house, but was always carried out under the sun or stars. The Khevsurs call themselves Christians, but their religion is a mixture of Christianity, Mohammedanism and heathen rites. They keep the Sabbath of the Christian church, the Friday of the Mohammedans and the Saturday of the Jews. They worship sacred trees and offer sacrifices to the spirits of the earth and air. Their priests are a combination of medicine-men and divines.

See G. F. R. Radde, *Die Chevs'uren und ihr Land* (Cassel, 1878); E. Chantre, *Recherches anthropologiques dans le Caucase* (1885–87).

KHIDR (pronounced *Khisr* by the Persians and Turks, and with different vocalization pronounced also as *Khadir* and as *Khudr*), a Mohammedan saint who according to the popular belief still lives as an omnipresent being. He reveals himself to those worthy of his companionship and advises and aids them. He watches over the welfare of all and especially of sailors who regard him as their particular patron saint. Sacrifices are offered to him whenever boats are launched. Khidr is declared to have inspired many Mohammedan prophets and authors and to have revealed their doctrine to them. In Mohammedan literature and poetry he is often mentioned as the only one who gained immortal life by drinking from the fountain of life. The role of the Khidr figure conforms closely to the role played by the prophet Elijah in Judaism, especially in his being immortal, omnipresent, and a helping adviser and guide. He is also like Elijah the consoler of those bereaved. Several stories of Elijah which were current in the Jewish world of the early Christian era have been incorporated with slight changes into the Koran where they are identified with the Khidr figure. One chief difference, however, is that while Elijah is a figure of the land, Khidr is "one who traverses the seas." This identification of Khidr with the sea is believed to be a survival of pagan legends and myths which Mohammedanism accumulated in its spread over Islam countries. In Syria Khidr is revered and practically worshipped as a sacred divinity. Countless sanctuaries where sacrifices are offered up to him are scattered over the country. "Khidr is near but God is far," as one of the inhabitants expressed it to an inquirer. The theologians of the official Mohammedan religion have tried to suppress these extravagant Khidr cults, but so far without success.

See S. I. Curtiss, *Primitive Semitic Religions To-day* (1903).

KHILCHIPUR, a mediatized chiefship in Central India, under the Bhopal agency; area, 273 sq.m.; pop. (1921), 40,043. The residence of the chief, who is a Khichi Rajput of the Chauhan clan, is at Khilchipur in Bhopal (pop. 5,300). He pays tribute to India, and has a salute of 9 guns.

KHINGAN, two mountain ranges in east Asia consisting of Great Khingan and Little Khingan. Great Khingan, a tilted fault-block, trends north-north-east by south-south-west, and stretches through 15° of latitude from the northern border of Shansi province in China as far as the northern bend of the Amur river, so forming the easternmost bastion of the high Mongolian plateau, the surface of which slopes upwards to the axis of the Khingan, 4,500–5,500 feet. Suess regarded it as the edge of the ancient archean core of north central Asia which he termed Angaraland. This buttressing range, whose highest slopes and valleys are forested, also forms the western "wall" of the Manchurian basin. The base of its gradual western slope lies at an altitude of 3,000 ft., but to the east the range falls more rapidly to the plains of central Manchuria whose undulations are partly caused by projecting spurs from the Great Khingan. It forms one of the most important orographical divides in Asia, for it intercepts the moisture-laden south-east winds and is thus a main factor in the contrast between fertile Manchuria on one hand and arid Mongolia on the other. Several outlying ranges on its eastern fringe give it the form of a terraced escarpment; the whole system is from 80 to 100 m. wide.

Little Khingan range trends from west to east and separates the Sungari valley from that of the Amur. It may be regarded as an offshoot of the Great Khingan, and like its parent range consists of old archean schists and igneous rocks. It is probably continued to the north-east by the Bureya mountains and Dusse-alin across the Amur river which, in this section of its course, is transverse, piercing terraced scarps with the south-west by north-east trend characteristic of Trans-Baikalia.

KHIVA, a town of Asiatic Russia in the Kharezm district of the Uzbek S.S.R. in 41° 30′ N., 60° 18′ E., lying 25 m. west of the Amu Darya, on which it and the oasis around it depend for irrigation. Pop. (1926) 19,866. The town was formerly the centre of a flourishing kingdom of great antiquity, which has declined owing to various physiographical and political causes. In very ancient times the Amu Darya flowed to the Caspian and thus possibly linked the oasis kingdom with the west, by the Sary Kamish depression. Later the river changed its course and now flows into the Sea of Aral. The increasing desiccation of Turkistan and the constant shift of the river towards the east, with consequent difficulties of irrigation to the oasis are other physiographical factors in its decline. The final political blow, following on a long series of troubles, was the heavy war indemnity imposed upon the khanate after the capture of the town in 1873. The whole region was involved in the civil strife following the 1917 revolution and the khanate ceased to exist, becoming absorbed in the Uzbek republic, but the effects of civil war on the delicate balance of irrigated regions are disastrous and the oasis is at present much crippled, especially as no railway net yet reaches it, and funds are lacking for energetic measures to cope with the hydrographic problem of the Amu Darya. For its present economic condition *see* UZBEK OR USBEK REPUBLIC. (X.)

History.—Khiva was once a great kingdom, under which the names of Chorasmia, Kharezm (Khwārizm) and Urgenj (Jurjānīya, Gurganj) held the keys of the mightiest river in Central Asia. The Oxus (Amu Darya) has changed its outlet, and no longer forms a waterway to the Caspian and thence to Europe.

Chorasmia is mentioned by Herodotus, it being then one of the Persian provinces, over which Darius placed satraps, but nothing material of it is known till it was seized by the Arabs in A.D. 680. When the power of the caliphs declined the governor of the province probably became independent; but the first king known to history is Mamun-ibn-Mohammed in 995. Khwārizm fell under the power of Mahmud of Ghazni in 1017, and subsequently under that of the Seljuk Turks. In 1097 the governor Kutb-ud-din assumed the title of king, and one of his descendants, 'Ala-ud-din Mohammed conquered Persia, and was the greatest prince in Central Asia when Jenghiz Khan appeared in 1219. Khiva was conquered again by Timur in 1379, and by the Uzbeks in 1512.

Russia established relations with Khiva in the 17th century. The Cossacks of the Yaik during their raids across the Caspian learnt of the existence of this rich territory and made more than one plundering expedition to the chief town, Urgenj. In 1717 Peter the Great, having heard of the presence of auriferous sand in the bed of the Oxus, desiring also to "open mercantile relations with India through Turan," and to release from slavery some Russian subjects, sent a military force to Khiva. When within

1oom. of the capital they encountered the troops of the khan. The battle lasted three days, and ended in victory for the Russian arms. The Khivans, however, induced the victors to break up their army into small detachments and treacherously annihilated them in detail. It was not until the third decade of the 19th century that the attention of the Muscovite government was again directed to the khanate. In 1839 a force under Gen. Perovsky moved from Orenburg across the Ust-Urt plateau to the Khivan frontiers, to occupy the khanate, liberate the captives and open the way for trade. This expedition likewise terminated in disaster. In 1847 the Russians founded a fort at the mouth of the Jaxartes or Syr Darya. This advance deprived the Khivans not only of territory, but of a large number of tax-paying Kirghiz, and also gave the Russians a base for further operations. For the next few years, however, the attention of the Russians was taken up with Khokand, their operations on that side culminating in the capture of Tashkent in 1865. Free in this quarter, they directed their thoughts once more to Khiva. In 1869 Krasnovodsk on the east shore of the Caspian was founded, and in 1871–72 the country leading to Khiva from different parts of Russian Turkistan was thoroughly explored and surveyed. In 1873 an expedition to Khiva was carefully organized on a large scale. The army of 10,000 men placed at the disposal of Gen. Kaufmann started from three different bases of operation—Krasnovodsk, Orenburg and Tashkent. Khiva was occupied almost without opposition. All the territory (35,700sq.m. and 110,000 souls) on the right bank of the Oxus was annexed to Russia, while a heavy war indemnity was imposed upon the khanate. In the summer of 1919 the Soviet Government firmly established itself in this area and the native dynasty was expelled. By autumn the Khan of Khiva was deposed and a People's Soviet Republic was substituted for the khanate The remaining sections of Russian Turkistan with Khiva and Bukhara and the Trans-Caspian province now constitute the two Socialist Soviet Republics of Uzbekistan and Turkmenistan. In Oct. 1924 these two republics were admitted to membership of the U S S R. The part of Khiva situated on the right bank of the Oxus is to-day part of Turkmenistan.

(C. EL.; A. N J. W.)

KHNOPFF, FERNAND (1858–1921), Belgian painter and etcher, was born at the château de Grembergen (Termonde), on Sept. 12, 1858, and studied under X. Mellery He developed a very original talent, his work being characterized by great delicacy of colour, tone and harmony, as subtle in spiritual and intellectual as in its material qualities. "A Crisis" (1881) was followed by "Listening to Schumann," "St. Anthony" and "The Queen of Sheba" (1883), and then came one of his best known works, "The Small Sphinx" (1884) Others are "Memories" (1889) and "White, Black and Gold" (1901) in the Brussels museum; "Portrait of Mlle. R." (1889); "A Stream at Fosset" (1897); "The Empress" (1899); "A Musician"; "Silence" (1890); "The Idea of Justice" (1905) and "Isolde" (1906), together with a polychrome bust "Sibyl" (1894) and an ivory mask (1897). "I lock my Door upon Myself (1891), which was exhibited at the New gallery, London, in 1902 and there attracted much attention, was acquired by the Pinakothek at Munich. He died on Nov. 14, 1921.

See L. Dumont-Wilden, *Fernand Khnopff* (Brussels, 1907).

KHOI. A district and town in the Persian province of Azerbaijan, lying in the north-west corner of Persia between Lake Urmia and the R. Aras. The district, which contains many flourishing villages, consists of an elevated valley 16 to 18 miles long and 8 miles broad, well drained and highly cultivated under a skilful system of irrigation which produces rich crops of wheat, barley, rice, cotton, and many kinds of fruit. Timber however is scarce as the surrounding hills are treeless.

The town of the same name lies in 38° 37′ N. by 45° 15′ E., at an elevation of 3,000 ft., 91 miles north-west of Tabriz, on the great trade-route from Trebizond at its junction with the road from Urmia to the Aras. The Kotur Chai tributary of the latter river flows two miles to the east of the town and is crossed by a brick-built bridge of 7 arches, 75 yd. long, with a roadway of 18 ft. Owing to its topographical position with reference to the frontiers of Persia, Turkey and Russia, Khoi seems always to have been regarded as possessing considerable strategical importance, and in the early part of the 19th century was surrounded with strong fortifications under the direction of a French engineer. James Morier saw the building work in progress when he passed through in 1810. The design took the form of a quadrilateral with faces 1,200 yd. in length and fortifications consisting of 2 lines of bastions and fosses, which made Khoi the most strongly fortified town in Persia. The city however surrendered to the Russians in 1827 without fighting and for some time after the conclusion of the ensuing treaty of Turkmanchai (Feb. 1828) was held by a garrison of 3,000 Russian troops as a guarantee for the payment of the war indemnity. During the Crimean war and again during the Russo-Turkish war of 1877–78 a considerable body of Persian troops was located there at the request of Russia. In the early part of 1911 the place was occupied by Turkish troops who however withdrew when a Russian Consul General put in an appearance with an escort of 4,000 men, and during the ensuing year this number was increased to something between 9 and 10 thousand, of all arms.

If its extensive suburbs are included, the population of Khoi must approach 60,000 souls, but of these only about one-third live within the walls. The community includes a considerable Armenian element, probably 500 families, who inhabit a quarter of their own outside the walls. The city within the walls is one of the best laid out towns in Persia, cool streams with lines of willows running along its broad and regular streets. There are some good buildings, including the Governor's residence; several mosques, an extensive brick-built bazaar and a fine caravanserai, and the town is the centre of a considerable transit trade as well as of local traffic with the districts across the Turkish border.

KHOJENT or **KHOJEND,** a town of Asiatic Russia, in the Khojent district of the Uzbekistan S S.R., on the left bank of the Syr-darya or Jaxartes, in 40° 18′ N., 69° 42′ E. Pop. (1926) 37,258 mainly Tajiks. The narrow Khojent pass is the entrance to the Ferghana valley, and the railway and the main road from Bukhara both utilize it. Before the Russian occupation there was much strife between the Khanates of Khokand and Bukhara as to the possession of this strategic point. In 1866 the town was stormed by the Russians and it played an important part in their war with Khokand in 1875. Irrigation from the Jaxartes is rendered difficult here by the height of the river bank. Cotton plantations, fruit gardens and vineyards surround the town, and silk worms are reared. There are a civic electric station and a cotton cleaning factory; the inhabitants weave and embroider cotton and silk goods.

KHOLM: *see* CHELM.

KHOLMOGORY, the capital of the district Kholmogory in Archangel, a former government of European Russia and now a province of the R.S.F.S.R., situated south-east of Archangel. Excellent cattle are raised on the Dvina in the district of Kholmogory which also contains sulphurous springs.

KHOND (Kandh), a Kui-speaking aboriginal tribe found in Orissa and the Ganjam district of Madras in India. In 1835 the Khonds attracted attention by their human sacrifices known as *meriah.* These were offered to ensure good crops, and the greater the victim's sufferings the better the crop. The victims had to be purchased to be efficacious and strangers were preferred. The *meriah* was well treated and, if a female, was encouraged to bear children before being immolated. The rites were simple and accompanied by orgies which lasted three days. Ten or twelve days before the sacrifice the victim's hair was cut off, and the villagers having bathed, went with the priest to the sacred grove to forewarn the goddess. The Khonds are as tall as the average Hindu and not much darker, while in features they are very Aryan. They are undoubtedly a mixed Dravidian race, with much Aryan blood. The Khond language is more closely related to Telugu than is Gondi.

See E. Thurston, *Tribes and Castes of Southern India* (1915); H. V. Russell, *Tribes and Castes of the Central Provinces* (1921).

KHORSABAD, a modern village about 12½ miles north-east of Mosul on the left bank of the Khosr. It was excavated by Botta in 1842 and his finds are in the Louvre. It has been usual to iden-

tify this site with Dur Sharrukin, usually translated "Sargon's Burgh," although recently Langdon has suggested that this name should be applied to Agade, now definitely identified with Ed-deir (*see* under AGADE). The town at Khorsabad was of very large extent and must have taken a long time to build, covering as it did 741 acres, over a square mile. It is rectangular in form; partly within and partly outside the city walls stood the royal palace, which was built on a terrace 45 feet high and covered 25 acres. It includes a temple and great stage tower and the palace itself with long endless sculptured corridors. The whole was found in good state of preservation and has been of great importance as it was excavated very early in the history of Assyriology, but fortunately at the same time with considerable care.

BIBLIOGRAPHY.—P. E. Botta and E. Flandin, *Monument de Ninive,* Paris, 1850 (an account of the original excavation); *Cambridge Ancient History,* vol. 1, 1923 (bibliography); S. Langdon, *Kish,* Paris, 1924.

KHOTAN, an oasis in the Tarim basin, situated on the Yurung-kash river, on the southern edge of the Takla-makan desert, China. The oasis is about 200 m. S.E. of Yarkand, and from the earliest times it has been the largest and most important of the group of oases along the southern margin of the Tarim basin. The oasis which comprises three towns, Khotan, or Ilchi; Yurung-kash and Kara-kash, occupies a terrace of fertile loess extending for nearly 40 miles along the northern foot of the Kunlun mountains. It owes its fertility to two rivers, the Yurungkash and Kara-kash which later unite to form the Khotan-darya. These rivers afford good irrigation and are responsible for much of the loess on which the oasis has grown up. Some of it is alluvium, washed down by these rivers from the Kunlun, but most of it is the result of subaerial deposit.

Khotan was a relatively weak state in the time of the early Han dynasty, but, in the later part of the first century of our era when China was energetically establishing control over the Tarim basin, its geographical position as the largest oasis and best supply base on the more southerly of the two chief routes to the West, and as a connecting link between Central Asia and India, gave it great importance. Its connection with India is illustrated by the fact that Buddhism reached China via Khotan which was for a time a famous centre of Buddhist learning. A rich prize in itself and the key to many trade routes, Khotan has experienced many fluctuations of political fortune. Conquered by the famous general Pan Ch'ao in A.D. 70 it was held by China during the later Han dynasty, and again under the Tangs in the seventh century when it was one of the four garrison centres from which the Tarim basin was then administered. In the following century it was conquered by the Arabs from West Turkistan and in the tenth it was annexed by Kashgar. Genghis Khan captured it in the 13th century and later it was included in the Mongol Central Asian khanate (Changatai). During this period Marco Polo passed through it (1274) and noted its agricultural wealth, especially of cotton, its commercial importance and the unwarlike character of its inhabitants. In recent centuries it has been one of the chief centres of Mohammedan activity in Chinese Central Asia and played a prominent part in the Dungan revolt against Chinese authority (1864–75) and that of Yakub Beg of Kashgar a year or two later.

The surrender of Kashgar and Khotan to the famous "agricultural army" in 1878 marked the final stage in the reassertion of Chinese authority and Khotan is now included in the province of Sinkiang, of which it is one of the chief centres. Its administration is typical of an area where irrigation is the basis of economic organization. The oasis is divided into a series of communes, corresponding to the areas irrigated by each of the chief canals. This enables the water to be distributed fairly and ensures that the expenses incidental to the upkeep of the irrigation works are equally divided amongst the peasants.

The oasis is still of outstanding agricultural importance. The staple cereals are wheat, rice, oats, millet and above all Indian corn. The early harvest of the spring-sown crops and the abundant water-supply in summer permit of its being grown everywhere as a second crop. The cotton crop is also of great value and good fodder crops of lucerne are grown. So too are great quantities of olives and fruits, including apricots, peaches and apples. There is a considerable export of dried fruit, especially to Aksu in the north and to the smaller oases east of Khotan. The cultivation of the mulberry is carried on everywhere as the basis of the silk industry, of which Khotan is an important centre. It has in addition a large manufacture of carpets and felts and ranks as the chief industrial city of East Turkistan. Its metal work is famous and there is extensive mining including that of gold which is still washed from the alluvium in the rivers. For centuries Khotan was famous for jade or nephrite, a semi-precious stone greatly esteemed by the Chinese for making small fancy boxes, bottles and cups, mouthpieces for pipes, bracelets, etc.

The population of the oasis is approximately 220,000. Mongolian traits are rare and the peasants on the whole bear a strong resemblance to the "Aryan" Galchas.

KHULNA, a town and district of British India, in the Presidency division of Bengal. The town stands on the river Bhairab, and is the terminus of a line of the Eastern Bengal State railway, on which much of the boat and steam traffic of Eastern Bengal converges. Pop. (1921), 16,049.

The DISTRICT OF KHULNA, which was formed out of Jessore in 1882, lies in the south of the delta of the Ganges between that district and the Bay of Bengal. Area (excluding the Sundarbans), 2,011 sq m.; forests in the Sundarbans extend over 2,297 sq. miles. The district is intersected by large tidal rivers, which expand into estuaries as they approach the sea; the rivers are connected by innumerable creeks and channels. The north-east part of the district is swampy; the north-west is more elevated and above flood level, the central part, though low-lying, is also under cultivation; the Sundarbans is an uninhabited area of swampy forest-clad islands. In 1921 the population was 1,453,034. Rice is the principal crop; jute ranks next in importance. The chief industries are fishing, boat-building and the manufacture of molasses from the date palm.

KHUNSAR, a town of Persia, sometimes included in the province of 'Iraq (Persian), and at others in that of Isfahan, situated in 33° 9′ N. by 50° 23′ E., at an elevation of 7,900 ft. The town, which lies on the Isfahan-Gulpaigan-Sultanabad highway and has a population of about 10,000 is picturesquely situated on both sides of a valley half-a-mile wide, through which runs a narrow stream of the same name, flowing in a north-easterly direction towards Qum. The town itself is 2 miles long and its gardens and orchards extend for a further 3 or 4 miles. They yield a great profusion of fruit, especially apples from which a kind of cider is brewed; but its keeping qualities are not sufficient to admit of its export. Grazing in the neighbourhood is good and fuel and timber plentiful. The town possesses 5 caravanserais, 3 mosques and a post-office. The population, in which there is a considerable leaven of *mullahs* and *saiyids* has the reputation of being prone to fanaticism.

KHURASAN originally signified a vast tract of country to the east of Iran, comprising the lands situated to the south of the Amu Darya and to the north of the Hindu Kush. To the Arab geographers, Khurasan had for its boundaries on the east Seistan and India, west the desert of Ghuzz and Jurjan, north Transoxiana, and south and south-west the desert of Persia. Under the present regime in Persia the meaning of the name has gradually become much more restricted and now indicates the north-easterly province of Persia, coterminous on the north with Russian Trans-Caspian territory (the river Atrak serving as the frontier as far as Chat), east with Afghanistan, west with the Persian provinces of Astarabad, Shah Rud, Semnan and Damghan, and Yazd, and south with Kerman. It thus still embraces a tract of very considerable extent measuring some 500 m. from north to south, and 300 m. from east to west and having an area of not less than 125,000 sq.m. It extends southward almost to 30° N. and includes the large district or sub-province of Qainat.

Physical Features.—The surface of the province is essentially mountainous, especially on the north and east. The ranges generally run in parallel ridges enclosing broad valleys with a normal direction from north-west to south-east and elevations in

the southern border of 11–13,000 ft. The whole of the north is occupied by an extensive highland system composed of the Elburz range and its prolongations from the neighbourhood of Shah Rud. The Great Kavir desert obtrudes into Khurasan and occupies its central and western part, and the Dasht i Lut obtrudes similarly in the south. The true character of these great salt depressions which form the distinctive feature of east Persia has scarcely been determined, some regarding them as the beds of dried up seas. The surface of Khurasan is thus very diversified, consisting mainly of highlands, saline swampy deserts and upland valleys, some of which are fertile and well watered. Broadly, the country offers the appearance of a group of oases watered by intermittent rivers and by wells. Of the fertile valleys—occurring mainly in the north—the chief are: the great longitudinal valley stretching north-westward from near the Afghan frontier and Herat, wherein are situated the important towns of Meshed, Kuchan, Shirwan and Bujnurd; the districts of Nishapur and Sabzavar farther south; and the districts around Birjand and Qain still farther south. These tracts produce, in particular, rice and other grains, cotton, tobacco, opium, and fruits in profusion.

The rivers of Khurasan are comparatively small. The most important are: the Atrak rising north-east of Kuchan and flowing into the Caspian sea; the Kashaf Rud or Ab i Meshed which joins the Hari Rud from Afghanistan, the two eventually losing themselves north of the Trans-Caspian railway; and the Kaleh i Mura (of which the Kara Su is a tributary) which rising in the hills near Bujnurd flows south and eventually loses itself in the great desert. All the other rivers are mere torrents which, though they often have a perennial supply near their sources, are so much drawn on for irrigation that it is only in spate that they have sufficient water to reach their terminals in the desert.

Natural Resources and Agriculture.—The mineral products consist of turquoises from the mines at Maadan near Nishapur; salt is found over great areas in the form of a thick efflorescence; and iron, lead, alum, gold and copper are said to exist. Coal is found some 20 m. S. of Meshed, but whether in workable quantities has yet to be determined. The agricultural products are fruits in great variety and most kinds of grain, some silk, saffron, large quantities of asafoetida, and cotton; also manna, tobacco, pistachio nuts and gums. The soil of the various districts is very varied in character and productivity: the north-west, north and north-east have a very rich soil and being abundantly irrigated are all extremely productive, especially of corn. Meshed is in a rich well watered plain as also is Kuchan where rice is said to yield four hundred fold.

Peoples.—Khurasan is peopled by a great variety of races; only that part of the province lying near the Meshed-Tehran roads being occupied mostly by Persians. To the north-west, on the frontier of Astarabad are Turkmans, largely of the Guklan and Yamut tribes. To the north and north-east are the Kurds of Bujnurd and Kuchan. South of Meshed are sections of the 'Amaq tribe of Timuris, while westward of these, around Turbat i Haidari (*q.v.*) are Turks and Baluchis. There are here and there Barbaris (of Mongol origin), Arabs, a few Jews and, scattered all over the country, are gipsies.

Communications and Trade.—The administrative capital of the province is Meshed (*q.v.*) and the provincial revenue amounted in 1926–7 to 29,510,251 krans (£ St.=45 krans). A road suitable for motor traffic traverses the north of the province from Tehran, via Shah Rud to Meshed; and a similar road runs south from Meshed to railhead of the Indian railway system at Duzdab. The Trans-Caspian railway skirts the province on the north, the important station of Ashqabad being only a few miles distant from the Persian frontier. The value of the great trade which passed by way of Meshed in 1925–6 was 38,400,000 krans, of which 19,000,000 krans represented imports. The articles of export, in order of value, were carpets (5,700,000 krans), hides and skins, opium, timber, cotton stuffs, silk and turquoises.

KHURJA, a town of British India, in the Bulandshahr district of the United Provinces, 27 m. N W. of Aligarh, near the main line of the East Indian railway. Pop (1921), 25,719. It is an important centre of trade in grain, indigo, sugar and *ghi*, and has cotton gins and presses and a manufacture of pottery. The principal building in the town is a modern Jain temple, a fine domed structure, which is richly carved and ornamented in gold and colours.

KHURRAMABAD, a Persian town in the province of Burujird (Luristan) in 33° 32′ N., 48° 15′ E., and at an elevation of 4,250 ft. Pop. (1917) 4,000. It is situated 138 m. W N.W. of Isfahan on the Khurramabad river (also called Ab-i-Istaneh) on the shortest route from the Persian Gulf to the main distributing centres of Persia, passing from Mohammerah via Ahwaz and Dizful. The section of this road from Khurramabad to Tehran is practicable for motors. Between the town and river stands the ruined Diz-i-Siyah (black castle), which in the middle ages was the residence of the governor of the district, with annexes called Falak ul Aflak (heaven of heavens).

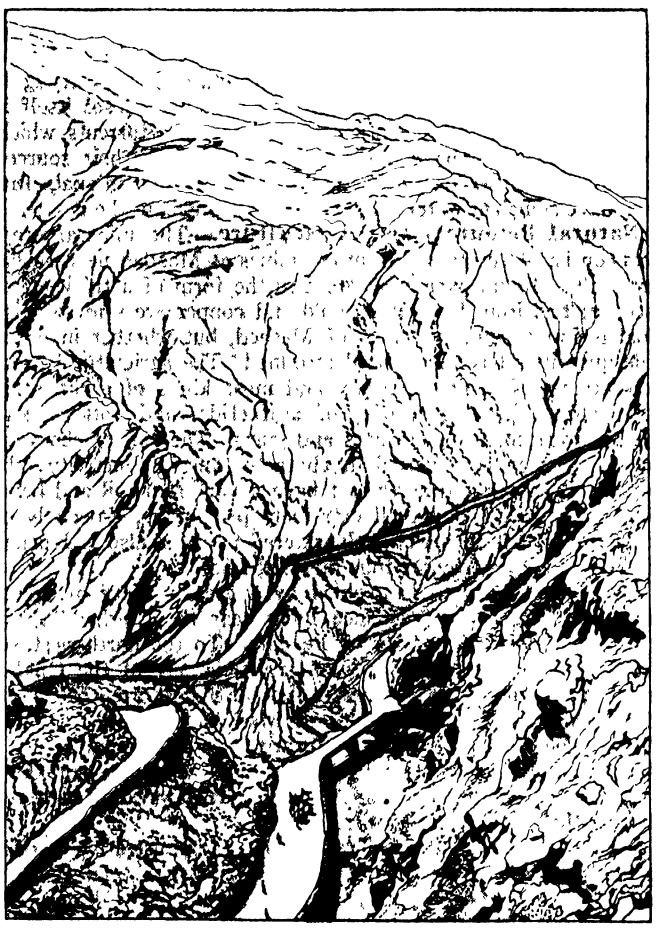
KHUZISTAN (formerly Arabistan), a province of Persia bounded west by the frontier of 'Iraq and the Shatt al Arab, north by the provinces of Burujird (Luristan) and Gulpaigan, east by those of Isfahan and Fars, and south by the Persian gulf. Khuzistan, meaning the "land of the Khuz," was a part of the Biblical Elam and corresponds largely to the ancient Susiana. It is watered and drained mainly by the Karun (*q v*) and the Karkheh river, whose waters are dissipated in the Hawiza marshes. Other independent but smaller streams are the Jerrahi, and Hindian or Tab rivers. All these rivers bring down much silt from the Zagros range and its offshoots in the north, and this goes to create extensive mud-flats in the south towards the coast of the Persian gulf. Thus, broadly, the province falls into two natural physical divisions: the northern mountainous part where the country slopes gently down from the Bakhtiari highlands, bare and shingly; and the southern part, which consists, to a great extent, of open alluvial plains or morasses which in places are fertile and grassy and in other parts wholly barren or else thickly sprinkled with desert scrub.

Population.—The population of Khuzistan has been estimated at about 230,000 settled, and 120,000 nomadic people, but in these figures no account is taken of the Bakhtiaris and Lurs who enter the north-eastern districts in winter, the most important numerically being probably the Sagwand Lurs who encamp in the district of Dizful, sometimes to the number of 15,000. The bulk of the population of Khuzistan is either pure Arab or, more frequently, a mixture of Arab and Persian, and the tribes are settled, or nomadic, or in a transitional stage between the two modes of life. Speaking generally, the tribal system of Khuzistan is rather loose and does not rest upon a rigid basis of race. Whole tribes are sometimes merged and disappear, or are distributed as sections among other tribes Among the more powerful or numerous of the tribal communities are the Kaab, probably numbering 50,000, located in southern Khuzistan around Mohammerah, Jerrahi district and Ahwaz; the Dizfuli around Dizful; the Muhaisin in the Mohammerah and Ahwaz districts; the Shushtari in Shushtar district; the Tamim, Qanawati, and Khamis, nomadic. The Kaab claim to be Awamir or Bani Amir whose original home is stated to have been in Nejd; their political influence, formerly very powerful, has declined in recent years, whilst that of the Muhaisin has risen. Mention should also be made of the tribes who dwell

in the Hawizeh district and who, in summer and autumn encamp in the marshes and in winter roam the deserts with their flocks and herds and who are regarded as turbulent elements.

Soil and Productions.—The soil of Khuzistan is naturally very fertile, but since the Shahdurwan weir across the Karun at Ahwaz was swept away and the numerous canals which diverted the water of the river for irrigation purposes became useless, a great part of that district, once accounted among the richest in Persia, has become uncultivated. A dam across the Karkheh, also, gave way in 1837 and its waters dissipated in marshes, submerged and ruined large areas in the neighbourhood of Hawizeh. Most of the crops depend for water on rainfall or wells. The climate is hot, the relative humidity high and the low-lying swampy districts unhealthy. The prevailing winds are north-west and south-east: the former hot and dry from the arid regions west of Mesopotamia, the latter bearing much moisture from the Persian gulf. Khuzistan is productive in patches. Wheat and barley are the more general crops in their distribution, but rice, cotton, sesame, beans and sugar cane are grown in a number of districts, while linseed, maize and pulse are produced in other localities. Special crops are indigo in the Dizful district, opium and pepper in Shushtar, and tobacco around Ram Hormuz and Aqili.



Communications and Trade.—Ahwaz was, and still is, the most important road centre in the province, being in direct communication with Shiraz by way of Ram Hormuz on the east, with Wasit and Baghdad on the west, with Shushtar, Qum and Tehran on the north (a large part of this road being fit for motor traffic), with Isfahan on the north-east, and with Mohammerah and Basra on the south. The other chief centres of trade and distribution are Dizful, Shushtar and Ram Hormuz, the latter being the market for the produce of the adjacent Bakhtiari and Lur country. The foreign trade of Khuzistan is carried on almost exclusively through Mohammerah (*q.v.*); a smaller port is Bandar Mashur, but it is without steamer communication. By far the most important mineral product is petroleum, from the extensive oilfields of the Anglo-Persian Oil Company, situated east of Shushtar, which is exported from Abadan (*q.v.*).

The revenue of the province amounted to 12,049,291 krans (£ St. = 45 krans) in 1926–7.

KHYBER PASS, the most important of the passes which lead from Afghanistan into India, and is now threaded by road and rail. It is a narrow defile winding between cliffs of shale and limestone 600 to 1,000 ft. high, stretching up to more lofty mountains behind. No other pass in the world has possessed such strategic importance or retains so many historic associations as this gateway to the plains of India. Owing to its difficulty and the intractability of the tribes on the route, it has not been so much used before modern times as has been generally supposed. The great invasions of India, either came via what is now British Baluchistan on Multan, or else if coming via Kabul turned aside somewhere below Jalalabad to travel the easier routes north of the Kabul river. The mountain barrier which separates the Peshawar plains from the Afghan highlands differs in many respects from the mountain barrier which intervenes between the Indus plains and the plateau farther south. To the south this barrier consists of a series of flexures folded parallel to the river, through which the plateau drainage breaks down in transverse lines forming gorges and clefts as it cuts through successive ridges. West of Peshawar the strike of the mountain systems is roughly from west to east, and this formation is maintained with more or less regularity as far south as the Tochi river and Waziristan. Almost immediately west of Peshawar, and stretching along the same parallel of latitude from the meridian of Kabul to within ten miles of the Peshawar cantonment, is the great central range of the Safed Koh, which forms throughout its long, straight line of rugged peaks the southern wall, or water-divide, of the Kabul river basin.

Pursuing the main road from Peshawar to Kabul, the fort of Jamrud, which commands the British end of the Khyber Pass, lies some 11 m. W of Peshawar. The road leads through a barren stony plain and some three miles beyond Jamrud, enters the mountains at an opening called Shadi Bagiar, where the Khyber proper begins. The highway runs for a short distance through the bed of a ravine, and then ascends on the left-hand side to a plateau called Shagai. From here can be seen the fort of Ali Masjid, which commands the centre of the pass, and which has been the scene of more than one famous siege. Still going westward the road turns to the right, and by an easy zigzag descends to the river of Ali Masjid, and runs along its bank. The new road along this cliff was made by the British during the second Afghan War (1879–80), and converted during and after the third Afghan War (1920) to a double motor road. This is the narrowest part of the

THE KHYBER PASS, THROUGH WHICH THE MILITARY ROAD FROM THE PUNJAB TO AFGHANISTAN RUNS; CONSTRUCTED DURING THE AFGHAN WARS

Khyber, not more than 15 ft. broad, with the Rhotas hill on the right fully 2,000 ft. overhead. Some three miles farther on the valley widens, and on either side lie the hamlets and some sixty towers of the Zakka Khel Afridis. Then comes the Loargi Shinwari plateau, some seven miles in length and three in its widest part, ending at Landi Kotal, where is another British fort, which closes this end of the Khyber and overlooks the plains of Afghanistan. The broad gauge railway from Peshawar to Jamrud has now been extended to Landi Kotal, and half-trains can climb to that place, where since the third Afghan War a British brigade is

cantoned in the uplands. After leaving Landi Kotal the great Kabul highway passes between low hills, until it debouches on the Kabul river and leads to Dakka. The road has been greatly improved and motors and light lorries run through to Kabul.

The Khyber Pass has been adopted by the British Government as the main road to Kabul, but the old road to India left the Kabul river near its junction with the Kunar, crossed the great divide between the Kunar valley and Bajour, and turned southwards to the plains. During the first Afghan War the Khyber was the scene of many skirmishes with the Afridis and some disasters to the British troops. It was at the fortress of Ali Masjid that Sir Neville Chamberlain's friendly mission to the amir Shere Ali was stopped in 1878, thus causing the second Afghan War; and on the outbreak of that war Ali Masjid was captured by Sir Samuel Browne. The treaty which closed the war in May 1879 left the Khyber tribes under British control. In 1897 the Afridis seized the pass, on the withdrawal of the British officers, and held it for some months. This was the chief cause of the Tirah expedition of 1897.

KIAMA: *see* WOLLONGONG.

KIAMIL PASHA (1832–1915), Turkish statesman, was the son of an artillery officer, Salih Agha. Having completed his military training in Egypt as a cavalry lieutenant, he was appointed by the Khedive, Abbas Pasha, tutor in English to his son Ibrahim Pasha. In 1861 Kibrizli Mehemmed Pasha took him into the service of the Ottoman Government. He was twice governor of Jerusalem and three times governor of Beirut. In 1878 he was appointed governor of Kossova and soon afterwards of Aleppo, with the rank of Pasha. He resigned as the result of the British protest against his conduct during the Armenian revolt at Zeitoun, and returning to Constantinople became Under-Secretary for the Interior. In 1881 he became minister of Evkaf, and after the resignation of the Kutchuk Said Pasha Cabinet in that year, grand vizier. In spite of his forced resignation from the governorship of Aleppo he steadily pursued a pro-British policy. He resigned the grand vizirate in 1887 owing to Russian intervention, but was reappointed in 1896. He was dismissed by Sultan Abdul Hamid, however, owing to his proposal that a Cabinet responsible to the nation should be formed, and was sent to Smyrna as governor, where he remained for 12 years.

After the promulgation of the constitution (1908) Kiamil Pasha joined the Kutchuk Said Pasha Cabinet and soon after became Grand Vizier for the third time. He was, however, strongly opposed by the Union and Progress party. During the Balkan War (1912) he became Grand Vizier for the fourth time, but was forced to resign in 1913 as the result of a military *coup d'état* and the unpopularity of the peace terms accepted by him. He retired to Egypt, and although he returned later to Constantinople he was forced by the Government immediately to leave. He went to Cyprus and died there in 1915. Kiamil Pasha knew English, French and Arabic and published a book on Turkish history.

KIANGSI, a province in the heart of China, lying within the South China highlands but drained to and linked up with the Lower Yang-tze valley. It is formed essentially of the basin of the Kan river with whose watershed the provincial boundaries for the most part coincide. As the life of Kiangsi is based on a tributary basin to the south of the arterial line of the Yang-tze, its position and rôle are analogous to those of Hunan rather than of Hupeh or Kiangsu, great focal provinces lying astride the Yang-tze valley proper. Like Hunan it is a corridor province, providing the chief alternative route across the South China highlands from the Lower Yang-tze valley to the Canton delta, the focus of South China. The Kiangsi route leading over the watershed by the Mei-ling pass was that followed by early British embassies, those of Macartney in 1793 and Amherst in 1816 on their journey overland between Canton and Peking. Communicating with the Yang-tze valley mid-way in its course between the central (Hupeh) basin and the delta, Kiangsi is orientated partly to the one and partly to the other. Although formerly linked with Anhwei and Kiangsu to constitute the old province of Kiangnan, it is commercially tributary to Hankow rather than to Shanghai.

Kiangsi is made up of a succession of ridges and troughs trending N.E.–S.W. characteristic of the eastern half of the South China highlands. These, running diagonally across it, give the province a frame which, though mountainous, is pierced by numerous gaps

BY COURTESY OF H. A. FRANCKE

A GENERAL VIEW OF KIANGSI

giving comparatively easy communication with adjoining provinces. From Fukien alone is Kiangsi separated by a continuous mountain system. The N.E.–S.W. ridges which enter Kiangsi die down, however, along the axis of the province to leave two basin-like areas, an upper and a lower. The upper basin collects the headstreams of the Kan at the confluence of which stands Kanchow, the focus of the basin and the second city of the province. The lower basin, much the larger of the two, forms an extensive lowland plain sloping towards the Po-yang lake through which the drainage of the province passes to the Yang-tze. The lake has undergone extensive sedimentation and a ring of important towns, once on its shores, is now separated from it by wide stretches of fertile alluvium. The focus of this lowland plain and the capital of the province is the large city of Nanchang, situated on the Kan at the point where it once emptied into the lake, now over 30 miles away.

Kiangsi cultivates the crops characteristic of the Yang-tze basin. Rice is grown throughout the province but especially in the alluvial soils bordering the Po-yang lake. It is one of the four provinces of China having a surplus production. This is collected at Nanchang from both the Po-yang plain and the upper valleys and sent to Wuhu, the great rice market of the Yang-tze valley. Of the other crops entering commerce, both sugar and tea have declined in importance. Sugar cultivation has suffered from Japanese competition and is now practically confined to the upper valleys The production of tea, grown on the hill-slopes towards the Hupeh border and collected at Kiukiang, has declined with the general decay of the China tea trade. Kiangsi teas are now mainly green teas, destined for export to Russia. There is some tobacco production to the east of the lake and this may increase in the future. Like the rest of the Yang-tze valley, Kiangsi grows for subsistence crops in addition to the rice of summer, temperate cereals and legumes such as wheat and beans during the winter half-year. The population of the province according to the Post Office estimate of 1923 is over 24 millions giving the high density of 352 to the square mile. Communications are at present almost entirely limited to navigation on the Po-yang lake and the lower part of the Kan river system and to roads. The only railway is a short line linking Nanchang with Kiu-kiang on the Yang-tze.

KIANG-SU, one of the smallest but probably the most important and the most densely-peopled of the provinces of China, at the outlet of the Yang-tze Kiang. In its natural state it was a water-logged deltaic plain, bounded on the north by the Shantung highlands and on the south by the scarps of south-east China. Except for outcrops of Carboniferous rocks around Nanking, the soils are almost wholly formed of recent deposits, loess and alkaline sands in the north and fertile silts and clays in the south. Lakes and swamps still occupy a considerable pro-

portion of the surface especially in the region of the Hwai marshes where the drainage is very indefinite. This swamp belt in the centre of the province (long inhabited by aboriginal tribes, the Hwai barbarians) has localised population in two distinct regions to the north and south of it, linked, however, by a line of towns along the Grand Canal. In northern Kiangsu the agricultural resources are limited, the main crops being wheat, millet and fruit; it is purely agrarian in character and the population is of only moderate density.

But southern Kiang-su, *i.e.*, south of the marsh belt, is the richest region in the whole country. It is the "Garden of China" and supports an enormous population mainly by the close interaction of agricultural, industrial and commercial activities. Rice, wheat, sesamum, peanuts and melons are grown in large quantities, while mulberry and cotton provide the basis of the great silk and cotton industries of the region. The cotton is mainly of Chinese native kinds; experiments seem to show that the early autumn climate of the delta is too humid for American varieties. It is the industrial region of China *par excellence*, embracing many long-established domestic handicrafts and countless new manufactures resulting from western contact. It is also the chief commercial outlet of the country and the bulk of China's foreign trade passes through it. This is the historic Kiang-nan, the heart of Manzi, whose opulence and activity made such an impression on Marco Polo when he visited it in the second half of the 13th century. Its intrinsic importance and its geographical position as the gateway to central China have made the Delta the chief scene of European commercial activity in the country since the beginning of the Treaty Port era and the problems arising out of this contact are here most clearly displayed. (*See* SHANGHAI.) The delta and its fringes are intersected by waterways, both natural and artificial, which afford the chief trade-routes. In addition to the Yang-tze and the Grand Canal which intersects it at Chin-kiang and runs from south to north, there is a network of canals which also serve to drain the land, especially in the districts immediately to the north of the river. The province also possesses about 400 miles of government railways comprising the important Shanghai-Nanking system with services to Hangchow and Ning-po and a section of the transverse Lung-nai Railway in the north which has been recently completed to the new port of Hai-chow.

The population of Kiang-su was estimated at nearly 34 millions in 1920, with an average density of 878 per square mile. Of this total 66% live in the deltaic tract, parts of which are among the most densely peopled areas in the world, the density rising to over 5,000 persons per square mile in the richest rice-growing districts. While the great majority of the people are farmers, Kiang-su contains a bigger industrial population, artisans in the western sense, than any other province in China and also has a large mercantile class. This is becoming increasingly articulate in public affairs, so that here more than in any other part of China except perhaps Kwangtung is there the nucleus of a definite "public opinion" on national policy. The large cluster of big cities like Soochow and Nanking in the delta, many of them with over 100,000 inhabitants, tends to develop political activities of a new type, so that Kiang-su may be regarded as the pulse of the new industrial China. It is a progressive province, as evidenced by the modernisation of the silk and cotton industries, the development of conservancy boards and afforestation schemes and not least by an energetic educational policy. In the matter of language there is an important distinction between northern Kiang-su which belongs to the Mandarin area of North China and the delta where the old Wu dialects are still the vernacular. Nanking, however, at the apex of the delta is mainly Mandarin-speaking and this, as the official language, is increasingly understood in the chief commercial centres of the deltaic region.

KIAOCHOW BAY: *see* TSINGTAO.

KIDD, BENJAMIN (1858–1916), British sociologist, was born on Sept. 9, 1858. He entered the civil service, becoming a clerk in the Inland Revenue office. During 1898 he travelled extensively in the United States and Canada for the purpose of economic study, and in 1902 he visited South Africa for the same reason. In 1904 he published *Social Evolution*, which was widely read and was translated into most European languages as well as into Chinese. His later publications included *The Control of the Tropics* (1898) and *Principles of Western Civilisation* (1902). He died at Croydon on Oct. 2, 1916.

KIDD, WILLIAM (CAPTAIN KIDD) (*c.* 1645–1701), privateer and pirate, was of obscure origin. In 1691 an award from the council of New York of £150 was given him for his services during the disturbances in the colony after the revolution of 1688. He served with credit against the French in the West Indies. In 1695 he came to London with a sloop of his own to trade. He was recommended to the colonial governor Lord Bellomont, as fit to command a vessel to cruise against pirates in the Eastern seas. Accordingly the "Adventure" galley was privately fitted out, and Captain Kidd received the king's commission to arrest all pirates, and a commission of reprisals against the French. Kidd sailed from Plymouth in May 1696 for New York, and in 1697 reached Madagascar where, instead of hunting the pirates down, he associated with them, capturing native trading vessels. During 1698–99 complaints of his proceedings reached the British Government. Kidd deserted the "Adventure" in Madagascar and eventually reached New England in a small sloop. He wrote to Bellomont, professing his ability to justify himself and sending the governor booty. He was arrested in July 1699, was sent to England for trial and found guilty of murder and piracy. He was hanged on May 23, 1701. About £14,000 of "Captain Kidd's Treasures" was recovered from Kidd's ship and from Gardiner's Island (off the E. end of Long Island).

See W. W. Campbell, *An Historical Sketch of Robin Hood and Captain Kidd* (New York, 1853). *See* also PIRATE.

KIDDERMINSTER, market town and municipal borough, Worcestershire, England, 15 m. N. of Worcester by rail, on the river Stour and the Staffordshire and Worcestershire canal. Pop. (1921) 27,118. In 736 lands upon the river Stour, called Stour in Usmere, identified with the site of Kidderminster (*Chideminstre*), were given to Earl Cyneberght by King Aethelbald to found a monastery. These lands were later given by Coenwulf, king of the Mercians, to Deneberht, bishop of Worcester, but were exchanged with the same king in 816 for other property. Kidderminster remained a royal manor until Henry II. granted it to Manser Biset. The town was possibly a borough in 1187 when the men paid £4 to an aid. As a royal possession it enjoyed many privileges in the 12th century. The first charter of incorporation granted in 1636, remained valid until the Municipal Reform act of 1835. Kidderminster sent two members to the parliament of 1295. The cloth trade is first mentioned in 1334, when it was enacted that no one should make woollen cloth in the borough without the bailiff's seal. The manufacture of woollen goods was replaced by that of carpets, in 1735. At first only the "Kidderminster" carpets were made, but in 1749 a Brussels loom was set up in the town and Brussels carpets were soon produced in large quantities. The church of All Saints is an Early English and Decorated building, with Perpendicular additions. There is a free grammar school founded in 1637. Richard Baxter became a minister in the town in 1641. Worsted spinning is carried on, and there are iron foundries.

KIDDUSH (Hebrew "sanctification") and *Habdālah* (Hebrew, "separation") are in Judaism respectively the beginning and concluding ceremonies of sabbaths and festivals. The former rite includes the blessing or sanctification of the day (*Hay Yōm*), of the wine (*'Al Hay-Yáyin*) and of the bread (*'Al Hal-Léḥem*) and is recited at the first of the three statutory meals. The last two items, which were the earlier, are pronounced at other meals. From these, which, however, possess no sacramental significance, the eucharist may have been derived. The term *Habdālah* is applied (*a*) to the paragraph in the *'Amīdah* of the evening service proclaiming the distinction between light and darkness and marking the boundary between sacred and secular days: (*b*) to the subsequent synagogal and domestic ceremony which contains the four blessings of *Habdālah*, wine, light (*Nēr*) and spices (*Besāmim*). At the conclusion of festivals and fasts alterations and omissions are introduced. The prohibition against kindling fire on

sabbath (Exod. xxxv., 3) is modified on festivals (Ib., xii., 16) hence the festival *Habdalah* lacks the blessing over the light. The origin of this blessing may, however, be symbolical, as may be that of the spices or myrtles (*'Asābim*) which are substituted in the East. The spices may recall the bowl of incense used after banquets in Roman days.

BIBLIOGRAPHY.—*Kiddūsh* and *Habdālah* can be studied in the translated prayerbooks of S. Singer (Ashkenazic rite, 1928) or M. Gaster (Sephardic rite, 1901). The volume of explanatory notes to the former, by I. Abrahams, should be consulted. *See* also I. Elbogen, *Der judische Gottesdienst* (Frankfort on the M., 1924); W. Oesterley and C. Box, *Religion and Worship of the Synagogue* (1911); *Jew. Encycl.* For illustrations of these favourite subjects, *see* the various series of Jewish pictures in J. Leusden, *Philologus* (Utrecht, 1682); B. Picart, *Cérémonies des Juifs* (Amsterdam, 1723–43); P. C. Kirchner, *Jud. Ceremonial* (Nuremberg, 1736): M. D. Oppenheim (frequently reproduced). Art students should consult library catalogues for illuminated Hebrew liturgies, wherein Habdālah and Kiddūsh are often depicted.

KIDERLEN-WÄCHTER, ALFRED VON (1852–1912), German diplomatist, was born at Stuttgart on July 10, 1852, the son of a banker Robert Kiderlen, who had married Baroness Marie von Wächter. He fought as a volunteer in the Franco-German War (1870–71) and then studied at different universities. In 1879 he entered the German Foreign Office: After holding various diplomatic posts, among them that of Prussian minister to Hamburg, he was sent to Bucharest in 1900 and was recalled in 1908 to act as deputy for the Foreign Secretary Von Schoen, and in June 1910 succeeded him in the office. He was soon in the thick of the negotiations with France (1911) over the Agadir incident, which, owing to the state of Kiderlen-Wächter's health, were partly conducted between him and the French ambassador, Jules Cambon, at the Bavarian spa of Kissingen. The mystery which Kiderlen-Wächter with the complicity of his chief, Bethmann-Hollweg, chose to maintain with regard to Germany's ultimate intentions in Morocco, was largely responsible for the crisis which arose between the western powers and Germany, and occasioned plain speaking in the House of Commons by Sir Edward Grey (Nov. 27, 1911), and by Lloyd George, then Chancellor of the Exchequer, at the Mansion House (July 21, 1911). An agreement on the basis of a cession of territory in the French Congo in exchange for a German declaration of complete *désintéressement* in Morocco was nevertheless ultimately effected. Kiderlen-Wächter died at Stuttgart on Dec. 30, 1912.

See E. Jaeckh, *Kiderlen-Wachter, Der Staatsmann und Mensch, Briefwechsel und nachlass* (1924).

KIDNAPPING, originally the stealing and carrying away of children and others to serve as servants or labourers in the American plantations. The term is commonly applied in England to the offence of taking away children from the possession of their parents. It is used in much the same sense in the United States. (*See* IMPRESSMENT; ABDUCTION.)

KIDNEY, DISEASES OF. (For the anatomy of the kidneys, *see* URINARY SYSTEM.) The results of morbid processes in the kidney may be grouped under three heads: the lesions produced, the effects of these on the composition of the urine, and the effects of the kidney-lesion on the body at large. Affections of the kidney are congenital or acquired. When acquired they may be the result of a pathological process limited to the kidney, or an accompaniment of disease in other parts of the body.

Congenital Affections.—The principal congenital affections are anomalies in the number or position of the kidneys or of their ducts; atrophy; cystic disease and growths. The most common abnormality is the fusion of originally separate kidneys and production of a single *horse-shoe kidney*, or if the fusion is more complete, a disc-like mass with two ureters. The kidneys may be situated in *abnormal positions;* thus they may be mistaken for tumours. In some cases *atrophy* is associated with mal-development, so that only the medullary portion of the kidney is developed; in others it is associated with arterial obstruction, or obstruction of the ureter. In *congenital cystic disease* the organ is transformed in whole or part into a mass of cysts, and the enlargement of the kidneys may be so great as to produce difficulties in birth. The cysts found in granular kidney are of the retention variety and are produced by constriction of urinary tubules by the fibrous tissue. In some cases cystic degeneration is accompanied by anomalies in the ureters and in the arterial supply. *Growths of the kidney* are sometimes found in infants; they are usually malignant, and may consist of a peculiar form of sarcoma, termed rhabdo-sarcoma, owing to the presence in the mass of voluntary muscular fibres. These tumours depend on anomalies of development; the tissue which forms the primitive kidney belongs to the same layer as that which forms the muscular system (mesoblast). *Anomalies of the excretory ducts* are various. The ureter may be double or much dilated and the pelvis of the kidney may be greatly dilated, with or without dilatation of the ureter.

Acquired Affections.—One or both of the kidneys in the adult (especially women) may be preternaturally mobile, constituting a *movable kidney,* either because it has a partial mesentery (*floating kidney*) or, more commonly, because it is loose under the peritoneum and not efficiently supported in its fatty bed. Movable kidney produces a variety of indefinite symptoms, such as pain in the loin and back, faintness, nausea and vomiting.

In some cases the movable kidney may be kept in its place by a pad and belt, but in others it requires surgical fixation with sutures. The operation is neither difficult nor dangerous, and its results are excellent.

Embolism.—The arrangement of the renal blood-vessels is peculiarly favourable to the production of cone-shaped areas of necrosis, the result of blockage by clots. Usually the clot is detached from the interior of the heart, and if the plug is infective owing to the presence of septic micro-organisms, a pyaemic abscess results. It is exceptional for the large branches of the renal artery to be blocked, so that the symptoms in ordinary cases are only the temporary appearance of blood or albumen in the urine. Blocking of the main renal vessels as a result of disease of the walls of the vessels may lead to disorganization of the kidneys Blocking of the veins, leading to extreme congestion of the kidney, occurs in cases of extreme weakness and wasting and sometimes in septic conditions, as in puerperal pyaemia, where a clot formed in one of the pelvic veins spreads up the vena cava and secondarily blocks the renal veins.

Passive congestion of the kidneys occurs in heart diseases and lung diseases, where the return of venous blood is interfered with. It may also be produced by tumours pressing on the vena cava. The engorged kidneys become brownish-red, enlarged and fibroid, and they secrete a scanty, high-coloured urine.

Active congestion, not easily distinguished from early acute inflammation, is produced by excretion in the urine of such materials as alcohol, turpentine, cantharides and the toxins of various diseases. Extreme congestion may follow exposure to cold, owing to the intimate relationship existing between the cutaneous and the renal vessels. Most acute specific diseases produce during their height a temporary nephritis, not usually followed by permanent alteration in the kidney; but some acute diseases cause a nephritis which may lay the foundation of permanent renal disease This is most common as a result of scarlet fever.

Bright's Disease.—This is the term (*q.v.*) loosely applied to certain varieties of kidney affection. Three forms are usually recognized—acute, chronic and the granular or fibrotic kidney. Of these, acute Bright's disease (acute nephritis) has been dealt with elsewhere. Chronic Bright's disease (chronic nephritis) is sometimes the sequel of the acute form, but often the malady is chronic (or, rather, sub-acute) from the beginning. Both acute and chronic nephritis are inflammatory. Acute and chronic changes often co-exist in the same kidney because of recrudescences and remissions of the renal disease. An example will make this point clear. Assume that a person has (1) acute nephritis in the course of scarlet fever, (2) convalesces, (3) is exposed to cold six months later, (4) recovers again, and (5) is again exposed to cold. His kidneys show acute inflammatory changes due to (5), somewhat chronic changes due to (4), very chronic changes due to (2), and remnants of acute changes due to (1) and (3). Since all the acute changes lead to swelling of the organ and the chronic changes lead to contraction according to the degree of chronicity, it follows that such a kidney may be larger or smaller than, or the same size

as, a normal kidney; that its naked eye appearance may be greatly or little changed but, assuredly, that its microscopical texture will be profoundly altered. A granular kidney is not inflammatory in the usual sense of the term but, by reason of its abnormality, is liable to undergo inflammation. In this case acute nephritic changes are superposed on those characteristic of granular kidney, and a condition arises that may be mistaken for that occurring in the hypothetical case above.

In Bright's disease all the renal elements, glomeruli, tubular epithelium, interstitial tissue with its contained blood-vessels, are affected, though in differing degrees. In acute scarlatinal nephritis the most obvious changes are in the glomeruli; in acute nephritis due to exposure the blood-vessels are congested to such an extent that the capsule of the kidney may be ruptured and the tubular epithelium is profoundly changed; in granular kidney the primary change concerns the connective tissue framework and tubules and glomeruli are affected secondarily. Granular kidney, indeed, is a specialized part of a general condition affecting the arterial system and left side of the heart (arterio-sclerosis). Whether as a result of glomerular or tubal changes, or both combined, the character of the urine is changed. Blockage of the tubules by desquamated epithelium leads to diminution in amount of urine, and the damaged glomeruli and tubules allow albumen and blood to pass through their walls to become mixed with the urine, while "casts" of the tubules composed of epithelial or coagulated albuminous cylinders make their appearance. Such changes are to some degree a measure of the damage the kidney has undergone. In uncomplicated granular kidney with the associated high arterial tension the urine is increased in amount, of low specific gravity, contains no more than a trace of albumen and at most a few hyaline casts.

The causes of acute, sub-acute and chronic nephritis are those given above for acute congestion, with the addition of pregnancy. Chronic lead poisoning and gout are undoubtedly associated with granular kidney in some cases, but in the majority no other cause than that of arterio-sclerosis can be inculpated.

Tuberculosis.—The kidney may be infected by tubercle in two ways: *ascending*, in which the primary lesion is in the testicle, epididymis, or urinary bladder, the lesion travelling up by the ureter or the lymphatics to the kidney; *descending*, where the tubercle bacillus reaches the kidney through the blood-vessels. In the latter case, miliary tubercles, as scattered granules, are seen, especially in the cortex of the kidney; the lesion is likely to be bilateral. In primary and in ascending tuberculosis the lesion is at first unilateral. In an advanced case the pelvis of the kidney is filled with caseous material, and caseous foci breaking down in the centre are scattered through the solid part of the organ.

New Growths.—Malignant disease of the kidney takes the form of sarcoma or carcinoma. Sometimes it is a hypernephroma, starting in what are spoken of as "adrenal rests" in the cortex of the kidney. The kidney is not so prone to malignant disease as other organs, such as the stomach, bowel or liver.

Stone in the Kidney.—Calculi are frequently found in the kidney consisting usually of uric acid, sometimes of oxalates, more rarely of phosphates. Calculous disease of the bladder (*q.v.*) is generally the sequel to the formation of a stone in the kidney, which, passing down, becomes coated by the salts in the urine. Calculi are usually formed in the pelvis of the kidney, and their formation is dependent either on the excessive amounts of uric acid, oxalic acid, etc., in the blood, or on an alteration in the composition of the urine, such as increased acidity, leading to abnormal deposition. The formation of abnormal crystals is often due to the presence of some colloid, such as blood, mucus or albumen, in the secretion, modifying the crystalline form. Once a minute calculus has been formed, its subsequent growth by deposition of further layers of the material is highly probable. Calculi formed in the pelvis of the kidney may be single and large, forming, indeed, an actual cast of the interior of the expanded kidney. At other times they are multiple and of varying size. Serious complications may result from the presence of a stone in the kidney, such as hydronephrosis, from the urinary secretion being pent up behind the obstruction, or complete suppression, which is apparently produced reflexly through the nervous system. In such cases the surgical removal of the stone is often followed by the restoration of the renal secretion. (*See* CALCULI.)

The symptoms of *renal calculus* may be very slight, even entirely absent if the stone is moulding itself into the interior of the kidney; but if the stone is movable, heavy and rough it may cause great distress, especially during exercise. There will probably be blood in the urine; and there will be pain in the loin and thigh and down into the testicle. The testicle also may be drawn up by its suspensory muscle, and there may be irritability of the bladder. With stone in one kidney the pains may be actually referred to the kidney of the other side. Generally, but not always, there is tenderness in the loin. If the stone is composed of lime it may throw a shadow on the Röntgen plate, but other stones may give no shadow.

Renal colic is the acute pain felt when a small stone is travelling down the ureter to the bladder. The pain is at times so acute that fomentations, morphia and hot baths fail to ease it, and nothing short of chloroform gives relief. The treatment for renal calculus is surgical.

Pyelitis.—Inflammation of the pelvis of the kidney is generally produced by the extension of gonorrhoeal or other septic inflammation upwards from the bladder and lower urinary tract, or by the presence of stone or of tubercle in the pelvis of the kidney Pyonephrosis, or distension of the kidney with pus, may result as a sequel to pyelitis or as a complication of hydronephrosis; in many cases the inflammation spreads to the capsule of the kidney and leads to the formation of an abscess outside the kidney—a *perinephritic abscess*. In some cases a perinephritic abscess results from a septic plug in a blood-vessel of the kidney, or it may occur as the result of an injury to the loose cellular tissue surrounding the kidney, without lesion of the kidney.

Hydronephrosis, or distension of the kidney with pent-up urine, results from intermittent obstruction of the ureter. Obstruction of the ureter, causing hydronephrosis, is likely to be due to the impaction of a stone, or to pressure on the ureter from a tumour in the pelvis—as, for instance, a cancer of the uterus—or to some abnormality of the ureter. Sometimes a kink of the ureter of a movable kidney causes hydronephrosis. The hydronephrosis produced by obstruction of the ureter may be intermittent; and when a certain degree of distension is produced, either as a result of the shifting of the calculus or of some other cause, the obstruction is temporarily relieved in a great outflow of urine, and the urinary discharge is re-established. When the hydronephrosis has long existed the kidney is converted into a sac, the remains of the renal tissues being spread out as a thin layer.

Effects on the Urine.—Diseases of the kidney produce alterations in the composition of the urine; either the proportion of the normal constituents being altered, or substances not normally present being excreted. There are two forms of suppression of the urine: *obstructive*, where the ureter is blocked by stone or other morbid process; *non-obstructive*, which is apt to occur in severe acute nephritis. In other cases complete suppression may occur as the result of shock or of injuries to distant parts of the body, as after severe surgical operations. In some diseases in which the quantity of urinary water excreted is normal, or even greater than normal, the efficiency of the renal activity is really diminished, inasmuch as the urine contains few solids. In estimating the efficiency of the kidneys it is necessary to take into consideration the quantity of solid matter daily excreted, as shown by the specific gravity of the urine. The nitrogenous constituents —urea, uric acid, creatinin, etc.—vary greatly in amount in different diseases. In most renal diseases the quantities of these substances are diminished because of the physiological impairment of the kidney. The chief abnormal constituents of the urine are serum-albumin, serum-globulin, albumoses (albumosuria), blood (haematuria), blood pigment (haemoglobinuria), pus (pyuria), chyle (chyluria), and pigments such as in melanuria and urobilinuria.

Effects on the Body at Large.—These may be persistent or intermittent or transitory. The most important persistent effects are, first, nutritional changes leading to general ill-health, wasting

and cachexia; and, secondly, cardio-vascular phenomena, such as enlargement (hypertrophy) of the heart, and thickening of the inner, and degeneration of the middle, coat of the smaller arteries. Amongst the intermittent or transitory effects are dropsy, secondary inflammations of certain organs and serous cavities, and uraemia. Some of these effects are seen in every form of severe kidney disease, and uraemia may occur in any advanced kidney disease. Renal dropsy is chiefly seen in acute and chronic Bright's disease, and the cardiac and arterial changes are commonest in cases of granular kidney, but may be absent in other diseases which destroy the kidney tissue, such as hydronephrosis. *Uraemia* is a toxic condition, and three varieties are recognized—the acute, the chronic and the latent. In part it depends upon the action of poisons retained in the body owing to the deficient action of the kidneys. It is also probable that abnormal substances having a toxic action, *e.g*, carbamate of ammonia, are produced as a result of a perverted metabolism. The dropsy of renal disease, according to some authorities, is due to effects produced in the capillaries by the presence of abnormal substances in the blood, but the question is not beyond dispute. High arterial tension, cardiac hypertrophy, and arterial degeneration may also be of toxic origin, or they may be produced by an attempt of the body to maintain an active circulation through the greatly diminished amount of kidney tissue available.

KIDWELLY (Cydweli), market town and municipal borough, Carmarthenshire, Wales, situated (as its name implies) near the junction of two streams, the Gwendraeth Fawr and the Gwendraeth Fach, a short distance from the shores of Carmarthen bay. Pop. (1921) 3,179. It lies on the South Wales coastal lowland, at this point narrow and swampy. The Normans realized the importance of this site for defence as it commanded the way along the coast, as well as two minor valley ways northwards whence Welsh raids were frequent. Consequently Kidwelly has a magnificent 13th century castle. The original castle was built in 1094 by William de Londres a follower of Fitz Hammon who conquered South Wales. In 1135 Kidwelly was furiously attacked by Gwenllian, wife of Griffith ap Rhys, prince of South Wales. The attack ended in the defeat and execution of Gwenllian on a site that still bears her name—Maes Gwenllian. The castle and town passed later into the house of Lancaster, and Kidwelly received its first charter from Henry VI., its present charter dating from 1618. The town has a fine 13th–14th century church, once a chapel of a Benedictine priory. The comparatively limited hinterland of Kidwelly prevented its growth during Stuart and Georgian times, although much coastal trading was carried on. Accumulation of sand has silted up the small harbour and the ever increasing power of Llanelly focussed the new developments of the coal field. Kidwelly naturally became a small station on the G.W.R. main line but this has left but a little mark on the town besides increasing its export of cockles. It also has old established brick works.

KIEL, the chief naval port of Germany on the Baltic, a town of the Prussian province of Schleswig-Holstein. Pop. (1925) 213,490, including the incorporated suburbs. The name of Kiel appears as early as the 10th century in the form Kyl (probably from the Anglo-Saxon *Kille*=a safe place for ships). In 1242 it received the Lübeck rights; in the 14th century it acquired various trading privileges, having in 1284 entered the Hanseatic League. By the treaty of Kiel in 1814 Norway was ceded to Sweden. In 1773 Kiel became part of Denmark, and in 1866 it passed with the rest of Schleswig-Holstein to Prussia. It is situated at the southern end of the Kieler Förde, 70 m. by rail N. from Hamburg. It consists of an old town, lying between the harbour and a sheet of water called Kleiner Kiel, and a new town. In the old town stands the palace, built in the 13th century, enlarged in the 18th and restored after a fire in 1838. Other buildings are the church of St. Nicholas (restored in 1877–1884), dating from 1240, with a lofty steeple; the old town-hall on the market square; and the church of the Holy Ghost. Farther to the north and facing the bay is the university, founded in 1665 by Christian Albert, duke of Schleswig. The new buildings were erected in 1876, and connected with them are a library and a school of forestry. The university has a good medical school. The Schleswig-Holstein museum of national antiquities is contained in the old university buildings.

Kiel has a magnificent harbour, which has a comparatively uniform depth of water, averaging 40 ft., and close to the shores 20 ft. Its length is 11 m. and its breadth varies from ¼ m. at the southern end to 4½ m. at the mouth. The government docks and ship-building yards are on the east side facing the town and comprise basins capable of containing the largest war-ships afloat. The principal industries are those connected with the navy and ship-building, but embrace also flour-mills, oil-works, iron-foundries, printing-works, saw-mills, breweries, brick-works, soap, margarine and chemical making and fish-curing. There is an important trade in coal, timber, oils, machinery, cereals, fish, butter and cheese.

KIEL CANAL. The Kiel canal connects the North sea and the Baltic. The sluices at the entrances at Holtenau (the harbour of Kiel) and Brunsbüttekoog (mouth of the Elbe) are 1,082·6ft. long, 147ft. wide and 45·9ft. high. The canal is 53·3 nautical m. long and 37·07ft. deep. Vessels are admitted on it which do not exceed the following dimensions: depth 29·7ft., width 131·2ft., length 1,033·5ft., height of masts over the waterline 131·2 feet. Steam and motor propelled vessels pass up the canal under their own power. The highest speed permitted is 8·1 knots, the lowest 5·4 Other vessels are tugged, either by private tugs or the tugs of the canal administration, as desired. Pilots are compulsory. They come on board outside the canal wharves in front of the entrances and are advisers to the ships' captains, who remain responsible for the conduct of their ships while using the canal.

The Kiel canal is owned by the German Reich, which administers it through the Reichskanalamt in Kiel. The managing director in Kiel and the port captains at the entrances to the canal are in charge of the shipping and the administration of their sluices under the Reichskanalamt. Special officials are in charge of the preservation of the canal works. Art. 380–386 of the Treaty of Versailles (June 28, 1919) lay down certain regulations respecting the Kiel canal Canal and pilotage dues are limited to a rate sufficient to cover the cost of administration, maintenance and improvements. All mercantile and war vessels of nations at peace with Germany have permanent free use of the canal, without special permission, and on an equal footing (but as foreign ships of war pass through German territorial waters in approaching or leaving the canal they are expected to obtain permission through diplomatic channels). Subjects, goods and vessels of all nations enjoy equal treatment as regards payments and attention. Traffic on the canal is subject only to general police, shipping and sanitary and customs regulations. Goods in transit arrive under seal or are accompanied by customs officers and are not subject to any further customs formalities. In the event of violations of any of these conditions, or of disputes as to the interpretation of them, any interested Power can appeal to the jurisdiction instituted for the purpose by the League of Nations. A local German authority at Kiel is qualified to deal with disputes in the first instance.

The Kiel canal, being the safest, most convenient, shortest and cheapest route from the North sea and the Baltic, is increasingly used by merchant vessels. In 1913, 55,382 ships passed of 10,350,000 tons net displacement; in 1924, 45,843 ships of 14,070,000 tons; in 1927, 53,711 ships of 19,912,069 tons.

(M. C. M.)

KIELCE (kē-ĕl'tse), a province in S.W. Poland, surrounded by the provinces of Lodz, Warsaw, Lublin, Cracow and Silesia. Area 25,736 sq km. Pop. (1921), 2,536,000, of which 90% are Poles (88% Roman Catholic), and the rest mostly Jews. Its surface is an elevated plateau 800 to 1,000 ft. in altitude, inter-

sected by ravines and rising to 1,350 ft., as in the Lysogóry hills, famous in legend and in war. The province is bounded on the north, south and east by the Vistula and its tributary, the Pilica, and is drained by the Nida, the Radomka and other rivers running through deep valleys. Silurian and Devonian quartzites, dolomite, limestones and sandstones prevail in the north, and contain rich iron ores, lead and copper ores. Carboniferous deposits containing rich coal seams occur, chiefly in the south, particularly in the Dombrova coalfield. The Triassic deposits contain very rich zinc ores of considerable thickness, and lead. The Cretaceous deposits yield gypsum, chalk and sulphur. White and black marble are also extracted. The soil is of great variety, and fertile in parts, but owing to the proximity of the Carpathians, the climate is severe. Rye, oats, wheat, barley and buckwheat are grown, modern intensive culture is spreading and land fetches high prices. Over 50% of the area is cultivated. Grain is exported. Gardening is a thriving industry in the south; beet is grown for sugar in the south-east. Industries are considerably developed; zinc ores are extracted, as well as iron and sulphur, and the coal-field in the south-west is the most thickly-populated part of the province. Tiles, metallic goods, leather, timber goods and flour are the chief products of the manufactures The province was the central part of the early Polish State and formed part of Lesser Poland. The population declined owing to the ravages of the World War, but the province still contains some of the most thickly populated parts of Poland. The chief towns are Kielce, Radom, Czenstochowa, Bendzin, Sosnowiec, Dombrowa, Zawiercie, Olkusz, Sandomierz, Pinczów, Ilża and Opatów

KIELCE, a town of Poland, capital of the province of Kielce 152 m. by rail S. of Warsaw, situated in a picturesque hilly country. It has a castle, built in 1638, and formerly held the Zaluski library, which was taken to St. Petersburg (Leningrad) after the Partitions, but was restored to Poland by the Treaty of Riga in 1921. The squares and boulevards are lined with handsome buildings. The principal factories are hemp-spinning, cotton-printing and cement works. The town was founded in 1173 by a bishop of Cracow.

KIEPERT, HEINRICH (1818–1899), German geographer, was born at Berlin on July 31, 1818. He studied geography at the university of Berlin and became professor there in 1854. He was a leading authority on Asia Minor, which he visited four times (1841–88). He died at Berlin on April 21, 1899.

His works include: *Atlas von Hellas und den hellenischen Kolonien* (1840–46); *Historisch-geographischer Atlas der alten Welt* (1848); *Atlas antiquus* (1st ed, 1854); *Neuer Hand-atlas über alle Teile der Erde* (1855, *et seq.*); *Lehrbuch der alten Geographie* (1877–78); *Leitfaden der alten Geographie* (1879, Engl. trans. 1881); *Formae orbis antiqui; Corpus inscriptionum latinarum;* also a map of Asia Minor, *Karte des osmanischen Reiches in Asien* (1844 and 1869).

KIEPERT, RICHARD (1846–1915), German cartographer, was born at Weimar on Sept. 13, 1846, the son of Heinrich Kiepert (1818–1899), also a noted cartographer. He received the doctorate of philosophy at Jena in 1874; from that year until 1878 he was engaged in the compilation of Richthofen's atlas of China, and from 1875 to 1887 he edited a geographical periodical *Globus.* He prepared maps from the data collected by many well-known German travellers, such as Rohlfs, Barth and Möllendorf After his father's death in 1898 he continued or brought up to date many of his maps, including the *Formae Orbis Antiqui* (1894, etc.). Perhaps his most important single work was the *Spezialkarte von Kleinasien* (Asia Minor) (1:400,000) (1902–8). He died in Berlin on Aug. 4, 1915.

KIERKEGAARD, SÖREN AABY (1813–1855), Danish philosopher, was born in Copenhagen on May 5, 1813. After graduating at the university in 1840, he travelled in Germany, and in 1842 settled in his native town where he died on Nov 11, 1855. In 1843 he published his chief work, *Euten—Eller* (*Either—or*), a discussion of the ethical and aesthetic ideas of life. His philosophy was a reaction against the speculative thinkers—Steffens (*q.v.*), Niels Treschow (1751–1833) and F. C. Sibbern (1785–1872); it was based on the absolute dualism of faith and knowledge, and of thought and reality. In his last years, especially in his *Ojeblikke,* he denounced the theology and practice of the State church on the ground that religion was a matter for the individual soul.

See his posthumous autobiography, *Syns punktetfor min Forfatter-virksomhed* ("Standpoint of my Literary Work"); Georg Brandes, *Soren Kierkegaard* (Copenhagen, 1877); H. Hoffding, *Sören Kierkegaard als philosoph* (Stuttgart 1896).

KIEV (Kē'ĕf), a city of the Ukrainian S.S.R. in 50° 30′ N., 30° 28′ E., on right bank of the Dnieper. Pop. (1926) 493,873. The city is of peculiar interest, for its rise was the first step in the Slav domination of the land that was to become Russia. Situated on the navigable Dnieper, in a region where the broad corridor between the Carpathians and the Pripet marshes opens towards the illimitable steppe, it was a critical point in the eastward expansion of the Slavs. East of the marshes, it was possible to turn north along the Dnieper and a string of primitive markets was thus formed which attracted Varangian traders. Its position on the soil map at the northern boundary of the black earth zone, with the less fertile forest soil to the north is instructive in view of Mavor's comment that after the first period of nuclear trade development, the subsequent history of Russia is the history of the exploitation of the soil. Even in the early period of the foundation of Kiev, the hunters trading in furs, honey, wax and slaves were beginning to engage in agriculture; the Russian *Annals* state that they paid tribute partly in furs and partly in the products of the *rala* or old Russian plough (Kluchevsky, *Course of Russian History,* Moscow, 1906–10).

History.—At what precise date a settlement first existed is unknown, but archaeology indicates that the plains of the Dnieper were inhabited in Palaeolithic times, and burial mounds (kurgans) of subsequent populations are present in abundance. According to Nestor's legend Kiev was founded in 864 by three brothers Kiy, Shchek and Khoriv, and after their death was seized by two Varangians (Scandinavians) Askold and Dir, followers of Rurik, also in 864, but the ancient trading link along the Dnieper is far older than this, and the Kiev which they captured was already sufficiently mature to be paying tribute to the Khazars. The princes of Kiev became the organizers and defenders of the flotilla of small craft that sailed each June down the Dnieper to the Black sea and Tsargrad (Byzantium), and through the Sea of Azov, the Don and Volga made contacts with eastern Islam. It was mainly a barter trade, Byzantine silks, stuffs, gold, wine and fruit in exchange for Russian furs, honey, wax, corn and slaves, and few Byzantine coins reached Russia, though colonial Roman coins of the 3rd and 4th centuries, and silver *dirhems* stamped at Samarkand, Balkh, Merv, etc., were found in 1869. By 880 Kiev had become the capital of the Varangian-Russian principality. From Kiev, too, marauding expeditions against Byzantium were made in the 9th and 10th centuries until, in 988, Prince Vladimir was baptized in the Dnieper and thus made Kiev the first home of the Greek Church in Russia.

The link with the Byzantine East survived the fall of Kiev; the decision of Vladimir and his council to reject Islam and Western Christianity and accept the Eastern, Greek or Orthodox faith had momentous consequences quite apart from its cultural importance. Its political implications are written in the union of the Orthodox Russian States under Moscow, in the deep cleavage between the Poles and the Russians and in the determination to free the country from the Mussulman yoke. Under the Kiev princes, Oleg, Svyatoslav, St. Vladimir and Yaroslav the Lawgiver, the principality of Kiev developed and the city became the centre of a wealthy court and the beauty and number of its churches was great, though the "400 churches and 8 markets" reported by Thietmar of Merseburg is probably an exaggeration. The learning of its princes and the beautiful workmanship of the frescoes and mosaics, the gold and silver ornaments, and the illuminated manuscripts bear witness to the culture of the ancient city. But civil strife among the Slav princes broke out and in 1169 Kiev was captured by Andrey Bogolyubski and never recovered its supremacy.

In 1240 the Tatars under Batu, a grand-nephew of Jenghiz Khan sacked Kiev and five years later, when Carpini passed

through the "Mother of Russian Cities," nothing remained but ruins and a few houses and survivors. From 1240 to 1320 it remained under Tatar rule, and passed to Lithuania until 1569, during which period it was laid in ruins by the khan of Crimea in 1483. It was under Polish rule until 1654 and was finally incorporated in Russia in 1686. Thus the proximity to western trade and to the rich steppe region, which at first led to its rise, later led to its embroilment in the political struggles of the west and to its exposure to devastation from the nomad conquerors of the steppe. In 1499 Kiev obtained the "Magdeburg Right," which secured to it self-government, its own court of law, coinage and Free Trade. The Ukrainian "Fraternities" which developed, on religious grounds, the struggle against Polish rule, had their centre in Kiev. From 1667 Kiev was governed by a *hetman* or elected city ruler: the hetman Mazeppa restored the old churches in the 18th century and built new ones. But from the time of Peter the Great, a policy of Russification of the Ukraine was organized from Kiev, and the fortress of Pechersk, around which a Great Russian population was settled, was erected In 1797 the Contract Fair was removed from Dubno to Kiev and thus stimulated its trade, while in the early 19th century the development of agriculture and the growing of sugar beet in the Ukraine developed sugar refining in the town.

An industrial proletariat developed, and side by side with it, there grew the Young Ukrainian National movement. In 1905 the workers joined the revolutionary movement and the garrison rebelled, but the revolt was mercilessly suppressed and followed by a terrible Jewish pogrom which lasted for three days. Following these tragedies the Ukrainian National Movement took a more decisive character, but was checked by the outbreak of war in 1914. After the February 1917 revolution, a Central Rada was formed which aimed at separating the Ukraine from Russia. At the same time the Kiev Soviet was formed under Bolshevik leadership, and civil war broke out between the two parties. After the October 1917 revolution, the Rada proclaimed the Ukrainian Democratic Republic, with Kiev as its capital. In Jan. 1918 the Red Army captured the town and proclaimed a Soviet republic, but retreated before the German troops called in by the Rada. Friction between the German troops and the Rada brought about the downfall of the latter and the appointment of General Skoropadsky as *hetman*.

After the revolution in Germany and the consequent withdrawal of German troops in 1918 Petlura replaced General Skoropadsky, and in 1919 the Soviet troops again captured the city. They retreated in Aug. 1919, on the advance of Denikin's army. Conflicts then raged between the troops of Petlura and those of Denikin, and after fierce street fighting, Denikin obtained the mastery. Soviet troops again captured the city in Dec. 1919. But in May 1920, the Poles, aided by Petlura, retook the city. They were driven out in the following month and peace at last settled on the exhausted city, only to be followed by famine and disease. During the fighting and bombardment much of the city was burned or destroyed and many works of art irrevocably lost, especially those of the Pechersky district. Though repairs have been carried out since 1920, and the bridge, blown up by the Poles on their retreat, has been restored, many heaps of ruins still recall the terrible time, as do the graves of the victims and the name of the street "Victims of the Revolution." In view of the unsettled conditions in Kiev, Kharkov was made the capital of the Soviet Ukrainian Republic.

Post-Revolution Recovery.—The vitality of the city, however, has led to rapid recovery and it is now the third largest city of the Soviet Union. The Kiev Contract Fair, so called because the contracts made here formerly regulated production, held from Feb. 1 to March 15, was restored in 1923, and its turnover in 1927 amounted to 44 million gold roubles. Kiev industrial enterprises in 1927 included 15 smelting works, 12 tobacco and cigarette factories, mainly makhorka tobacco, 11 flourmills, and sugar refining, glass, nail, distilling, yeast, leather and shoe factories. Industries recently established include the production of machinery for leather manufactures, hydraulic presses for the ironing of chrome leather, and the manufacture of grain elevators. The freightage of goods on the Dnieper at Kiev is great and the town forms a distributing centre for goods transhipped and sent by the four railway lines that converge on it, and also a collecting centre for export along the river. Formerly Bessarabian goods formed a large item of trade and there was a Bessarabian quarter in the town. In addition to its river and railway communications, a regular air service to Kharkov now runs twice weekly, occupying 3½ hours, with a station at Poltava from which there is an air service to Odessa.

Topography.—The town is mainly built on the hilly bluffs of the right bank of the river rising to about 300 ft. above the level of the river and separated by ravines; the low, level country of the left bank stretches to the horizon The river here divides into two arms, with the island of Tukhanov in the centre. In spring the river rises 15 to 20 ft. and the island, the left bank and the lower parts of the right bank, are submerged. The bed of the river is sandy and shifting and is only kept from returning to the more easterly channel along which it formerly flowed by costly engineering works. The low-lying Podol, in which the Contract Fair is held, and where, up to the end of the 14th century were the trading quarters of the Armenians and Genoese, surrounded by an earthen wall, is a very ancient part of the city, where, under Lithuanian and Polish rule, the life of Kiev was concentrated. There is a large Jewish quarter here, which has been the scene of many revolting *pogroms* (massacres).

Of the Old Town on the hills above, there remains the Golden Gate, a ruin of the 11th century earthen ramparts, bastions and gates. The gate was built in 1037, but only the side walls, enclosed by a railing, now remain. Near it is the theatre in which Stolypin, the prime minister of Russia, was shot in 1911 and which is now a forum for congresses. The cathedral of St. Sophia, the oldest in Russia, built in the 11th century, has been rebuilt so many times that its original form is lost, and only a few of its 19 domes date back to mediaeval times. The golden cupola of its four-storeyed campanile is visible for many miles across the steppe. The interior of the cathedral has beautiful 11th century frescoes and mosaics, covered with whitewash during the Uniat occupation of the cathedral in the 17th century and rediscovered in 1842. They are the oldest monuments of Russo-Byzantine art and represent hunting scenes, gladiatorial combats, games and dances. The church of St. Andrew, rebuilt in florid style (1744–67) stands on the spot where, according to Russian tradition, that apostle stood and declared that the hill would become the site of a great city. The monastery of St. Michael, sometimes called of the Golden Heads, because of the 15 gilded cupolas of the original church, was built in 1108 and restored by the Cossack chieftain, Bogdan Chmielnicki, who released the city from Polish rule in 1651, when it came under the rule of Moscow. Near it is a column of the Irene monastery, built in the 11th century, which was discovered during street levelling operations in the 19th century. The Decimal Church (1842) stands on the site of a 10th century church destroyed by the Tatars, in the environs of which were the market and palaces. Foundations of the palace of the Grand Dukes were discovered in its churchyard. The Andreas Church, built by Rastrelli in 1750, is picturesquely situated on the edge of a cliff overlooking the Dnieper and the Podol quarter of the town. Upon the Perun hill, where stood the ancient temple of the pagan god Perun, is the dome-crowned church of the Three Saints (1640).

On the Pechersky hill was the famous Pechersky (Cave) monastery; in the 18th century a fortress was erected here, and its arsenal was the scene of desperate fighting during the 1917–20 civil wars, when much of the district was reduced to ruins. The monastery or *Lavra* was an ancient and very sacred spot. The hetman Mazeppa replaced the wooden 12th century building by imposing towers and stone walls. In pre-revolution times it was visited annually by 250,000 pilgrims, its Cavern monastery, with its caves and catacombs where the bodies of the monks were buried, was a special object of pilgrimage. The foundation of the monastery is ascribed to the 11th century saints Anthony and Hilarion, and by the middle of the 12th century it had become wealthy and beautiful. Completely ruined by the Mongol Batu

and his hordes in 1240, it remained deserted for two centuries. The present building dates from the time of Peter the Great, a fire having destroyed a previous building. Among the more notable names of the saints buried in the catacombs are Nestor the Chronicler and Iliya of Murom, the old Cossack of the Russian epics. Under Soviet rule the monastery has been converted into a home for disabled soldiers, with workshops. The printing press, founded in the Lavra in 1601, became in the 17th century the centre of Ukrainian cultural achievements. When the Russianizing of the Ukraine became a policy of the tsarist Government, only books of a religious character were allowed to be printed here. At the present time the press is in the hands of the Ukrainian academy of science.

The school of painting and engraving organized by the monastery was famous throughout the empire; it is now a workshop for the production of ikons. A museum of religious cults has been formed since the revolution from the collections of the Ecclesiastical academy, the Bratsky monastery and the Pechersky Lavra itself and is situated in one part of the Lavra. The Nikolaiev cathedral, built by the hetman Mazeppa, was completely destroyed by bombardment in 1919. Near its ruins is the former graveyard of the Kiev nobility, with a chapel in classical style built on the supposed site of the grave of Askold. In the former Bratsky monastery is the cathedral of the Baptism of Christ (1695), typical of Ukrainian baroque, with grape vine decoration. The Academy of the Bratsky monastery was in the 16th century a school in which Ukrainian scientists, artists and statesmen were trained. Later it became a theological seminary. Its rich library was handed over to the Ukrainian science library after the 1917 revolution. The buildings of the Bratsky monastery are now partly the headquarters of the local Communist party and partly a medical school. Within the Florus monastery, a church of the Resurrection was built in 1920. Opposite the entrance to the Florus monastery is the former Catholic Dominican Church, erected during Polish rule in the 16th century, destroyed by the Cossacks under Bogdan Chmielnicki and transformed into the Greek Orthodox Church of Peter and Paul by Peter the Great. The former Pokrovsky monastery has been converted since the revolution into a Workers' Home, School, Club and Hospital.

The city has several theatres, including a Jewish state theatre. Of the museums, the All-Ukrainian historical museum is specially valuable for its rich archaeological exhibits, and the Zoological for its collections of insectivora. The State art museum contains fine examples of Dutch and Flemish schools, paintings by Spanish masters, Gobelin tapestries and Persian ceramics. Its former university is now an academy of science, and there are art, medical and agricultural institutes. An interesting experiment in the reclamation of homeless children is the Children's City, in which there are approximately 1,000 children, who cultivate their own fields and have workshops of their own.

BIBLIOGRAPHY.—The Russian literature concerning Kiev is voluminous. Its bibliography will be found in the *Russian Geographical Dictionary* of P. Semenov, and in the *Russian Encyclopaedic Dictionary*, published by Brockhaus and Efron (vol. xv., 1895). Among recent publications are: Rambaud's *La Russie épique* (Paris, 1876); Avenarius, *Kniga o Kievskikh Bogatuiryakh* (St. Petersburg, 1876), dealing with the early Kiev heroes; Zakrevski, *Opisanie Kieva* (1868); the materials issued by the commission for the investigation of the ancient records of the city; Taranovskiy, *Gorod Kiev* (Kiev, 1881); De Baye, *Kiev, la mère des villes russes* (1896); Goetz, *Das Kiewer Hohlenkloster als Kulturzentrum des vormongolischen Russlands* (Passau, 1904). *See* also Count Bobrinsky, *Kurgans of Smiela* (1897); *Guide to the Soviet Union* (Moscow, 1925).

KIKUYU, a native region of British East Africa, on the equator. It consists chiefly of forests, though some parts of the land are now under cultivation. (*See* BRITISH EAST AFRICA.)

KILBARCHAN, burgh of barony and parish, Renfrewshire, Scotland, with a station on the L.M.S railway, 13 m. W. by S. of Glasgow, and 1 m. from Milliken Park station. Pop. (1921), 3,352. In a niche in the town steeple (erected in 1755) is the statue of the famous piper, Habbie Simson, who died about the beginning of the 17th century. The linen and cotton industries have languished. Two miles S.W. is a great rock of greenstone called Clochoderrick, 12 ft. in height, 22 ft. in length, and 17 ft. in breadth. About 2 m. N.W. on Gryfe Water, lies Bridge of Weir (pop. 2,242), the industries of which include tanning and currying and calico-printing. It has a station on the L.M.S. railway. Immediately to the south-west of Bridge of Weir are the ruins of Ranfurly castle, the ancient seat of the Knoxes. About 4 m. N.W. of Bridge of Weir lies the holiday resort of Kilmalcolm (pronounced Kilmacome; pop. 2,220), with a station on the L.M S. railway. It has a golf-course, public park and hydropathic establishment.

KILBIRNIE, town and parish, north Ayrshire, Scotland, on the Garnock, 20½ m. S W. of Glasgow, with a station on the L.M.S. railway. Pop. (1921) 5,341. The industries include flax-spinning, rope, linen-thread and fishing net manufactures, and iron and steel works. The parish church dates mostly from the Reformation. In the churchyard are effigies of Capt. Thomas Crawford of Jordanhill (d. 1603), who in 1575 effected the surprise of Dumbarton castle, and his lady. Near Kilbirnie Place, a modern mansion, are the ruins of Kilbirnie castle, an ancient seat of the earls of Crawford, destroyed by fire in 1757. About 1 m. E. is Kilbirnie Loch, 1¼ m long.

KILDARE, EARLS OF: *see* FITZGERALD.

KILDARE, a county of Ireland in the province of Leinster, bounded west by Co. Leix (formerly Queen's County) and Co. Offaly (formerly King's County), north by Meath, east by Dublin and Wicklow, and south by Carlow. The area is 418,496 acres or about 654 sq m. Pop. (1926) 58,035. The greater part of the county is formed of grey Carboniferous limestone, well seen in the flat land about Clane. Along the south-east the broken ground of Silurian shales forms the higher country, rising towards the Leinster chain, the granite core of which appears in the south round Castledermot. A parallel ridge of Silurian rocks rises from the plain north of Kildare town (Hill of Allen [300 ft] and Chair of Kildare), with some Old Red Sandstone on its flanks. The low ground is diversified by eskers and masses of glacial gravel, notably at the dry sandy plateau of the Curragh; but in part it retains sufficient moisture to give rise to extensive bogs.

The principal rivers are the Boyne, which with its tributary the Blackwater rises in the north of the county, but soon passes into Meath; the Barrow, which forms the boundary of Kildare with Co. Leix, and receives the Greese and the Lane shortly after entering Kildare; the Lesser Barrow, which flows southward from the Bog of Allen to near Rathangan; and the Liffey, which enters the county near Ballymore Eustace, and flowing north-west and then north-east quits it at Leixlip, having received the Morrel between Celbridge and Clane, and the Ryewater at Leixlip. Trout are taken in the upper waters, and there are salmon reaches near Leixlip.

History and Antiquities.—According to the *Book of Leinster* the original name of Kildare was *Druim Criaidh* (Drumcree), which it retained until the time of St. Brigit, after which it was changed to *Cilldara*, "the church of the oak," from an old oak under whose shadow the saint had constructed her cell. Kildare was a liberty of Dublin until 1296, when it was constituted a separate county.

There are several large standing stones, the principal being those at Punchestown, Harristown, Jigginstown and Mullamast. Among remarkable earthworks are the raths at Mullamast, Knockcaellagh near Kilcullen and Ardscull near Naas, and the numerous sepulchral mounds in the Curragh. Of the round towers the finest is that of Kildare; there are remains of others at Taghadoe, Old Kilcullen, Oughterard and Castledermot.

There are remains of a Franciscan abbey at Castledermot. At Graney are ruins of an Augustinian nunnery and portions of a building said to have belonged to the Knights Templars. The town of Kildare has ruins of four monastic buildings, including the nunnery founded by St. Brigit. The site of a monastery at Old Kilcullen, said to date from the time of St. Patrick, is marked by two stone crosses, one of which is curiously sculptured. On the Liffey are the remains of Great Connel abbey near Celbridge, of St. Wolstan's near Celbridge, and of New abbey. At Moone, where there was a Franciscan monastery, are the remains of an ancient cross with curious sculpturings. Among castles may be

mentioned those of Athy and Castledermot, built about the time of the Anglo-Norman invasion; Maynooth castle, built by the Fitzgeralds; Kilkea, restored within the 19th century; and Timolin, erected in the reign of King John.

Owing to a considerable degree to the large extent of bog, the climate of the northern districts is very moist, and fogs are frequent, but the eastern portion is drier, and the climate of the Liffey valley is mild and healthy. The soil is principally a rich deep loam inclining occasionally to clay, easily cultivated and very fertile if properly drained. About 40,000 acres in the northern part of the county are included in the Bog of Allen, which is, however, intersected in many places by elevated tracts of firm ground. To the east of the town of Kildare is the Curragh, an undulating down upwards of 4,800 acres in extent. The most fertile and highly cultivated districts of Kildare are the valleys of the Liffey and a tract in the south watered by the Greese. The demesne lands along the valley of the Liffey are finely wooded. The pastures which are not ploughed are generally very rich. Wheat is a scanty crop, but oats, barley, turnips and potatoes are all considerably cultivated. Cattle and sheep are grazed extensively. Of the former, crosses with the shorthorn or the Durham are the commonest breed. Leicesters are the principal breed of sheep. Poultry farming is a growing industry.

There are a few small cotton, woollen and paper mills, as well as breweries and distilleries, and several corn mills. Large quantities of turf are exported to Dublin by canal. The lines of the Great Southern follow the northern boundary of the county, with a branch to Carbury and Edenderry, and cross the county by way of Newbridge and Kildare, with southward branches to Naas (and Tullow, Co. Carlow) and to Athy and the south. The northern border is traversed by the Royal canal, which connects Dublin with the Shannon at Cloondara. Farther south the Grand canal, which connects Dublin with the Shannon at Shannon Harbour, occupies the valley of the Liffey until at Sallins it enters the Bog of Allen, passing into Co. Offaly near the source of the Boyne. Several branch canals afford communication with the southern districts.

The administrative county of Kildare returns 3 members to Dáil Eireann.

KILDARE, a market town and the county town of Co. Kildare, Ireland, 30 m. S.W. from Dublin by rail. Pop. (1926) 1,971. There is a Protestant cathedral church, the diocese of which was united with Dublin in 1846. St. Brigit or Bridget founded the religious community in the 5th century. The cathedral suffered at the hands of the Danes and the Irish, and during the Elizabethan wars. Extensive restoration was begun in 1875; the choir, which dated from the late 17th century, was rebuilt in 1896. Close to the church are an ancient cross and a round tower with a doorway showing Romanesque ornament. There are remains of a 13th century castle and of a Carmelite monastery. Kildare was incorporated by James II., and returned two members to the Irish parliament.

KILHAM, ALEXANDER (1762–1798), English Methodist, was born at Epworth, Lincolnshire, on July 10, 1762. He was admitted by John Wesley in 1785 into the regular itinerant ministry. He became the leader and spokesman of the democratic party in the Connection which claimed for the laity the free election of class-leaders and stewards, and equal representation with ministers at Conference. They also contended that the ministry should possess no official authority or pastoral prerogative, but should merely carry into effect the decisions of majorities in the different meetings. Kilham further advocated the complete separation of the Methodists from the Anglican Church. In the violent controversy that ensued he wrote many pamphlets; for this he was arraigned before the Conference of 1796 and expelled, and he then founded the Methodist New Connection (1798, merged since 1906 in the United Methodist Church).

KILIAN (CHILIAN, KILLIAN), **ST.,** British missionary bishop and the apostle of eastern Franconia, where he began his labours towards the end of the 7th century. According to Hrabanus Maurus Kilian was a native of Ireland, whence with Coloman and Totman he went to eastern Franconia. After having preached the gospel in Würzburg, the whole party were put to death by the orders of an unjust judge named Gozbert. The relics of the three martyrs are venerated in the cathedral of that town. His festival is on July 8.

KILIMANJARO (kĭ-lĭ-măn-jah'rō), a mountain in East Africa, its centre lying in 3° 5′ S and 37° 23′ E.; the highest known summit of Africa, rising as a volcanic cone from a plateau of about 3,000 ft. to 19,321 feet. Though completely isolated it is one of several summits on the eastern edge of the plateau of equatorial Africa. Along with Mount Kenya (*q.v.*), 200 m. to the north, and Mount Meru (*q.v.*), 25 m. due west, it stands on a line of volcanic cones. Kilimanjaro lies on an east to west fault which is crossed by other faults near the peak. The volcanic rocks are leucitic and the oldest flows are of kenyte (trachy-dolerite suite) covered by a nepheline-phonolite suite.

The major axis of Kilimanjaro runs almost east and west, and on it rise the two principal summits, Kibo (west), Mawenzi (east). Kibo, the higher, is a truncated cone with a nearly perfect extinct crater, and marks a comparatively recent period of volcanic activity; while Mawenzi (16,892 ft.) is the older core of a former summit, of which the crater walls have been removed by denudation. The two peaks, about 7 m apart, are connected by a saddle (14,000 ft.), below which the vast mass slopes, in a typical volcanic curve, to the plains below. The sides are furrowed on the south and east by a large number of narrow ravines, the streams in which feed the Pangani and Lake Jipe (south) and the Tsavo tributary of the Sabaki (east) South-west of Kibo, the Shira ridge seems to be of independent origin, while in the north-west a rugged group of cones, of comparatively recent origin, has poured forth vast lava-flows. In the south-east is another ridge running down from Mawenzi.

The lava slopes of the Kibo peak are covered to a depth of some 200 ft with an ice-cap, which, where ravines occur, takes the form of genuine glaciers The crater walls are highest on the south. The rim here sinks precipitously some 600 ft. to the interior of the crater, which measures rather over 2,000 yd. in diameter, and is in part covered by ice, in part by a bare cone of ashes. On the west the rim is breached, allowing the passage of an important glacier. Lower down this cleft is occupied by two glaciers, one of which reaches a lower level (13,800 ft) than any other on Kilimanjaro. On the north-west three large glaciers reach down to 16,000 ft.

Mawenzi peak has no permanent ice-cap. The rock of which it is composed has become very jagged by denudation, forming stupendous walls and precipices. On the east the peak falls with great abruptness some 6,500 ft. to a vast ravine, due apparently to dislocation. Below this the slope is more gradual and more symmetrical Like the other high mountains of eastern Africa, Kilimanjaro presents well-defined zones of vegetation. The lowest slopes are arid and scantily covered with scrub, but between 4,000 and 6,000 ft. on the south side the slopes are well watered and cultivated. The forest zone begins, on the south, at about 6,500 ft., and extends to 9,500, but in the north it is narrower, and in the north-west, the driest quarter of the mountain, almost disappears. In the alpine zone, marked especially by tree lobelias and *Senecio,* flowering plants extend up to 15,700 ft on the sheltered south-west flank of Mawenzi, but elsewhere vegetation grows only in dwarfed patches beyond 13,000 ft. The special fauna and flora of the upper zone are akin to those of other high African mountains. The southern slopes, between 4,000 and 6,000 ft., form the well-peopled country of Chaga, divided into small districts.

Johannes Rebmann of the Church Missionary Society journeyed inland from Mombasa in 1848 and discovered Kilimanjaro, which is some 200 m. inland. Visits were paid to the mountain by Baron Karl von der Decken (1861 and 1862) and Charles New (1867), Joseph Thomson (1883), Sir H. H. Johnston (1884) and others. The mountain was studied by F. Jaeger in 1907.

It has been the special study of Dr. Hans Meyer, who made four expeditions to it, accomplishing the first ascent to the summit in 1889. In 1884 the mountain was secured by a British company, in 1886 it was ceded to Germany and in 1919 was included in the British mandated territory of Tanganyika.

See Hans Meyer, *Across East African Glaciers* (1891); *Der Kilimanjaro* (Berlin, 1900); F. Jaeger, *Forsch. Hochregion d. Kilimandscharo* (*Mitt. deutsch. Schutzgeb.*, 1909).

KILIN or CH'I-LIN, one of the four symbolical creatures which in Chinese mythology are believed to keep watch and ward over the Celestial Empire. It is a unicorn, portrayed in Chinese art as having the body and legs of a deer and an ox's tail. Its advent on earth heralds an age of enlightened government and civic prosperity. It is regarded as the noblest of the animal creation and as the incarnation of fire, water, wood, metal and earth. It lives for a thousand years, and is believed to step so softly as to leave no footprints and to crush no living thing.

KILINDINI, a commodious landlocked harbour at the south-west end of Mombasa island, East Africa, and the port for Kenya and Uganda. Officially it forms part of Mombasa harbour. (*See* MOMBASA.)

KILKEE, a seaside resort on Moore Bay in Co. Clare, Ireland. Pop. (1926) 1,682. Bishop's island, an isolated rock in the vicinity, has remains of an oratory and house ascribed to the recluse St. Senan.

KILKENNY, a county of Ireland in the province of Leinster, bounded north by Co. Leix, east by Carlow and Wexford, south by Waterford, and west by Waterford and Tipperary. Area 511,775 ac. or about 800 sq. miles. Pop. (1926), 70,965. The greater part of Kilkenny forms the south-eastern extremity of the central plain of Ireland and is composed largely of Carboniferous limestone. The Old Red Sandstone, with a Silurian core, forms the high ridge of Slievenaman in the south, and its upper laminated beds contain *Archanodon,* the earliest known fresh-water mollusc, and plant remains, at Kiltorcan near Ballyhale. The Leinster granite appears mainly as inliers in the Silurian of the south-east. The high synclinal coalfield forms the most important feature of the north of the county. A prolongation of the field runs out south-west by Tullaroan. The coal of the basin is anthracite, and the most productive portions are at Castlecomer. Hematitic iron of a rich quality is found in the Cambro-Silurian rocks at several places; and tradition asserts that silver shields were made about 850 B.C. at Argetros or Silverwood on the Nore. Manganese is obtained in some of the limestone quarries, and also near the Barrow. Marl is abundant in various districts. Pipeclay and potter's clay are found, and also yellow ochre. Copper occurs near Knocktopher.

The principal rivers, the Suir, the Barrow and the Nore, rise in the Slieve Bloom mountains (Co. Tipperary and Co. Leix), and flow into Waterford harbour. The Suir forms the boundary of the county with Waterford, and is navigable for small vessels to Carrick. The Nore, navigable to Inistioge, enters the county at its north-western boundary, and flows by Kilkenny to the Barrow, 9 m. above Ross, having received the King's river at Jerpoint and the Argula near Inistioge. The Barrow, navigable beyond the limits of Kilkenny into Kildare, forms the eastern boundary of the county from near New Bridge. Turloughs or temporary lakes are occasionally formed by the bursting up of underground streams.

Kilkenny is believed to have been created by King John. It had previously formed part of the kingdom of Ossory, and was one of the liberties granted to the heiresses of Strongbow with palatinate rights. There are ancient stone circles on Slieve Grian and on the hill of Cloghmanta. Many dolmens and raths (or encampments) occur in the county. Five round towers are known, one adjoining the Protestant cathedral of Kilkenny, and others at Tulloherin, Kilree, Fertagh and Aghaviller. There are remains of a Cistercian monastery at Jerpoint, said to have been founded by Dunnough, King of Ossory, and of another of the same order at Graigue, founded in 1212. The Dominicans had an abbey at Rosbercon, founded in 1267, and another at Thomastown of which there are some remains. The Carmelites had a monastery at Knocktopher. There are remains of an Augustinian monastery at Inistioge, and of priories at Callan and Kells. There are also ruins of the castles of Callan, Legan, Grenan and Clonamery, besides the ancient portions of Kilkenny castle.

The surface occupied by bog or wet land is very small. Myrtle and arbutus grow in the open in winter. There is less rain than at Dublin, and vegetation is earlier than in the adjacent counties. Along the banks of the Suir, Nore and Barrow are rich alluvial deposits. Above the coal-measures in the northern part of the county there is a moorland tract devoted chiefly to pasturage. Above the limestone is a deep rich loam well adapted for the growth of wheat. The heath-covered hills afford excellent honey. Oats, barley, turnips and potatoes are grown; the cultivation of wheat has declined. Cattle, sheep, pigs and poultry are reared, the Kerry cattle being in considerable request.

The linen manufacture introduced in the 17th century to supersede the woollen manufacture gradually became extinct and that now carried on is also very small. There are, however, breweries, distilleries, tanneries and flour-mills, as well as marble polishing works. The Carboniferous sandstones furnish the hard pavement slabs sold as "Carlow flags." The black limestone with white shells in it at Kilkenny is quarried as an ornamental marble. Good slates are quarried at Kilmoganny, in the Silurian inlier on the Slievenaman range. The county is traversed from north to south by the Maryborough, Kilkenny and Waterford branch of the Great Southern railway, and the Waterford and Limerick line runs for a short distance through the southern part of the county. The administrative counties of Carlow and Kilkenny together return five members to the Dáil Eireann.

KILKENNY, a city and municipal borough, the capital of Co. Kilkenny, Ireland, on the Nore, 81 m. S.W. of Dublin by rail. Pop. (1926) 10,056.

Kilkenny proper owes its origin to an English settlement in the time of Strongbow, and it received a charter from William Marshall, who married Strongbow's daughter. This charter was confirmed by Edward III., and from Edward IV Irishtown received the privilege of choosing a portreeve independent of Kilkenny. By Elizabeth, the boroughs, while retaining their distinct rights, were constituted one corporation, which in 1609 was made a free borough by James I., and in the following year a free city. James II. constituted the city and liberties a distinct county, to be styled the county of the city of Kilkenny, the burgesses of Irishtown continuing, however, to elect a portreeve until the passing of the Municipal Reform Act. Frequent parliaments were held at Kilkenny from the 14th to the 16th century. In 1642 it was the meeting-place of the assembly of confederate Catholics. In 1650 it surrendered to the parliamentary forces.

It consists of Englishtown (or Kilkenny proper) and Irishtown, separated by a rivulet, but although Irishtown retains its name, it is now included in the borough of Kilkenny. The present cathedral of St. Canice, from whom the town takes its name, dates from about 1255. The see of Ossory, which originated in the monastery of Aghaboe founded by St. Canice in the 6th century, and was named after the early kingdom of Ossory, was probably moved to Kilkenny about the year 1200. In 1835 the diocese of Ferns and Leighlin was united to it. The cathedral has a length from east to west of 226 ft., and a breadth along the transepts from north to south of 123 ft. It is mainly in Early English style, but was extensively restored in 1865. The north transept incorporates the parish church. The adjacent library of St. Canice contains many ancient books. A short distance from the south transept is a round tower 100 ft. high. The episcopal palace near the east end of the cathedral was erected in the time of Edward III. and enlarged in 1735. The Protestant church of St. Mary is of earlier foundation than the present cathedral; that of St. John includes a portion of the hospital of St. John founded about 1220; and the Roman Catholic cathedral, of the diocese of Ossory, dedicated to St. Mary (1843–1857), is a cruciform structure in the Early Pointed style. There are important remains of two monasteries—the Dominican abbey founded in 1225, and now

used as a Roman Catholic church; and the Franciscan abbey on the banks of the Nore, founded about 1230. The castle stands on a precipice above the Nore. It was built by Strongbow, but rebuilt by William Marshall after the destruction of the first castle in 1175. The Protestant college of St. John, originally founded in the 16th century, and re-endowed in 1684, stands near the river opposite the castle. In it Swift, Farquhar, Congreve and Bishop Berkeley received part of their education The Roman Catholic college of St. Kyran (Kieran) was completed about 1840.

In the neighbourhood are collieries as well as long-established quarries for marble, the manufactures connected with which are an important industry of the town. The city also possesses corn-mills, breweries and tanneries. Not far from the city are the limestone caverns of Dunmore, which have yielded numerous human remains.

KILKENNY, STATUTE OF, the name given to a body of laws promulgated in 1366 with the object of strengthening the English authority in Ireland. In 1361, Edward III. sent his second son, Lionel, duke of Clarence, who was already married to an Irish heiress, to represent him in Ireland. From the English point of view the country was in an unsatisfactory condition. Lawless and predatory, the English settlers were hardly distinguishable from the native Irish, and the authority of the English king over both had almost vanished. Lionel and his advisers summoned a parliament to meet at Kilkenny early in 1366 and here the statute of Kilkenny was passed into law. It began by relating how the existing lawlessness was due to the malign influence of the Irish and, like Magna Carta, its first positive provision declared that the church should be free. As a prime remedy for the prevailing evils all marriages between the two races were forbidden. Englishmen must not speak the Irish tongue, nor receive Irish minstrels into their dwellings, nor even ride in the Irish fashion; while to give or sell horses or armour to the Irish was made a treasonable offence. Moreover English and not the Brehon law was to be employed, and no Irishman could legally be received into a religious house, nor presented to a benefice. The statute also contained clauses for compelling the English settlers to keep the laws. For each county four wardens of the peace were to be appointed, while the sheriffs were to hold their tourns twice a year and were not to oppress the people by their exactions. An attempt was made to prevent the emigration of labourers, and finally the spiritual arm was invoked to secure obedience by threats of excommunication. The statute, although continually re-enacted represents an ideal rather than a practical legislative measure, and under the conditions then prevalent in Ireland little could be done toward carrying out its provisions.

The full text is published in the *Statutes and Ordinances of Ireland. John to Henry V.*, by H. F. Berry (1907). *See* also E. Curtis, *Mediaeval Ireland* (1923), pp. 283–286.

KILLALA (pron. *Killálla*), a small town on the north coast of Co. Mayo, Ireland. Pop. (1921) 503. It was for many centuries a bishop's see, the foundation being attributed to St. Patrick in the 5th century, but the diocese was joined with Achonry early in the 17th century and with Tuam in 1833. The cathedral church of St. Patrick is a plain 17th century structure. There is a souterrain, evidently connected with a rath, or encampment, in the graveyard. A round tower, 84 ft. in height, stands on a hill. Near the Moy river, south of Killala, are the abbeys of Moyne and Roserk or Rosserick, both Decorated in style, and both possessing fine cloisters. At Rathfran, 2 m. N., is a Dominican abbey (1274), and in the neighbourhood are camps, cromlechs, and an inscribed ogham stone, 12 ft. in height. Killala gives name to a Roman Catholic diocese, the seat of which, however, is at Ballina.

KILLALOE, a town of Co. Clare, Ireland, at the lower extremity of Lough Derg on the river Shannon, at the foot of the Slieve Bernagh mountains. Pop. (1921) 821. The cathedral of St. Flannan occupies the site of a 6th century church founded by St. Dalua. The present building is mainly of the 12th century, with a Romanesque doorway. In the churchyard is an ancient oratory said to date from the period of St. Dalua. Near Killaloe stood Brian Boru's palace of Kincora, the capital of the kings of Munster. The town is connected with Ballina (Co. Tipperary) by a bridge of 13 arches. Slate is quarried and there were formerly woollen manufactures. Killaloe might benefit considerably from an extension of the Shannon electricity schemes to include Lough Derg. It is a centre for the Shannon salmon-fishing and for trout-fishing in Lough Derg. It gives name to Protestant and Roman Catholic dioceses

KILLARNEY, a market town of Co. Kerry, Ireland, 185¼ m. S.W. from Dublin by rail. Pop. of urban district (1926) 5,325. Here are the Roman Catholic cathedral and bishop's palace of the diocese of Kerry. The only manufacture of importance now carried on at Killarney is that of fancy articles from arbutus wood; but it owed its origin to iron-smelting works, for which abundant fuel was obtained from the neighbouring forests.

The lakes of Killarney, about 1½ m. from the town, are surrounded by mountains. The lower lake, or Lough Leane (area, 5,001 ac.), is studded with islands, on the largest of which, Ross island, are the ruins of Ross castle, an old fortress of the O'Donoghues; and on another island, the "sweet Innisfallen" of Moore, are the ruins of a late 6th century abbey founded by St. Finian. Between the lower lake and the middle or Torc lake (680 ac. in extent) stands Muckross abbey, built by Franciscans about 1440. The Long Range, a winding and wooded channel, 2½ m. in length, leads to the upper lake (430 ac.) Notable ruins and remains, besides Muckross and Innisfallen, include Aghadoe, with its ruined church of the 12th century (formerly a cathedral) and remains of a round tower; and the Ogham Cave of Dunloe, a souterrain containing inscribed stones. The waters of the neighbourhood provide trout and salmon.

KILLDEER, the commonest American plover, so called in imitation of its whistling cry. About the size of a snipe, it is sooty-brown above, but with bright buff on the tail coverts, and a white wing-bar; beneath it is white except for two black pectoral bands. It is the largest of the ringed plovers forming the genus *Aegialitis* Mostly wintering in the south or on the sea-shore, in spring it spreads over the interior, breeding on ploughed lands or grass-fields. The nest is in a slight hollow, and is often surrounded with small pebbles and fragments of shells. Here the hen lays her four pear-shaped, stone-coloured eggs, always arranged with their pointed ends touching each other. In Canada the bird does not range farther north than 56° N In winter it may range south to Bermuda and Peru. The killdeer (*A. vocifera*) has several congeners in America, among which may be noticed *A. semipalmata*, resembling the ordinary ringed plover of the Old World, except that it has its toes connected by a web at the base; and *A. nivosa* from the west of both the American continents.

KILLER-WHALE, another name for the grampus (*q.v.*). The false killer (*Pseudorca crassidea*) is readily distinguished by being completely black, instead of having white underparts. It is of very irregular occurrence. In 1861, a hundred grounded at Kiel; a few were seen in European waters in the following year, and its next appearance in this region was in 1927, when about 125 were stranded in Scotland

KILLIECRANKIE, pass, Perthshire, Scotland, 3¾ m. N N W. of Pitlochry by the L M S. railway. Beginning close to Killiecrankie station it extends southwards to the bridge of Garry, through the narrow, wooded glen in the channel of which flows the Garry. A road constructed by General Wade in 1732 runs up the pass, and between this and the river is the railway. The battle between the Jacobites (1689) under Viscount Dundee and the royal force, led by General Hugh Mackay, though named from the ravine, was not actually fought in the pass. The Highlanders were drawn up where the railway station now stands and before Mackay had time to form his force was swept back into the pass, and lost nearly half their number. Viscount Dundee was killed near Urrard House.

KILLIGREW, SIR HENRY (d. 1603), English diplomatist, was the fourth son of John Killigrew of Arwenack. He became M.P. for Launceston in 1553. He lived on the continent during Mary's reign but returned to England when Elizabeth came to the throne and served the queen as a diplomatist. He was employed on a mission to Germany, and in conducting negotiations with Mary

queen of Scots in Scotland. In 1572 he was M.P. for Truro. He was knighted in 1591, and after other diplomatic missions he died early in 1603. Many of Sir Henry's letters on public matters are in the Record Office, London, and in the British Museum. He married Catherine (d. 1583), daughter of Sir Anthony Cooke.

SIR ROBERT KILLIGREW (*c.* 1579–1633), son of Sir William Killigrew, M.P. (d. 1622), was a member of all the parliaments between 1603 and 1633. A man of some scientific knowledge, he had been in the habit of supplying powders to Robert Carr, earl of Somerset, and it was alleged, though without certainty, that the powder administered to Sir Thomas Overbury came from him. He died early in 1633, leaving five sons, three of whom attained some reputation.

KILLIGREW, THOMAS (1612–1683), English dramatist and wit, son of Sir Robert Killigrew, was born in Lothbury, London, on Feb. 7, 1612. Pepys says that as a boy he satisfied his love of the stage by volunteering at the Red Bull to take the part of a devil, thus seeing the play for nothing. In 1633 he became page to Charles I., and was faithfully attached to the royal house throughout his life. In 1641 he published two tragi-comedies, *The Prisoners* and *Claracilla,* both of which had probably been produced before 1636. In 1647 he followed Prince Charles into exile. At the Restoration he became groom of the bedchamber to Charles II., and later chamberlain to the queen. He received in 1660, with Sir William Davenant, a patent to erect a new playhouse, the performances in which were to be independent of the censorship of the master of the revels. This infringement of his prerogative caused a dispute with Sir Henry Herbert, then holder of the office, but Killigrew settled the matter by generous concessions. He acted independently of Davenant, his company being known as the King's Servants. They played at the Red Bull, until in 1663 he built for them the original Theatre Royal in Drury Lane. Pepys writes in 1664 that Killigrew intended to have four opera seasons of six weeks each during the year, and that he paid several visits to Rome to secure singers and scene decorators. In 1664 his plays were published as *Comedies and Tragedies. Written by Thomas Killigrew.* They are *Claracilla; The Princess, or Love at First Sight; The Parson's Wedding; The Pilgrim; Cicilia and Clorinda, or Love in Arms; Thomaso, or the Wanderer;* and *Bellamira, her Dream, or Love of Shadows. The Parson's Wedding* (acted *c.* 1640, reprinted in the various editions of Dodsley's *Old Plays* and in the *Ancient British Drama*) is an unsavoury play, which displays nevertheless considerable wit, and some of its jokes were appropriated by Congreve. It was revived in 1664 and 1672 or 1673, all the parts being in both cases taken by women. Killigrew succeeded Sir Henry Herbert as master of the revels in 1679. He died at Whitehall on March 19, 1683. He was twice married, first to Cecilia Crofts, maid of honour to Queen Henrietta Maria, and secondly to Charlotte de Hesse, by whom he had a son Thomas (1657–1719), who was the author of a successful little piece, *Chit-Chat,* played at Drury Lane on Feb. 14, 1719, with Mrs. Oldfield in the part of Florinda.

Killigrew enjoyed a greater reputation as a wit than as a dramatist. Sir John Denham said of him:—

> Had Cowley ne'er spoke, Killigrew ne'er writ,
> Combined in one, they'd made a matchless wit.

Many stories are related of his bold speeches to Charles I. Pepys (Feb. 12, 1668) records that he was said to hold the title of king's fool or jester, with a cap and bells at the expense of the king's wardrobe, and that he might therefore revile or jeer anybody, even the greatest, without offence.

KILLIN, village of Perthshire, Scotland, on Loch Tay, on a branch line of the L.M.S. from Killin junction, 4 m. distant, which also runs to Loch Tay pier. Pop. (1921) 610. It is situated near the confluence of the rivers and glens of the Dochart and Lochay, and is a popular tourist centre. It manufactures tweeds. Near the village a stone marks the site of Fingal's Grove. An island in the Dochart (which is crossed at Killin by a bridge of five arches) is the ancient burial-place of the clan Macnab. Finlarig castle, a ruin, was a stronghold of the Campbells of Glenorchy, and several earls of Breadalbane were buried adjoining it, where the modern mausoleum of the family stands. The Lochay rises in the hills beyond the forest of Mamlorn and has a course of 15 m. The Dochart, issuing from Loch Dochart, flows north-east for 13 m. and falls into Loch Tay. The ruined castle on an islet in the loch once belonged to the Campbells of Lochawe.

KILLIS, a town of north Syria, 60 m. N. of Aleppo on the boundary between French Mandated Territory and Anatolia, but by the Franco-Turkish Convention of May 30, 1926, assigned to Anatolia. The country around is extremely fertile; olives especially are cultivated. The population is estimated at 20,000 (Circassians, Turks, Arabs). It is in the area served by the Baghdad railway and lies also on the carriage road from Aleppo to Aintab and Birejik.

See E. Honigmann, "Killiz" in *Encyc. Islam* (bibl.). (E. Ro.)

KILLYBEGS, a seaport and market town of Co. Donegal, Ireland. Pop. (1921) 634. Its land-locked harbour is used as a naval station, and is the centre of an important fishery. The manufacture of Donegal carpets is important. There are slight remains of a castle and ancient church; and a mineral spring is still used. The town received a charter from James I., and was a parliamentary borough, returning two members, until the Union.

KILLYLEAGH, a small seaport and market town of Co. Down, Ireland, on the western shore of Strangford lough. Pop. (1921), 1,610. Linen manufacture is the principal industry, and agricultural produce is exported. The modern castle preserves the towers of an old fortification, built by Sir John de Courcy, besieged by Shane O'Neill (1567), and destroyed by Monk (1648). The town was incorporated by James I., and returned two members to the Irish parliament.

KILMAINE, CHARLES EDWARD (1751–1799), French general, was born at Dublin on Oct. 19, 1751. In 1762 he went with his father to France, where he changed his name from Jennings to Kilmaine, after a village in Mayo. He entered the French army in 1774, and afterwards served as a volunteer in the Navy (1778), fighting in Senegal. He took part in the War of American Independence (1780–1783), rejoining the army on his return to France. In 1791 he was recalled to active service and rose rapidly to the rank of lieutenant-general (1793). He distinguished himself in the wars on the northern and eastern frontiers but aroused suspicion by his foreign birth and his relations with England. He was suspended from Aug. 4, 1793 until 1795. He took part in the Italian campaigns of 1796 and 1797, and was made commandant of Lombardy. He afterwards received the command of the cavalry in Bonaparte's "army of England" and was commander-in-chief during the absence of Desaix (1798). He died on Dec. 15, 1799.

KILMALLOCK, a market town of Co. Limerick, Ireland, 124¼ m. S W. of Dublin by rail. Pop. (1926) 1,101. It received a charter in the reign of Edward III., at which time it was walled and fortified, with four gates, two of which remain. Its fortifications were for the most part demolished by order of Cromwell. Two castellated mansions may still be seen. The church of St. Peter and St. Paul belonged to a former abbey, and its north-west tower is a converted round tower. The 13th century Dominican abbey has Early English remains. The foundation of Kilmallock is attributed to the Geraldines. Eight miles from the town is Lough Gur, near which are numerous stone circles and other remains.

KILMARNOCK, municipal and police burgh, manufacturing town and parish, Ayrshire, Scotland, on Kilmarnock Water, a tributary of the Irvine, 24 m. S.W. of Glasgow by the L.M S. railway. Pop. (1921) 33,756. The town possesses an institute with a good museum; a corn exchange with a tower; an art gallery; an observatory, and an academy and a technical school. The grounds of Kilmarnock House, presented to the town in 1893, have been laid out as a public park, and the house itself was given to the town by Lord Howard de Walden in 1921. In Kay Park, purchased from the duke of Portland, stands the Burns Memorial, consisting of two storeys and a tower, and containing a museum in which have been placed many important mss. of the poet and the McKie library of Burns's books. The marble statue of the poet, by W. G. Stevenson, stands on a terrace on the southern face. A Reformers' monument was unveiled in Kay Park in 1885. Dean

to the north of the town, which was burnt down in 1735, was restored in 1915. Kilmarnock rose into importance in the 17th century by its production of striped woollen "Kilmarnock cowls" (Scotch bonnets), and afterwards acquired a great name for its carpets. Woollen spinning is carried on, tweeds, shawls, lace curtains, cottons and winceys are produced; and there are extensive manufactures of shoes, china and earthenware, tanneries, and engineering and machinery works. The iron industry is prominent, the town being situated in the midst of a rich mineral region. Here, too, are workshops of the L.M.S. railway company. Kilmarnock is famous for its dairy produce, and every October holds one of the largest cheese-shows in Scotland. The neighbourhood abounds in coal, and freestone is quarried. The burgh is governed by a provost and council. Alexander Smith, the poet (1830–1867), whose father was a lace-pattern designer, and Sir James Shaw (1764–1843), lord mayor of London in 1806, to whom a statue was erected in the town in 1848, were natives of Kilmarnock. It dates from the 15th century, and in 1591 was made a burgh of barony under the Boyds, the ruling house of the district. The last Boyd who bore the title of Lord Kilmarnock was beheaded on Tower Hill, London, in 1746, for his share in the Jacobite rising. The first edition of Robert Burns's poems was published here in 1786.

KILMAURS, burgh of barony and parish, Ayrshire, Scotland, on the Carmel, 21½ m. S. by W. of Glasgow by the L.M.S. railway. Pop. (1921) 2,144. The chief industries are shoe and hosiery factories, and there are coal mines in the neighbourhood. The parish church, dating from 1170, and dedicated either to the Virgin or to a Scottish saint of the 9th century called Maure, was largely rebuilt in 1888. Adjoining it is the burial-place of the earls of Glencairn, some of whom bore the style of Lord Kilmaurs. The town was made a burgh of barony in 1527 by the earl of that date. Burns's patron, the 13th earl, on whose death the poet wrote his touching "Lament," sold the Kilmaurs estate in 1786 to the marchioness of Titchfield.

KILMER, JOYCE (1886–1918), American poet, was born at New Brunswick, N.J., on Dec. 6, 1886, and educated at Rutgers and Columbia (A.B., 1908). Shortly after graduation he took up editorial and journalistic work in New York city and rose rapidly to prominence as an accomplished journalist, serving on the staff of the *New York Times*, 1913–18, and contributing to many magazines. It is as a poet, however, that he is chiefly remembered, his love of the common and beautiful things finding a simple and delicate expression in verse that won for many of his poems, such as "Trees," "Stars," "Roofs," "The Snow Man," "Roses," wide-spread favour both with literary critics and with the people. He was killed in action near the village of Seringes, France, on July 30, 1918. His books were *Summer of Love* (1911); *Trees and Other Poems* (1914); *The Circus and Other Essays* (1916); *Main Street and Other Poems* (1917); and *Literature in the Making* (1917).

See the "Memoir" by R. C. Holliday in *Joyce Kilmer; Poems Essays and Letters* (1918); Annie K. Kilmer *Memories of My Son* (1920), R. Le Gallienne "Joyce Kilmer" *Bookman* (Amer.), vol. xlviii. (1918), K. Bregy, *Poets and Pilgrims* (1925).

KILN, a place for burning, baking or drying. Kilns may be divided into two classes—those in which the materials come into actual contact with the flames, and those in which the furnace is beneath or surrounding the oven. Lime-kilns are of the first class, and brick-kilns, pottery-kilns, etc., of the second, which also includes places for merely drying materials, such as hop-kilns, usually called "oasts" or "oast-houses."

KILPATRICK, NEW, or **EAST,** also called BEARSDEN, town and parish in Dumbartonshire, Scotland, 5½ m. N.W. of Glasgow by road, with two stations on the L.N.E.R. branch line from Glasgow to Milngavie. Pop. (1921) 5,240. The town is largely inhabited by business men from Glasgow, and part of it, with a population of 3,598, was added to Glasgow in 1912. St. Peter's College, a fine structure, was presented to the Roman Catholic Church in 1892. Remains of the Wall of Antoninus are close to the town, and Roman remains occur in the district. Old Kilpatrick (pop. 2,705) 10½ m. from Glasgow, has stations on the L.M.S. and L.N.E.R., and is traditionally the birthplace of St. Patrick. To the north, occupying an area of about 6 m. from east to west and 5 m. from north to south run the Kilpatrick Hills, of which the highest points are Duncomb and Fynloch Hill (each 1,313 ft.).

KILRUSH, a seaport and watering-place of Co. Clare, Ireland, on the north shore of the Shannon estuary 45 m. below Limerick. Pop. of urban district (1926) 3,346. It has extensive fisheries, and flagstone quarries, and exports peat fuel; while general fairs, horse fairs and annual agricultural shows are held. Off the harbour lies Scattery island (*Inis Cathaigh*), where St. Senan (d. 544) founded a monastery. There are the remains of his oratory and house and of seven rude churches or chapels, together with a round tower and a holy well

KILSYTH, police burgh and parish of Stirlingshire, Scotland, on the Kelvin, 13 m. N.N.E. of Glasgow by the L.N.E. railway. There is another station on the L.M.S. railway, and the town is close to the Forth and Clyde canal. Pop. (1921) 7,600. Chief industries are coal-mining and iron-works; there are also manufactures of paper and cotton, besides quarrying of whinstone and freestone. There are considerable remains of the Wall of Antoninus south of the town, and to the north the ruins of the old castle. Kilsyth dates from the middle of the 17th century and became a burgh of barony in 1826. It was the scene of Montrose's defeat of the Covenanters on Aug. 15, 1645.

KILT, properly the short loose skirt or petticoat, reaching to the knees and usually made of tartan, forming part of the dress of a Scottish Highlander (*see* DRESS). The word means that which is "girded or tucked up," and is probably of Scandinavian origin (*cf.* Danish *kilte*, to tuck up). The early kilt was not a separate garment but was merely the lower part of the plaid, in which the Highlander wrapped himself

KILWA, a seaport of Tanganyika Territory, East Africa, about 200 m. S. of Zanzibar. There are two Kilwas, one on the mainland—Kilwa Kivinje; the other, the ancient city, on an island—Kilwa Kisiwani. Kilwa Kivinje, on the northern side of Kilwa bay, is regularly laid out, the houses in the European quarter being large and substantial. Pop. (1921) about 2,200. The harbour is poor and this with the lack of a railway hinders trade development.

Kilwa Kisiwani, 25 m. to the south of the modern town, possesses a deep harbour sheltered from all winds by projecting coral reefs. The island on which it is built is separated from the mainland by a shallow and narrow channel There is a small modern quarter; the ruins of the ancient city include massive walls and bastions, remains of a palace and of two large mosques, of which the domed roofs are in fair preservation, besides several Arab forts. On the island of Songa Manara, at the southern end of Kilwa bay, hidden in dense vegetation, are the ruins of another city, unknown to history. Fragments of palaces and mosques in carved limestone exist, and on the beach are the remains of a lighthouse. Chinese coins, dating between A.D. 713 and 1201, and pieces of porcelain have been found on the seashore, washed up from the reefs.

The sultanate of Kilwa is reputed to have been founded about A.D. 975 by Ali bin Ḥasan, a Persian prince from Shiraz, upon the site of the ancient Greek colony of Rhapta. The new state, at first confined to the town of Kilwa, extended its influence along the coast from Zanzibar to Sofala, and the city came to be regarded as the capital of the Zenj "empire" (*see* ZANZIBAR: *History*). An Arab chronicle gives a list of over forty sovereigns who reigned at Kilwa in a period of five hundred years (*cf* A. M. H. J. Stokvis, *Manuel d'histoire*, Leiden, 1888, i. 558). Pedro Alvares Cabral, the Portuguese navigator, was the first European to visit it. His fleet, on its way to India, anchored in Kilwa bay in 1500. Kilwa was then a large and wealthy city, possessing, it is stated, three hundred mosques. In 1502 Kilwa submitted to Vasco da Gama, but the sultan neglecting to pay the tribute imposed upon him, the city in 1505 was occupied by the Portuguese. They built a fort there; the first erected by them on the east coast of Africa. Fighting ensued between the Arabs and the Portuguese, the city was destroyed; and in 1512 the Portuguese,

whose ranks had been decimated by fever, temporarily abandoned the place. Subsequently Kilwa became one of the chief centres of the slave trade. Towards the end of the 17th century it fell under the dominion of the imams of Muscat, and on the separation in 1856 of their Arabian and African possessions became subject to the sultan of Zanzibar. It is stated by Sir Richard Burton that about 1830 the people of Kilwa Kisiwani migrated to the mainland and founded Kilwa Kivinje because of the unwelcome attentions of British warships engaged in suppressing the slave trade. In 1885 Kilwa came under German rule, and the modern town was laid out by the Germans. Since 1919 Kilwa has been under British rule as part of Tanganyika Territory.

A version of the Arabic chronicles of Kilwa was published in the *Journal* of the Royal Asiatic Society for 1895.

KILWARDBY, ROBERT (d. 1279), archbishop of Canterbury and cardinal, studied at the University of Paris, where he soon became famous as a teacher of grammar and logic. He joined the order of St. Dominic, and was chosen provincial prior of his order in England in 1261, and in Oct 1272 Pope Gregory X. terminated a dispute over the vacant archbishopric of Canterbury by appointing Kilwardby. In 1278 Pope Nicholas III made him cardinal-bishop of Porto and Santa Rufina; he resigned his archbishopric and left England, carrying with him the registers and other valuable property belonging to the see of Canterbury. He died in Italy on Sept 11, 1279. Kilwardby was the first member of a mendicant order to attain a high position in the English Church. Among his numerous writings, which became very popular among students, are *De ortu scientiarum, De tempore, De Universale,* and some commentaries on Aristotle

See N. Trevet, *Annales sex regum Angliae,* ed T Hog (London, 1845); W. F. Hook, *Lives of the Archbishops of Canterbury,* vol. iii. (1860–76); J. Quétif and J. Échard, *Scriptores ordinis Predicatorum* (Paris, 1719–21).

KILWINNING, police burgh, market town and parish, Ayrshire, Scotland, on the right bank of the Garnock, 24 m. S.W. of Glasgow with two stations on the L M S. railway. Pop. (1921), 5,404. The ruined abbey, originally one of the richest in Scotland, was founded about 1140 by Hugh de Morville, lord of Cunninghame, for Tyronensian monks of the Benedictine order, and was dedicated to St. Winnin, who lived on the spot in the 8th century and has given his name to the town. This beautiful specimen of Early English architecture was largely destroyed in 1561, and its lands were granted to the earl of Eglinton and others. Kilwinning is the traditional birthplace of Scottish freemasonry, the lodge, believed to have been founded by the foreign architects and masons who came to build the abbey, being regarded as the mother lodge in Scotland. The royal company of archers of Kilwinning—dating, it is said, as far back as 1488—meet every July to shoot at the popinjay Fairs and an annual cattle show are held The large iron, coal and fire-clay works at Eglinton, engineering works and worsted spinning, employ most of the inhabitants.

KIMBERLEY, JOHN WODEHOUSE, 1ST EARL OF (1826–1902), English statesman, was born Jan 7, 1826, being the eldest son of the Hon. Henry Wodehouse and grandson of the 2nd Baron Wodehouse (the barony dating from 1797), whom he succeeded in 1846. He was educated at Eton and Christ Church, Oxford. He married Lady Florence Fitzgibbon (d. 1895), daughter of the last earl of Clare. In 1852–1856 and 1859–1861 he was under secretary of state for foreign affairs in Lord Aberdeen's and Lord Palmerston's ministries. In the interval (1856–1858) he had been envoy-extraordinary to Russia; and in 1863 he was sent on a special mission to Copenhagen on the forlorn hope of finding a peaceful solution of the Schleswig-Holstein question. In 1864 he became under secretary for India, but towards the end of the year was made lord-lieutenant of Ireland. He was created earl of Kimberley in 1866. In July 1866 Russell's ministry fell. Kimberley was lord privy seal in Gladstone's cabinet of 1868, and in July 1870 was transferred to the colonial office. The new town of Kimberley was named after him. Kimberley returned to the Colonial Office in 1880, but at the end of 1882 he was transferred to the duchy of Lancaster and then to the secretaryship of state for India, a post he retained during the remainder of Gladstone's tenure of power (1882–1886, 1892–1894), though in 1892–1894 he combined with it that of the lord presidency of the council. In the Rosebery cabinet (1894–1895) he was foreign secretary. Lord Kimberley was a loyal Gladstonian. As leader of the Liberal party in the House of Lords he acted with undeviating dignity; and in opposition he was a courteous antagonist and a critic of weight and experience. He was for many years a member of the senate of London University, and its chancellor in 1899. He died in London on April 8, 1902, being succeeded in the earldom by his eldest and only surviving son, Lord Wodehouse.

KIMBERLEY, town, 29° S., 24° 40′ E.; altitude 4,012 ft.; centre of the Griqualand West diamond industry, and 647 m. by rail from Cape Town. Population, including suburbs, in 1926 included 17,268 Europeans. In 1921 there were 18,288 Europeans, 13,048 natives, 920 Asiatics and 7,446 mixed and other races, giving a total of 39,702. The town is built on bare veld midway between the Modder and Vaal rivers. Its plan is unusually irregular for South Africa, owing to the town having grown out of several mining camps. Among the principal buildings are the High Court of Griqualand, a clock tower, the post office and the town hall, grouped about the market square. The public library has a good collection of books, and the museum has a considerable number of objects relating to the Bushmen and their culture In the district of Newton is a memorial to those killed in the siege of 1899–1900. Most of the white workmen employed in the mines live in the suburb of Kenilworth, which was laid out by the De Beers company as a model village. Here Siege Avenue, has been planted with 16 rows of trees, shrubs and vines.

The chief attraction of the town is the diamond mines. (*See* DIAMOND.) The Kimberley is within a few minutes' walk of the market square. The De Beers mine is one mile east of the Kimberley mine. The other principal mines, Bultontein, Du Toits Pan and Wesselton, are still farther distant from the town. Barbed wire fencing surrounds the mines, which cover about 180 acres

Kimberley was founded in 1870 by diggers who discovered diamonds on the farms of Du Toits Pan and Bultontein. In 1871 richer diamonds were found on the neighbouring farm of Vooruitzight at places named De Beers and Colesberg Kopje. There were at first three distinct mining camps, one at Du Toits Pan, another at De Beers (called De Beers Rush or Old De Beers) and the third at the Colesberg Kopje (called De Beers New Rush or New Rush simply). The Colesberg Kopje mine was in July 1873 renamed Kimberley in honour of the then secretary of state for the colonies, the 1st earl of Kimberley, by whose direction the mines were—in 1871—taken under the protection of Great Britain Kimberley was also chosen as the name of the town into which the mining camps developed. In 1880 the town was incorporated in Cape Colony. (*See* GRIQUALAND) Among those early attracted to Kimberley were Cecil Rhodes and "Barney" Barnato, who in time came to represent two groups of financiers controlling the mines The amalgamation of their interests in 1889 —when the De Beers group purchased the Kimberley mine for £5,338,650—put the whole diamond production of the Kimberley fields in the hands of one company, the De Beers Consolidated Mines, Ltd., so named after the former owners of the farm on which are situated the chief mines Kimberley in consequence became largely dependent on the good-will of the De Beers corporation, the town having practically no further industries other than diamond mining The importance of the industry led to the building of a railway from Cape Town, opened in 1885. On the outbreak of war between the British and the Boers in 1899 Kimberley was invested by a Boer force. The siege began on Oct. 12, and lasted until Feb. 15, 1900, when the town was relieved by General Sir John French. In 1906 the town was put in direct railway communication with Johannesburg, and in 1908 the completion of the line from Bloemfontein gave Natal direct access to Kimberley, which thus became an important railway centre.

KIMERIDGIAN: *see* JURASSIC SYSTEM.

KIMHI or **OIMHI,** the family name of three Jewish grammarians and biblical scholars who worked at Narbonne in the 12th and 13th centuries.

JOSEPH ḲIMḤI (*c.* 1105–70), a native of southern Spain, settled in Provence, where he was one of the first to set forth in Hebrew the results of Hebraic philology as expounded by the Spanish Jews in Arabic. His acquaintance with Latin grammar led him to divide the Hebrew vowels into five long vowels and five short, previous grammarians having simply spoken of seven vowels without distinction of quantity. His grammatical textbook, *Sefer Ha-Zikkaron,* "Book of Remembrance" (ed. W. Bacher, Berlin, 1888), was marked by methodical comprehensiveness, and introduced into the theory of the verbs a new classification of the stems which has been retained by later scholars. In the more ample *Sefer Ha-Galuy,* "Book of Demonstration" (ed. Matthews, Berlin, 1887), he attacks the philological work of the Frenchman R. Jacob Tam, who espoused the antiquated system of Menaḥem b. Saruq, and this he supplements by an independent critique of Menaḥem. This work is a mine of varied exegetical and philological details. He also wrote commentaries on various scriptural books, those on Proverbs and Job being published. He composed an apologetic work *Sefer Ha-Berith* ("Book of the Bond"), and translated into Hebrew the ethico-philosophical work of Baḥya ibn Paquda ("Duties of the Heart").

MOSES ḲIMḤI (d. *c.* 1190) was the author of a Hebrew grammar, *Mahalak Shebile Ha-daat.* He was the first to make the verb *paqadh* a model for conjugation, and the first also to introduce the now usual sequence in the enumeration of stem-forms. In the first half of the 16th century it became the favourite manual for the study of Hebrew among non-Judaic scholars (1st ed., Pesara, 1508). Of his Biblical commentaries, those on Proverbs, Ezra and Nehemiah are in the great rabbinical bibles falsely as the work of Abraham ibn Ezra.

DAVID ḲIMḤI (*c.* 1160–1235), also known as *Redaq,* eclipsed the fame both of his father and his brother. His *magnum opus* is the *Sefer Miklol,* "Book of Completeness," which covers the grammar (first printed in Constantinople, 1532–4) and the lexicon, *Sefer Hashorashim,* "Book of Roots" (first printed in Italy before 1480). In the grammar he combined the paradigmatic method of his brother Moses with the procedure of the older scholars who devoted attention to details. In his dictionary, again, he recast the lexicological materials independently, and enriched lexicography itself, especially by his numerous etymological explanations. Under the title *Et Sofer,* "Pen of the Writer" (Lyk, 1864), David composed a sort of grammatical compendium as a guide to the correct punctuation of the Biblical manuscripts; it consists mainly of extracts from the *Miklol.* His Biblical commentaries include those on Chronicles, on the Psalms, on the prophets and on Genesis. His annotations on the Psalms are especially interesting for the polemical excursuses directed against the Christian interpretation; his commentary on Genesis (ed. A. Gunsburg, Pressburg, 1842) explains Biblical narratives as visions. The popularity of his Biblical exegesis is demonstrated by the fact that the first printed texts of the Hebrew Bible were accompanied by his commentary.

His commentaries have been reprinted, many of them in Latin translations. A new edition of that on the Psalms was begun by Schiller-Szinessy (*First Book of Psalms,* Cambridge, 1883).

Abr. Geiger wrote of the three Ḳimḥis in the Hebrew periodical *Oẓar Nehmad* (vol. ii., 1857=A Geiger, *Gesammelte Schriften,* v. 1–47). *See* further the *Jewish Encyclopaedia.*

KIN, a collective word for persons related by blood, as descended from a common ancestor. In law, the term "next of kin" is applied to the person or persons who, as being in the nearest degree of blood relationship to a person dying intestate, share according to degree in his personal estate. (*See* INTESTACY, INHERITANCE, SUCCESSION.)

KINCARDINESHIRE, or THE MEARNS, eastern county, Scotland, bounded east by the North Sea, south and south-west by Forfarshire, and north-west and north by Aberdeenshire. Area (excluding water), 244,482 acres. In the west and north-west the Grampian hills extend into the county, reaching 2,555 ft. in Mount Battock, where the counties of Aberdeen, Forfar and Kincardine meet. This is one of several masses of granite rising through the crystalline schists of the Dalradian group which occupy the portion of the country north of the great fault crossing it from near Stonehaven to Edzell (in Forfarshire), and continuing south-westward across Scotland. In the extreme north the Hill of Fare, famous for its sheep walks reaches 1,545 ft. In the north the county slopes from the Grampians to the picturesque and finely-wooded valley of the Dee, and in the south it falls to the Howe (Hollow) of the Mearns, a continuation north-eastward of Strathmore. Here, and generally south of the great fault mentioned above, the rocks are of old red sandstone age, with diabase and other volcanic intrusions. The Dee and North Esk serve as boundary streams during part of their courses, the one of Aberdeenshire, the other of Forfarshire. The other principal rivers are Bervie Water (20 m. long), flowing south-eastwards to the North Sea; the Water of Feugh (20 m.) taking a north-easterly direction and falling into the Dee at Banchory, and forming near its mouth a beautiful cascade; the Dye (15 m.) rising in Mount Battock and ending its course in the Feugh; Luther Water (14 m.) rising not far from the castle of Drumtochty and joining the North Esk; the Cowie (13 m.) and the Carron (8½ m.) entering the sea at Stonehaven. Glen Dye in the north centre of the county is very beautiful, and the small Den Fenella, south-east of Laurencekirk, contains a fine waterfall. Except in the vicinity of St. Cyrus, the coast from below Johnshaven to Girdle Ness presents rugged cliffs, with an average height of 100 to 250 ft., interrupted only by occasional creeks and bays, as at Bervie, Stonehaven, Portlethen, Findon, and Nigg. The evidences of glacial action show that the flow during the Ice Age was northward along the coast, though it approached the coastal district with a south-eastward direction from the hills and an eastward trend across the lower ground; as the shore was approached it gradually took on an easterly and finally a northerly direction.

Agriculture and Industries.—Much of the Grampian territory is occupied by grouse moors, but the land by the Dee, in the Howe and along the coast, is scientifically farmed and yields well. The most fertile region is along the coast, where the soil is generally deep loam resting on clay, although in some places it is poor and thin, or stiff and cold. Oats are the principal crop followed by barley; wheat is not largely grown. About one-fifth of the total area is mountain and heath land. Turnips form the main green crop, but potatoes are raised. About half the holdings consist of 50 acres and under. Large stocks of cattle are kept. Blackfaced sheep are chiefly kept on the hill runs, Cheviots or a cross with Leicesters being usually found on the lowland farms. Pigs are also reared in considerable numbers.

Apart from agriculture, the principal industry is the fishing, of which Stonehaven is the centre, in spite of the difficult coast. The village of Findon (pron. *Finnan*), now no longer a fishing centre, gave its name to the well-known smoked haddocks. The salmon fisheries of the sea and the rivers yield a substantial return. Manufactures are of little more than local importance. Woollens are made at Stonehaven, flax is spun at Inverbervie and Johnshaven. There are also a large distillery and a tannery at Stonehaven, which is the chief port for seaborne trade.

The Deeside railway runs through the portion of the county on the northern bank of the Dee. The L.M.S. and L.N.E.R. run to Aberdeen via Laurencekirk to Stonehaven, using the same metals, and there is a branch line of the L.N.E. from Montrose to Bervie.

Population and Government.—The population was 41,779 in 1921, when 111 persons spoke Gaelic and English. The chief town is Stonehaven (pop. in 1921, 4,856) with Laurencekirk (1,461) and Banchory (1,776), but part of the city of Aberdeen, with a population of 11,339, is within the county. The county returns one of the three Aberdeenshire members to parliament, and Inverbervie, the only royal burgh, belongs to the Montrose group of parliamentary burghs. Kincardine is united in one sheriffdom with the shires of Aberdeen and Banff, and one of the Aberdeen sheriffs-substitute sits at Stonehaven. The county is under school-board jurisdiction. The academy at Stonehaven and a few of the public schools earn grants for higher education. At Blairs, in the north-east of the shire near the Dee, is a Roman Catholic training college for priests.

History.—The county belonged of old to the district of Pictavia and apparently was overrun for a brief period by the Romans. In the parish of Fetteresso are the remains of the camp of Raedykes, in which, according to tradition, the Caledonians under Galgacus were lodged before their battle with Agricola. Mearns, the alternative name for the county, is believed to have been derived from Mernia, a Scottish king, to whom the land was granted, and whose brother, Angus, had obtained the adjoining shire of Forfar. The antiquities consist mostly of stone circles, cairns, tumuli, standing stones and a structure in the parish of Dunnottar vaguely known as a "Picts' kiln." The town which gave the shire its name stood about 2 m. N.E. of Fettercairn. By the end of the 16th century it had declined to a mere hamlet, and is now represented only by the ruins of the royal castle and an ancient burial-ground The Bruces, earls of Elgin, also bear the title of earl of Kincardine.

KINDERGARTEN, the name given by Friedrich Froebel (*q.v.*) to an institution founded by him in Blankenburg, Germany, in 1837, to meet the educational needs of children between the ages of four and six years, through the agency of play. Froebel was at this time a teacher of varied experience whose training had included study at the University of Jena and Pestalozzi's school at Yverdun. From these he had gained a knowledge of the principle of evolution, and from it had drawn the conclusion that education is, in essence, the guidance of children's development from stage to stage, and that the chief agency in that development is their spontaneous play activity. He therefore concluded that the early years are of strategic importance, and that the work of these should receive careful attention. He had tried to improve the work of his boys at Keilhau but felt that they lacked the foundation which they might have had if the earlier years had been utilized.

Froebel had long wished to organize a programme of activities for a group of children of preschool age, when the opportunity to do so came to him through his appointment to the directorship of an orphanage in Burgdorf, Switzerland, in 1835. Here he experimented with a group of young children, working out with them games, songs, marches, handwork and other play forms. He also devised a progressive series of play materials from which the children might gain certain definite ideas, and by means of which they might give expression to others. For the first he selected a set of six soft balls, one of each of the six colours; for the second, a wooden sphere, cube and cylinder; for the third, a two-inch cube divided into eight smaller cubes; and for the fourth, a two-inch cube divided into eight oblong blocks, two inches long, one inch wide and half an inch thick. The fifth and sixth were three-inch cubes with more complex sub-divisions for building purposes. All of these were contained in boxes appropriate to their sizes and shapes. The remaining playthings in the series consisted of wooden tablets of different sizes and shapes; sticks of different lengths; and rings of different diameters. To distinguish these from other play material Froebel named those in this series "gifts" and the flexible material that accompanied them, "occupations."

The success of this experiment assured Froebel that he was working along right lines and he therefore left Burgdorf in 1837, and settled in Blankenburg. Here a little later he announced the opening of "a school for the psychological training of little children by means of play and occupations." To this the name "Kindergarten," meaning "a garden of children," was given in 1840. The new institution attracted many visitors, and through these and Froebel's demonstrations and lectures, soon became well known. It continued in operation until 1844, when it was merged with the school at Keilhau, and Froebel's training classes moved to Liebenstein, and later to Marienthal. Here his work was continued until his death in 1852. The number of Kindergartens that had been established at this time was quite small—probably less than 20. His work was carried on, however,—at first through his ablest co-workers—Madame Froebel, his widow, the Baroness von Marenholtz-Bülow, his most brilliant pupil, and Fräulein Henrietta Breyman, his grand-niece. Madame Froebel built up a strong training centre in Hamburg. The baroness lectured in practically all the countries of Europe, and established a training school in Berlin. Fräulein Breyman supervised Kindergartens in Belgium and Switzerland, and (as Frau Schröder) later established the Pestalozzi-Froebel Haus in Berlin. In Italy the Kindergarten was introduced by Madame Salis-Schwabe. The movement gained favour everywhere, and during the 25 years after Froebel's death, Kindergartens had been established in the leading cities of Germany, Great Britain, Holland, Belgium, Switzerland, Austria, Hungary, Canada, Japan and the United States.

THE UNITED STATES

It is in the United States that the Kindergarten has had its fullest development. The first Kindergartens were established in Boston, New York, Milwaukee, Chicago and St. Louis in the early '70s; and these, with the demonstration Kindergarten at the Philadelphia Exposition in 1876 gave the American people the opportunity to judge of its merits. Within the next decade Kindergartens had been established in all the large cities of the country. These early Kindergartens were all private or supported by organizations. As they proved their merit they were gradually adopted by the schools of their communities. This could not be done, however, without the enactment of a law in the State in question permitting the use of public school funds for the education of children of Kindergarten age. The first States to enact such laws—Connecticut, Indiana and Vermont—did so during the '80s. These laws made it possible to organize Kindergarten training courses in the State-supported teacher's training institutions. The first States to offer such courses were Minnesota, Connecticut, Kansas and New York.

The adoption of the Kindergarten by the school was an advantage to both. The housing and equipment which the school afforded was better than that which the isolated Kindergartens could provide, and the teachers were better trained. The Kindergarten shared with the grades such other advantages as the services of health experts and other specialists. It in turn contributed new ideals and types of work, and a better attitude toward children than the school had shown. The most important result of the combination was the change brought about in the Kindergarten play material and methods. The period was one of emphasis on health, and the health experts pointed out the injury to children's eyes and nerves caused by the smallness of the materials. They also pointed out weaknesses in the methods used. These and other criticisms were taken seriously by the teachers and school authorities and a programme of improvement in materials and methods was inaugurated. As a result all the materials were enlarged by 1900. These materials gave the children much satisfaction. The size of the blocks led to their use on the floor by small groups, and the working out of little group projects. For this, however, still larger blocks and a variety of forms were felt to be needed. This need was met by sets of patented building blocks, and others involving similar features worked out in different cities. Such blocks are based wholly on children's needs, and have no relation to the Froebelian series of "gifts and occupations."

The gradual changes in the Kindergarten materials have been accompanied by corresponding changes in the methods of using them, all the changes being such as to contribute to the children's health and development. The best methods of using the materials have not all been worked out, but these problems are being given much thought. As a whole, the Kindergarten is doing better work and is held in higher esteem than ever before. (N. C. V.)

GREAT BRITAIN

The movement towards freedom in America has had its counterpart in England, and emphasis is nowadays laid by the followers of Froebel in England on the choice and variety of material and on detailed study of the individual both by educational toys and by careful observation of the effect of giving children freedom to develop. The influences, however, of the doctrines of Froebel have during the last 50 years gradually extended far beyond the Kindergarten proper. They have profoundly affected the education of young children in all countries modifying existing practices

in infant schools and combining with newer influences to create other schools of a fresh type. (*See* NURSERY SCHOOLS, OPEN AIR NURSERY SCHOOLS, etc.) The term is loosely used to-day in England and elsewhere either of method, when speaking of the infant school, or as descriptive of the preliminary classes attached to the preparatory department of the ordinary secondary school.

OTHER COUNTRIES

In Austria the Kindergarten is recognized and regulated by the Government, though the Volks-Kindergarten are not numerous. In Belgium the mistresses of the *Ecoles Gardiennes* are instructed in the "idea of the kindergarten" and "Froebel's method," and in 1880 the minister of public instruction issued a programme for the *Ecoles Gardiennes Communales*, which is both in fact and profession a kindergarten manual. (*See* NURSERY SCHOOLS.)

KINDERSLEY, SIR ROBERT MOLESWORTH, G.B.E., 1920 (1872–), British financier, was born Nov. 21, 1872, and educated at Repton school. He entered upon a business career in London and became a partner in the banking firm of Lazard Bros. and Company. During the World War he was president of the National Committee for War Savings. He became a director of the Bank of England, and in 1924 was a member of the Dawes committee on Germany's capacity to pay her War debts. (*See* SAVINGS MOVEMENT.)

KINDĪ or **ALKINDI** (ABŪ YŪSUF YA QŪB IBN ISHĀQ UL-KINDĪ) (died *c.* 873), sometimes called "the Philosopher of the Arabs," was born in Kufa where his father was governor, and studied at Basra and Baghdad. In the orthodox reaction under Motawakkil, when all philosophy was suspect, his library was confiscated, but he himself seems to have escaped. He was one of the earliest translators and commentators of Aristotle, but like Fārābī appears to have been superseded by Avicenna.

Kindī's philosophy is a combination of Aristotelian and Neo-Platonic elements. He stresses the unity of God, whose influence on the world he believes to be transmitted through intermediate agencies, the lowest of which is the human soul. He has an original fourfold division of intelligence: (*a*) the intellect which is always active, (*b*) the passive intellect of the human soul, (*c*) the intellect of the human soul which passes from potentiality to actuality, and (*d*) the intellect which demonstrates the necessary relations between premises. In place of Aristotle's categories he substitutes matter, form, movement, place and time.

Of Kindī's 270 works, covering philosophy, cosmology, astronomy, astrology, optics, mathematics and medicine, about 20 are extant. During the middle ages some were translated into Latin by Gerald of Cremona and others, and exercised a considerable influence on the West. His philosophical opuscula were edited by A. Nagy (Münster, 1897).

KINEMATICS, the branch of mechanics which discusses the phenomena of motion without reference to force or mass; Gr. Κίνημα, motion. *See* MECHANICS, MATHEMATICAL MODELS.

KINETICS, the branch of mechanics which comprises the phenomena of motion as affected by force; it is the modern equivalent of dynamics in the restricted sense (*see* MECHANICS).

KINETIC THEORY OF MATTER. The kinetic theory of matter rests upon two distinct, but closely related hypotheses, the hypothesis of the molecular structure of matter and the hypothesis that heat is a manifestation to the random to-and-from motion of the molecules.

The hypothesis of the molecular structure of matter forms the basis of the science of chemistry (*see* CHEMISTRY). A mass of a given chemical substance, say common salt (chloride of sodium) or water (oxide of hydrogen) consists of a number of exactly similar molecules. All the chemical properties of common salt or of water are inherent in a single molecule of the substance, so that it is proper to speak of a molecule of salt or a molecule of water. The molecule is the smallest unit of which this is true; it is possible by chemical and electrical means to divide a molecule of common salt into two atoms, but these no longer have the chemical properties of common salt; indeed they are not common salt at all, one being an atom of sodium and the other being an atom of chlorine.

Molecular Motion.—The hypothesis that heat arises from the motions of the molecules of a substance, each moving as an independent unit, is based upon a large mass of observational evidence, the most convincing of which, perhaps, is that the results of the kinetic theory of matter, all of which would be fallacious if this hypothesis were not true, are found to be in excellent agreement with observation. In some cases the heat-motion does not consist solely of molecular motion, the motions of the atoms inside the molecules contributing a large part of the heat of the substance Roughly speaking, heat-motion is found to assume three distinct forms which correspond to the three distinct states in which matter can exist, the solid, liquid and gaseous.

FIG. 1.—KINETIC THEORY OF GASES. GRAPHS ILLUSTRATING THE LAW OF DISTRIBUTION OF VELOCITIES

Horizontal=values component of velocity. Vertical=number of molecules in Maxwell's steady state. Thin curve=total number of molecules in steady state for each value of velocity component. Thick curve=total number of molecules in steady state for each value

Modern research on the crystalline structure of solids has made it clear that in a solid the atoms form independent units, and that the heat motion is not a motion of complete molecules but of complete atoms only. In a sense there are no molecules in a solid. In a mass of common salt the atoms of sodium alternate with the atoms of chlorine, but a given atom of sodium is no more closely associated with the atom of chlorine on its right than with that on its left, and any division of the salt into molecules of sodium chloride can only be arbitrary and artificial. The same general conclusion emerges from a study of the specific heats of solids; these show that the atoms, and not the molecules,

are the independently moving units. The distances traversed by the atoms of a solid are very small in extent, as is shown by innumerable facts of everyday observation. For instance, the surface of a finely-carved metal (such as a plate used for steel engraving) will retain its exact shape for centuries, and again, when a metal body is coated with gold-leaf, the atoms of the gold remain on its surface indefinitely; if they moved through any but the smallest distances they would soon become mixed with the atoms of the baser metal and diffused through its interior. Thus the atoms of a solid can only make small excursions about their mean positions.

In a gas the state of things is very different; an odour is known to spread rapidly through great distances, even in the stillest air, and a gaseous poison or corrosive not only attacks those objects which are in contact with its source, but all those which can be reached by the motion of its moving parts. Common observation shows that these moving parts are complete molecules; the atoms do not travel separately. For instance the molecule of ammonia vapour consists of four atoms: three of hydrogen and one of nitrogen. Neither hydrogen nor nitrogen has any perceptible odour, yet on spilling ammonia we are greeted with an extremely pungent smell. This is the smell neither of hydrogen nor of nitrogen nor a mixture of the two smells; it is the characteristic smell of ammonia which is produced only by complete molecules of the substance.

As a preliminary to examining further into the nature of atomic or molecular motion and the differences of character of this motion, let us try to picture the state of things which would exist in a mass of solid matter in which all the atoms are imagined to be at rest relatively to one another. The fact that a solid body in its natural state is capable both of compression and of dilatation indicates that its atoms must not be supposed to be fixed rigidly in position relative to one another; the further fact that a motion of either compression or of dilatation is opposed by forces which are brought into play in the interior of the solid suggests that the position of rest is one in which the atoms may be regarded as being in stable equilibrium under their mutual forces. Such a mass of imaginary matter as we are now considering may be compared to a collection of heavy particles held in position relatively to one another by a system of light spiral springs, one spring being supposed to connect each pair of adjacent particles. Let two such masses of matter be suspended by strings from the same point, and then let one mass be drawn aside, pendulum-wise, and allowed to impinge on the other. After impact the two masses will rebound, and the process may be repeated any number of times, but ultimately the two masses will be found again hanging in contact side by side. At the first impact each layer of surface atoms which takes the shock of the impact will be thrust back upon the layer behind it; this latter layer will in this way be set into motion and so influence the layer still further behind; and so on indefinitely. The impact will accordingly result in all the atoms in the mass being set into motion, and by the time that the masses have ceased impinging on one another the atoms of which they are composed will be performing oscillations about their positions of equilibrium. The kinetic energy with which the moving mass originally impinged on that at rest is now represented by the energy, kinetic and potential, of the small motions of the individual atoms of which the bodies are composed.

Common experience, however, shows that when two bodies impinge, the kinetic energy which appears to be lost from the mass-motion of the bodies is in reality transformed into heat-energy. Thus the atomic theory of matter, as we have now pictured it, leads us to identify heat-energy in a solid with the energy of motion of the atoms of the body relatively to one another. A body in which all the atoms were at rest relatively to one another would be a body devoid of heat. This conception of the nature of heat leads at once to an absolute zero of temperature—a temperature of no heat-motion—which is identical, as will be seen later, with that reached in other ways, namely, about $-273°$ C.

The point of view which has now been gained enables us to interpret most of the thermal properties of solids in terms of atomic theory. Suppose, for instance, that two bodies, both devoid of heat, are placed in contact with one another, and that the surface of the one is then rubbed over that of the other. The atoms of the two surface-layers will exert forces upon one another, so that, when the rubbing takes place, each layer will set the atoms of the other into motion, and the energy put into the act of rubbing will be used in establishing this heat-motion. In this we see the explanation of the phenomenon of the generation of heat by friction. At first the heat-motion will be confined to atoms near the rubbing surfaces of the two bodies, but, as already explained, these will in time set the interior atoms into motion, so that ultimately the heat-motion will become spread throughout the whole mass. Here we have an instance of the conduction of heat; it does not, however, explain the whole phenomenon of conduction of heat, for other processes also help in the process, especially in substances which are conductors of electricity. When the atoms of a solid are oscillating about their equilibrium positions there is no reason why their mean distance apart should be the same as when they are at rest. This leads to an interpretation of the fact that a change of dimensions usually attends a change in the temperature of a substance. Suppose, for instance, that two atoms, when at rest in equilibrium are at a distance a apart. It is very possible that the repulsive force they exert when at a distance $a-e$ may be greater than the attractive force they exert when at a distance $a-e$. If so, their mean distance apart, averaged through a sufficiently long interval of their motion, will be greater than a. A body made up of atoms of this kind will expand on heating.

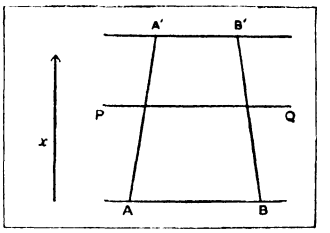

FIG. 2.—KINETIC THEORY OF GASES
Diagram showing conduction of molecular heat. A B, A'B' represent layers of a gas at different temperatures. PQ is a layer intermediate between AB and A'B', while AA' and B'B represent the free paths of molecules passing both ways between the two layers

As the temperature of a body increases, the average energy of its atoms will increase, so that the range of their excursions from their positions of equilibrium will also increase At a certain temperature a stage will be reached in which it becomes a frequent occurrence for an atom to wander so far from its position of equilibrium that it does not return but falls into a new position of equilibrium and oscillates about this. When the body is in this state, the relative positions of the atoms are not permanently fixed, so that the body is no longer of unalterable shape; is has assumed a plastic or molten condition. The electric forces between the wandering atoms now causes them to combine into permanent molecules. The substance attains to a perfectly liquid state as soon as the energy of motion of the molecules is so great that there is constant rearrangement of position among them.

A molecule moving from its original position in a liquid mass will usually fall into a new position in which it will be acted on by forces from a new set of neighbouring molecules. But if a wandering molecule which was originally close to the surface happens to start off in the right direction it may escape from the liquid mass altogether and describe a free path in space until it is checked by meeting a second wandering molecule or other obstacle. The liquid is continually losing mass by the loss of individual molecules in this way, and this explains the process of evaporation. Moreover, the molecules which escape are, on the whole, those with the greatest energy. The average energy of the molecules which remain in the liquid is accordingly lowered by the process. In this we see the explanation of the fall of temperature which accompanies evaporation. When a liquid undergoing evaporation is contained in a closed vessel a molecule which has left the liquid will, after a certain number of collisions with other free molecules and with the sides of the vessel, fall back again into the liquid. Thus the process of evaporation is necessarily accompanied by a process of recondensation. When a stage is reached such that the number of molecules lost to the liquid by evaporation is exactly equal to that regained by condensation, we have a liquid in equilibrium with its own vapour. If the whole

liquid becomes vaporized before this stage is attained, a state will exist in which the vessel is occupied solely by free molecules, describing paths which are disturbed only by encounters with other free molecules or the sides of the vessel. The whole mass is now in the gaseous state.

At normal temperature and pressure the density of a substance in the gaseous state is of the order of one-thousandth of the density of the same substance in the solid or liquid state. It follows that the average distance apart of the molecules in the gaseous state is roughly ten times as great as in the solid or liquid state, and hence that in the gaseous state the molecules are at distances apart which are large compared with their linear dimensions. (If the molecules of air at normal temperature and pressure were arranged in cubical order, the edge of each cube would be about 3.3×10^{-7} cms.; the average diameter of a molecule in air is 3.7×10^{-8} cms.) Further important evidence as to the nature of the gaseous state of matter is provided by the experiments of Joule and Kelvin. These experiments showed that when a gas is allowed to stream out into a vacuum, its change of temperature is in general very slight. In terms of the molecular theory this indicates that the total energy of the gas is very approximately equal to the sum of the separate energies of its different molecules: the potential energy arising from intermolecular forces between pairs of molecules may be treated as negligible when the matter is in the gaseous state. These two simplifying facts bring the properties of the gaseous state of matter within the range of mathematical treatment. The kinetic theory of gases attempts to account, in terms of the molecular structure of matter, for all the non-chemical and non-electrical properties of gases. The remainder of this article is mainly devoted to a brief statement of the methods and results of the kinetic theory. No attempt will be made to follow the historic order of development, but the main outlines of the present theory will be set out in their most logical form and order.

THE KINETIC THEORY OF GASES

A number of molecules whose motion is determined by dynamical laws will pass through a series of configurations which can be theoretically determined as soon as the structure of each molecule and the initial position and velocity of every part of it are known. The kinetic theory is not, however, concerned with the problem of determining the sequence of positions of individual molecules which will develop out of given conditions; it aims instead at discovering properties which are true for all systems of molecules, no matter what the initial conditions of the system may have been.

The Normal State of Maximum Entropy.—The first and most fundamental theorem of the kinetic theory shows that, for any given system of molecules, there exist a series of "normal states" such that, whatever the initial state of the system may have been, it tends, after the lapse of sufficient time, to pass into one of these normal states and to stay there. The normal states can, of course, only be specified statistically; they have no reference to the motions of individual molecules. Boltzmann has shown that the normal states correspond thermodynamically to states of maximum entropy. Thus the passage of a system to a normal state is accompanied by an increase of its entropy, and when the system has once attained a normal state it cannot leave it, except under the action of some outside agency, because the entropy, being already a maximum, cannot increase any further. The different normal states which are possible for a given system of molecules are specified by giving different values to a single quantity, which may be regarded as measuring either the total energy of the system or its temperature. There is only one normal state for a system of given energy, and all systems having this given amount of energy will move towards this state. Thus—

A system starting from an abnormal state tends to assume that normal state which has the same total energy; and

A system starting from a normal state remains in the normal state.

The kinetic theory deduces all the ordinary physical properties of gases from the supposition that a gas is a collection of freely and independently moving molecules which have attained to the normal state.

The Law of Distribution of Velocities.—When a gas has attained its normal state, the collisions between its molecules do not remove it from that state, so that the statistical effect of all these collisions must be *nil*. Let us divide all possible velocities up into distinct ranges, $a, b, c, \ldots$ When two molecules moving with velocities a, b, collide, the collision changes the motion of both and they assume new velocities p, q. Thus the collision takes one molecule away from each of the classes a, b, and adds one to each of the classes p, q. In order that the statistical state may remain unchanged, as it must if the gas is in the normal state, there must be a corresponding collision which takes one molecule from each of the classes p, q, and adds one to each of the classes a, b. By the use of this consideration Maxwell, Boltzmann and Lorentz determined the law according to which the velocities are distributed among the different possible ranges of velocity. Confining our attention to one component of velocity u, it is found that the values of u for the different molecules conform to what is called the law of trial and error—they are distributed at random around the value $u=0$ according to the same law as determines the distribution of shots around the middle point of a line-target. To express the result mathematically, if u, v, w denote the three components of velocity in three directions at right angles in space, then the number of molecules whose velocity is such that

u lies between u and $u+du$
v ,, ,, v and $v+dv$
w ,, ,, w and $w+dw$

is found to be

$$N\left(\frac{hm}{\pi}\right)^{\frac{3}{2}} e^{-hm(u^2+v^2+w^2)}\,du\,dv\,dw. \qquad (1)$$

Here N is the total number of molecules and m is the mass of each, while h is a constant, different values of h corresponding to the different normal states possible for the system. This law is commonly known as Maxwell's law of distribution of velocities.

If we fix our attention on any one component of velocity, say u, disregarding the values of v and w entirely, it is found that the number of molecules for which this component lies between u and $u+du$ is

$$N\left(\frac{hm}{\pi}\right)^{\frac{1}{2}} e^{-hmu^2}du. \qquad (2)$$

This partition of values of u is shown graphically in the thin curve in fig. 1. The numbers along the horizontal axis represent values of u, and the corresponding height of the thin curve is proportional to the total number of molecules which have this particular value of u in Maxwell's steady state. The whole area of this curve is equal to $100\sqrt{\pi}$, or 177·25, of the small squares. Let us, for instance, suppose that each of these small squares represents a million molecules, then we find that in a gas of 177,250,000 molecules, rather less than 20 million have values of u between 0 and 0·1, about 19 million have values of u between 0·1 and 0·2 and so on, while less than a million have values between 1·7 and 1·8, and less than 40,000 have values between 2·4 and 2·5. These values of u are measured on an arbitrary scale which has not yet been determined, but which, as we shall immediately see, depends on the total amount of heat motion, and so on the temperature of the gas. But whatever the scale on which u is measured, we see that high values of u are very rare, the majority of molecules keep to reasonably small values and the favourite value of all is zero. In many problems the total velocity of a molecule is of greater importance than its individual components. If c^2 is written for $u^2+v^2+w^2$, so that c is the total velocity of a molecule, it can readily be deduced from formula (1) that the total number of molecules for which c lies between c and $c+dc$ is

$$4\pi N\left(\frac{hm}{\pi}\right)^{\frac{3}{2}} e^{-hmc^2}c^2dc. \qquad (3)$$

This distribution of velocities is represented graphically by

the thick curve in fig. 1. We see that both very high and low values of c are now very rare, the favourite value for c being unity. This explains the meaning of the scale on which velocities have been measured. The kinetic energy of a molecule is $\frac{1}{2}mc^2$, and on averaging over all molecules it is found, from formula (3), that the average kinetic energy of all the molecules of the gas is $\frac{3}{4}h$. The total heat energy of the gas is accordingly proportional to $1/h$. The total heat energy of a gas is, however, known to be proportional to its temperature on the absolute scale; indeed it is through this property that the absolute scale is most simply defined. Denoting the absolute temperature by T, we see that $1/h$ must be proportional to T.

The actual relation is taken to be

$$\frac{1}{h} = 2\mathrm{RT}$$

where R is a constant, generally known as the "universal gas constant," but sometimes called "Boltzmann's constant." The average kinetic energy of a molecule is now $\frac{3}{2}$R T Comparing this with experimental evaluations of this quantity, it is found that

$$\mathrm{R} = 1{\cdot}372 \times 10^{-16}$$

in centimetre-gramme-second-centigrade units.

Equipartition of Energy.—If molecules of different kinds are mixed, as for instance oxygen and nitrogen to form air, and the mixture is then allowed to assume its normal state, it can be proved that in the final state h has the same value for both types of molecules. Since $h = \frac{1}{2}\mathrm{RT}$ this is merely equivalent to saying that when two sorts of gas are mixed they will in the long run assume the same temperature. The average kinetic energy of a molecule of either sort being $\frac{3}{2}$RT, it follows that the process of mixing causes equalization of the kinetic energies of the different types of molecules. Thus in the normal state the lighter molecules move, on the average, faster than the more massive ones, the masses of the different types of molecules being inversely proportional to the average squares of the velocities. This provides the simplest instance of the "Theorem of Equipartition of Energy," a general theorem which proves that the total energy in the normal state is divided up between the different capacities for holding energy, in such a way that on the average each has the same amount.

THE GAS-LAWS

One of the earliest triumphs of the kinetic theory was its explanation of the laws which had been found to connect the density-pressure and temperature of a gas. The kinetic theory regards a mass of gas as a collection of independently moving molecules; if these are shut up in a closed vessel, molecules must continually collide with the walls of the vessel, exerting pressure at the moment of collision, and the kinetic theory interprets the pressure of the gas as the aggregate of the pressure exerted by the various molecules when they collide with the boundary

Boyle had found that as a gas was compressed its pressure increased directly as its density. On the kinetic theory the necessity for this law is obvious, since doubling the density of a gas doubles the number of molecules in any small volume and so doubles the number of collisions with any small area of its boundary. Charles and Gay-Lussac had found that as a gas was heated its pressure increased directly as its temperature, and the kinetic theory provides a simple explanation of this also. For heating a gas increases the mean velocity of the molecules; this has a twofold effect on the pressure. If the mean velocity is increased n-fold, the force of each collision is increased n-fold, and collisions also occur n times as frequently, so that the pressure is increased to n^2 times its original value. The pressure is accordingly proportional to the square of the molecular velocity, and this, we have seen, is proportional to the absolute temperature. This is the law of Charles and Gay-Lussac.

Calculation of the Pressure in a Gas.—The actual amount of the pressure is readily calculated. The molecules can be divided up into a system of showers, such that all the molecules in any one shower have all approximately the same velocity and are all moving in the same direction. Let us fix our attention on any one shower, which we shall call shower A, this being specified by the condition that the three velocity components u, v, w of its molecules lie within the small range du, dv, dw already mentioned. Let us consider the impact of the molecules of this shower on an area A of the boundary of the containing vessel. For convenience we may suppose this to be parallel to the plane of yz. Then each molecule of shower A which strikes this area gives up momentum mu to the boundary before it is brought to rest, and as it rebounds with equal velocity it also acquires momentum mu in the opposite direction from the boundary, so that the total transfer of momentum is $2mu$. The number of molecules belonging to shower A which strike the area S in a small interval of time dt is equal to the number which lay within a distance $u\,dt$ of the area S, at the beginning of this interval, and so occupied a small disk of volume $Sudt$ of the gas. If the gas contained ν molecules in all per unit volume, the total number of molecules inside this small disk was $S\nu udt$, and hence, from formula (1), the number belonging to shower A was

$$S\nu udt\left(\frac{hm}{\pi}\right)^{\frac{3}{2}} e^{-hm(u^2+v^2+w^2)}du\,dv\,dw.$$

Each of these molecules transfers momentum of amount $2mu$ to the area S of the boundary, so that the total impact of molecules of shower A on this area in time dt is equal to $2mu$ times the above expression, or

$$2S\nu dt\left(\frac{hm}{\pi}\right)^{\frac{3}{2}} m\, e^{-hm(u^2+v^2+w^2)}u^2\,du\,dv\,dw.$$

The total impact of the molecules of all showers is obtained by integrating this expression over all possible values of u, v, w; it is found to be

$$\frac{S\nu dt}{2h}.$$

Since this must be equal to p S dt, where p is the total pressure per unit area on the boundary, the value of p is clearly

$$p = \frac{\nu}{2h} = \nu\mathrm{RT}. \qquad (4)$$

If C^2 denotes the average value of the square of the velocity $u^2+v^2+w^2$ for the different molecules, we have seen that

$$m\mathrm{C}^2 = \tfrac{3}{2}\,\mathrm{RT},$$

so that the pressure can be written in the form

$$p = \tfrac{1}{3}\,m\nu\mathrm{C}^2,$$

or again, since $m\nu$, the total mass in a unit volume, is equal to the density ρ,

$$p = \tfrac{1}{3}\rho\mathrm{C}^2. \qquad (5)$$

The total kinetic energy of translation of all the molecules in unit volume is $\frac{1}{2}m\nu\mathrm{C}^2$, and this is equal to $\frac{1}{2}\rho\mathrm{C}^2$, so that *the pressure in a gas is equal to two-thirds of the kinetic energy of translation per unit volume.* Since p and ρ can be measured for actual gases, this formula gives a direct means of calculating the molecular velocities in any given gas. For instance, it is found that

for hydrogen at	0° Cent.,	C =	183,900 cms.	per sec.
,, air ,,	15° ,,	C =	49,800 ,,	,, ,,
,, mercury vapour at	0° ,,	C =	18,500 ,,	,, ,,

and other velocities can readily be calculated.

Brownian Movements.—From the value $\mathrm{R} = 1{\cdot}37 \times 10^{-16}$ it is readily calculated that a molecule, or aggregation of molecules, of mass 10^{-12} grammes, ought to have a mean velocity of about 2mm. a second at 0° Centigrade. Such a velocity ought accordingly to be set up in a particle of 10^{-12} grammes mass immersed in air or liquid at 0° C., by the continual jostling of the surrounding molecules or particles. A particle of this mass is easily visible microscopically, and a velocity of 2mm. per second would of course be visible if continued for a sufficient length of time. Each bombardment will, however, change the motion of the particle, so that changes are too frequent for the separate motions to be individually visible. But it can be shown that from the aggrega-

tion of these separate short motions the particle ought to have a resultant motion, described with an average velocity which, although much smaller than 2mm. a second, ought still to be microscopically visible. R. von S. Smoluchowski and Einstein have shown that this theoretically predicted motion is simply that seen in the "Brownian movements" first observed by the botanist Robert Brown in 1827. Thus the "Brownian movements" provide visual demonstration of the reality of the heat-motion postulated by the kinetic theory (See *Brownian Movement.*)

Pressure in a Mixture of Gases.—Imagine that a gas consists of a mixture of gases of different kinds, so that unit volume contains ν of one kind, ν' of another, ν'' of a third, and so on. The pressure on the boundary now is the sum of the pressures exerted at all collisions by molecules of all kinds. The pressure exerted by the first kind of molecules is of course ν RT, that exerted by the second kind is ν' RT, and so on, so that the total pressure p is given by

$$p=(\nu+\nu'+\nu''+\ldots)\mathrm{RT}.$$

Dalton's Law.—Since the pressure as given by this formula can be written as the sum of a number of separate terms, one for each gas in the mixture, we have Dalton's law: *The pressure of a mixture of gases is the sum of the pressures which would be exerted separately by the several constituents if each alone were present.*

Avogadro's Law.—The above formula shows that $\nu+\nu'+\nu''+\ldots$, the total number of molecules per unit volume, is determined when p, T and the constant R are given. Hence we have Avogadro's law. *Different gases, at the same temperature and pressure, contain equal numbers of molecules per unit volume.* According to the best determinations the number of molecules in a cubic centimetre of gas at a temperature of 0° C. and at a pressure of 760mm. of mercury (normal atmospheric pressure) is $2{\cdot}705\times10^{19}$. Since the density of hydrogen under these conditions is 0·00008987, it follows at once that the mass of the hydrogen molecule is $3{\cdot}323\times10^{-24}$ grammes The masses of other molecules are of course proportional to their molecular weights; the molecule of oxygen, for instance, has a mass of 52×10^{-24} grammes, and so on.

Boyle's and Charles' Laws.—If v is the volume of a homogeneous mass of gas, and N the total number of its molecules, $\mathrm{N}=v(\nu+\nu'+\nu''+\ldots)$, so that

$$pv=\mathrm{RNT}.$$

In this equation we have the combined laws of Boyle and Charles: *When the temperature of a gas is kept constant the pressure varies inversely as the volume, and when the volume is kept constant the pressure varies as the temperature.* Since the volume at constant pressure is exactly proportional to the absolute temperature, it follows that the co-efficients of expansion of all gases ought, to within the limits of error introduced by the assumptions on which we are working, to have the same value $\frac{1}{273}$

Van der Waals's Equation.—The laws which have just been stated are obeyed very approximately, but not with perfect accuracy, by all gases of which the density is not too great or the temperature too low. Van der Waals, in a famous monograph, *On the Continuity of the Liquid and Gaseous States* (Leiden, 1873), has shown that the imperfections of the foregoing formula for the pressure may be traced to two causes:—

(i) The calculation has not allowed for the finite size of the molecules, and their consequent interference with one another's motion, and

(ii) The calculation has not allowed for the field of intermolecular force between the molecules, which, although small, is known to have a real existence. The presence of this field of force results in the molecules, when they reach the boundary, being acted on by forces in addition to those originating in their impact with the boundary.

To allow for the first of these two factors, Van der Waals finds that v must be replaced by $v-b$, where b is four times the aggregate space occupied by all the molecules, while to allow for the second factor, p must be replaced by $p+a/v^2$. Thus the pressure-volume-temperature relation is given by the equation

$$(p+a/v^2)\ (v-b)=\mathrm{RNT}$$

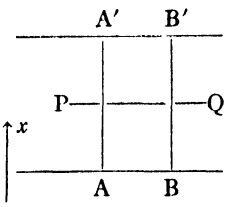
which is known as Van der Waals's equation. This equation is found to be capable of representing the relation between p, v and T which is obtained experimentally over large ranges of values. (*See* CONDENSATION OF GASES.) A series of observations on any gas make it possible to determine the values of a and b for the gas in question. The value of a obtained in this way gives valuable information as to the field of force surrounding the molecules; the value of b gives still more valuable information, for it discloses the total volume occupied by all the molecules of the gas, thus providing information as to the sizes of the individual molecules. There are, however, other and better ways of determining the sizes of molecules, as we shall now see.

THE FREE PATH IN A GAS

Let us regard each molecule of a gas, for simplicity, as a small round shot. These shot travel with a velocity which, as we have seen, is something like 2 kilometres a second in hydrogen, and about half a kilometre a second in air. Each shot travels on in a straight line until it strikes some sort of target, after which its speed is changed and its direction of motion altered Some molecules strike the target formed by the boundary of the vessel containing the gas; their impact gives rise to the pressure on the boundary which we have just discussed If the molecules were mere points, this would be the only target; each molecule would travel on until it hit the boundary, since the chance of two points hitting one another would be infinitesimal. Actually the molecules are of finite size, and although this size is small, we cannot legitimately disregard the possibility of molecules hitting one another; indeed each molecule in a flask of air under normal conditions hits other molecules several million times for each time it hits the boundary. If the diameter of each molecule is σ, two molecules cannot pass so close that their centres are at a distance less than σ of one another without a collision taking place, so that each molecule can be regarded as forming a target of area $\pi\sigma^2$. If there are ν molecules per unit volume, the number in a small layer of thickness t and cross section S is νtS, and these form a target of total area $\pi\sigma^2\nu t$S. This quantity is proportional to t, and for a certain value of t it becomes equal to S. When t has this value, the target formed by the combined molecules precisely fills up the whole area S, so that no molecule can get through without a collision. The value of t which makes $\pi\sigma^2\nu t$S equal to S is

$$t=\frac{1}{\pi\nu\sigma^2}$$

so that in travelling through a layer of this thickness in the gas each molecule will collide with some other molecule and have its speed and direction of motion changed



The foregoing simple calculation requires adjustment in several respects; in particular we must allow for the possibility of the molecules "covering" one another in their motion, so that the area of the total target is substantially less than the sum of the areas of the targets presented by the separate molecules An exact calculation, first given by Maxwell, shows that the distance l which a molecule is likely to travel before colliding with another molecule is given by

$$l=\frac{1}{\sqrt{2}\pi\nu\sigma^2}. \qquad (7)$$

In ordinary air the length of the average free path is about 0·000006cm or a four-hundred-thousandth part of an inch. Since the molecule of air travels at a rate of 50,000cm. a second, it must describe 8,000 million free paths every second, and so collides with 8,000 million other molecules in each second of its existence.

Conduction of Heat.—During the description of any free path the energy of a molecule remains unchanged, although it may gain or lose energy at a collision with another molecule. Consider the motions of molecules in a gas in which the tem-

perature is not uniform. Let one layer AB of the gas be at a temperature T, while another parallel layer A′B′ at a distance l (equal to the free path of the molecules) is at a temperature T′ Owing to the difference of temperature, the average energies of the molecules in the two layers will be different; let them be E,E′ respectively. A molecule which starts from a collision at A and describes the free path AA′ before collision at A′ is likely to have the energy E appropriate to the layer AB, while one which describes the free path B′B in the reverse direction is likely to have the energy E′ appropriate to the layer A′B′. If the temperature T is higher than T′, E will be greater than E′, so that more energy is carried from the hot layer AB to the cold layer A′B′ than travels in the reverse direction, and there is a resultant flow of heat-energy from the hot parts of the gas to the cold. In this way the kinetic theory explains the conduction of heat in a gas

To study the amount of this flow of heat, let us fix our attention on the molecules which cross a unit area PQ, halfway between the two layers AB, A′B′. Half of these will cross PQ in one direction and half in the other. If there are ν molecules per unit volume each travelling with an average velocity c, then $\frac{1}{2}\nu c$ molecules will cross in each direction per unit time. The stream which crosses in the direction AA′ will transport energy $\frac{1}{2}\nu c$E across the unit area in the direction $\overrightarrow{AA'}$, while the other stream will transport energy $\frac{1}{2}\nu c$E′ in the reverse direction. The net transport of energy across the plane in unit time is accordingly

$$\tfrac{1}{2}\nu c(\mathrm{E}-\mathrm{E}').$$

The foregoing simple discussion needs correction, since the free paths which cross the plane PQ are not, in general, perpendicular to PQ. A simple mathematical investigation shows that the necessary correction consists in multiplication by a factor $\frac{2}{3}$, so that the net transport of energy is

$$\tfrac{1}{3}\nu c(\mathrm{E}-\mathrm{E}') \qquad (8)$$

where E,E′ are the values of E in layers at a distance l apart. By definition of ν and E, νE is the total energy per unit volume at A, and this is equal to $\rho\,\mathrm{C}_v\,\mathrm{T}$, where ρ is the density and C_v is the specific heat of the gas at constant volume. Thus in place of formula (8), the net transport of energy in unit time may be taken to be

$$\tfrac{1}{3}\rho\mathrm{C}_v c(\mathrm{T}-\mathrm{T}') \qquad (9)$$

If x is a co-ordinate measured perpendicular to PQ in the direction AA′, we may put

$$\mathrm{T}-\mathrm{T}' = -l\frac{d'\mathrm{T}}{dx},$$

and the flow of heat-energy per unit area per unit time is seen to be

$$-\vartheta\frac{d'\mathrm{T}}{dx} \qquad (10)$$

where

$$\vartheta = \tfrac{1}{3}\rho\mathrm{C}_v c l \qquad (11)$$

In the theory of heat the flow of heat is given by expression (10) where ϑ is the coefficient of conduction of heat. Thus the kinetic theory explains the conduction of heat and predicts for the coefficient of conduction the value given by formula (11). This value needs minor adjustments of various kinds, and these result in ϑ assuming a value substantially larger than that given by equation (11).

Viscosity.—The phenomenon of gaseous viscosity can be discussed in a very similar way. We now suppose the layers AB and A′B′ of the gas to be moving parallel to PQ with different velocities v,v' so that molecule in the layer AB is likely to have momentum mv parallel to AB. We no longer investigate the transfer of energy E across the plane PQ, but the transfer of momentum mv. As in formula (8) the net transfer per unit time is

$$\tfrac{1}{3}\nu c(mv-mv').$$

Since the density ρ of the gas is equal to mv, this may be put in the form

$$\tfrac{1}{3}\rho c(v-v')$$

or

$$-\tfrac{1}{3}\rho c l\frac{dv}{dx}.$$

This is equal to

$$-\kappa\frac{dv}{dx}$$

where

$$\kappa = \tfrac{1}{3}\rho c l. \qquad (12)$$

This is accordingly the value of the coefficient of viscosity predicted by the kinetic theory. In terms of the coefficient of viscosity κ, the coefficient of conduction of heat ϑ can be expressed in the form

$$\vartheta = \kappa\mathrm{C}_v. \qquad (13)$$

Diffusion.—The phenomenon of diffusion can be treated in a very similar manner. We consider a mixture of two gases G_1 and G_2, supposing that the proportion of G_1 in the mixture is θ at AB and is θ' at A′B′. The chance of a molecule which describes a free path AA′ being a molecule of G_1 is θ, so that the mass of the gas G_1 which is carried by each molecule describing such a free path is, *on the average* equal to θm. As in formula (8), the net transport of G_1 across the plane PQ per unit time is

$$\tfrac{1}{3}\nu c(\theta m-\theta' m')$$

or

$$-\tfrac{1}{3}\nu_1 l\frac{d}{dx}(\theta m).$$

This can be put in the form

$$-\mathrm{D}\frac{d}{dx}(\nu m\theta)$$

where D, which is the coefficient of diffusion is given by

$$\mathrm{D} = \tfrac{1}{3}cl.$$

THE SIZE OF MOLECULES

We have seen that the kinetic theory explains the three phenomena of Conduction of Heat, Viscosity and Diffusion as all three depend on transport by molecules describing free paths. As a consequence the three coefficients of conduction of heat, of viscosity, and of diffusion are all proportional to the length of this free path, and a comparison of theoretical values of these coefficients with observational values provides three distinct means of evaluating the molecular free path. The validity and accuracy of the methods of the kinetic theory can be tested by examining whether the lengths of free path deduced from these different phenomena agree *inter se*. It is rather more convenient to discuss the values of the molecular radii, which are connected with the free path by formula (7), especially as this provides the further check of examining whether these agree with the values necessary to account for the observed deviations from Boyle's law.

The table below gives the values of the radii of the molecules of seven substances with which it is easy to experiment in the gaseous state, calculated from formulae provided by the kinetic theory of gases. For the formulae and method of calculation *see* J. H. Jeans, *The Dynamical Theory of Gases*, (4th ed.), chap. xiv, from which the following table is extracted.

Molecular Radii calculated from the Kinetic Theory of Gases

Gas	From deviations from Boyle's Law	From the coefficient of viscosity	From conduction of heat	From the coefficient of diffusion
	Cms.	Cms.	Cms.	Cms.
Hydrogen	$1{\cdot}27\times10^{-8}$	$1{\cdot}36\times10^{-8}$	$1{\cdot}36\times10^{-8}$	$1{\cdot}36\times10^{-8}$
Helium	0·99	1·09	1·10	..
Nitrogen	0·78	1·89	1·89	1·92
Air	1·66	1·87	1·87	1·87
Oxygen	.	1·81	1·81	1·82
Ethylene	.	2·78	2·78	2·75
Carbon-dioxide	1·71	2·31	2·41	2·19

The comparatively good agreement of the values obtained for the same quantity by entirely different methods provides satisfactory confirmation of the truth of the molecular theory of matter as well as of the methods and formulae of the kinetic theory of gases. That the various values just tabulated do not agree even better need not cause surprise, in view of the fact that the quantities are calculated on the hypothesis that the molecules are spherical in shape. This hypothesis is introduced for the sake of simplicity, but is known to be unjustifiable in fact. What is given by the formulae is accordingly the mean radius of an irregularly shaped solid (or, more probably, of the region in which the field of force surrounding such a solid is above a certain intensity), and the mean has to be taken in different ways in the different phenomena. This and the difficulty of obtaining accurate experimental results fully account for the differences *inter se* in the values of the quantities calculated

In general, the kinetic theory is found to give a satisfactory account of all physical phenomena which depend on the motions of molecules as a whole. In the closing decades of last century various attempts were made to apply the theory to problems of the internal dynamics of the molecule. The failure of the theory here was as striking as its success had been in its applications to the molecules as a whole. The reason of this failure is now satisfactorily understood; it is simply that on passing to the interior of a molecule we encounter a new system of dynamics with which the kinetic theory is unable to deal. In brief, we pass from the province of the old classical kinetic theory of gases to the province of the modern quantum theory (*see* QUANTUM THEORY).

(J. H. J.)

For general literature on this subject *see* bibliography at end of CHEMISTRY. *Physical.*

KING, CLARENCE (1842–1901), American geologist, was born at Newport (R.I.), on Jan. 6, 1842. He was known as an organizer and for ten years chief of the U S geological exploration of the 40th parallel, which laid the foundation of a systematic survey of the country. In 1862 he graduated from the Sheffield Scientific school of Yale. In the following years he was a student of glaciology under Agassiz; undertook a trip across the continent on horse-back; and accepted a position as volunteer geologist on the California geological survey. The high mountain mass of the southern Sierras was discovered by him at this time, and he explored the desert regions of southern California and Arizona.

King persuaded the Government to make a thorough geological survey of California in order to develop its mineral resources, and accomplished the famous exploration of the 40th parallel against almost insuperable difficulties. The final summary of this work, a masterpiece of writing, was published in 1878, under the title *Systematic Geology*. He was instrumental in organizing the surveys of the country into one U S. geological survey in 1879, of which he was made the first director, but retired in order to devote himself to some of the deeper problems of geology. He also gave much of his time to his profession as a mining engineer and skilled adviser in mining suits, and added to his literary reputation by his occasional articles and his book *Mountaineering in the Sierra Nevada*. His exposure of a great diamond fraud in 1872, which might otherwise have equalled the "Mississippi Bubble" as a financial disaster, gave him much prominence in the public eye. He died at Phoenix, Arizona, Dec. 24, 1901.

See S. F. Emmons, "Clarence King," Silliman's *Journal*, series 4, vol. xiii., p. 224–237.

KING, EDWARD (1612–1637), the subject of Milton's *Lycidas*, was born in Ireland, the son of Sir John King, a member of a Yorkshire family which had migrated to Ireland. Edward King was admitted a pensioner of Christ's College, Cambridge, on June 9, 1626, and four years later was elected a fellow. Milton, though two years his senior and himself anxious to secure a fellowship, remained a close friend of his rival, whose amiable character seems to have endeared him to the whole college. King served from 1633 to 1634 as praelector and tutor of his college, and was to have entered the church. His career, however, was cut short by the tragedy which inspired Milton's verse. In 1637 he set out for Ireland to visit his family, but on Aug. 10, the ship in which he was sailing struck on a rock near the Welsh coast, and King was drowned. Of his own writings many Latin poems contributed to different collections of Cambridge verse survive.

KING, EDWARD (1829–1910), English bishop, was the second son of Walter King, archdeacon of Rochester. Graduating from Oriel College, Oxford, he was ordained in 1854, and four years later became chaplain and lecturer at Cuddesdon Theological College. He was principal at Cuddesdon from 1863 to 1873, when he became regius professor of pastoral theology at Oxford and canon of Christ Church He was a friend of Pusey and a leading member of the English Church Union. In Oxford, and especially among the younger men, he exercised an exceptional influence, due to his remarkable charm in personal intercourse, and his sincerity and goodness. In 1885 he was made bishop of Lincoln, where he won the respect of all by his saintliness. The most eventful episode of his episcopate was his prosecution (1888–90) for ritualistic practices before the archbishop of Canterbury, Dr. Benson, and, on appeal, before the judicial committee of the Privy Council (*see* LINCOLN JUDGMENT) He died at Lincoln on March 8, 1910.

See B. W. Randolph and J. W. Townroe, *The Mind and Work of Bishop King* (1918).

KING, HENRY (1591–1669), English bishop and poet, eldest son of John King, afterwards bishop of London, was baptized on Jan. 16, 1591 Educated at Westminster school to Christ Church, Oxford, he was made bishop of Chichester in 1642, receiving at the same time the rich living of Petworth, Sussex After the capture of Chichester by the parliament he was imprisoned for a short time. King was a close friend of Brian Duppa and personally acquainted with Charles I. In one of his poems dated 1649 he speaks of the *Eikon Basilike* as the king's own work. Restored to his benefice at the Restoration, King died at Chichester on Sept. 30, 1669. His works include *Poems, Elegies, Paradoxes and Sonets* (1657), *The Psalmes of David from the New Translation of the Bible, turned into Meter* (1651), and several sermons. He was one of the executors of John Donne, and prefixed an elegy to the 1663 edition of his friend's poems

King's Poems and Psalms were edited, with a biographical sketch, by J. Hannah (1843); *The Poems of Bishop Henry King*, edited by John Sparrow (London, 1925).

KING (OF OCKHAM), PETER KING, 1ST BARON (1669–1734), lord chancellor of England, was born at Exeter in 1669. He studied at Leiden University, entered the Middle Temple in 1694 and was called to the bar in 1698. In 1700 he was returned to parliament for Beer Alston in Devonshire; he was appointed recorder of Glastonbury in 1705 and recorder of London in 1708. He was chief justice of the common pleas from 1714 to 1725, when he was appointed speaker of the House of Lords and was raised to the peerage. In June of the same year he was made lord chancellor, holding office until compelled by a paralytic stroke to resign in 1733. He died at Ockham, Surrey, on July 22, 1734. Lord King as chancellor failed to sustain the reputation which he had acquired at the common law bar. Nevertheless he left his mark on English law by establishing the principles that a will of immovable property is governed by the *lex loci rei sitae*, and that where a husband had a legal right to the personal estate of his wife, which must be asserted by a suit in equity, the court would not help him unless he made a provision out of the property for the wife, if she required it. He was also the author of the Act (4 Geo. II. c. 26) by virtue of which English superseded Latin as the language of the courts.

He published some books on Church History: *An Enquiry into the Constitution . . . of the Primitive Church* (anonymous, 1691), and *History of the Apostles' Creed* (1702).

KING, RUFUS (1755–1827), American political leader, was born on March 24, 1755, at Scarborough, Me., then a part of Massachusetts. He graduated from Harvard in 1777 and was admitted to the bar in 1780. He served in the Massachusetts general court in 1783–84 and in the Confederation Congress in 1784–87. During these critical years he adopted the "States' rights" attitude. It was largely through his efforts that the general court in 1784 rejected the amendment to the Articles of Confederation authorizing Congress to levy a 5% impost. On Feb. 21, 1787, he

introduced the resolution in Congress sanctioning the call for the Philadelphia Constitutional Convention, in which he supported the large-State party. In 1788 he was one of the most influential members of the Massachusetts convention which ratified the Federal Constitution. He removed to New York in 1788, was elected to the New York assembly in the spring of 1789, and was chosen one of the first representatives of New York in the U.S. Senate. In this body he served in 1789–96, becoming one of the recognized leaders of the Federalist Party. He was minister to Great Britain in 1796–1803 and again in 1825–26; was the Federalist candidate for vice-president in 1804 and 1808, and for president in 1816. He was returned to the Senate in 1813 and re-elected in 1819. In the Missouri compromise debates he supported the anti-slavery programme, but for constitutional reasons voted against the second clause of the Tallmadge amendments providing that slaves born in the State after its admission into the Union should be free at the age of 25 years. He died at Jamaica, L.I., on April 29, 1827.

The Life and Correspondence of Rufus King, begun about 1850 by his son, Charles King, was completed by his grandson, Charles R. King, and published in six volumes (1894–1900).

Rufus King's son, JOHN ALSOP KING (1788–1867), was educated at Harrow School, England, and in Paris, served in the War of 1812 as a cavalry lieutenant, and was a member of the New York assembly in 1819–21 and of the New York senate in 1823. When his father was sent as minister to Great Britain in 1825 he accompanied him as secretary of the American legation and remained as chargé d'affaires until Aug. 1826. He was a member of the New York assembly again in 1832 and in 1840, was a Whig representative in Congress in 1849–51, and in 1857–59 was governor of New York State. In 1861 he was a delegate to the Peace Conference in Washington.

Another son, CHARLES KING (1789–1867), was also educated abroad, served in 1814 in the New York assembly and was president of Columbia college in 1849–64.

A third son, JAMES GORE KING (1791–1853), was an assistant adjutant-general in the War of 1812, was a banker in Liverpool and in New York, and was president of the New York and Erie railroad until 1837. In London in 1835 he secured the loan to American bankers of £1,000,000 from the governors of the Bank of England. In 1849–51 he was a representative in Congress from New Jersey.

Charles King's son, RUFUS KING (1814–76), graduated from the U.S. military academy in 1833, and was adjutant-general of New York State in 1839–43, a brigadier-general of volunteers in the Union army in 1861 and U.S. minister to the Papal States in 1863–67.

His son, CHARLES KING (b. 1844), served in the artillery until 1870 and in the cavalry until 1879; he was appointed brigadier-general U.S. Volunteers in the Spanish War in 1898 and served in the Philippines. He wrote *Famous and Decisive Battles* (1884), *Campaigning with Crook* (1890) and stories of military life.

BIBLIOGRAPHY.—*See* E. H. Brush, *Rufus King and His Times* (1926); S. F. Bemis (editor), *The American Secretaries of State* (1927).

KING, THOMAS (1730–1805), English actor and dramatist, was born in London on Aug. 20, 1730, and died on Dec. 11, 1805. Garrick saw him act in a booth at Windsor, and engaged him for Drury Lane. He made his first appearance there in 1748 as the Herald in *King Lear*. He played the part of Allworth in Massinger's *New Way to Pay Old Debts* (1748), and during the summer he played Romeo and other leading parts in Bristol. For eight years he was the leading comedy actor at the Smock Alley theatre in Dublin, but in 1759 he returned to Drury Lane and took leading parts until 1802. One of his earliest successes was as Lord Ogleby in *The Clandestine Marriage* (1766), which was compared to Garrick's Hamlet and Kemble's Coriolanus, but he reached the height of his reputation with his creation of the part of Sir Peter Teazle in *The School for Scandal* (1777).

KING, WILLIAM (1650–1729), British divine, archbishop of Dublin, the son of James King, an Aberdeen man who migrated to Antrim, was born in May 1650. He was educated at Trinity College, Dublin, and became dean of St. Patrick's in 1689, bishop of Derry in 1691, and archbishop of Dublin in 1702. In 1718 he founded the King lectureship in divinity at Trinity College, Dublin. He died in May 1729. King was a convinced supporter of the revolution and author of *The State of the Protestants in Ireland under King James's Government* (1691). His chief work is *De Origine Mali* (1702; Eng. trans., 1731).

See *A Great Archbishop of Dublin, William King, D.D.*, ed. Sir C. S. King, Bart. (1908).

KING, WILLIAM (1663–1712), English poet and miscellaneous writer, son of Ezekiel King, was educated at Westminster school, and at Christ Church, Oxford. He became known as a humorous writer on the Tory and High Church side. He took part in the controversy aroused by the conversion of the once stubborn non-juror William Sherlock, one of his contributions being an entertaining ballad, "The Battle Royal," in which the disputants are Sherlock and South. A pamphlet in defence of Denmark was rewarded by a secretaryship to the princess Anne. He wrote various pamphlets in support of Charles Boyle in his controversy with Richard Bentley over the genuineness of the *Epistles of Phalaris*. He satirized Bentley in ten *Dialogues of the Dead relating to . . . the Epistles of Phalaris* (1699) In 1700 he published *The Transactioneer, with some of his Philosophical Fancies, in two Dialogues*, ridiculing Hans Sloane, who was then the secretary of the Royal Society. This was followed up later with some burlesque *Useful Transactions in Philosophy* (1709). King wrote four pamphlets in support of Sacheverell. He held various Government offices in Ireland between 1701 and 1708, and in 1711 Swift obtained for King the office of gazetteer, worth from £200 to £250. King was now very poor, but he had no taste for work, and he resigned his office on July 1, 1712. He died on Dec. 25 in the same year.

King's *Remains . . .* were edited by J. Brown in 1732; and in 1776 John Nichols produced an excellent edition of his *Original Works . . . with Historical Notes and Memoirs of the Author*. Dr. Johnson included him in his *Lives of the Poets*, and his works appear in subsequent collections.

KING, WILLIAM LYON MACKENZIE (1874–), Canadian statesman, was born at Berlin—now Kitchener—Ontario, Dec. 17, 1874, the son of John King and Isabel Grace, daughter of William Lyon Mackenzie, M.P., who had been prominent in the struggle for political freedom in 1837. He was educated at Toronto university, and became fellow of political economy in the university of Chicago and of political science in Harvard university. Mr. King entered the public service of Canada in 1900 as deputy Minister of Labour, and acted as editor of *The Labour Gazette* for some years. He was chairman of several royal commissions on industrial and immigration problems. In 1906 he represented Canada in negotiations with the British Government on immigration from Britain, and in the same year the honour of C.M.G. was conferred on him. He was Canadian representative to the Government of India on immigration from the Orient and was one of the British delegates on the International Opium commission in China in 1909. He was elected as a Liberal member of Parliament for North Waterloo in 1908, and in 1909 was Minister of Labour in the Laurier administration.

From 1914–17, under the auspices of the Rockefeller Foundation, Mr. King investigated the subject of industrial relations, and afterwards wrote *Industry and Humanity, a Study in the Principles Underlying Industrial Reconstruction* (1918), as well as other studies on economic subjects. During the World War he assisted leading industrial corporations in America to maintain a continuous maximum output of essential war supplies, and industrial representation plans were drafted under his direction which were adopted by the Colorado Fuel and Iron Co., the Bethlehem Steel corporation, the Bethlehem Shipbuilding corporation, the General Electric Co., the Consolidation Coal Co., the International Harvester Co. and other industrial corporations in America. At the National Liberal convention at Ottawa in 1919 he was selected as the successor to Sir Wilfrid Laurier, and became leader of the Opposition in the same year. In 1921 he became Prime Minister of Canada, and in this capacity he attended the Imperial conference in 1923. He held office until 1926, and after one general election in June of that year found himself with a majority of only six in the Dominion House of

Commons. His advice to Governor General Lord Byng, to dissolve Parliament not being taken, he resigned office, which was assumed by the Conservative leader, Mr. Meighen, and a second general election was held in September. The deadlock was then broken by the return of Mr. King to office with a substantial majority. Mr. King attended the Imperial Conference in London a month later, and in 1928 signed the Kellogg Pact in Paris on behalf of Canada.

As Premier.—Mr. King's first administration followed the Coalition Government which had been created during the War, and, although formerly there had been two parties in the House, a third party, known as the Progressives, was also returned in the general elections of 1921. It was this party which supported the Liberal Government. On the dissolution of the House in 1925 an attempt was made to return to the two-party system of government, but the Progressives were still given support. The Prime Minister himself was defeated, together with several of his ministers, but owing to the support and co-operation of the Progressives he was enabled to retain control After the War many new problems arose, and both the Conservatives and the Liberals declared their policy. An able speaker, Mr. King in his appeal to the electorate urged the adoption of a tariff for revenue, and suggested that the problem of taxation could be solved with the aid of an advisory board on taxation. He also stated his willingness to give the principle of public ownership of railroads a fair trial, though he was averse to either a privately or publicly owned railway monopoly. The Liberal party further advocated the reform of the Senate of Canada by fixing an age limit, and by abolishing the life tenure of office for senators. The object of this reform was to make the Senate more responsive to public opinion. Mr. King maintained that the principle of Canadian nationalism could best be developed within the British Empire, and that the bonds of Empire would be strengthened by reciprocal trade treaties. He stated that no attempt would be made to dictate to Great Britain how she should tax her people. The policy of the Liberal party as expressed by Mr. King may be summed up as "unity, moderation and progress."

KING, WILLIAM RUFUS (1786–1853), American statesman, was born in Sampson county, N.C., on April 6, 1786. He graduated at the University of North Carolina in 1803, and was admitted to the bar in 1806. He served in the State legislature, 1806–09 and in 1810 was elected to the U S. House of Representatives where he served six years as an ardent supporter of Madison's Administration. In 1816 he was appointed secretary of the legation to the Kingdom of Naples and afterwards to Russia, serving in both countries under William Pinckney, minister. Upon his return to the United States in 1818 he settled in Alabama, was a delegate to the convention which organized the new State Government, and in 1819 was elected one of the first U.S. senators from that State. Though re-elected, he served in the Senate without intermission until 1844 when he was appointed minister to France. He was instrumental in persuading the French Government not to join England in protest against the annexation of Texas by the United States. He returned to Alabama in 1848 and was again elected to the Senate to fill an unexpired term, and re-elected for a full term in 1849. In 1850 he became president of the Senate. In 1853 he was nominated for vice president on the Democratic ticket which carried the name of Franklin Pierce at its head and was successful in the election. He died near Cahawba, Ala., on April 18, 1853, soon after taking the oath of his office.

KING, a title, in its actual use generally implying sovereignty of the most exalted rank (O. Eng. *cyning,* abbreviated into *cyng, cing; cf.* O.H.G. *chun- kuning, chun- kunig;* M.H.G. *künic, kunec, künc;* Mod. Ger. *König;* O. Norse *konungr, kongr;* Swed. *konung, kung*). Any inclusive definition of the word "king" is, however, impossible. It always implies sovereignty, but in no special degree or sense; *e.g.,* the sovereigns of the British Empire and of Siam are both kings, and so too, at least in popular parlance, are the chiefs of many barbarous peoples, *e.g.,* the Zulus. The use of the title is, in fact, involved in considerable confusion, largely the result of historic causes. It is used to translate the Homeric ἄναξ equally with the Athenian βασιλεύς or the Roman *rex.* Yet the Homeric "kings" were but tribal chiefs; while the Athenian and Roman kings were kings in something more than the modern sense, as supreme priests as well as supreme rulers and lawgivers (*see* ARCHON; and ROME: *History*). In the English Bible, too, the title of king is given indiscriminately to the great king of Persia and to potentates who were little more than Oriental sheikhs. A more practical difficulty, moreover, presented itself in international intercourse, before diplomatic conventions became, in the 19th century, more or less stereotyped. Originally the title of king was superior to that of emperor, and it was to avoid the assumption of the superior title of *rex* that the chief magistrates of Rome adopted the names of *Caesar, imperator* and *princeps* to signalize their authority. But with the development of the Roman imperial idea the title emperor came to mean more than had been involved in that of *rex;* very early in the history of the Empire there were subject kings; while with the Hellenizing of the East Roman Empire its rulers assumed the style of βασιλεύς, no longer to be translated "king" but "emperor." From this Roman conception of the supremacy of the emperor the mediaeval Empire of the West inherited its traditions. With the barbarian invasions the Teutonic idea of kingship had come into touch with the Roman idea of empire and with the theocratic conceptions which this had absorbed from the old Roman and Oriental views of kingship. With these the Teutonic kingship had in its origin but little in common.

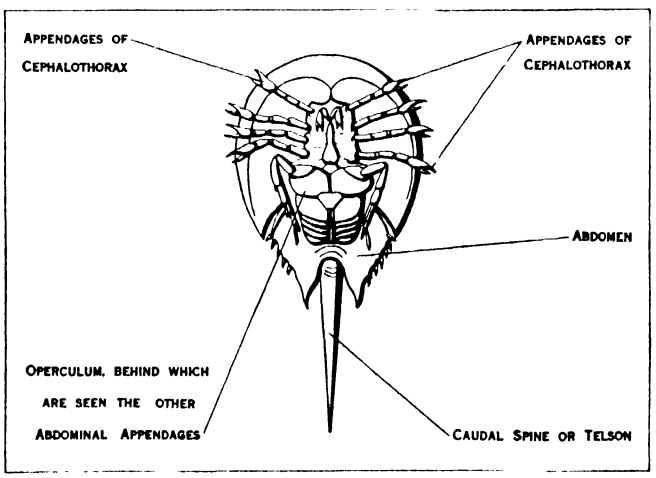
Etymologically the Romance and Teutonic words for king have quite distinct origins. The Latin *rex* corresponds to the Sanskrit *rājā,* and meant originally steersman The Teutonic king on the contrary corresponds to the Sanskrit *janaka,* and "simply meant father, the father of a family, the king of his own kin, the father of a clan, the father of a people." The Teutonic kingship, in short, was national; the king was the supreme representative of the people, "hedged with divinity" in so far as he was the reputed descendant of the national gods, but with none of that absolute theocratic authority associated with the titles of *rex* or βασιλεύς. This, however, was modified by contact with Rome and Christianity. The early Teutonic conquerors had never lost their reverence for the Roman emperor, and were from time to time proud to acknowledge their inferiority by accepting titles, such as "patrician," by which this was implied. But by the coronation of Charles, king of the Franks, as emperor of the West, the German kingship was absorbed into the Roman imperial idea, a process which exercised a profound effect on the evolution of the Teutonic kingship generally. In the symmetrical political theory of mediaeval Europe, pope and emperor were sun and moon, kings but lesser satellites; though the theory only partially and occasionally corresponded with the facts. But the elevation of Charlemagne had had a profound effect in modifying the *status* of kingship in nations that never came under his sceptre nor under that of his successors. The shadowy claim of the emperors to universal dominion was in theory everywhere acknowledged; but independent kings hastened to assert their own dignity by surrounding themselves with the ceremonial forms of the Empire and occasionally, as in the case of the Saxon *bretwaldas* in England, by assuming the imperial style. The mere fact of this usurpation showed that the title of king was regarded as inferior to that of emperor; and so it continued, as a matter of sentiment at least, down to the end of the Holy Roman Empire in 1806 and the cheapening of the imperial title by its multiplication in the 19th century. To the last, moreover, the emperor retained the prerogative of creating kings, as in the case of the king of Prussia in 1701, a right borrowed and freely used by the emperor Napoleon. Since 1814 the title of king has been assumed or bestowed by a consensus of the Powers; *e.g.,* the elector of Hanover was made king by the congress of Vienna (1814), and *per contra* the title of king was refused to the elector of Hesse by the congress of Aix-la-Chapelle (1818). In general the title of king is now taken to imply a sovereign and independent international position. This was implied in the recognition of the title of king in the rulers of Greece,

Rumania, Serbia and Bulgaria when these countries were declared absolutely independent of Turkey. The fiction of this independent sovereignty was preserved even in the case of the kings of Bavaria, Saxony and Württemberg, who were technically members of a free confederation of sovereign states, but were not independent, since their relations with foreign Powers were almost entirely controlled by the king of Prussia as German emperor.

Divine Right of Kings.—The theory of the "divine right" of kings, as at present understood, is of comparatively modern growth. The principle that the kingship is "descendible in one sacred family," as George Canning put it, is not only still that of the British constitution, as that of all monarchical states, but is practically that of kingship from the beginning. This is, however, quite a different thing from asserting, with the modern upholders of the doctrine of "divine right," not only that "legitimate" monarchs derive their authority from, and are responsible to, God alone, but that this authority is by divine ordinance hereditary in a certain order of succession. The power of popular election remained, even though popular choice was by custom or by religious sentiment confined within the limits of a single family. The custom of primogeniture grew up owing to the obvious convenience of a simple rule that should avoid ruinous contests; the so-called "Salic Law" went further, and by excluding females, removed another possible source of weakness. Neither did the Teutonic kingship imply absolute power. The idea of kingship as a theocratic function which played so great a part in the political controversies of the 17th century, is due ultimately to Oriental influences brought to bear through Christianity. The crowning and anointing of the emperors, borrowed from Byzantium and traceable to the influence of the Old Testament, was imitated by lesser potentates; and this "sacring" by ecclesiastical authority gave to the king a character of special sanctity. The Christian king thus became, in a sense, like the Roman *rex*, both king and priest. Shakespeare makes Richard II. say, "Not all the water in the rough rude sea can wash the balm off from an anointed king" (act iii. sc. 2); and this conception of the kingship tended to gather strength with the weakening of the prestige of the papacy and of the clergy generally. Before the Reformation the anointed king was, within his realm, the accredited vicar of God for secular purposes; after the Reformation he became this in Protestant states for religious purposes also. In England it is not without significance that the sacerdotal vestments, generally discarded by the clergy—dalmatic, alb and stole—continued to be among the insignia of the sovereign (*see* CORONATION). Moreover, this sacrosanct character he acquired, not by virtue of his "sacring," but by hereditary right; the coronation, anointing and vesting were but the outward and visible symbol of a divine grace adherent in the sovereign by virtue of his title. Even Roman Catholic monarchs, like Louis XIV., would never have admitted that their coronation by the archbishop constituted any part of their title to reign; it was no more than the consecration of their title. In England the doctrine of the divine right of kings was developed to its extremest logical conclusions during the political controversies of the 17th century. Of its exponents the most distinguished was Hobbes, the most exaggerated Sir Robert Filmer. It was the main issue to be decided by the Civil War, the royalists holding that "all Christian kings, princes and governors" derive their authority direct from God, the parliamentarians that this authority is the outcome of a contract, actual or implied, between sovereign and people. In one case the king's power would be unlimited, according to Louis XIV.'s famous saying: *"L'état, c'est moi!"*, or limitable only by his own free act; in the other his actions would be governed by the advice and consent of the people, to whom he would be ultimately responsible. The victory of this latter principle was proclaimed to all the world by the execution of Charles I. The doctrine of divine right, indeed, for a while drew nourishment from the blood of the royal "martyr"; it was the guiding principle of the Anglican Church of the Restoration; but it suffered a rude blow when James II. made it impossible for the clergy to obey both their conscience and their king; and the revolution of 1688 made an end of it as a great political force. These events had effects far beyond England. They served as precedents for the crusade of republican France against kings, and later for the substitution of the democratic kingship of Louis Philippe, "king of the French by the grace of God and the will of the people," for the "legitimate" kingship of Charles X., "king of France by the grace of God."

The theory of the crown in Britain, as held by descent modified and modifiable by parliamentary action, and yet also "by the grace of God," is in strict accordance with the earliest traditions of the English kingship; but the rival theory of inalienable divine right is not dead It survives among the Carlists in Spain and the Royalists in France (*see* LEGITIMISTS); and even in England there is a remnant of enthusiasts who still maintain the claims of a remote descendant of Charles I. to the throne (*see* JACOBITES).

See J. Neville Figgis, *Theory of the Divine Right of Kings* (Cambridge, 1896). (W. A. P.)



KING-BIRD (*Tyrannus tyrannus*), a common inhabitant of North America, extending from 57° N. lat. southward, but absent from California. In Canada and the northern United States it is a summer visitor, wintering in Central America, Cuba, Peru and Bolivia. The bird owes its name to the fury with which the cock will attack any bird that approaches his nest. The plumage is ashy-grey above and white beneath, with erectile feathers or the crown, which part to reveal an orange base, passing into scarlet and then to white farther back The king-bird lives on insects. The nest is large, neatly lined with fine grass and containing five or six pale salmon-coloured eggs, spotted with purple brown and orange, especially near the larger end The allied chickeree (*T. dominicensis*) of the West Indies is even more pugnacious. It eats berries as well as insects. The *Tyrannidae* are a numerous and diverse group, confined to America. Perhaps the most beautiful form is *Muscivora regia*. Many of this family are called fly-catchers in America

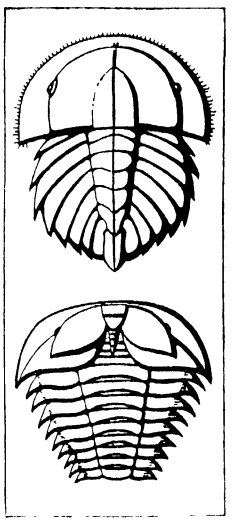
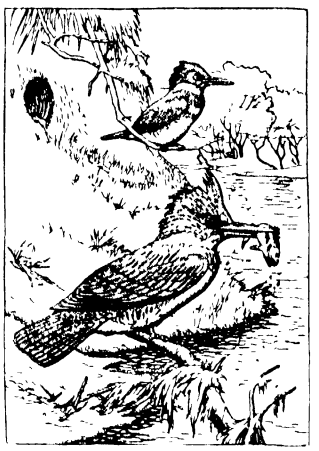
KING-BIRD (TYRANNUS TYRANNUS), FOUND ONLY IN NORTH AMERICA

KING-CRAB, a marine arachnid, belonging to the order Xiphosura Four or five species, belonging to three genera, are recognized, the best known being *Limulus* (or *Xiphosura*) *polyphemus*, which inhabits the eastern coast of America from Maine to Yucatan. It burrows in sand or mud, feeding on marine worms. Large numbers are caught for use as a fertiliser and as swine and poultry food. The eggs are laid during May, June and July.



FROM PARKER AND HASWELL, "TEXT BOOK OF ZOOLOGY"

LIMULUS POLYPHEMUS, ADULT (DORSAL ASPECT), SHOWING PARTS
The fossil remains suggest a coast-line at one time between Europe and America



At this period, the king-crabs come into extremely shallow water at high tide, the male clinging to the back of the female by means of claspers. Fertilisation is external and the eggs are buried in the sand, where they are hatched by the heat of the sun. The young only gradually acquire the long tail, which is used as a lever by the adults to enable them to regain their feet when overturned.

The other species inhabit south-east Asia and differ from *L. polyphemus* in details of structure. Perhaps the best known is *Tachypleus gigas,* ranging from the Bay of Bengal to Japan. King-crabs inhabited Europe, Asia, and America in Secondary and Tertiary times, while allied forms, differing in the unfused posterior segments, occurred in the Silurian, Devonian, and Carboniferous epochs. *See* ARACHNIDA.

Above. *Limulus polyphemus,* young (dorsal aspect)
Below. *Neolimulus falcatus,* fossil, U. Silurian

KINGFISHER. The common kingfisher, *Alcedo ispida,* is a beautiful European bird, extending also to Northern Africa and South-west Asia to Sindh Nowhere very abundant, the brilliant blue-green back and chestnut breast render it conspicuous. The sexes are alike. Its food, which it obtains by plunging into the water, consists of small fish, Crustacea and aquatic insects. The legend of the kingfishers, the transformed Ceyx and Alcyone, nesting on the waves during the seven "Halcyon days" (Ovid, *Metam.* bk xi.) is but a legend. In actual fact, the birds nest, early in the year, in a tunnel which they excavate in a bank. The nest consists of the fish-bones which the parents throw up, and in it six to eight white, translucent eggs are laid When the young hatch, the mixture of these bones with the faeces (which the parents, unlike most birds, do not remove) and decaying fish forms a dripping, fetid mass. The flesh of the kingfisher is said to be distasteful to birds of prey The American belted kingfisher (*Megaceryle alcyon*) is larger and less brilliantly coloured

BY COURTESY OF THE NATIONAL ASSOCIATION OF AUDUBON SOCIETIES
BELTED KINGFISHER (MEGA CERYLE ALCYON), OF THE UNITED STATES

The family *Alcedinidae* to which the kingfisher belongs is related to the hornbills (*Bucerotidae*) and consists of two subfamilies, *Alcedininae* and *Daceloninae* Very uniform in structure, the kingfishers are characterized by the feebleness of the feet, in which the third and fourth digits are united (*syndactylism*); in two genera, *Alcyone,* and *Ceyx,* the second digit is aborted. *Tanysiptera* is remarkable for the elongation of the middle pair of tail feathers, which are spatulate. The family is cosmopolitan, though only one genus, *Ceryle,* is found in America. The Australian region is the headquarters of the group, and here are found the "laughing jackass," *Dacelo gigas,* and its relatives. Many kingfishers live on insects.

The only fossil kingfisher known is *Halcyornis toliapicus,* from the Eocene of Sheppey.

KINGHORN, royal and police burgh parish, Fifeshire, Scotland. Pop. (1921), 2,425. It is situated on the Firth of Forth, 2¼ m. E. by N. of Burntisland, on the L.N.E. railway. It enjoys some repute as a summer resort. The leading industries are ship-building, bleaching and the making of flax and glue. Alexander III., who created Kinghorn a burgh, was killed by a fall from his horse over the cliffs, since called King's Wud End, a little to the west of the burgh. A monument was erected in 1887 to mark the supposed scene of the accident. Kinghorn belongs to the Kirkcaldy district group of parliamentary burghs. At PETTYCUR, 1 m. to the south, is a good small harbour, and at Kinghorn Ness a battery in connection with the fortifications on Inchkeith. About 1 m. north of Kinghorn is the estate of Grange, which belonged to Sir William Kirkcaldy. INCHKEITH, an island, nearly 1 m. by ¼ m., in the fairway of the Firth of Forth, 2½ m. S. by E. of Kinghorn and 3½ m. N. by E. of Leith, belongs to the parish of Kinghorn. It is a barren rock, with a harbour, and a lighthouse on the summit.

KINGLAKE, ALEXANDER WILLIAM (1809–1891), English historian and traveller, was born at Taunton on Aug. 5, 1809. His father, a successful solicitor, intended his son for a legal career. Kinglake went to Eton and Trinity college, Cambridge, where he matriculated in 1828, being a contemporary and friend of Tennyson and Thackeray. After leaving Cambridge he joined Lincoln's Inn, and was called to the bar in 1837. While still a student he travelled, in 1835, throughout the East. *Eothen,* a sensitive and witty record of impressions keenly felt and remembered, was published in 1844; it remains a classic In 1854 he went to the Crimea, and was present at the battle of the Alma. Lord Raglan suggested to Kinglake the plan for an elaborate *History of the Crimean War,* and placed his private papers at the writer's disposal. For the rest of his life Kinglake was engaged upon this monumental history. Its eight volumes appeared at intervals between 1863 and 1887. Kinglake lived principally in London, and sat in parliament for Bridgwater from 1857 to 1868. He died on Jan. 2, 1891.

KINGLET: *see* GOLD-CREST

KING-OF-ARMS: *see* HERALD.

KING-POST, the vertical member in a king-post truss, which consists of a triangle, whose sloping sides form the main rafters, tied together at the bottom by a horizontal member, which is connected to the apex of the rafters by a vertical member, or king-post, in the centre. The king-post is not a true post, but, being in tension, is actually a tie.

KINGS, FIRST AND SECOND BOOKS OF, in the Bible, the last two books of the "Earlier (or Former) Prophets." They were originally reckoned as a single book (Josephus, Talmud, etc.), though modern Bibles follow the Septuagint, where they are called the third and fourth books of "kingdoms," the first and second being our books of Samuel. All four are closely connected (*See* SAMUEL, BOOKS OF)

General Character.—The most noticeable feature in Kings is the recurring interest in the centralization of worship in the Temple at Jerusalem as prescribed in Deuteronomy and enforced by Josiah. To this 2 Sam. vii. and xxiv. are introductory. Amidst the great variety in style and manner which marks the several parts of the history, features which reflect the teaching of Deuteronomy recur regularly in similar stereotyped forms. They point to a specific redaction, and it would seem that the "Deuteronomic" editor who treated the foundation of the Temple, the central event of Solomon's life, as a religious epoch of the first importance, regarded this as the beginning of a new era—the history of Israel under the one sanctuary. Another characteristic feature is the chronological scheme; the events of each king's reign are thrown into a framework on this type: "In the twentieth year of Jeroboam, king of Israel, Asa began to reign over Judah, and reigned in Jerusalem forty-one years." . . . "In the third year of Asa, king of Judah, Baasha began to reign over Israel in Tirzah twenty-four years." The history moves between Judah and Israel according to the date of each accession; as soon as a new king has been introduced, everything that happened in his reign is discussed, and wound up by another formula as to the death and burial of the sovereign; and to this mechanical arrangement the natural connection of events is often sacrificed. The elaborate synchronisms give an aspect of precision; but in reality the data for Judah and Israel do not agree, and remarkable deviations are sometimes found. (*See* BIBLE: *Old Testament,* "Chronology.")

Another characteristic is the retrospective application to the history of a standard belonging to the later developments of

Hebrew religion. Thus the redactor regards the sins of Jeroboam as the cause of the downfall of Israel (2 Ki. xvii. 21 *seq.*), and passes an unfavourable judgment upon all its rulers, not merely to the effect that they did evil in the sight of Yahweh but that they followed in the way of Jeroboam. But his opinion was manifestly not shared by Elijah or Elisha, nor by the original narrator of the lives of these prophets. Moreover, the redactor in 1 Ki. iii. 2 *seq.* regards worship at the high places as sinful after the building of the Temple, although even the best kings before Hezekiah made no attempt to suppress these shrines. This feature in the redaction displays itself especially in the speeches placed in the mouths of actors in the history.

For his sources the compiler refers chiefly to two distinct works, the "words" or "chronicles" of the kings of Israel and those of the kings of Judah. How much is copied from these works and how much is expressed in the compiler's own language is, of course, uncertain. The history consists usually of an epitome of each reign. It states the king's age at succession (Judah only), length of reign, death and burial, with allusions to his buildings, wars, and other political events. In the case of Judah, also, the name of the royal or queen-mother is mentioned. The use which the compiler makes of his sources shows that his aim was not the *history* of the past but its *religious significance*.

DIVISION OF THE BOOK

Solomon.—We may divide the book into three sections: (1) the life of Solomon, (2) the kingdoms of Ephraim (or Samaria) and Judah, and (3) the separate history of Judah after the fall of Samaria. The events which lead up to the death of David and the accession of Solomon (1 Ki. i., ii.) are closely connected with 2 Sam. ix.–xx. The unity is broken by the appendix 2 Sam. xxi.–xxiv. which is closely connected, as regards subject-matter, with v.–viii.; the literary questions depend largely upon the structure of the books of Samuel (*q v.*). It is evident that either the compiler drew upon other sources for the occasion and has been remarkably brief elsewhere, or that his epitomes have been supplemented by the later insertion of material not necessarily itself of late origin. At present 1 Ki. i., ii. are both the close of David's life (no source is cited) and the necessary introduction to Solomon. But both Lucian's recension of the Septuagint (ed. Lagarde) and Josephus, begin the book at ii. 12, thus separating the annalistic accounts of the two. Since the contents of 1 Ki. iii.–xi. do not form a continuous narrative, the compiler's authority ("Acts of S." xi. 41) can hardly have been an ordinary chronicle. The chapters comprise (*a*) sundry notices of the king's prosperous and peaceful career, severed by (*b*) a description of the Temple and other buildings; and they conclude with (*c*) some account of the external troubles. After an introduction (iii.), (*a*) contains generalizing statements of Solomon's might, wealth and wisdom (iv. 20 *seq*, 25, 29–34; x. 23–25, 27) and stories of a late and popular character (iii. 16–28, x. 1–10, 13). The Septuagint has many deviations from the Hebrew text, and this, together with the present form of the parallel passages in Chronicles, show that the text was not fixed even at a late period (4th–2nd century B.C.). The account of the end of Solomon's reign deals with his religious laxity (xi. 1–13, now in a Deuteronomic form), as the punishment for which the separation of the two kingdoms is announced; and the rise of the adversaries who, according to xi. 25, had troubled the whole of his reign, and are, therefore, not the penalty for the sins of his old age. Both, however, form an introduction to subsequent events, and the life of Solomon concludes with a brief annalistic notice of his death, length of reign, successor, and place of burial. (*See* SOLOMON.)

Ephraim and Judah.—In the history of the two kingdoms the redactor follows a scheme determined by the order of succession. The fluctuation of tradition concerning the schism is evident from a comparison with the Septuagint; and all that is related of Ahijah falls under suspicion of being foreign to the oldest history. The story of the man of God from Judah (xiii.) is shown to be late by its conceptions of prophetism and revelation, and by the term "cities of Samaria" (*v.* 32, for Samaria as a *province, cf.* 2 Ki. xvii. 24, 26; for the building of this city by Omri *see* 1 Ki. xvi. 24). It is a late Judaean narrative inserted after the Deuteronomic redaction, and breaks the connection between xii. 31 and xiii. 33 *seq.* The latter describe the idolatrous worship instituted by the first king of the schismatic north, and the religious attitude occurs regularly throughout the compiler's epitome, however brief the reigns of the kings. The brief reign of Elah preserves an important extract in xvi. 9, but the date in *v.* 10*a* (LXX. omits) presupposes the late finished chronological scheme. Zimri's seven days receive the inevitable condemnation, but the older material embedded in xvi. 15*b*–18 is closely connected with *v.* 9 and is continued in the non-editorial portions of Omri's reign (xvi. 21 *seq.*, length of reign in *v.* 23, and *v.* 24).

As regards *Judah*, the vivid account of the accession of Rehoboam in xii. 1–16 is reminiscent of the full narratives in 2 Sam. ix.–xx. and 1 Ki. i., ii. (*cf.* especially *v.* 16 with 2 Sam. xx. 1). Ch. xii. 15*b* refers to the prophecy of Ahijah (*see* above) and "unto this day," *v.* 19, cannot be by a contemporary author; *v.* 17 (LXX. omits) finds a parallel in 2 Chron. xi. 16 *seq.* and may represent an Ephraimite standpoint. The Judaean standpoint is prominent in *vv.* 21–24, where (*a*) the inclusion of Benjamin and (*b*) the cessation of war (at the command of Shemaiah) conflict with (*a*) xi. 32, 36, xii. 20 and (*b*) xiv. 30 respectively. Rehoboam's history, resumed by the redactor in xiv. 21–24, continues with a brief account of the spoiling of the Temple and palace by Sheshonk (Shishak). (The incident appears in 2 Chron. xii. in a rather different context, *before* the details which now precede *v.* 21 *seq*.) The reign of Abijam is entirely due to the editor, whose brief statement of the war in xv. 7*b* is supplemented by a lengthy story in 2 Chron. xiii. (where the name is Abijah). The account of Asa's reign contains a valuable summary of his war with Baasha xv. 16–22; the isolated *v.* 15 is possibly related to *v.* 18 (*cf.* also vii. 51). Jehoshaphat is dealt with in xxii. 41–50 after the death of Ahab; but the Septuagint, which follows a different chronological scheme (placing his accession in the reign of Omri), gives the summary (with some variations) after xvi. 28.

THE OVERTHROW OF OMRI'S DYNASTY

Ahab to Jehu.—The history of the few years between the close of Ahab's life and the accession of Jehu covers about one-third of the entire book of Kings. This is due to the inclusion of narratives, partly of a political character, and partly interested in the work of prophets. The climax is the overthrow of Omri's dynasty by the usurper Jehu, when, after a period of close intercourse between Israel and Judah, their two kings perished. The annals of each kingdom would naturally deal independently with these events, but the present literary structure of 1 Ki. xvii.–2 Ki. xi. is extremely complicated by the presence of the narratives referred to. As regards the framework, the epitome of Ahab is preserved in xvi. 29–34 and xxii. 39; it contains some unknown references (his ivory house and cities), and a stern religious judgment upon his Phoenician alliance, on which the intervening chapters throw more light. The colourless summary of his son, Ahaziah (xxii. 51–53), concludes in 2 Ki. i. 17 *seq.* where *v.* 18 should precede the accession of his brother, Jehoram (*v.* 17*b*). Jehoram is again introduced in iii. 1–3 (note the variant synchronism), but the usual conclusion is wanting. In Judah, Jehoshaphat was succeeded by his son, Jehoram, who had married Athaliah, the daughter of Ahab and Jezebel (viii. 16–24); to the annalistic details (*vv.* 20–22) 2 Chron. xxi. 11 *sqq.* adds a novel narrative. His son, Ahaziah (viii. 25 *sqq.*) is, like his father, denounced for his relations with Israel. He is again introduced in the isolated ix. 29, and Lucian's recension adds after x. 36 a variant summary of his reign but *without* the regular introduction. Further confusion appears in the Septuagint, which inserts after i. 18 (Jehoram of Israel) a notice corresponding to iii. 1–3, and concludes "and the anger of the Lord was kindled against the house of Ahab." This would be appropriate in a position nearer ix. *seq.*, where the deaths of Jehoram and Ahaziah are described.

In 1 Ki. xx., xxii. 1–28 (xxi. follows xix. in the LXX.) Ahab is viewed rather more favourably than in the Elijah-narratives (xix., xxi.) or in the compiler's summary. Ch. xxii. 6, moreover, proves that there is some exaggeration in xviii. 4, 13; the great contest between Elijah and the king, between Yahweh and Baal, has been idealized. Ch. xxii. is important for its ideas of prophetism (es-

pecially *vv.* 19–23; *cf.* Ezek. xiv. 9; 2 Sam. xxiv. 1 (in contrast to 1 Chron. xxi. 1); a gloss at the end of *v.* 28, omitted by the Septuagint, wrongly identifies Micaiah with the well-known Micah (i. 2). Although the punishment passed upon Ahab in xxi. 20 *sqq.* (20*b*–26 betray the compiler's hand; *cf.* xiv. 10 *seq.*) is modified in *v.* 29, this is ignored in the account of his death, xxii. 38, which takes place at Samaria. The ascension of Elijah (2 Ki. ii.) is the introduction to the work of Elisha. Of the stories of Elisha some find him at the head of the prophetic gilds (iv. 1, 38–44, vi. 1–7), in others he has friendly relations with the "king of Israel" and the court. As a personage of almost superhuman dignity he moves in certain narratives where political records appear to have been utilized to describe the activity of the prophets. With vi. 24–vii. 20 (after the complete cessation of hostilities in vi. 23) compare the general style of 1 Ki xx., xxii.; with the famine in Samaria, vi. 25, *cf. ibid.* xvii.; with the victory, *cf. ibid.* xx. The account of Elisha and Hazael (viii. 7–15) implies friendly relations with Damascus (in *v.* 12 the terrors of war are in the future). Ch. ix. 7–10*a* are a Deuteronomic insertion amplifying the message in *vv.* 3–6 (*cf.* 1 Ki. xxi 20 *seq.*) The oracle in ix. 25 *seq.* is not that in 1 Ki. xxi. 19 *seq.* and mentions the additional detail that Naboth's sons were slain. Here his field or portion is located near Jezreel, but in 1 Ki. xxi. 18 his vineyard is by the royal palace in Samaria (*cf.* xxii. 38 and contrast xxi. 1, where the LXX. omits reference to Jezreel). This variation reappears in 2 Ki. x. 1, 11 *seq.*, and 17; in ix. 27 compared with 2 Chron. xxii. 9; and in the duplication of an historical incident, viz, the war against the Aramaeans at Ramoth-Gilead (*a*) by Jehoshaphat and Ahab, and (*b*) by Ahaziah and Jehoram, in each case with the death of the Israelite king, at Samaria and Jezreel respectively (*see* above, and observe the contradiction in 1 Ki. xxi. 29 and xxii. 38). These and other questions here are involved with (*a*) the probability that Elisha's work belongs rather to the accession of Jehu, with whose dynasty he was on most intimate terms until his death some 45 years later (2 Ki. xiii. 14–21), and (*b*) the problem of the wars between Israel and Syria which appear to have begun only in the time of Jehu (x. 32). (*See* ELIJAH, ELISHA.)

Dynasty of Jehu.—There is no editorial introduction to Jehu (x. 32 *sqq.*). The summary mentions the beginning of the Aramaean wars, the continuation of which is found in the redactor's account of his successor, Jehoahaz (xiii. 1–9). But xiii. 4–6 modify the disasters, and by pointing to the "saviour" or deliverer (*cf.* Judges iii. 9, 15) seem to anticipate xiv. 27. The self-contained account of Jehoash (xiii. 10–13) is supplemented (*a*) by the story of the death of Elisha (*vv.* 14–21), who would seem to have flourished *after* the rise of Jehu and not *before*, and (*b*) by some account of the Aramaean wars (*vv.* 22–25). Here, *v.* 23 is noteworthy for the sympathy towards the northern kingdom (similarly *vv.* 4–6). (*c*) The defeat of Amaziah of Judah appears in xiv. 8–14 after the annals of Judah, although from an Israelite source (*v.* 11*b* Bethshemesh is defined as Judaean.)

In Judah Jehu's reform and the overthrow of Jezebel (ix., x. 15–28) find their counterpart in the murder of Athaliah and the destruction of the temple of Baal (xi. 18). The editorial conclusion of the reign of Ahaziah, the introduction to that of Athaliah, and the sources for both are wanting. The lengthy document describing the accession of Joash and the abruptly introduced priest, Jehoiada, shows an obvious interest in the Temple and temple-procedure; and both xi. and xii. resemble xxii. *seq.* Azariah (Uzziah) is briefly summarized in xv. 1–7, hence the notice in xiv. 22 seems out of place; perhaps the usual statements of Amaziah's death and burial (*cf.* xiv. 20*b*, 22*b*), which were to be expected after *v.* 18, have been supplemented by the account of the rebellion (*vv.* 19, 20*a*, 21). Both xiv. 22 and xv. 5 presuppose fuller records of which 2 Chron. xxvi. 6–7, 16–20 may represent later and less trustworthy versions. The chronological notes for the accession of Azariah imply different views of the history of Judah after the defeat of Amaziah; with xiv. 17, *cf.* xiii. 10, xiv. 2, 23, but contrast xv. 1, and again *v.* 8.

The important reign of Jeroboam II. of Israel is dismissed as briefly as that of Azariah (xiv. 23–29). Of his successors Zechariah, Shallum and Menahem only the briefest records remain, now embedded in the editorial framework (xv. 8–25). The summary of Pekah (?the same as Pekahiah) contains excerpts which form the continuation of the older material in *v.* 25 (*cf.* also *vv.* 10, 14, 16, 19, 20). For a similar adjustment of an earlier record to the framework, *see* above on 1 Ki. xv. 25–31, xvi. 8–25. Two accounts of the fall of Samaria are given, one under the reign of the contemporary Judaean Hezekiah (xvii. 1–6, xviii. 9–12). Reflections on the disappearance of the northern kingdom appear in xvii. 7–23 and xviii. 12; the latter belongs to the Judaean history. The former is composite: xvii. 21–23 (cf. *v.* 18) look back to the introduction of calf-worship by Jeroboam I., and agree with the compiler's usual standpoint; but *vv.* 19–20 include Judah and presuppose the exile. The remaining verses survey types of idolatry partly of a general kind (*vv.* 9–12, 16*a*), and partly characteristic of Judah in the last years of the monarchy (*vv.* 16*b*. 17). The brief account of the subsequent history of Israel in xvii. 24–41 is not from one source; the piety of the new settlers (*v.* 32–34*a*, 41) conflicts with the later point of view in 34*b*–40. The last-mentioned supplements the epilogue in xvii. 7–23, forms a solemn conclusion to the history of the northern kingdom, and is apparently aimed at the Samaritans.

Later History of Judah.—The summary of Jotham (xv. 32–38) alludes to the hostility of Pekah (*v.* 37) upon which the Israelite annals are silent. This is resumed in the account of Ahaz (xvi. 5 *sqq.*; *v.* 6 is confused), and is supplemented by a description, evidently from the Temple records, in which the ritual innovations by "King Ahaz" are described (*vv.* 10–18). The summary of Hezekiah (xviii. 1–8) emphasizes his important religious reforms and includes two references to his military achievements. Of these *v.* 7 is supplemented by (*a*) the annalistic extract in *vv.* 13–16, and (*b*) narratives in which the great contemporary prophet, Isaiah, is the central figure (On these *see* HEZEKIAH ISAIAH) In the accounts of the reactionary kings Manasseh and Amon, xxi. 7–15, refer to the exile and find a parallel in xxiii. 26 *seq.*; and xxi. 10 *sqq.* are replaced in 2 Chron. xxxiii. 10–20 by a novel record of Manasseh's penitence (*see* also *ibid. v.* 23 and note omission of 2 Ki. xxiii 26 from Chron.).

Josiah's reign forms the climax of the history. The usual framework (xxii 1; 2, xxiii. 28, 30*b*) is supplemented by narratives dealing with the Temple repairs and his reforms. These are closely related to xi *seq.* (*cf.* xxii. 3–7 with xii. 4 *sqq.*), but have signs of revision; xxii. 16 *seq.*, xxiii. 26 *seq*, point distinctly to the exile, and xxiii. 16–20 are an insertion (the altar in *v.* 16 is already destroyed in *v.* 15) after 1 Ki. xiii. The reforms of Josiah are described in terms that point to an acquaintance with the teaching of Deuteronomy which promulgates the reforms themselves. (*See* DEUTERONOMY, JOSIAH.)

For the last four kings of Judah, the reference to the worship at the high places (presumably abolished by Josiah) are wanting; xxiv. 3 *seq.*, and probably *v.* 2, which treat the fall of Judah as the punishment for Manasseh's sins, are a Deuteronomic insertion; *v.* 13 *seq.* and *v.* 15 *seq.* are duplicates. With xxiv. 18–xxv. 21 *cf.* Jer. lii. 1–27 (the text of the latter, especially *vv.* 19 *sqq.*, is superior); and the fragments *ibid.* xxxix. 1–10. Ch. xxv. 22–26 appears in much fuller form in Jer. xl. 7–9, xli. 1–3, 17 *seq.* It is noteworthy that Jeremiah (in contrast to Isaiah, above) does not enter into the history in Kings. The book of Chronicles in general has a briefer account of the last years, and ignores both the narratives which also appear in Jeremiah and the concluding hopeful note struck by the restoration of Jehoiachin (xxv. 27–30).

Conclusions.—It would seem that there was an independent history of (north) Israel with its own chronological scheme. It was based upon annals and fuller political records and at some period apparently passed through circles where the purely domestic stories of the prophets (Elisha) were current (*cf.* similarly the prophetic narratives in the books of Samuel). This was ultimately taken over by a Judaean editor who was under the influence of the far-reaching reforms ascribed to the 18th year of Josiah (621 B.C.). Certain passages seem to imply that in his time the Temple was still standing and the Davidic dynasty uninterrupted. On the other hand this could apply to the *second*

Temples and to the resumption of the Davidic monarchy under Zerubbabel; and if the object of the compiler was to show from past history that "the sovereign is responsible for the purity of the national religion" (G. F. Moore, *Ency. Bib.*, col. 2,079), a later date would satisfy the conditions. Moreover, although the phrase "unto this day" sometimes seems to presuppose a pre-exilic date, it is retained even in the very late books of Chronicles (2 Chron. v. 9, viii. 8, xxi. 10, compared with 1 Ki. viii. 8, ix. 21, 2 Ki. viii. 22). Again, not only is the history carried down to the death of Jehoiachin (2 Ki. xxv. 27, 29 *sqq.*), but the chronological scheme (480 years from the beginning of the Temple to the return from Babylon) points to a date subsequent to 537.

One may contrast the Israelite detailed narratives (relatively early) with those of Judaean origin (often secondary, and with an anti-Israelite bias). The sympathetic treatment of the northern history in 2 Ki. xiii. 4 *seq.* 23, xiv. 26, has literary parallels in the Deuteronomic redaction of Judges (where Israelite tradition is again predominant); and is quite distinct from the hostile (Judaean) feeling to the north which is also Deuteronomic In other words, a *twofold* Deuteronomic redaction of Kings can be traced (similarly in the Book of Joshua); and, as the northern prophet Hosea (*q.v.*) approximates the Deuteronomic standpoint, it is possible that the first Deuteronomic compilation of Kings originated outside Judah. Note that an Israelite source could be drawn upon for an impartial account of Judaean history (2 Ki xiv. 8–14), and that the book of Jeremiah, with its strong Deuteronomic colouring takes a sympathetic view of (north) Israel. Although ultimately Judaean writers rejected as heathen a people who claimed to be followers of Yahweh (Ezr. iv. 2; 2 Ki. xvii. 28, 33; contrast *ib.* 34–40, a *secondary* insertion) the violent anti-Samarian feeling had once been less prominent; and it may reasonably be supposed that relations between north and south had been closer. But the age wherein the composition of the book of Kings may be placed has been left exceptionally obscure; the Chronicler's history (Chron.–Ezra–Nehemiah) has its own ideas of the course of events, and it has virtually superseded both Kings and Jeremiah, which now have an abrupt conclusion. (*See* further: JEWS.)

BIBLIOGRAPHY.—Driver, *Lit. of O. T.* (1909), the commentaries (German) of Benzinger (1899) and Kittel (1900); F. C. Kent's *Israel's Hist. and Biog. Narratives* (1905), and the concise works of Barnes (Camb. Bible) and Skinner (Century Bible). On the Hebrew text consult Burney (1903); the article "Kings," by W. R. Smith, *Ency. Brit.*, 9th and 11th ed. (partly retained here), is revised by Kautzsch in the *Ency Biblica.* (S. A. C.)

KING'S BENCH, COURT OF, is descended from the court held *coram rege* when it was part of that undifferentiated *Curia Regis* which was still performing legislative and executive as well as judicial functions It was a court to hear cases which concerned the king, or cases affecting great persons privileged to be tried only before the king himself. If the king was absent abroad, such cases were heard *coram consilio nostro* It was also a court to correct the errors and defaults of all other courts, and after the close of the civil wars of Henry III.'s reign was mainly occupied with the trial of criminal or quasi-criminal cases. In 1268 it obtained a chief justice of its own, but only very gradually did it become a separate court of common law. It still followed the king whenever summoned to do so, although the presence of the king in court became a fiction by the end of the 14th century, during which it lost its former close connection both with the king himself and with the king's council. Thus it was not until a century after the court of common pleas (*q.v.*) had become a distinct court of common law that the court of king's bench attained a similar position. It exercised a supreme and general jurisdiction, which comprised (1) criminal jurisdiction; (2) civil jurisdiction; and (3) jurisdiction over the errors of inferior courts including those of the court of common pleas, until by the Act of 1830 the court of exchequer chamber became a court of appeal intermediate between the three common law courts and parliament. It also heard appeals from the court of king's bench in Ireland till 1783, and exercised jurisdiction over officials and others by means of the prerogative writs; *e.g., habeas corpus, certiorari, prohibition, mandamus, quo warranto* and *ne exeat regno.*

By the Judicature act, 1873, the court became the king's bench division of the High Court of Justice. It consists of a chief justice—now lord chief justice of England—and 18 puisne judges. Appeals from inferior courts come before a divisional court, composed of two or three judges of the division. For appeals from the divisional court to the court of appeal *see* PRACTICE and PROCEDURE.

See Baldwin, *The King's Council;* Holdsworth, *Hist. Eng. Law,* vol. i. (H. H. L. B.)

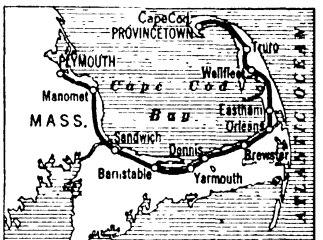
KINGSBRIDGE, a market town of Devonshire, England, 48 m S.S.W. of Exeter, on a branch of the G.W.R. Pop. of urban district (1921) 2,946. Kingsbridge (*Kyngysbrygge*) was formerly included in the manor of Churchstow, the first trace of its separate existence being found in the Hundred Roll of 1276, which records that in the manor of Churchstow there is a new borough, which has a Friday market and a separate assize of bread and ale. The name Kingsbridge however does not appear till half a century later. Kingsbridge became a separate parish before 1414 when the church was rebuilt and consecrated to St Edmund. In 1461 the abbot of Buckfastleigh obtained a Saturday market at Kingsbridge and a three-days' fair at the feast of St. Margaret, both of which are still held. The manor remained in possession of the abbot until the Dissolution, when it was granted to Sir William Petre Kingsbridge was never represented in parliament or incorporated by charter, the government being by a portreeve, and down to the present day the steward of the manor holds a court leet and court baron and appoints a portreeve and constables. In 1798 the town mills were converted into a woollen manufactory, which up to recent times produced large quantities of cloth, and the serge manufacture was introduced early in the 19th century. The town has been famous from remote times for a beverage called "white ale" Included in Kingsbridge is the little town of Dodbrooke, which at the time of the Domesday Survey had a population of 42, and a flock of 108 sheep and 27 goats; and in 1257 was granted a Wednesday market and a fair at the Feast of St Mary Magdalene. It lies 6 m. from the English Channel, at the head of an inlet, on a sharply sloping site The church of St. Edmund is mainly Perpendicular, but there are Transitional Norman and Early English portions.

KING'S COUNSEL, a title conferred on barristers by Royal patent on the recommendation of the lord chancellor, the patent of appointment being contained in the words "one of His Majesty's counsel learned in the law." It confers certain rights of precedence. The first such counsel was Sir Francis Bacon, appointed by Queen Elizabeth The official costume includes a silk gown, hence the expression to "take silk"

KING'S COUNTY: *see* OFFALY COUNTY

KING'S EVIDENCE, the evidence given to the Crown by an accomplice in crime upon an explicit promise of pardon. The conditions governing such evidence are subject to the discretion of the court. It is usually obtained, on application by the counsel for the prosecution, after acquittal of the person about to be examined in order that the full facts may be revealed without fear of reprisal.

In the United States such evidence goes under the name of "State's evidence." This device of securing the testimony of one criminal by a promise of immunity is in common use. The promise is generally merely an agreement by the prosecuting attorney with the consent of the court to *nol. pros.* the case against the testifying criminal if full disclosure be made, though the attorney may also agree to use his efforts to secure a pardon.



KING'S EVIL, an old, but not yet obsolete, name given to the scrofula, which in the popular estimation was deemed capable of cure by the royal touch. The practice of "touching" for the scrofula, or "King's Evil," was confined amongst the nations of Europe to the two Royal Houses of England and France. It cannot be traced back to an earlier date than the reign of Edward III. in England, and of St. Louis (Louis IX.) in France; consequently, it is believed that the performance of healing by the touch emanated in the first instance from the French crusader-king, whose miraculous powers were subsequently transmitted to his descendant and representative, Isabella of Valois, wife of Ed-

ward II. of England. In any case, Queen Isabella's son and heir, Edward III., claimant to the French throne by his mother, was the first English king to order a public display of an attribute that had hitherto been associated with the Valois kings alone. From his reign dates the use of the "touch-piece," a gold medal given to the sufferer as a kind of talisman, which was originally the angel coin, stamped with designs of St. Michael and of a three-masted ship.

The actual ceremony seems first to have consisted of the sovereign's personal act of washing the diseased flesh with water, but under Henry VII. the use of an ablution was omitted, and a regular office was drawn up for insertion in the Service Book. The king now merely touched his afflicted subject in the presence of the court chaplain who offered up certain prayers and afterwards presented the touch-piece, pierced so that it might be suspended by a ribbon round the patient's neck. The Hanoverian kings declined to touch, and there exists no further record of any healing ceremony thenceforward at the English court. The practice, however, was continued by the exiled Stuarts, and was constantly performed in Italy by James Stuart, "the old Pretender," and by his two sons. *See* A. M. Hocart, *Kingship* (1927)

KINGSFORD, WILLIAM (1819–1898), British engineer and Canadian historian, was born in London on Dec. 23, 1819. He first studied architecture, but enlisted in the 1st Dragoon Guards, from which he obtained his discharge in Canada in 1841. After serving in the office of the city surveyor of Montreal, he made a survey for the Lachine canal (1846–48), and was employed in the building of the Hudson River railroad in 1849, and on the Panama railroad in 1851. From 1853 to 1864 he was surveyor, and later district superintendent, for the Grand Trunk railroad. From 1872 to 1879 he held a Government post in charge of the harbours of the Great Lakes and the St Lawrence. He died on Sept. 28, 1898. Besides a *History of Canada* (10 vols., 1887–97), ending with the union of Upper and Lower Canada in 1841, his works include *Canadian Archaeology* (1886); and *Early Bibliography of Ontario* (1892).

KING'S HIGHWAY, an American thoroughfare 90 m. in length extending from Plymouth, Mass., to Provincetown, in the same State. First called King's highway during colonial days, this name was revived during the Pilgrim Tercentenary of 1920 Within sight of Cape Cod bay and the Atlantic ocean through much of the distance, nearly every mile contains historic landmarks associated with the struggles of the hardy New Englanders who helped to found the Union. Cape Cod, throughout which the highway passes, is a Mecca for the tourist. Its attractions include woods, ponds, sea views and quaint, picturesque villages, among which are Manomet, Sandwich, Barnstable, Yarmouth, Brewster, Eastham, Wellfleet, Orleans and Truro

KINGSLEY, CHARLES (1819–1875), English clergyman, poet and novelist, was born on June 12, 1819, at Holne vicarage, Dartmoor, Devon. His early years were spent at Barnack in the Fen country and at Clovelly in North Devon. The scenery of both made a great impression on his mind, and was afterwards described with singular vividness in his writings. He was educated at private schools and at King's college, London, after his father's promotion to the rectory of St. Luke's, Chelsea. In 1838 he entered Magdalene College, Cambridge, and in 1842 he was ordained to the curacy of Eversley in Hampshire, to the rectory of which he was not long afterwards presented, and this, with short intervals, was his home for the remaining thirty-three years of his life. In 1844 he married Fanny, daughter of Pascoe Grenfell, and in 1848 he published his first volume, *The Saint's Tragedy*. In 1859 he became chaplain to Queen Victoria; from 1860 to 1869 he was professor of modern history at Cambridge. In 1873 he became a canon of Westminster. He died at Eversley on Jan. 23, 1875.

Kingsley threw himself heartily into the movement known as Christian Socialism, of which Frederick Denison Maurice was the recognized leader, and for many years he was considered as an extreme radical in a profession the traditions of which were conservative. While in this phase he wrote his novels *Yeast* and *Alton Locke,* in which he showed sympathy with the aims of the Chartists Yet even then he considered that the true leaders of the people were a peer and a dean, and there was no real inconsistency in the fact that at a later period he was among the defenders of Governor Eyre in the measures adopted by him to put down the Jamaican disturbances He looked rather to the extension of the co-operative principle and to sanitary reform for the amelioration of the condition of the people than to any radical political change. His politics might therefore have been described as Toryism tempered by sympathy, or as Radicalism tempered by hereditary scorn of subject races. He was bitterly opposed to what he considered to be the mediaevalism and narrowness of the Oxford Tractarian movement. In *Macmillan's Magazine* for Jan. 1864 he asserted that truth for its own sake was not obligatory with the Roman Catholic clergy, quoting as his authority John Henry Newman (*q.v.*). In the ensuing controversy Kingsley was completely discomfited He was a broad churchman, who held what would be called a liberal theology, but the more orthodox and conservative elements in his character gained the upper hand as time went on

As a novelist his chief power lay in his descriptive faculties. The descriptions of South American scenery in *Westward Ho!,* of the Egyptian desert in *Hypatia,* of the North Devon scenery in *Two Years Ago,* are among the most brilliant pieces of word-painting in English prose-writing; and the American scenery is even more vividly and more truthfully described when he had seen it only by the eye of his imagination than in his work *At Last,* which was written after he had visited the tropics. His sympathy for children taught him how to secure their interests. His version of the old Greek stories entitled *The Heroes,* and *Water-babies* and *Madam How and Lady Why,* in which he deals with natural history, rank high among books for children.

In person Charles Kingsley was tall and spare, sinewy rather than powerful, and of a restless excitable temperament. His complexion was swarthy, his hair dark, and his eye bright and piercing. His temper was hot, kept under rigid control; his disposition tender, gentle and loving, with flashing scorn and indignation against all that was ignoble and impure; he was a good husband, father and friend. One of his daughters, Mary St. Leger Kingsley (Mrs. Harrison), became well known as a novelist under the pseudonym of "Lucas Malet."

Kingsley's life was written by his widow in 1877, entitled *Charles Kingsley, his Letters and Memoirs of his Life,* and presents a very touching and beautiful picture of her husband, but perhaps hardly does justice to his humour, his wit, his overflowing vitality and boyish fun.

The following is a list of Kingsley's writings —*Saint's Tragedy,* a drama (1848); *Alton Locke,* a novel (1849); *Yeast,* a novel (1849); *Twenty-five Village Sermons* (1849); *Phaeton, or Loose Thoughts for Loose Thinkers* (1852); *Sermons on National Subjects* (1st series, 1852); *Hypatia,* a novel (1853); *Glaucus, or the Wonders of the Shore* (1855); *Sermons on National Subjects* (2nd series, 1854); *Alexandria and her Schools* (1854); *Westward Ho!* a novel (1855); *Sermons for the Times* (1855); *The Heroes,* Greek fairy tales (1856); *Two Years Ago,* a novel (1857); *Andromeda and other Poems* (1858); *The Good News of God,* sermons (1859); *Miscellanies* (1859); *Limits of Exact Science applied to History* (Inaugural Lectures 1860), *Town and Country Sermons* (1861); *Sermons on the Pentateuch* (1863); *Water-babies* (1863); *The Roman and the Teuton* (1864); *David and other Sermons* (1866); *Hereward the Wake,* a novel (1866); *The Ancient Régime* (Lectures at the Royal Institution, 1867); *Water of Life and other Sermons* (1867); *The Hermits* (1869); *Madam How and Lady Why* (1869); *At last* (1871); *Town Geology* (1872); *Discipline and other Sermons* (1872); *Prose Idylls* (1873); *Plays and Puritans* (1873); *Health and Education* (1874); *Westminster Sermons* (1874); *Lectures delivered in America* (1875). He was a large contributor to periodical literature; many of his essays are included in *Prose Idylls* and other works in the above list. His contributions to the *Christian Socialist* and *Politics for the People* were frequently signed "Parson Lot."

KINGSLEY, HENRY (1830–76), English novelist, younger brother of Charles Kingsley, was born at Barnack, Northampton-

shire on Jan. 2, 1830. In 1853 he left Oxford, where he was an undergraduate at Worcester college, for the Australian goldfields. This venture, however, was not a success, and after five years he returned to England. He then wrote *Recollections of Geoffrey Hamlyn* (1859), a novel of Australian life. This was the first of a series of novels of which *Ravenshoe* (1861), his best work, and *The Hillyars and The Burtons* (1865) are the best known. He edited for 18 months the *Edinburgh Daily Review*, for which he had acted as war correspondent during the Franco-German War. He died at Cuckfield, Sussex, on May 24, 1876.

See a memoir by C. K. Shorter prefixed to a reprint (1894) of Kingsley's novels.

KINGSLEY, MARY HENRIETTA (1862–1900), English traveller, ethnologist and author, daughter of George Henry Kingsley (1827–1892), brother of Charles Kingsley (*q.v.*), was born in Islington, London, on Oct. 13, 1862. She studied sociology at Cambridge, and on the death of her parents she resolved to study native religion and law in West Africa. From 1893–94, she pursued her investigations at Kabinda, Old Calabar, Fernando Po, and on the Lower Congo. After a short visit to England, she returned in Dec. 1894, and, proceeding via Old Calabar to the French Congo, ascended the Ogowé river, traversing much unknown country. Returning to the coast Miss Kingsley went to Corisco and to the German colony of Cameroon, where she made the ascent of the Great Cameroon (13,760 ft.) from a direction until then unattempted. She returned to England in Oct. 1895. The story of her adventures and her investigations in fetish is vividly told in her *Travels in West Africa* (1897).

Her chief concern was for the development of the negro on African lines and for the government of the British possessions on the West Coast by methods which left the native "a free unsmashed man—not a whitewashed slave or an enemy." Miss Kingsley made preparations for a third journey to the West Coast, but the Boer War changed her plans, and she went first to South Africa to nurse fever cases. She died of enteric fever at Simon's Town, where she was engaged in tending Boer prisoners, on June 3, 1900. Miss Kingsley's works, besides her *Travels*, include *West African Studies, The Story of West Africa*, a memoir of her father prefixed to his *Notes on Sport and Travel* (1899), and many contributions to the study of West African law and folk-lore.

See a notice by George A. Macmillan prefixed to a second edition (1901) of the *Studies*.

KING'S LYNN, a town and seaport in Norfolk, England, on the estuary of the Great Ouse near its outflow into the Wash. Pop. (1921) 19,975.

As Lynn (Lun, Lenne, Bishop's Lynn) owes its origin to the trade which was carried by the Ouse and its tributaries, its history dates from the period of settled occupation by the Saxons. It belonged to the bishops of Thetford before the Conquest. Herbert de Losinga (*c.* 1054–1119) granted its jurisdiction to the cathedral of Norwich but this right was resumed by a later bishop, John de Gray, who in 1204 had obtained from John a charter establishing Lynn as a free borough. A grant in 1206 gave the burgesses a gild merchant, the husting court to be held once a week only, and general liberties according to the customs of Oxford, saving the rights of the bishop and the earl of Arundel, whose ancestor William D'Albini had received from William II. the moiety of the tolbooth.

Henry VIII. granted Lynn two charters, the first (1524) incorporating it under mayor and aldermen; the second (1537) changing its name to King's Lynn and transferring to the corporation all the rights hitherto enjoyed by the bishop. Edward VI. added the possessions of the gild of the Trinity, or gild merchant, and St. George's gild, while Queen Mary annexed South Lynn. Admiralty rights were granted by James I. Lynn, which had declared for the crown in 1643, surrendered its privileges to Charles II. in 1684, but recovered its charter on the eve of the Revolution. In the 18th century besides the pleasure fair, still held in February, there was another in October, now abolished. A royal charter of 1524 established the cattle, corn and general provisions market, still held every Tuesday and Saturday. Lynn has ranked high among English seaports from early times.

It is 97 m. N. by E. from London, by the L.N.E.R. On the land side the town was formerly defended by a fosse; there are remains of the old wall, including the handsome 15th century South Gate. Several by-channels of the river are known as fleets, recalling the similar *flethe* of Hamburg. The Public Walks is a promenade parallel to the wall. In the centre stands an octagonal Chapel of the Red Mount (Perpendicular), once frequented by pilgrims. The church of St. Margaret, formerly the priory church, has two towers, and contains two of the finest monumental brasses known (dated 1349 and 1364). St. Nicholas chapel, at the north end of the town, is also Perpendicular, with a tower of earlier date. All Saints' church in South Lynn is a Decorated cruciform structure. Of a Franciscan friary there remains the Perpendicular Grey Friars' Steeple, and the doorway remains of a priests' college founded in 1502. The grammar school was founded in the reign of Henry VIII. The guildhall has a Renaissance front, the custom-house is of the 17th century.

The fisheries are important, including extensive mussel-fisheries under the jurisdiction of the corporation, and there are also corn-mills, iron and brass foundries, agricultural implement manufactories, ship-building yards, rope and sail works.

KING'S MOUNTAIN, a mountainous ridge in Gaston county, North Carolina, and York county, South Carolina, U.S.A. It is an outlier of the Blue Ridge running parallel with it, *i.e.*, north-east and south-west; but in contrast with the other mountains of the Blue Ridge, King's Mountain has a crest marked with sharp and irregular notches. Its highest point and great escarpment are in North Carolina. About 1½m. S. of the line between the two States, where the ridge is about 60ft. above the surrounding country and very narrow at the top, the battle of King's Mountain was fought on Oct. 7, 1780, between a force of about 100 Provincial Rangers and about 1,000 Loyalist militia under Maj. Patrick Ferguson, and an American force of about 900 backwoodsmen under Cols. William Campbell, Benjamin Cleveland, Isaac Shelby, John Sevier and James Williams, in which the Americans were victorious. The British loss is stated as 119 killed (including the commander), 123 wounded and 664 prisoners; the American loss was 28 killed (including Col. Williams) and 62 wounded. The victory largely contributed to the success of General Greene's campaign against Lord Cornwallis. A monument erected in 1815 was replaced in 1880 by a much larger one, and a monument for which Congress appropriated $30,000 in 1906 was completed in 1909.

See L. C. Draper, *King's Mountain and its Heroes* (Cincinnati, 1881); Edward McCrady, *South Carolina in the Revolution 1775–1780* (1901); Kathrine Keogh White, *The King's Mountain Men* (Dayton, Va., 1924).

KINGSPORT, a rapidly growing industrial city of Sullivan county, Tennessee, U.S.A., on the Holston river, in the mountainous north-eastern part of the State. It is on Federal highway 11, and is served by the Clinchfield railroad. The population was 5,692 in 1920 and was estimated locally at 15,000 in 1928 (95% natives of the region) It is in a rich lumbering, mining and farming region of beautiful scenery, and has large manufacturing industries, including pulp and paper mills, book printing and binding plant, tanneries, textile mills, and plants making brick, cement, glass and chemicals. The city was planned by John Nolen, laid out in 1916 and incorporated in 1917.

KING'S PROCTOR, the proctor or solicitor representing the Crown in the courts of probate and divorce. By the Matrimonial Causes Act of 1860 the king's proctor may, under the direction of the attorney-general, intervene in petitions of divorce or declarations of nullity of marriage for the purpose of proving collusion between the parties concerned (*see* DIVORCE). The king's proctor may also act in an official capacity as Treasury solicitor to administer the personal estate of an intestate which has lapsed to the Crown. In this capacity he is responsible for the enforcement of payments due to the Treasury and conducts its legal business in general. *See* PROCTOR and SOLICITOR.

KING'S REGULATIONS, the regulations governing the organization and discipline of the British navy and army, issued in volume form under the authority of the king.

KINGSTON, ELIZABETH, DUCHESS OF (1720–1788), sometimes called countess of Bristol, daughter of Colonel Thomas Chudleigh (d. 1726), was appointed maid of honour to Augusta, princess of Wales, in 1743. On Aug. 4, 1744, she was privately married to August John Hervey, afterwards 3rd earl of Bristol. Their union was kept secret to enable Elizabeth to retain her post at court. She became the mistress of Evelyn Pierrepont, 2nd duke of Kingston, and was a very prominent figure in London society. Hervey wished for a divorce from his wife; but Elizabeth was unwilling to face publicity. However she began a suit of jactitation against Hervey, and the court in Feb. 1769 pronounced her a spinster. She married Kingston, who died four years later, leaving her all his property on condition that she remain a widow. The duchess was received with honour in Rome by Clement XIV.; after which she returned to England to defend a bigamy charge preferred against her by Kingston's nephew, Evelyn Meadows (d. 1826). The House of Lords in 1776 found her guilty, and she hurriedly left England. She lived in Calais, St. Petersburg, Paris, Rome and elsewhere, and died in Paris on Aug. 26, 1788. The duchess was ridiculed as Kitty Crocodile by the comedian Samuel Foote in a play *A Trip to Calais*, which he was not allowed to produce.

See J. H. Jesse's *Memoirs of the Court of England, 1688–1760*, vol. iv. (1901).

KINGSTON, WILLIAM HENRY GILES (1814–80), English novelist, son of Lucy Henry Kingston, was born in London on Feb. 28, 1814. Much of his youth was spent at Oporto, where his father was a merchant, and he entered the London office of the firm. He early wrote newspaper articles on Portuguese subjects. These were translated into Portuguese, and the author received a Portuguese order of knighthood and a pension for his services in the conclusion of the commercial treaty of 1842. In 1844 his first book, *The Circassian Chief*, appeared, and in 1845 *The Prime Minister, a Story of the Days of the Great Marquis of Pombal*. The *Lusitanian Sketches* describe Kingston's travels in Portugal. In 1851 *Peter the Whaler*, his first book for boys, indicated his true vocation. Kingston retired from business, and within 30 years he wrote upwards of 130 tales of adventure for boys. He had a practical knowledge of seamanship, and his stories of the sea, full of thrilling adventures and hairbreadth escapes, exactly hit the taste of his boy readers. Classic examples are *The Three Midshipmen* (1862); *The Three Lieutenants* (1874); *The Three Commanders* (1875); and *The Three Admirals* (1877). He died at Willesden on Aug. 5, 1880.

KINGSTON, the chief city of Frontenac county, Ontario, Canada, at the north-eastern extremity of Lake Ontario, and the mouth of the Cataraqui River. Pop. (1921) 21,753. It is an important station on the Canadian National and Canadian Pacific railways, and has steamboat communication with other ports on Lake Ontario and the Bay of Quinte, on the St. Lawrence and the Rideau canal. It contains a stone graving dock, 280 ft. long, 100 ft. wide, and with a depth of 16 ft. at low water on the sill. The fortifications, which at one time made it one of the strongest fortresses in Canada, are now out of date. The sterility of the surrounding country and the growth of railways have lessened its commercial importance, but it still contains a number of small factories and important locomotive works and shipbuilding yards. As an educational and residential centre it retains high rank, and it is a popular summer resort. It is the seat of an Anglican and of a Roman Catholic bishopric, of the Royal Military College (founded by the Dominion government in 1875), of an artillery school, and of Queen's University, an institution founded in 1839 under the nominal control of the Presbyterian church, including (1925–26) about 3,219 students. In the suburbs are a Dominion penitentiary and a provincial lunatic asylum. Founded by the French in 1673, under the name Kateracoui, soon changed to Fort Frontenac, it played an important part in the wars between English and French. Taken and destroyed by the English in 1758, it was refounded in 1782 under its present name, and was from 1841 to 1844 the capital of Canada.

KINGSTON, a city of New York, U.S.A., on the W. bank of the Hudson, at the mouth of Rondout creek, 90m. N. of New York city; the county seat of Ulster county and the first capital of the State. It is served by the New York, Ontario and Western, the Ulster and Delaware, and the West Shore railways, and by river steamers. The population in 1925 was 28,099. It is in the midst of beautiful mountain scenery: the Catskills to the north-west, the Shawangunk mountains to the south-west, and the Berkshires in the distance across the river. The immense Ashokan reservoir (with a shore-line of 40m.) of the New York city water-supply system is 6m. W. The city has railroad repair shops, shirt and cigar factories, and many brick yards. The diversified products of its many factories were valued in 1925 at $17,326,136. In 1614 a small fort was built by the Dutch at the mouth of the Rondout, and in 1652 a settlement was made near by, which was abandoned after three or four years because of threatened attacks from the Indians. In 1658 a stockade was built by order of Gov. Peter Stuyvesant, who in 1661 named the place Wiltwyck and gave it a municipal charter. In 1663 it was burned by the Indians, and most of the inhabitants were massacred or taken captive. The English took possession in 1664, naming it Kingston (1669) after Kingston Lisle, the family seat of Gov. Francis Lovelace. In 1673–1734 it was again under the Dutch, who called it Swanenburg. The convention which drafted the first State constitution met in Kingston in 1777; and here the constitution was adopted (April 20), Gov. Clinton was inaugurated (July 30), John Jay held the first term of the New York supreme court, and the New York council of safety met. The low stone building (erected about 1676) where the first state senate met, is now the property of the State, and houses a colonial museum. On October 16, 1777, the town was sacked and burned by the British under Gen. Sir John Vaughan. Kingston was one of the places considered in 1787 for the site of the national capital. It was incorporated as a village in 1805 and chartered as a city in 1872.

KINGSTON, a borough of Luzerne county, Pa., U.S.A., on the Susquehanna river, opposite Wilkes-Barre. It is served by the Central of New Jersey, the Lackawanna and the Lehigh Valley railways. The population was 8,952 in 1920 (20% foreign-born white) and was estimated locally at 21,000 in 1928. Anthracite-mining is the dominant industry, and there are railway repair shops and factories making silk, hosiery, underwear and adding machines. In the early days Kingston (or Kingstown, from Kings Towne, R.I.) was commonly known as the "Forty Township," because the first permanent settlement was made by 40 pioneers from Connecticut, sent out by the Susquehanna company in 1769. In 1772 the famous stockade called "Forty Fort" was built here, and in 1777 it was enlarged and strengthened. Here on July 3, 1778, gathered 400 men and boys who went out under the command of Col. Zebulon Butler (1731–95) to meet a force of 1,100 British troops and Indians, commanded by Major John Butler and Old King (Sayenqueraghte). The Americans were defeated in the engagement that followed, and many of those captured were massacred or tortured by the Indians. A monument has been erected near the site of the fort. (*See* WYOMING VALLEY.) Kingston was incorporated as a borough in 1857.

KINGSTON, the capital and chief port of Jamaica, West Indies. Pop. (1921) 62,560, mostly negroes. It is situated on the south of the island, near the eastern end, fronting a splendid land-locked harbour. Area, with suburbs 1,080 acres. The town has a good modern equipment including electric trams. The Institute of Jamaica maintains a public library, museum and art gallery especially devoted to local interests. The old parish church in King Street, dating probably from 1692, was the burial-place of Admiral Benbow (1702). The suburbs are remarkable for their beauty. The climate is dry and healthy; the temperature ranges from 93° to 66° F. Kingston was founded in 1693, after the town of Port Royal at the harbour mouth had been ruined by an earthquake in 1692. In 1703, Port Royal having been again laid waste by fire, Kingston became the commercial, and in 1872 the political, capital of the island, superseding Spanish Town. On several occasions Kingston has been almost entirely consumed by fire, the conflagrations of 1780, 1843, 1862 and 1882 being particularly severe. On Jan. 14, 1907, it was wrecked by a violent earthquake. A long immunity had led to the erection of many buildings not

specially designed and practically the whole town had to be rebuilt. In 1923 Kingston and the adjacent Parish of St. Andrew were incorporated under a joint mayor and council which administers all municipal services. (*See* JAMAICA.)

KINGSTON-ON-THAMES, a town and borough in Surrey, England, 11 m. S.W. of Charing Cross, London; on the S.R. Pop. (1921) 39,479. The position of Kingston on the Thames where it was fordable accounts for its origin; its later prosperity was due to the bridge which existed in 1223 and possibly long before. In 836 or 838 it was the meeting-place of the council under Ecgbert, and in the 10th century some if not all of the West Saxon kings were crowned at Kingston. In Edward the Confessor's time it was a royal manor, and in 1086 included a church, five mills and three fisheries. Domesday also mentions bedels in Kingston. The original charters were granted by John in 1200 and 1209. Henry III. sanctioned the gild-merchant which had existed previously, and granted other privileges. Henry VI. incorporated the town. The market, still held on Saturdays, was granted by James I., and the Wednesday market by Charles II. To these a cattle-market on Thursdays has been added by the corporation. The only remaining fair, now held on Nov. 13, was granted by Henry III. It is near Richmond and Bushey Parks, and is a residential district. The ancient wooden bridge (1223) was superseded by a structure of stone in 1827. The parish church of All Saints, mainly Perpendicular, contains several brasses of the 15th century, and monuments by Chantrey and others; the grammar school, rebuilt in 1878, was originally founded as a chantry by Edward Lovekyn in 1305, and converted into a school by Queen Elizabeth. Near the parish church stood the chapel of St. Mary, where the Saxon kings were crowned. The ancient stone used as a throne at these coronations was removed to the market-place in 1850. There are large market gardens in the neighbourhood, and the town possesses oil-mills, flour-mills, iron foundries. Its industries include paper making and stationery, and manufacture of machinery. Kingston returns one member to parliament.

KINGSTON-UPON-HULL, EARLS AND DUKES OF. These titles were borne by the family of Pierrepont, or Pierrepoint, from 1628 to 1773.

ROBERT PIERREPONT (1584–1643), second son of Sir Henry Pierrepont of Holme Pierrepont, Nottinghamshire, was M.P. for Nottingham in 1601, and was created Baron Pierrepont and Viscount Newark in 1627, being made earl of Kingston-upon-Hull in the following year. He remained neutral on the outbreak of the Civil War; but afterwards he joined the king, and was appointed lieutenant-general of the eastern counties. Whilst defending Gainsborough he was taken prisoner, and was accidentally killed on July 25, 1643, while being conveyed to Hull. The earl had five sons, one of whom was Francis Pierrepont (d. 1659), a colonel in the parliamentary army and afterwards a member of the Long Parliament; and another was William Pierrepont, a leading member of the parliamentary party

His son HENRY PIERREPONT (1606–1680), 2nd earl of Kingston and 1st marquess of Dorchester, represented Charles I. during the negotiations at Uxbridge. In 1645 he was made a privy councillor and created marquess of Dorchester; but in 1647 he compounded for his estates by paying a large fine to the parliamentarians. After the Restoration he was restored to the privy council, and was made recorder of Nottingham and a fellow of the Royal Society. The title of marquess of Dorchester became extinct at his death on Dec. 8, 1680. He was succeeded as 3rd earl of Kingston by Robert (d. 1682), a son of Robert Pierrepont of Thoresby, Nottinghamshire, and as 4th earl by Robert's brother William (d. 1690).

EVELYN PIERREPONT (*c.* 1655–1726), 5th earl and 1st duke of Kingston, another brother, had been member of parliament for East Retford before his accession to the peerage. He was made a privy councillor and in 1715 was created duke of Kingston; afterwards serving as lord privy seal and lord president of the council. The duke, who died on March 5, 1726, was a prominent figure in society. He was twice married, and had five daughters, among whom was Lady Mary Wortley Montagu (*q.v.*), and one son, William, earl of Kingston (d. 1713).

The latter's son, EVELYN PIERREPONT (1711–1773), succeeded his grandfather as second duke of Kingston. When the rebellion of 1745 broke out he raised a regiment called "Kingston's light horse," which distinguished itself at Culloden. The duke, who attained the rank of general in the army, is chiefly famous for his connection with Elizabeth Kingston (*q.v.*), who claimed to be duchess of Kingston. The Kingston titles became extinct on the duke's death without children on Sept. 23, 1773.

See R. B. Moffat, *Pierrepont Genealogies* (1913).

KINGSTOWN (DUN LAOGHAIRE), a seaport of Co. Dublin, Ireland, at the south-eastern extremity of Dublin Bay, 6 m. S.E. from Dublin by rail. Pop. of urban district (1926) 18,992. The original name of Kingstown was Dunleary, which was changed after the embarkation of George IV. at the port in 1821. The town was a fishing village before the construction of an extensive harbour, begun in 1817 and completed in 1859. The eastern pier has a length of 3,500 ft. and the western of 4,950 ft., the total area enclosed being about 250 ac., with a varying depth of from 10 to 28 feet. Kingstown is the station of the mail steamers to Holyhead in connection with the L.M S.R. The principal export is cattle, and the principal imports corn and provisions. Kingstown is the centre of an extensive sea-fishery.

KINGSVILLE, a town of southern Texas, U S.A., 42m. S.W. of Corpus Christi, served by the Missouri Pacific railway. The population was 4,770 in 1920. There are oil and gas fields near by. The town ships cotton, corn, fruits, vegetables and cattle, and has cotton-seed oil and cotton mills, railroad car shops and other manufacturing industries. It is the seat of the South Texas State Teachers college.

KING-TE-CHEN, an historic centre of porcelain manufacture in China. It lies in north-east Kiangsi at the mouth of a valley rising across the Anhwei border and from the upper reaches of which King-te-chen draws its supplies of clay and kaolin. There are workable coal-beds in the vicinity of the town. The industry had its beginnings as far back as the Ch'en dynasty (A.D. 557–587) and early in the eleventh century during the reign of King Te of the Sung dynasty it began to make porcelain for Imperial use. The town then adopted the name of the Emperor. Since the T'aiping rebellion of the mid-nineteenth century the industry has declined somewhat in importance and its staple product has become rice bowls in place of fine porcelain.

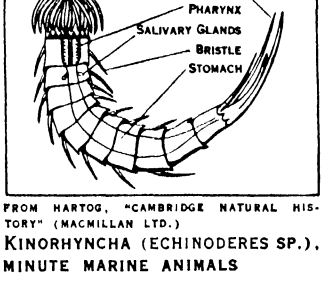
KINGUSSIE, police burgh, Inverness-shire, Scotland. Pop. (1921) 1,202. It lies at a height of 750 ft. above sea-level, on the left bank of the Spey, here crossed by a bridge, 46½ m. S. by S.E. of Inverness by the L M.S. railway. It was founded towards the end of the 18th century by the duke of Gordon, in the hope of its becoming a centre of woollen manufactures. This expectation was not realized, but in time the place grew popular as a health resort, the surrounding scenery being beautiful. On the right bank of the river is Ruthven, where James Macpherson was born in 1736.

KING WILLIAM'S TOWN is situated 1,314 feet above sea level on the Buffalo River, South Africa, 42 m. by rail W.N.W. of East London. In 1921 the population consisted of 2,875 natives, 68 Asiatics, 778 coloured, etc., and 5,928 whites. The latter had increased by 1926 to 6,444. "King," as the town is locally called, stands 1,275 ft. above the sea at the foot of the Amatola Mountains, and in the midst of a thickly populated agricultural district. The town is well laid out and most of the public buildings and merchants' stores are built of stone. There are manufactories of sweets and jams, candles, soap, matches and leather, and a large trade in wool, hides and grains is done with East London. "King" is also an important entrepôt for trade with the natives throughout Kaffraria, with which there is direct railway communication. Founded by Sir Benjamin D'Urban in May 1835 during the Kaffir War of that year, the town is named after William IV. It was abandoned in December 1836, but was reoccupied in 1846 and was the capital of British Kaffraria from its creation in 1847 to its incorporation in 1865 with Cape Colony. Many of the colonists in the neighbouring districts are descendants of members of the German legion disbanded after the Crimean War and provided with homes in Cape Colony; hence such names as

Berlin, Potsdam, Braunschweig, Frankfurt, given to settlements in this part of the country.

KINKAJOU (*Cercoleptes caudivolvulus*), the single species of an aberrant genus of the raccoon family (*Procyonidae*). A native of the forests of the warmer parts of South and Central America, the kinkajou is about the size of a cat, of a uniform pale, yellowish-brown colour, nocturnal and arboreal in habits, feeding on fruit, honey, eggs and small birds and mammals. It is often tamed as a pet. (*See* CARNIVORA.)

KINKEL, JOHANN GOTTFRIED (1815–1882), German poet, was born on Aug. 11, 1815 at Obercassel, and in 1846 became extraordinary professor of art at Bonn. He had already published his *Gedichte* (1843), and his prettily told verse tale, *Otto der Schütz, eine rheinische Geschichte in zwölf Abenteueren* (1846; 75th ed. 1896). Captured fighting in the revolutionary outbreak of 1848, he was sentenced to imprisonment for life but escaped from Spandau in 1850. He spent some time in the United States, and in England, until 1866, when he became a professor at Zurich. There he died on Nov. 13, 1882. His works include an unfinished lyric-epic cycle, *Der Grobschmied von Antwerpen* (1868), and a history of Christian art (1845).



See A. Strodtmann, *Gottfried Kinkel* (2 vols., Hamburg, 1851); and O. Henne am Rhyn, *G. Kinkel, ein Lebensbild* (Zürich, 1883).

KINNOR, the Hebrew name for an ancient stringed instrument, the first mentioned in the Bible (Gen. iv. 21), where it is now always translated "harp." The identification of the instrument has been much discussed, but the weight of evidence supports the view that the Semitic *kinnor* is the Greek cithara (*q.v.*).

KINO, an astringent drug obtained from East India, Malabar, or Amboyna. It is the evaporated juice flowing from incisions in the trunk of *Pterocarpus Marsupium*, a tree of the family Leguminosae, though Botany Bay or eucalyptus kino is used in Australia. When exuding from the tree it resembles red-currant jelly, but hardens in a few hours after exposure to the air and sun and breaks up into angular, brittle fragments of a blackish-red colour and shining surface. In cold water it is only partially dissolved, leaving a pale flocculent residue which is soluble in boiling water but deposited again on cooling. It is soluble in alcohol and caustic alkalis, but not in ether.

The chief constituent is kino-tannic acid (about 75%). It is not absorbed at all from the stomach and only very slowly from the intestine. Other constituents are gum, pyrocatechin, and kinoin, a crystalline neutral principle. Kino-red is also present in small quantity, being an oxidation product of kino-tannic acid. The drug is frequently used in diarrhoea, its value being due to the relative insolubility of kino-tannic acid, which enables it to affect the lower part of the intestine. In this respect it is parallel with catechu.

KINORHYNCHA, an isolated group of minute animals containing the single genus *Echinoderes*, with some 18 species. They occur in mud and on seaweeds at the bottom of shallow seas below low-water mark, and devour organic debris. The body is enclosed in a stout cuticle, prolonged in places into spines and bristles. These are especially conspicuous in two rings round the proboscis and in the two posterior caudal spines. The body is divided into 11 segments and the protrusible proboscis into two. The alimentary canal consists of protrusible pharynx and straight intestine. The sexes are separate.

FROM HARTOG, "CAMBRIDGE NATURAL HISTORY" (MACMILLAN LTD.)

KINORHYNCHA (ECHINODERES SP.), MINUTE MARINE ANIMALS

KINROSS-SHIRE, county of Scotland, bounded on the north and west by Perthshire, on the south-west by Clackmannanshire, and on the south and east by Fife; area (excluding water) 52,392 acres. Excepting Clackmannanshire it is the smallest county in Scotland in point both of area and of population. In the north and west it includes several summits of the Ochil hills, consisting of volcanic lava and agglomerates of lower old red sandstone age. In the east are the Lomond hills and in the south Benarty and the Cleish hills, where hard caps of intensive basalt have preserved the soft sandstones and marls of the upper old red sandstone which have been denuded to a lower level in the central lowland or plain of Kinross. Gravel, sand and other glacial detritus overlie wide areas. The lowland borders Loch Leven (*q.v.*), which is less noted for scenic beauty than for its historical associations and trout fishing. On the river Devon, which forms part of the boundary with Perthshire, there is beautiful scenery, notably at the gorge of the Devil's Mill, at Rumbling Bridge (where actually one bridge surmounts another of earlier date), and at Caldron Linn.

The parishes of Kinross and Orwell, previously part of Fife, seem to have been constituted a shire about the middle of the 13th century. At the date of Edward I.'s ordinance for the government of Scotland (1305) this shire had become an hereditary sheriffdom, John of Kinross then being named for the office. Close to the town of Kinross, on the margin of Loch Leven, stands Kinross house, built in 1685 by Sir William Bruce for the duke of York (James II.) in case the Exclusion bill should debar him from the throne of England, but the mansion, however, never was occupied by royalty.

More than half of the holdings exceed 50 ac. each. Much of the land has been reclaimed. Oats are the principal crop and wheat is grown. Turnips and potatoes are the chief green crops. The raising of livestock is widely pursued. Many cattle are pastured on the lowland farms. The number of sheep is high for the area. Tartans, plaids, and other woollens, and linen are manufactured at Kinross and Milnathort (a centre for livestock sales). The L.N.E. railway runs through the county via Kinross with a branch line from Mawcarse Junction.

The population was 7,963 in 1921. The only town, Kinross, had a pop. in 1921 of 2,631. Kinross is the county town and of considerable antiquity. The county unites with Perthshire to return two members to parliament. It forms a sheriffdom with Fifeshire and a sheriff-substitute sits at Kinross.

KINSALE, a market town and seaport of Co. Cork, Ireland, on the east shore of Kinsale Harbour (the estuary of the Bandon river) 24 m. south of Cork by rail. Pop. of urban district (1926) 2,881. Kinsale is said to derive its name from *cean taile*, the headland in the sea. At an early period the town belonged to the De Courcys, a representative of whom was created baron of Kinsale or Kingsale in 1181. It received a charter of incorporation from Edward III., having previously been a borough by prescription. It was the scene of an engagement between the French and English fleets in 1380, was forcibly entered by the English in 1488, captured by the Spaniards and retaken by the English in 1601, and entered by the English in 1641, who expelled the Irish inhabitants. It was the scene of the landing of James II. and of the French army sent to his assistance in 1689, and was taken by the English in the following year. The Charles Fort was completed in 1677 and captured by the earl of Marlborough in 1690. The parish church of St. Multose is said to have been founded as a conventual church in the 12th century. Kinsale, with the neighbouring villages of Scilly and Cove, is much frequented by summer visitors, and is the headquarters of the South of Ireland Fishing Company, with a fishery pier and a harbour with a depth at the pier of 20 ft. at spring tide, at the quay 14 ft., while at neap tide both have 9 ft. of water; but the general trade is of little importance owing to the proximity of Queenstown and Cork.

KINSHIP. I. **Kinship in Human Culture.**—Birth, suckling and the tender cares bestowed by the parents on their offspring establish bonds of union between the members of a family, both in human and in animal societies. The devotion of the suckling mother is not an exclusively human virtue; the watchful and protecting father is to be found among many species of birds and mammals; and the pathetic response of the young to their parents moves the heart of the animal lover as well as of the philanthropist. With many animals, kinship, the protective sentiment of the parents, and the child's response to it, constitute part of the innate endowment indispensable for the survival of the species.

With man, however, we find physiological kinship deeply modi-

fied and grown into what is perhaps the most important social institution of mankind. Kinship controls family life, law, social organization and economics, and it deeply influences religion, morality and art. With us the parental relation figures in the ten commandments; maternal love remains the symbol and prototype of many moral virtues; the relations within the Trinity, the obligations between man and his Maker, and those of Christian to Christian are conceived in terms of kinship—Son to Father; child to One addressed as "our Father which art in heaven"; brother to brother. In other societies, the cult of a Mother Goddess, or again ancestor-worship, or kinship with animals or spirits give the dominant tone to religion, morality and art, and directly influence law, social organization and economics. Every human culture is built upon its own system of kinship, that is, upon a special type of personal bonds primarily derived from procreation and family life. Without a deeper understanding of kinship it is impossible to grasp the organization, the modes of thought and the general character of human civilization from its humblest origins to its highest development.

II. **The Family as the Source of Kinship.**—At first sight kinship, the bonds of union between parents and children and between more remote relatives, appear to be simple enough: the typical family (*q.v.*), a group consisting of mother, father and their progeny, is found in all communities, savage, barbarous and civilized; everywhere it plays an important rôle and influences the whole extent of social organization and culture.

Indeed it seems hardly to differ at all from its modern, civilized counterpart, as we know it from our own experience. Among native tribes mother, father and children share the camp, the dwelling, the food and the life. The intimacy of family existence, the daily round of meals, the domestic occupations and outdoor work, the rest at night and the awakening to a new day, run in both civilized and savage societies on strictly parallel lines, allowing for the difference in levels of culture. The members of the household are as a rule as closely bound together in a native tribe as they are in a European society, attached to each other, sharing life and most of its interests, exchanging counsel and help, company, cheer and economic co-operation. The same bonds unite them as unite our family, the same distances and barriers separate them from other households. In Australia, as well as among most North American Indians, in Oceania and in Asia, among the African tribes and in South America, the individual undivided family stands out conspicuous, a definite social unit marked off from the rest of society by a clear line of division.

It would be easy to illustrate this picture by a host of actual descriptions. In no ethnographic area is the family absent as a domestic institution. Putting these facts together with our childhood's vision of the first marriage—Adam and Eve in paradise—with the patriarchal traditions of the Bible and of classical antiquity, with the early sociological theories from Aristotle onwards, we might conclude with Sir Henry Maine that it would be impossible to imagine any form of social organization at the beginning of human culture, but that of the patriarchal family. And we might be led to assume that our own type of family is to be found wherever we go, and that kinship is built on the same pattern in every part of the world.

III. **The Controversy on Kinship.**—The layman is therefore not unjustifiably taken aback, when on opening a modern scientific book on primitive society, he finds himself confronted by extreme dissension and acrimonious controversy about the very subject on which he expected a simple statement of obvious fact. Broadly speaking, anthropologists are divided on the questions: does the essential unit consist of the family, or of a wider group, such as the clan, the horde, the "undivided commune"; was marriage between single pairs present from the outset or did it evolve from a preceding promiscuity or group marriage; was human kinship originally individual or communistic? One school stands by individual marriage and kinship, and the importance of the family, the other affirms an original communism in sex, economics and kinship—and the two schools are still disputing the issue.

This great anthropological rift, however, is not due merely to the perversity and pugnacity of specialists, nor to any inherent vice of method or insufficiency of material. It often happens in science that the seemingly simplest and most fundamental problems are really the most difficult and remain longest debated and unsettled. As the physicists cannot make up their minds on matter, force or energy, as the chemists change their views on the atom and the elements, as the mathematicians are least certain about space, time and numbers, so the social anthropologists may be forgiven if they still debate, at times hotly, kinship—that conception in which centre all their other problems and ideas.

IV. **Modes of Counting Descent.**—Kinship, indeed, apparently simple when regarded as ties of union arising within the family out of procreation and the rearing of the young, becomes far more complex when we study it in its further ramifications in tribal life. On one point of great importance a correction has to be made in the traditional view that had undivided sway, before Bachofen, McLennan and Morgan revolutionised social anthropology during the latter half of the 19th century. Kinship is by no means invariably patriarchal; it is not always based on the recognition of the father's primary importance in establishing descent; nor is his right to exercise authority or to hand over his position, wealth and privileges to his son universal. In many societies the mother is the parent through whom kinship is counted, her brother is the male head of the family and inheritance of goods, succession of office and all rights, obligations and privileges are passed from a man to his sister's children.

This legal system is called *mother-right* (*see* MATRIARCHY), or more correctly *matriliny;* and the relation between a man and his sister's son, *avunculate* (*q.v.*). The circumstance that kinship can be traced through both father and mother has been termed (by Lowie) "the bilateral principle of counting descent"; while the almost universal fact that in any given culture emphasis is laid upon one side only has been defined as the *unilateral* mode of regarding kinship. The bilateral aspect of kinship is never completely obliterated and unilateral counting only means a more or less limited emphasis on one side and never a complete elimination of the other.

V. **The Hypertrophy of Primitive Bonds.**—Another feature which makes kinship in many a native culture very different from our own is its extraordinary hypertrophy: it transcends the limits of the family, of the local group, at times even of the widest circle of acquaintances.

Perhaps the most baffling and disquieting symptom of these collective aspects of kinship is the queer linguistic usage known as the "classificatory" system of kinship nomenclature. In most savage tongues a man applies such terms as father, mother, brother, sister and so on, not only to the members of his family but, according to rules which vary with the social organization, to classes of people who stand in a definite relation to his parents. In some communities, indeed, for example in Australia, kinship terms go as far as actual social relations and even beyond—that is, even distant strangers never met or seen are regarded as potentially belonging to one class of kindred or another.

Thus language and linguistic usage seem apparently to break the bonds of family, to obliterate parenthood by substituting a "group of fathers" for the individual one, a "group of mothers" for the real mother, and so on. Nor is this usage a mere rule of politeness: the "classificatory" terms are applied according to strict rules, to a number of people, whose relationship is traceable by pedigree or by membership in a clan or class. Behind the linguistic usage there is always a set of mutual obligations between an individual and all those whom he calls "fathers," "mothers," "brothers," etc. The "fathers" or "brothers" act as a group on certain occasions and they are therefore a well-defined social class and not merely a name.

VI. **Clans, Moieties and Classes of Relatives.**—Thus the classificatory use of kinship terms is not alone in grouping people into classes of kindred. The majority of native tribes are actually divided not only into families, but into bigger groups, which yet possess to a certain extent a kinship character. Thus in certain areas, the tribe falls into two halves or moieties. Each of these has its name, its collective sense of unity, usually a special myth defining its character and its relation to the other moiety. The

division of certain Australian tribes into the moieties of Eagle-hawk and Crow and the bi-partition of the eastern North American Indians are classical examples of this division. Usually this halving of the tribe is associated with strict prohibitions of marriage within the same moiety, so that a man of the first must marry a woman of the second and vice versa. (*See* DUAL ORGANIZATION.) In other tribes there are four clans or classes, in others again eight, these sections regulating marriage and playing a conspicuous part in ceremonial and economic life. (*See* MARRIAGE CLASSES.) Among the majority of peoples, however, there is an odd number of clans which cannot be brought under the dual or any other numeric principle.

What makes it difficult to understand these modes of grouping is precisely their kinship character. The members of a clan regard themselves as kindred, trace their descent from a common ancestor, conceive of their exogamous prohibitions as of a variety or extension of incest, and, under certain conditions behave to each other like kinsmen.

Thus there exist tribes where an individual really seems to acknowledge many "fathers," many "mothers," "sisters," "wives," and so on. And yet in every such case, the man also possesses one real or own relative, a father, a few own brothers and own sisters and certainly an individual mother.

VII. **The Hypotheses of Group Marriage and Group Kinship.**—As to the fathers, a plausible hypothesis suggests that their plurality might be perhaps due to uncertainty of fatherhood under a system of primitive group marriage. Was not marriage originally promiscuous, communal, between two groups rather than between two indivíduals? Was not therefore Kinship, derived from such group-marriage, originally group-kinship? Is not the classificatory use of kinship terms partly the expression of such group-family relations as they still persist, partly the survival of a more definitely communistic kinship of primeval times? And we see how a plausible reasoning has led many an anthropologist—from Morgan to Rivers, from McLennan to Frazer, from Bachofen to Sydney Hartland—to the theory of a primitive group-marriage and group-family, and to the assumption that primitive kinship was a class kinship, between groups and not between individuals. On the other hand this position has been vehemently disputed by the other school, who cannot reconcile it with the supreme importance of the family, with the apparently primeval nature of marriage between single pairs and with the individuality of Motherhood. By Darwin as well as by Westermarck, by Andrew Lang and by Crawley almost every assumption of the group-kinship school has been disputed, while recently Lowie and Malinowski have tried to show by the analysis of actual facts that the family is after all the foundation of all social order.

VIII. **Individual and Collective Kinship.**—The problem has been undoubtedly vitiated by the uncompromising championship of the clan versus the family, primitive monogamy versus group-marriage, individual relations versus clanship. *The question is not whether Kinship is individual or communal—it evidently is both—but what is the relation between its two aspects?* It is an undeniable fact that the family is universal and sociologically more important than the clan which, in the evolution of humanity, it preceded and outlasted. But the clan is in certain communities extremely vital and effective. What is the relation between them? Individual legal prerogatives and self-interest are always predominant, but corporate feeling, co-operation, joint ownership and joint responsibility are important elements in primitive justice and legal organisation. All these bonds and relations, individual as well as communal, are founded on kinship and the sense of kinship. The real task of the enlightened anthropologist is not to join either "school" in denying or belittling one side of kinship or the other, but to establish the relation between the two sides.

IX. **The Variety of Meanings in each Classificatory Term.**—The traditional approach to the problem, since Morgan, has been through language. The classificatory character of the terms made a great impression upon anthropologists (*cf.* above, V.)—but they failed to analyse it linguistically! Now in all human languages we find homonyms, that is, words with a variety of meanings, and in primitive languages such words abound and do not cause any confusion. Thus in technology we frequently find that the same word is used to designate the natural objects from which the material is taken, the material in its raw form, the various stages of manufacture, and finally the finished object. In Melanesia, for instance, the same term *waga* describes a tree as it stands in the forest, its felled and lopped trunk, the dug-out in its various stages, and the finished canoe. Similarly such words as "magical power" (*mana, wakan, orenda,* etc.), "prohibition" (*tabu*), and what not, cover a great variety of meanings.

The first thing to ask then about kinship terms is, whether they really "confuse," "merge" or "lump" the various relatives designated by the same term, or whether on the contrary each time they are used, they receive a distinct meaning, that is, refer to one individual only? As a matter of fact, in actual use kinship terms have always a distinct and concrete meaning and there never is any doubt in the mind of the speaker or hearers as to who is designated in each case. The emotional tone in the first place usually indicates whether a word such as Mother, Father, Son, Daughter, Brother, Sister, is used towards or about "own" relatives, or merely "classificatory" ones. And emotional intonation is an important part of phonetic equipment.

In the second place, there is always an additional apparatus of adjectives, suffixes and other circumlocutions which make it possible to specify whether the actual mother is meant or her sister, or yet another of those whom the classificatory term "mother" embraces. Recently, in Spencer and Gillen's new book (*The Arunta,* 1928) we are given a very rich auxiliary terminology of this kind, which proves that even in that stronghold of classificatory kinship, Central Australia, there exist highly developed linguistic means for differentiating individuals within each class.

Finally we have the context of situation and narrative, the most powerful index of semantic discrimination of meaning in primitive languages. Thus in reality each so called classificatory term is a class label for a number of distinct words, every one of which has its own specific individual meaning. These individual words are in actual use differentiated from each other phonetically, by the index of emotional tone; lexicographically by the index of circumlocution; contextually by the index of situation. The individual meanings are moreover not built up in a haphazard manner; they are related to each other; they start with a main or primary reference; which then through successive extensions engenders a series of derived meanings.

X. **The Initial Situation of Kinship.**—What is throughout humanity the initial situation of kinship in which the primary meanings of the terms are formed; and above all is that initial situation individual or collective? Does the child form its kinship meaning on one set of parents, one Mother and one Father, or is it surrounded—at the time when its first sociological categories are being shaped—by a group-family, by classes of Mothers and Fathers? This as we know (*cf.* above, III.) is the point at issue, and apparently the answer seems to frame itself according as we approach facts from the side of maternity or paternity (*cf.* above, VII.).

A deeper sociological analysis shows however that the problem of Maternity and that of Paternity are not so different.

XI. **Biological and Sociological Parentage.**—Biological factors, though important, are not, however, in human societies the omnipotent, exclusively determining element, which they apparently are in animal ones (*cf.* I.). Legal rules, social institutions, moral and religious doctrines and practices deeply modify the ideas, sentiments and the behaviour of man. Kinship which in its final form, is a product of the institutions and doctrines of a society is always shaped by laws and normative ideas. Indeed there is no reason why the transformation should not go so far that the sentimental and legal bond between a child and its mother should not become collective instead of individual. Indeed a brilliant anthropologist (Rivers) has recently propounded the hypothesis of a sociological "group motherhood" as a correlate to "group marriage" and "group fatherhood" and this hypothesis has been made one of the foundation stones in a new matriarchal theory of primitive culture. (*The Mothers* by Briffault, 1927.)

Thus both maternity and paternity are partly based on bio-

logical arrangements of the human organism and innate mental tendencies, and both are deeply modified by social institutions and norms. In both, the facts must be examined carefully; neither a mere zoological induction, nor plausibly brilliant hypotheses about the omnipotence of society can yield a satisfactory answer.

XII. **Sex and the Uncertainty of Fatherhood.**—It will be best in fact to discuss maternity and paternity together. The two sides of parenthood are linked by sexual life. The laxity of savages has been given a great and undue prominence in discussions on kinship. Wherever sexual relations occur between two groups, as in the Pirrauru custom of Central Australia and sporadically in Siberia and Melanesia; or even merely allowed as between marriage classes and clans, some anthropologists are inclined to speak of "a still existing group-marriage" forgetting that marriage implies far more than the right of sexual intercourse. Again, in various customs of religions and ceremonial nature (temple prostitution, *jus primae noctis,* ritual defloration, bridal night relaxations, sex hospitality and exchange of partners) survivals of a primitive sex communism have been discerned. This, combined with the testimony of classificatory terms, has led to the hypothesis of primitive promiscuity and group family.

In reality, however, *sexual freedom* is an entirely different matter from the *liberty of parenthood,* and between the two there enter some interesting institutions and legal rules.

XIII. **The Principle of Legitimacy.**—In fact the tolerance of free intercourse wherever this exists is not extended to the liberty of conception. The rule in most savage tribes which allow pre-nuptial relations is that unmarried boys and girls may enjoy themselves as much as they like, provided that there be no issue. At times, as among the Areoi (*q.v.*), the untrammelled artistic fraternities of Polynesia, heavy penalties are inflicted on the unmarried mother, and illegitimate children are killed or aborted (*see* INFANTICIDE). At times the putative father is penalised unless he marries the girl, or again important economic and social pressure make it advantageous for him to marry her. Almost universally the child born before wedlock has a different status from the legitimate offspring, usually very much to his disadvantage. Very interesting are the cases where, as among the Todas, one of the physiologically possible fathers of a polyandrous household has to perform a special rite in order to assume the legal position of fatherhood. A child deprived of such a legal father is disgraced for life, even though born in wedlock.

And this brings us to the important point. Physiological paternity, the begetting of a child, is not, as a rule, sufficient and may even be irrelevant in determining social fatherhood. In fact native peoples have naturally but an imperfect idea of the mechanism of procreation. Some (Central Australians, certain Melanesians, a few African tribes) attribute the child to the agency of spiritual beings; others again (Ba-Ila, Rossel Islanders, some Australian tribes) over-emphasize the man's share. But in all cases, where the subject has been competently investigated, we find that the mechanism of procreation is conceived in a manner in which some biological knowledge is arbitrarily mixed up with animistic beliefs. This doctrine stands in a definite relation to the kinship ideas and legal principles of a community. Invariably also the bond of kinship, believed to be established by the act of procreation, bodily or spiritual, is of an individual nature and fatherhood has at times to be reaffirmed by a special legal ceremony, also individual.

XIV. **Natural and Sociological Maternity.**—Maternity is obviously as much involved in native doctrines of conception as is fatherhood. Indeed, the ban on prenuptial children hits the mother harder than the father, and it penalises always an individual, not a group. An individual woman suffers the disadvantages of an illegitimate child, unless there is a man legally united to her who individually shares her responsibility.

Wherever there is an attempt to cause or prevent conception by religious and magical rites, these refer always to an individual mother and child. The mother becomes usually subject to tabus during gestation which she keeps individually and of which her husband often takes a share. The welfare of the child concerns its own mother and father even before it is born. At birth again various social, magical and moral rules separate the mother from her husband and isolate her with her child. The few female relatives who often assist her are her nearest individual kinswomen. There is no transformation of an individual birth into a group birth—by legal fiction or ritual—but on the contrary there is a social imposition of individual burdens, responsibilities and sentiments upon the real mother. The father, though very much in the shadow, participates through customs of the *couvade* (*q.v.*) type, vigils and tabus in his wife's confinement, and this he also does individually.

XV. **No Group Parenthood.**—The ideas and institutions which control conception, pregnancy and birth, show that these cannot be regarded by the anthropologist as mere physiological facts, but as facts deeply modified by culture and social organization. Conception is not left to the chance of free intercourse, even where this is allowed, but its necessary condition is marriage. Parenthood, to be normal, must be made legitimate, that is, based on a socially approved, but individual marriage contract. Society decrees that the initial setting of kinship be the individual family based on individual marriage. And this social decree backs up the natural tenderness and affection which seem to be innate in the human, as well as in the animal, parent. The child again responds with a unique, life-long attachment to the one woman and one man who constitute its first social horizon—that is to its mother and father.

XVI. **The Extensions of Kinship.**—The relation of parents and children is individual, and so is that between brothers and sisters, who are to each other the natural playmates and helpmates of childhood, and remain the legal partners and moral allies in later life.

The household is thus the workshop where kinship ties are forged, and the constitution of the individual family supplies the pattern upon which they are built. We return thus to the simple view so long prevalent in tradition and pre-scientific thought (*cf.* II.), but now we have established it by a survey and analysis of facts, made it precise—and at the same time qualified it considerably. For the individual household provides only the initial situation of kinship; and the individual parents, brothers and sisters supply only the primary meaning of kinship terms. This fact is of the greatest importance, but to appreciate it fully it is necessary to follow the further development of kinship bonds.

As the child grows beyond the earliest stages of infancy, it is brought into contact with other households—those of the grandparents and those of the brothers and sisters of either parent. Perhaps the most important among these persons is the mother's sister.

XVII. **The Substitute Mother.**—The mother is the physiologically and morally indispensable parent in all societies. Yet there is always the danger of her failing, temporarily or permanently. The substitution of one person for another—in case of death, illness or incapacity—is one of the fundamental elements of primitive organization, and this substitution always takes place on the basis of kinship. In a matrilineal society, the natural substitute for a mother is her sister, usually the one nearest in age. In matrilocal communities, she is on the spot, in patrilocal ones she has to be summoned if it is necessary; even when not needed she will come on long visits. Thus the child, as a rule, becomes familiar early in life with its mother's sister. She again—having perhaps performed important duties during pregnancy and at childbirth—is especially devoted to her potential ward. She often assists the mother, in case of illness replaces her, occasionally may take the child to her own home for a time. She and the mother both know that, under circumstances, she may have to act as a mother to the child. Later on in life the child comes also to realize this and to regard her as *substitute or secondary mother.*

The substitute mother is, in certain respects, equivalent to the real one: the child sees her in the intimacy of the household, side by side with the real mother, receives the same services from her, realizes that at times she replaces the real parent, acting thus as a secondary or substitute mother. The child equally well realizes, however, that this is a very different "Mother" from the real one. A new relationship is thus built up for which the first one

is certainly the pattern, but the process is never a simple repetition.

Linguistically, the extension of the same term *Mother* to the mother's sister is obviously no more a complete assimilation than is its sociological equivalent. The child forms a new meaning for the old word—in fact, it acquires a new word with the same form, but a different referent and usually a different phonetic character in its emotional tone. When he calls his mother's sister "Mother," he neither fuses the two ideas nor confuses the two people. He merely emphasizes the similarity while he ignores the differences. This one-sided emphasis corresponds to the fact that similarity is here the basis of legal obligation. The mother's sister is beholden to the child in virtue of her equivalence to the mother. It is this which has to be expressed and the child is taught to call her "Mother" since in doing so it puts her under an obligation. The difference is obvious, irrelevant—in a way to be obliterated or glossed over. The verbal magic, which is the first form by which legal obligations are established, has to create a fictitious identity between Mother's Sister and Mother.

What has been said about the mother's sister applies also to the father's brother who, under father-right, is often regarded as a substitute father. His wife would then act as a substitute mother, especially in case of adoption. Under mother-right again, the mother's sister's husband would be the substitute father.

XVIII. **The Special Relations of Mother-right and Father-right.**—Among the people closely related to the parents there are, however, some to whom no extension of an already existing kinship attitude is possible. The grandparents obviously belong here, and also the father's sister and the mother's brother. Under mother-right and exogamy, the father's sister is never of the mother's kin and cannot be assimilated to the mother while, though of the father's kin, she is not of his sex and, therefore, cannot be assimilated to him. Under unilateral father-right, she again is the chief kinswoman of the child. The mother's brother occupies the same singular position both under mother-right and father-right. New attitudes have to be built towards these relatives and, as a rule, we find also special terms for them.

The children of the mother's sister and of the father's brother, or "parallel cousins" as they are called in Anthropology, are usually regarded by a savage child as his "secondary" brothers and sisters and addressed by these terms. To them the primary family attitude is also partially extended, as it is to their parents.

The children of the mother's brother and father's sister—the "cross-cousins" as they are technically called—usually require the creation of a new type of bond. The terminologies of the cross-cousins often present strange verbal assimilations. Thus, in matrilineal societies, the paternal cross-cousin is often called "Father"; and under father-right mother's brother's daughter is labelled "Mother." If we consider, however, that under mother-right, the paternal cross-cousin (father's sister's son) is not Ego's real kinsman—that he is related to Ego only as the father's nearest kinsman—then the verbal identification is less strange. The appellation then really means: "that man who is to me only in so far related as he is my father's nearest in blood." And a similar psychological attitude underlies the strange use of Mother to a cross-cousin and other anomalous terms of this type.

XIX. **The Elimination of Sex from Workaday Life.**—The unilateral principle which declares that kinship is counted through mother or father only (compare above, IV.) means, in fact, looked at concretely as it enters the life of an individual, that the family bonds are extended on one side only. An important aspect of this one-sided extension is the development of rules of exogamy out of rules of incest. These rules eliminate sex out of the household and the clan respectively. Incomprehensible in their biological function, since biologists agree that occasional inbreeding is innocuous, they can be accounted for by the incompatibility of sexual interest with practical co-operation in everyday life. The emotional tension which accompanies erotic play, the jealousies and dissensions which it arouses as well as its obsessive and distractive influence, make it difficult to mingle sex with serious pursuits. Hence war and hunting, agriculture and trading enterprises, religious and public ceremonial, are often hedged round with sexual tabus.

Domestic life and all those relations which start in the family, that is parent and child, brother and sister, are permanently protected from the upsetting influence of sex by the tabu of incest. Later on, when the savage child, sexually ripe at an early age, enters the wider group of his village community and tribe, an important division is established in all his associations by the unilateral principle. Some people, male and female, become his natural associates in work, legal interests and spiritual concerns. These are his wider kindred, his clansmen and clanswomen, to whom he extends the modified and diluted family attitude, comprising among others, the rules of incest which here become the much wider and weaker tabus of exogamy. The other group consists of women with whom he may amuse himself and pursue his amorous inclinations, and of men with whom he enters into relations of more or less friendly rivalry or reciprocity.

The unilateral principle is thus instrumental in securing for the clan the same condition of sexually undisturbed co-operation as is secured for the family by the prohibition of incest.

Unilateral descent is also intimately bound up with the nature of filiation, that is, with the handing over of status, power, office and possessions, from one generation to the other. Order and simplicity in the rules of filiation are of the greatest importance for social cohesion. Indeed, we find that most political quarrels and tribal dissensions are due, apart from sex, to questions of inheritance and succession,—from lowest savagery right up to modern civilization. Rivalries during lifetime, fights and rifts after the death of a man, especially if he be powerful, are of universal occurrence. For, as we know, mother-right and father-right are never absolute and the rules are always elastic and sometimes ambiguous. The generalization may, therefore, be laid down that the simpler and stricter the laws of filiation, the more stringently enforced either mother-right or father-right at the expense of the other, the greater will be the order and cohesion in a community, the smoother will be the transmission of authority, tradition and wealth from one generation to the other.

XX. **The Further Extensions of Kinship.**—So far mainly the principles of extension have been analysed—its driving forces, so to speak: such as the need of substitute parents; the value of eliminating sex from household and clan; the importance of establishing order in filiation. The process itself consists, as in the case of mother substitution, in a series of successive extensions, each of which brings about a partial loosening and modification of the old ties, and the formation of new ones upon the old model.

In the earler stages, the infant is mainly passive—as when it forms the first bonds by accepting the parental cares; as when it is weaned from the mother; taught to name its parents; to accept a substitute mother and father and to extend to them the parental appellations. Later on when the baby assumes the status of a child, often by donning the first dress, when he begins to follow the parents and takes some part in their pursuits, his interest in new associations and in the formation of new bonds becomes more active too.

Then there comes, in some tribes at least, again a stage of abrupt, passively received training. The rites of tribal initiation as a rule, entail a dramatic break with the old life and the creation of new bonds. The novice is made to forget his associations with the family, especially with its female members, above all with the mother. In the course of the moral and mythological training which he receives, he is taught in a systematic way what kinship means, he is instructed in the principles of unilateral descent, the rules of exogamy, the duties and responsibilities towards his kindred and relatives. In other tribes, where there are no initiation rites, the same moral and legal education is given gradually, spread over a longer period—but it always has to be received, and it is always given with reference to kinship.

The boy and girl now enter the active life of the tribe. Often the individual has to change his residence, the girl on marrying into another village, the boy on assuming his full unilateral kinship status. In matriarchal and patrilocal communities, for instance, he leaves his father's place and joins his mother's brother. With this a new recrystallization of kinship bonds takes place—always, however, on the same principle: with the old pattern

carried over, but adjusted to the individual's new status and to his new conditions of life.

Marriage opens a new phase and constitutes another transition (see *s.v.*). Here a new set of relatives is acquired, besides the individual mate, and the terminology is enriched by another set of expressions, as a rule some taken over from the old vocabulary of kinship, and some new ones added. Incidentally a new household is founded, with which the whole kinship story starts afresh.

Later on, with old age, with the marriage of children and the arrival of grandchildren, the kinship horizon changes once more, as a rule by the growth and multiplication of the younger generation, lineal and collateral, and by their gradual taking of duties, responsibilities and privileges out of Ego's hands.

XXI. **The Nature of the Extensions.**—Thus each successive transformation of kinship bonds is, as a rule, associated with a biological stage in human life; each corresponds to a different type of social setting; each is conditioned by different functions performed by the group. Kinship invariably begins in the family —mother, father and child, the latter depending for nourishment, comfort and safety upon its parents. From the individual household and the mainly biological functions of the family, the child passes into the social horizon of a few associated households, which by the first extension of kinship, furnish him with his "substitute" parents, brothers and sisters, and by the formation of new relationships, supply his grandparents, his maternal uncle, paternal aunt and his cross-cousins. At, and after, puberty, he learns, in a more explicit and systematic manner, the principles of his tribal kinship and law. This is done through initiation or training within the horizon of the local community. Entering afterwards the stage of active life, as a member of his clan he takes part in most tribal concerns—economic, ceremonial, legal, warlike or religious. Soon, also, he makes a choice of his matrimonial mate, according to the kinship rules regulating marriage in his tribe.

One side of the whole process consists in the gradual assimilation of the new ties to the old ones; the other side, in the creation of new interests, adoption of new functions and formation of new ties. Even when the old ties are purposely destroyed, as in initiation, the new ones are built on their pattern. Throughout the process each extension leads to the formation of new ties and thus to the weakening of the old ones, but never to their complete obliteration, nor to the confusion of the two sets. The new relationships receive some elements of the old ones, which become incorporated in them, but invariably they contain new elements also.

At the end, the individual finds himself not with one confused or amalgamated mass of kindred, but rather, surrounded by a number of gradually widening circles: the family, the collateral relatives, the local kinsmen and relatives, the clansmen, and the relatives within the tribe; and, cutting athwart this concentric system, his own new household and his relatives-in-law.

XXII. **The Persistence of Family Ties.**—Why does the family pattern persist throughout these extensions, not only in terminology, but in legal fiction, in totemic tradition and in the character of the various rules? It must never be forgotten, of course, that kinship at the tribal end is by no means identical with kinship at the family end. As the ties widen, their original family character becomes more and more attenuated and diluted by other ingredients. Tribal kinship bears only a remote, at times mainly figurative, resemblance to the family ties, but that it is built under their influence and as an extension of them is beyond doubt.

The main force which brings about this extension is the extreme strength of family ties. The power of the earliest family experiences to influence all subsequent social relations is a universal fact which was not sufficiently appreciated until recently. In spite of their exaggerated claims and fantastic distortions, psychoanalytic writers have helped to show how all-pervading the family sentiments are in society, and how the reminiscences of paternal authority and of maternal tenderness enter into most relations of later life.

In the small communities of savages, where all social relations are direct and personal, where all co-operation is by actual contact, where solidarity and substitution operate within groups of people constantly in touch with each other, the family pattern can be adapted to all wider formations much more concretely and liberally. In all the extensions the new bonds and obligations are formed on account of the old ones; therefore, to an extent, in their image. The unilateral principle deflecting the spread of the family pattern to one side only, makes its sway within the clan only the more concentrated, while it frees from its constraint a whole sphere of relations—those between clans.

The final product of the process of kinship extensions: the clan system, with its twofold relationships within the kinship group and across the groups, is thus the natural product of the influences which drive family kinship into wider spheres of action and of the unilateral principle.

XXIII. **The Clan and the Family.**—Nothing is as important and difficult in the study of primitive sociology as the correct understanding of the nature of the clan and its relation to the family. The primary and fundamental elements of parent to child kinship—the bonds of procreation, the physiological services, the innate emotional response—which make up the family bonds, vanish completely from the relationship within the clan. Totemic identity, the mythological fiction of common totemic descent, magical, religious and legal functions, are new elements which have entered into it, and which constitute the greatly modified kinship of the clan.

But though the clan is essentially non-reproductive, non-sexual and non-parental, though it never is the primary basis and source of kinship, its connection with the family is real and genetic. The clan grows out of family kinship round one of the parents by the affirmation of the exclusive procreative relevance of this one parent, by the injunction of legal solidarity with one side of kindred, accompanied often by legal fiction and linguistic metaphor.

The clan differs from the family, however, not only in the nature of its bonds but also in structure. It is the result of the widest possible extension of kinship ties, but on one side only. While the family contains essentially the two principles, male and female, present in procreation, in the physiological division of functions and in sociological protection, the clan is based upon the elimination of either the paternal or the maternal element from relevant kinship. It is rather the clan of the relevant parent, *plus* the clan of the irrelevant parent, *plus* the other clans related to Ego by marriage or other forms of affinity, which together embrace the classificatory body of relatives. In fact the classificatory nomenclature always refers to the tribe or the community or a wider portion of it, and never to one clan only. It is the tribe, therefore, as a correlated system of clans, or such portion of it as is embraced by the classificatory nomenclature, which corresponds to the widest circle of kinship extensions.

It is an easy but dangerous mistake to maintain that "the classificatory system and our own are the outcome of the social institutions of the clan and the family respectively," and to say that as "among ourselves this (the essential) social unit is the family" so "amongst most peoples of rude culture the clan or other exogamous group is the essential unit of social organization" (Rivers, *Kinship and Social Organization*, pp. 74, 75). This view carries on Morgan's mistaken opinion that the clan is a domestic institution, made *ad hoc* for purposes of group-marriage, a mistake which has recently been reaffirmed in the phrase that "the clan, like the family, is a reproductive group" (Briffault, 1927). All this is a continuous source of error in that it construes the clan into an independent, self-sufficient kinship unit, whereas the clan is essentially a group correlated to other groups of a similar nature, and dependent upon their existence. In its simplest form the correlated system is reduced to two clans, but never to one. It is this compound system which corresponds to the family, which itself is a self-sufficient independent kinship unit. The clan in fact never bears the imprint of extended full family kinship, but only of one side of it.

It is a curious mistake to take savage fiction and linguistic simile at their face value, and to regard, with Morgan, the clan as a "domestic institution," made *ad hoc* for purposes of group-marriage; or, with Rivers, to imagine that the clan has been the

foundation of classificatory nomenclature in the same sense as the family is the basis of our own terminology; or to affirm that "the clan, like the family, is a reproductive group."

The function of the clan system is neither generative nor domestic; exogamy is not primarily an injunction to marry a woman of another clan, but the prohibition of sexual intercourse within the clan. Again the relations between the older and younger generation within the clan, or between age-grades, are neither an equivalent nor a copy of the parent to child relations—above all, not as regards reproductive functions!

The relation of the members of a clan is a modified and extended kinship solidarity; it implies co-operation in most communal undertakings and the exclusion of sexual interests. Thus some elements of the later parent to child and brother to sister relationship are carried over into clanship, but two elements never enter it: the matrimonial relation and early parent to child relation. The first of these is extended, in a modified form, into the relationship between different clans, members of which may pursue amusements and sexual interests in common, as between males and females; and between individuals of the same sex, render each other reciprocal services from group to group, and join in enterprises on a tribal scale.

XXIV. **Summary and Conclusions.**—We can now define kinship, in the first place, as the personal bonds based upon procreation, socially interpreted; and, in the second place, as the wider bonds derived from the primary ones by the process of gradual extensions which occur in all communities during the life-history of the individual. On the level of savagery and lower barbarism, the powerful persistence of family bonds is given freer play, hence the extensions are more numerous and more definitely systematized; they are backed up by legal fictions of totemic descent; by ideas of one-sided procreation or mystic identity; and they lead to the formation of wider groups such as the clan, moiety or exogamous division.

Kinship is thus a class of social relations, which must be subdivided into several varieties: primary kinship always founded on marriage and family; and the derived forms, correlated with the group of cognate households, the village-community and the clan. The terms of kinship, which are but linguistic expressions of all these relationships, have obviously also a manifold meaning, which corresponds to the social reality. Thus is explained the existence, side by side of individual and classificatory terms, of the family and the clan, of the individual and communal aspects of kinship. The enigmatic and apparently anomalous character of primitive kinship vanishes with a closer scrutiny of the facts.

To explain kinship there is no need of an appeal to a fanciful history of mankind, beginning with Promiscuity or Hetairism, passing through Group-Marriage, Marital Gerontocracy and Anomalous Marriages, and only ending, after many errors and efforts, in monogamous marriage. Where empirical facts yield a sufficient explanation hypotheses are superfluous—they are a disease of method. Especially erroneous in these speculations is the neglect of domesticity and the influences of everyday life in early childhood, combined, as this neglect often is, with an over-emphasis on sex. Sex, far from being the principal clue to kinship, plays only a subordinate part in its formation, separated as it is from parenthood by the rule of legitimacy. It is the elimination of sex and not indulgence in it which, through the rules of incest and exogamy, really influences kinship and clanship.

The study of kinship, far from demonstrating the small importance of the family, proves the tenacity of its bonds and their persistence through life as a standard for all wider social relations. The age-long experience of mankind, which Anthropology alone can unravel, teaches us that the institutions of marriage and family have never been absent in human history, that they form the indispensable foundation for the structure of human society, and that, however they might become modified in the future, they will never be destroyed nor their influence seriously impaired.

KINSTON, a city of North Carolina, U.S.A., on the Neuse river, 70m. S E. of Raleigh; the county seat of Lenoir county. It is on Federal highway 70, and is served by the Atlantic Coast Line, the Carolina, the Kinston Carolina and the Norfolk Southern railways. The population was 9,771 in 1920 (41% negroes) and was estimated locally at 13,600 in 1928. It is a shipping point for tobacco, cotton, live stock, poultry and garden produce, and has various manufacturing industries, with an annual output valued at $14,886,000. The city was founded about 1750, incorporated as a town in 1762, and chartered as a city in 1826.

KIOWA. This American Indian tribe of the western Plains is generally considered to constitute a separate linguistic stock, but may prove related to the Tanoan Pueblo. They were non-agricultural, unsettled, warlike, predatory, and with the Comanche raided Mexicans, Texans, Americans and Indians. Their culture is of southern Plains type. About 1,600 survive in Oklahoma. (*See* J. Mooney, *Bur. Am. Ethn. Report,* xvi., 1898.)

(A. L. K.)

KIPCHAK, the Mongol designation of the Khanate, more generally known as the Golden Horde. This khanate was ruled by the successors of Genghis Khan and was, at the height of its expansion, of huge extent, reaching from the Dnieper in Europe far into Central Asia. In 1242 its capital was set up at Sarai on the Volga, and in 1395 Timur (Tamerlane) sacked it. The Golden Horde gradually disintegrated from internal secession. (*See* MONGOLS.)

KIPLING, RUDYARD (1865–), British author, was born in Bombay on Dec. 30, 1865. His father, John Lockwood Kipling (1837–1911), an artist of considerable ability, was from 1875 to 1893 curator of the Lahore museum in India. His mother was Miss Alice Macdonald of Birmingham, two of whose sisters were married respectively to Sir E. Burne-Jones and Sir Edward Poynter. He was educated at the United Services College, Westward Ho, North Devon, which is the scene of his story *Stalky and Co.* On his return to India he became at the age of 17 sub-editor of the Lahore *Civil and Military Gazette.* In 1886, in his 21st year, he published *Departmental Ditties,* a volume of light verse chiefly satirical, only in two or three poems giving promise of his authentic poetical note. In 1887 he published *Plain Tales from the Hills,* a collection mainly of the stories contributed to his own journal. During the next two years he brought out, in six slim paper-covered volumes of Wheeler's Railway Library (Allahabad), *Soldiers Three, The Story of the Gadsbys, In Black and White, Under the Deodars, the Phantom 'Rickshaw* and *Wee Willie Winkee,* at a rupee apiece. These were in form and substance a

continuation of the *Plain Tales*. This series of tales, all written before the author was 24, revealed a new master of fiction. They were unequal, as his books continued to be throughout; the sketches of Anglo-Indian social life being generally inferior to the rest. The style was to some extent disfigured by jerkiness and mannered tricks. But Kipling possessed the supreme spell of the story-teller to entrance and transport. The freshness of the invention, the variety of character, the vigour of narrative, the raciness of dialogue, the magic of atmosphere, were alike remarkable. The soldier-stories, especially the exuberant vitality of the cycle which contains the immortal Mulvaney, established the author's fame throughout the world.

The new author's talent was quickly recognized in India, but it was not till the books reached England that his true rank was appreciated and proclaimed. Between 1887 and 1889 he travelled through India, China, Japan and America, finally arriving in England to find himself already famous. His travel sketches, contributed to *The Civil and Military Gazette* and *The Pioneer*, were afterwards collected (the author's hand having been forced by unauthorized publication) in the two volumes *From Sea to Sea* (1809). A further set of Indian tales, equal to the best, appeared in *Macmillan's Magazine* and were republished with others in *Life's Handicap* (1891). In *The Light that Failed* (1891, after appearing with a different ending in *Lippincott's Magazine*) Kipling essayed his first long story (dramatized 1905), but with comparative unsuccess. In his subsequent work his delight in the display of descriptive and verbal technicalities grew on him. His polemic against "the sheltered life" and "little Englandism" became more didactic. His terseness sometimes degenerated into abruptness and obscurity.

But in the meanwhile his genius became prominent in verse. Readers of the *Plain Tales* had been impressed by the snatches of poetry prefixed to them for mottoes, certain of them being subscribed "Barrack Room Ballad." Kipling now contributed to the *National Observer*, then edited by W. E. Henley, a series of *Barrack Room Ballads*. These vigorous verses in soldier slang, when published in a book in 1892, together with the fine ballad of "East and West" and other poems, won for their author a second fame, wider than he had attained as a story-teller. In this volume the Ballads of the "Bolivar" and of the "Clampherdown," introducing Kipling's poetry of the ocean and the engine-room, and "The Flag of England," finding a voice for the Imperial sentiment, which—largely under the influence of Kipling's own writings—had been rapidly gaining force in England, gave the key-note of much of his later verse. In 1898 Kipling paid the first of several visits to South Africa and became imbued with a type of Imperialism that reacted on his literature, not altogether to its advantage. Before finally settling in England Kipling lived some years in America and married in 1892 Miss Caroline Starr Balestier, sister of the Wolcott Balestier to whom he dedicated *Barrack Room Ballads*, and with whom in collaboration he wrote the *Naulahka* (1891), one of his less successful books.

The next collection of stories, *Many Inventions* (1893), contained the splendid Mulvaney extravaganza, "My Lord the Elephant"; a vividly realized tale of metempsychosis, "The Finest Story in the World"; and in that fascinating tale "In the Rukh," the prelude to the next new exhibition of the author's genius. This came in 1894 with *The Jungle Book*, followed in 1895 by *The Second Jungle Book*. With these inspired beast-stories Kipling conquered a new world and a new audience, and produced what many critics regard as his most flawless work. His chief subsequent publications were *The Seven Seas* (poems), 1896; *Captains Courageous* (a yarn of deep-sea fishery), 1897; *The Day's Work* (collected stories), 1898; *A Fleet in Being* (an account of a cruise in a man-of-war), 1898; *Stalky and Co.* (mentioned above), 1899; *From Sea to Sea* (mentioned above), 1899; *Kim*, 1901; *Just So Stories* (for children), 1902; *The Five Nations* (poems, concluding with what proved Mr. Kipling's most universally known and popular poem, "Recessional," originally published in *The Times* on July 17, 1897, on the occasion of Queen Victoria's second jubilee), 1903; *Traffics and Discoveries* (collected stories), 1904; *Puck of Pook's Hill* (stories), 1906; *Actions and Reactions* (stories), 1909; *Rewards and Fairies* (1910, a companion volume to *Puck of Pook's Hill*); 24 poems contributed to a *History of England* (1911) for young people, in which he joined C. R. L. Fletcher; *The Irish Guards in the Great War* (1925), the most notable of his war books; *Debits and Credits* (1926); and *A Book of Words* (1928), a collection of speeches and addresses delivered between 1906 and 1927. Of Kipling's longer narratives *Kim* is the most successful; picaresque in design it gives a series of delightful pictures of Indian life, and is a classic in its kind. In *Puck of Pook's Hill* and *Rewards and Fairies* Kipling sought to create for children a semi-historical mythology of the English country-side; this patriotism was to be rooted in the sense of the history of the land beneath their feet, in the "instinct of inherited continuity," to use a phrase from one of his addresses. But everything he wrote, even to a farcical extravaganza inspired by his enthusiasm for the motor-car, breathed the meteoric energy that was the nature of the man. A vigorous and unconventional poet, a pioneer in the modern phase of literary Imperialism, and one of the rare masters in English prose of the art of the short story, Kipling had already by the opening of the 20th century won a conspicuous place among the creative literary forces of his day which was recognized by the award of the Nobel prize for literature in 1907.

KIPPER, properly the name by which the male salmon is known at the approach of the breeding season, when he develops a sharp cartilaginous beak, known as the "kip" from which "kipper" is said to be derived. From the practice of rendering the breeding (*i.e.*, "kipper") salmon fit for food by splitting, salting, and smoke-drying them, the term "kipper" is also used of other fish, particularly herrings, cured in the same way. A "bloater" as distinct from a "kipper" is a herring cured whole without being split open.

KIPPIS, ANDREW (1725–1795), English Nonconformist divine and biographer, son of Robert Kippis, a silk-hosier, was born at Nottingham on March 28, 1725. He was educated at Sleaford, and at Dr. Doddridge's academy at Northampton. He was pastor successively of churches at Boston, Dorking and at Westminster, where he died on Oct. 8, 1795. He was classical and philological tutor in training colleges for the Presbyterian ministry at Hoxton and at Hackney. In 1778 he was elected a fellow of the Antiquarian society, and a fellow of the Royal Society in 1779.

Kippis contributed to *The Gentleman's Magazine, The Monthly Review* and *The Library;* and he had a good deal to do with the establishment and conduct of *The New Annual Register*. He published also sermons, pamphlets and biographies. His chief work is his edition of the *Biographia Britannica*, of which, however, he only lived to publish 5 vols. (folio, 1778–93).

KIRBY, WILLIAM (1759–1850), English entomologist, was born at Witnesham, Suffolk on Sept. 19, 1759. He was educated at Caius College, Cambridge, and after taking orders in 1782, spent his entire life at Barham in Suffolk. His *Monographia Apum Angliae* (2 vols., 1802), the first scientific treatise on its subject, brought him to the notice of the leading entomologists of his own and foreign countries, and his *Introduction to Entomology* (4 vols., 1815–26; 7th ed., 1856), written in collaboration with W. Spence, was equally successful. Kirby died on July 4, 1850.

Besides the books already mentioned he published *The History, Habits and Instincts of Animals* (2 vols., 1835), several papers in the *Transactions of the Linnean Society*, the *Zoological Journal* and other periodicals, and some devotional works. *See* the *Life* by J. Freeman (1852).

KIRCHER, ATHANASIUS (1601–1680), German scholar and mathematician, was born on May 2, 1601, at Geisa near Fulda. He was educated at the Jesuit college of Fulda, and became a novice of the order at Mainz in 1618. He taught philo-

sophy, mathematics and Oriental languages at Würzburg, whence he was driven (1631) by the troubles of the Thirty Years' War to Avignon. In 1635 he settled in Rome, where he taught mathematics in the Collegio Romano, but resigned in 1643 to study archaeology. He died on Nov. 28, 1680.

His works include *Prodromus Coptus* (1636); *Lingua Aegyptiaca restituta* (1643); *Obeliscus Pamphilius* (1650); and *Oedipus Aegyptiacus*—(1652–55)—works which may claim the merit of having first called attention to Egyptian hieroglyphics. The valuable collection of antiquities which he bequeathed to the Collegio Romano has been described by Buonanni (*Musaeum Kircherianum*, 1709; republished by Battara in 1773).

See Brischar, *Anastasius Kircher, ein Lebensbild* (1877). His autobiography in Latin was translated into German (1901) by N Seng.

KIRCHHEIM-UNTER-TECK, a town in the republic of Württemberg, situated on the Lauter, at the north-west foot of the Rauhe Alb, 15 m. S.E. of Stuttgart by rail. Pop. (1925) 5,385. The town has a former royal castle built in 1538. The manufactures include hosiery, soap, pianofortes, machinery, furniture, chemicals and cement. It also has wool-spinning establishments, breweries, and a corn exchange, and trades in wool, timber and pigs. In the vicinity are the ruins of the castle of Teck, the hereditary stronghold of the dukes of that name. Kirchheim has belonged to Württemberg since 1381.

KIRCHHOFF, GUSTAV ROBERT (1824–87), German physicist, was born at Königsberg (Prussia) on March 12, 1824, and was educated at the university of his native town. After acting as *Privatdozent* at Berlin for some time, he became extraordinary professor of physics at Breslau in 1850. Four years later he was appointed professor of physics at Heidelberg, and in 1875 he was transferred to Berlin, where he died on Oct. 17, 1887. Kirchhoff's contributions to experimental and mathematical physics were numerous and important. In his work in electricity Kirchhoff was greatly influenced by Weber. He modified the resistance bridge as designed by Wheatstone, and developed a theorem which gives the distribution of currents in a network. Kirchhoff extended Ohm's theory for a linear conductor to the case of conductors in three dimensions, and so generalised the equations dealing with the flow of electricity in conductors. He also tried to establish a connection between electrostatic and electrodynamic conceptions of electricity. Another important piece of work was the demonstration that an electric disturbance is propagated along a wire with the same velocity as light is propagated in free space. In other papers, various miscellaneous topics were treated—the thermal conductivity of iron, crystalline reflection and refraction, certain propositions in the thermodynamics of solution, vaporization and chemical reaction. An important part of his work was contained in his *Vorlesungen über mathematische Physik* (1876), in which the principles of dynamics, as well as various special problems, were treated in a somewhat novel and original manner.

His name is best known for the researches, in conjunction with R. W. von Bunsen on the development of spectrum analysis. He can scarcely be called an inventor, for not only had many investigators already used the prism as an instrument of chemical inquiry, but considerable progress had been made towards the explanation of the principles upon which spectrum analysis rests. But to him belongs the merit of having, most probably without knowing what had already been done, enunciated a complete account of its theory and established the method on a solid basis. Kirchhoff gave the explanation of the Fraunhofer lines and thus opened up to investigation a new field in spectrum analysis applied to the composition of celestial bodies.

Kirchhoff's work is collected in *Gesammelte Abhandlungen* (Leipzig, 1882). *See* W. Voigt, *Zum Gedächtniss von G. Kirchhoff* (Göttingen, 1888).

KIRCHHOFF, JOHANN WILHELM ADOLF (1826–1908), German classical scholar and epigraphist, was born in Berlin. His works include *Die Homerische Odyssee* (1859), putting forward a new theory as to the composition of the *Odyssey;* editions of Plotinus (1856), Euripides (1855 and 1877–78), Aeschylus (1880), Hesiod (*Works and Days,* 1889), Xenophon, *On the Athenian Constitution* (3rd ed., 1889); *Über die Entstehungszeit des Herodotischen Geschichtswerkes* (2nd ed., 1878); *Thukydides und sein Urkundenmaterial* (1895).

The following works are the result of his epigraphical and palaeographical studies: *Die Umbrischen Sprachdenkmaler* (1851); *Das Stadtrecht von Bantia* (1853), on the tablet discovered in 1790 at Oppido near Banzi, containing a plebiscite relating to the municipal affairs of the ancient Bantia; *Das Gotische Runenalphabet* (1852); *Die Fränkischen Runen* (1855); *Studien zur Geschichte des Griechischen Alphabets* (4th ed, 1887). The second part of vol. iv. of the *Corpus Inscriptionum Graecarum* (1850, containing the Christian inscriptions) and vol. i. of the *C. I. Atticarum* (1873, containing the inscriptions before 403), with supplements thereto (vol. iv. pts. 1–3, 1877–91), are edited by him.

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

KARA-KIRGHIZ, OR NATIVE OF THE RUSSIAN PAMIRS, WITH MATCH-LOCK RIFLE

KIRGHIS. The term Kirghis or Kirghiz is very loosely used. The Russians usually include under this term a variety of peoples, including the Kaizak (*q.v.*). The term should probably be limited to those Turkic tribes whose original home was the upper Yenisei, but most of whom now live south of Yarkand, and to the north of Kashgar and Aksu. Although some are agriculturists and hunters, the culture of the majority differs in few respects from the horse-breeding nomadism of the Mongols whose customs, in spite of Czaplicka's statement, are also very similar to those of the Kirghis. They are exogamous in relation to the blood clan, but enjoy a good deal of antenuptial freedom within the clan. (*See* also KIRGHIZ REPUBLIC.) (L. H. D. B.)

KIRGHIZ REPUBLIC, an autonomous Socialist Soviet republic, in the Russian S.F.S.R., lying to the south-east of Kazakstan, which forms its northern boundary. It lies between 43° 24′ N and 39° 17′ N. and 70° E. and 80° E. Chinese Turkistan lies on the east, the autonomous Badakshan area and the Tajik A.S.S.R. on the south, while on the west are the Uzbek A.S.S.R. and Kazakstan. It is a mountain region, lying within the western extension of the Tian Shan range which branches off from the Khan-tengri mountain knot (23,600 ft.) in 80° 11′ E and 42° 13′ N, on the western border of Chinese Turkistan. The Kunghei Ala-tau skirts the north of Lake Issyk-Kul; its southern slopes lie in the Kirghiz A.S.S.R, and its northern in Kazakstan.

Most of the Alexander range, a western continuation of the Kunghei-Ala-tau, lies within the Kirghiz republic, as does the valley to the north, where the Chu river is the frontier between Kazakstan and the Kirghiz A.S.S.R. as far west as the village of Kamyshanka. The Alexander range bifurcates into two branches, the southern or Talas-tau lying within the Kirghiz A.S.S.R. The Terskei Ala-tau skirts the south of Lake Issyk-Kul, separating the lake, which appears to be a hollow of tectonic origin, from the high valley of the Naryn river. Striking south-westwards from Khan-tengri is the Kok-shal tau, whose crest forms the boundary between Russia and Chinese Turkistan. This range terminates in the Terek-tau, from which the Ferghana mountains branch north-west and form a knot with the Talas-tau. The Naryn river enters the Ferghana valley through a deep cleft in the Ferghana range, the northern portion of which is sometimes called the Uzun-tau. From the knot, the Ala-tau branch to the north-west and the Chatkal-tau to the south-west. The Naryn river rises in two streams, the little and the great Naryn and between them, and parallel with them, lies the Dzhitym-tau range; south of the Naryn, below the town of Narynsk, lies the Kalkagar range, with the Dongus-tau to the north. Lake Son-Kul lies between this range and the Dzhungal-tau. Stretching from the Talas-tau to the Dongus-tau is the Susamyr-tau. From Lake Chatyr-Kul to

the north-east, the great Ak-Sai plateau extends with the Ak-Sai river flowing along to Chinese Turkestan. The topography of the region has been profoundly influenced by its geological history. The closely folded Palaeozoic limestones and slates, which form the Tian Shan system were once a peneplain, in which warping and tilting took place, and in the basins thus formed late Mesozoic and Tertiary sandstones and shales were deposited, and the whole surface was once more worn down. But in late Tertiary times folding took place and the region was pushed to a great height, so that the plateau south of Lake Issyk-Kul is at an average elevation of 12,000 ft. Lake Issyk-Kul itself is 5,000 ft. above sea level. The main mass of the plateau is about 150 m. in width and consists of broad shallow basins (altitude *c.* 10,000 ft.) running in an east-west direction, separated by the broad ridges mentioned previously which slope gently to altitudes of 13,000 to 16,000 ft., their flat tops reminiscent of the ancient peneplain. The Kokshal-tau range (16,000 ft.) has a more typical young fold mountain appearance, with sharp-edged peaks. The republic is a glacial region, the numerous small glaciers varying from one to five miles in length and occurring usually at altitudes of 12,000 ft. Broad U-shaped glacial valleys are the prevailing type, though V-shaped river gorges alternate picturesquely with them. Terraces occur in the river valleys, sometimes half a dozen, one above the other. Ellsworth Huntington concluded from his examination of the region that there had been at least five decreasingly severe glacial advances, with interglacial periods of warm climate.

The climate varies with altitude and exposure; slopes exposed to the west or north receive winds bearing more moisture and have less insolation and are therefore more favourable to vegetation. Rainfall increases steadily with altitude up to 10,000 ft., after which precipitation takes the form of snow, even in the height of summer, and hard frosts occur at night. The prevailing vegetation, in dependence on this abundant precipitation and on the altitude, is alpine and sub-alpine meadow, with luscious grass and abundance of gaily coloured flowers. Forests are rare, except in the valley bottoms and along some of the northern slopes; they are coniferous in type, with some birch and poplar. According to P. P. Semenov, the northern slopes may be roughly divided into a steppe region reaching 1,575 ft. in altitude, a zone of cultivation to 4,300 ft., then coniferous trees to 8,100 ft., sub-alpine, and alpine pasture to 11,900 ft., with perpetual snow above. Apple, plum and apricot grow wild in a few valleys up to 7,000 ft., but fruits and berries are rare. The abundance of flowers, especially east of Lake Issyk-Kul makes bee-keeping profitable, and 820 tons of honey were exported in 1914. Wild animal life is scarce, though birds are numerous in the lower slopes, especially round the lakes. The mouflon, antelope and argalleh are found, and also rabbits. Between 9,000 and 12,000 ft., where the grass is richest, the marmot is found in great numbers. The chief wealth of the region, in dependence on the fact that 90% of the useful land is occupied by meadow and pasture, is in its flocks and herds. The fat-tailed sheep is the most numerous and there were about 4,000,000 in 1926–27, furnishing milk, meat, wool and leather. Cows and yaks are also bred mainly as milch and draught cattle, the latter to be exported to the agricultural areas of the other central Asiatic republics. Horses of a small, shaggy, stocky breed come next in numbers, and are valued mainly for riding, not as pack animals. The two-humped Bactrian camel is bred, both for sale in the lowlands and as a beast of burden; its milk and hair are also useful. Goats, often used to lead the flocks of sheep, are kept and in a few valleys pigs are bred. Watch dogs guard every encampment.

The ancient nomad method of relying entirely on pasture both winter and summer is fast dying out. To-day the largest group of inhabitants depends on herding plus some cultivation, often the growing of lucerne. Many Kirghiz are in the semi-nomadic stage of relying on some particular valley for wintering their flocks. This means that hay must be grown and dried for winter use, and grain, especially wheat and barley, is often grown as well. The houses in these winter "auls" are built of mud, with flat roofs, on which are stored the haystacks for winter use; the grain fields are roughly divided by mud and stone walls. In many places the crops are dependent on primitive irrigation channels. The milk, meat and "kumiss" or fermented mare's milk, diet, is increasingly supplemented by grain, tea and sugar. The tents and their furniture are much the same as those in Kazakstan (*q.v.*). In the fertile loess belt extending from Frunze to the north-east of Lake Issyk-Kul, there are colonies of Russian settlers, and here and in the loess region round Dzhalyal-Abad and Osh, where the eastern end of the Ferghana valley penetrates into the republic, irrigation-cultivation of an intensive type is carried on; cotton in 1926–27 yielded 38,000 tons, and grain and fruits, vine, apricot, peach and melon were raised in quantity. Rice and opium poppy are grown near Dzhalyal-Abad, and the silkworm is bred, about 128,000 tons of cocoons per annum being produced. A little coal and rock salt are mined, but lack of transport facilities prevents the working of the coal, naphtha, ozokerite, iron, copper, lead, silver, zinc, gold and asbestos known to exist. Homespun woollen, cotton and silk goods are made; felt and rugs for the tents, ornamented leather goods and small metal utensils, but they are essentially peasant industries to meet local needs.

Factory industry is almost non-existent, except for a few distilleries and oil pressing works, but since 1925 three or four cotton-cleaning factories have been successfully established in the Dzhalyal-Abad-Osh district. Means of communication in this remote and difficult region are almost absent. A branch of the Orenburg-Tashkent railway passes through Frunze and has been recently extended to Tokmak, and a branch of the Kokand-Andizhan railway reaches Dzhalyal-Abad, but these two regions are on the fringes of the republic. Steamers ply on Lake Issyk-Kul. Education and medical help are available only in a few settlements; the vast majority of the Kirghiz are beyond their reach. Of the 9% of the population able to read and write, most are Russians. The population in 1926 was about 990,000, of whom 66·6% were Kara-Kirghiz, 11·1% Uzbeks, 11·7% Russians and 6·4% Ukrainians. The administrative centre is Frunze, mainly a Russian town; Naryn, in the centre of the high plateau, pop. (1926) 1,547 is the only settlement of town type where the Kirghiz predominate. The Kara-Kirghiz are a branch of the same Turkish (Mongol-Tatar) race as the Kazak-Kirghiz and resemble them in physical type and language (*see* KAZAKSTAN). The name Kirghiz originally applied to them alone and they trace it from a legendary chief named Kirghiz. Kara (black) was prefixed because of the colour of their felt tents or "kibitkas." Russian writers refer to them as *Cherniye* (Black) or *Dikokammeniye* (Wild Stone or Rocky) Kirghiz, and a few English writers have called them Black Kirghiz

The name Kirghiz first occurs in an account of an embassy sent to them by the East Roman emperor, Justin II. in 569. Chinese chroniclers (1280–1367) refer to them as Ki-li-ki-tz' and place their territory north-west of Pekin, about the head-streams of the Yenisei, while the earlier records of the T'ang dynasty (618–907) refer to them as Kha-kia-tz' (pronounced Khaka, and sometimes transliterated Haka). These records also afford evidence of their Mongol-Tatar origin. They have been settled in these mountain fastnesses at least since the 13th century and probably earlier. At one time the upper Yenisei and Baikal regions were occupied by the Kara-Kirghiz and they were referred to by the Mongols as Burut, ut being the Mongolian plural ending modified to Buriat (*see* BURIAT-MONGOL S.S.R.). However, in the 17th century the Russians and Kazak-Kirghiz exterminated those east of the Irtish, and drove the remainder west and south-west. Most of them sought refuge with their nomad Kara-Kirghiz kinsmen in the highlands of the Tiań Shan and Pamir region. The Kara-Kirghiz are grouped into the On (right or east) section, occupying the Issyk-Kul, Chu, Tekes and Naryn valleys and the Sol (left or west) section, occupying the region between the Talass and Oxus headstreams. Nomad groups often visit the Pamir plateau in summer, and Kara-Kirghiz are to be found in Chinese Turkistan. Their region was annexed to Russia in 1864, and under the tsarist Government formed part of the Turkistan province. For a time after 1917 there was a Turkistan republic, which included the Kara-Kirghiz region. In 1924 it ceased to exist and the Kara-Kirghiz autonomous area, reorganized in 1926 as a

republic, was created.

KIRIN: *see* MANCHURIA.

KIRK, SIR JOHN (1832–1922), British naturalist and administrator, son of the Rev. John Kirk, was born at Barry, near Arbroath, on Dec. 19, 1832 and died on Jan. 15, 1922. He was educated at Edinburgh for the medical profession, and after serving on the civil medical staff in the Dardanelles throughout the Crimean War, was appointed in Feb. 1858 physician and naturalist to David Livingstone's second expedition to Central Africa. He was by Livingstone's side in most of his journeyings during the next five years, and was one of the first four white men to behold Lake Nyassa (Sept. 16, 1859). He was finally invalided home on May 9, 1863. The reputation he gained during this expedition led to his appointment in Jan. 1866 as acting surgeon to the political agency at Zanzibar. In 1867 he was made vice-consul of Zanzibar, and in 1868 became assistant political agent, being raised to the rank of consul-general and agent in 1873. He retired in 1887. The twenty-one years spent by Kirk in Zanzibar covered the most critical period of the history of European intervention in East Africa; and during the greater part of that time he was the ritual ruler (*see* ZANZIBAR). Kirk resigned his post (July 1887), retiring from the consular service. In 1889–1890 he was a plenipotentiary at the slave trade conference in Brussels, and was one of the delegates who fixed the tariff duties to be imposed in the Congo basin. In 1895 he was sent by the British government on a mission to the Niger; and on his return he was appointed a member of the Foreign Office committee for constructing the Uganda railway. As a naturalist Kirk took high rank, and many species of the flora and fauna of Central Africa were made known by him, and several bear his name, *e g*, the *Otogale kirkii* (a lemuroid), the *Madoqua kirkii* (a diminutive antelope), the *Landolphia kirkii* and the *Clematis kirkii*.

KIRKBY, JOHN (d. 1290), English ecclesiastic and statesman, entered the public service as a clerk of the chancery during the reign of Henry III., and became keeper of the great seal in 1272. In 1282 he was employed by Edward I. to collect money in the counties and boroughs. His services to Edward were rewarded by several valuable benefices in the church. In 1286, two years after he had become treasurer, he was elected bishop of Ely, and he was ordained priest and consecrated by John Peckham, Archbishop of Canterbury. He died at Ely on March 26, 1290.

Kirkby's Quest is the name given to a survey of various English counties which was made under the bishop's direction probably in 1284–85. For this see *Inquisitions and Assessments relating to Feudal Aids, 1284–1431*, vol. i. (1899).

KIRKCALDY, a royal and police burgh, parish, and seaport, of Fifeshire, Scotland Pop. (1921), 3,959. It lies on the Firth of Forth, 26 m. N. of Edinburgh by the L.N.E. railway, via the Forth bridge. Although Columba is said to have planted a church here, the authoritative history of the town does not begin for several centuries after the era of the saint. In 1240 the church was bestowed by David, bishop of St. Andrews, on Dunfermline abbey, and in 1334 the town with its harbour was granted by David II. to the same abbey, by which it was conveyed to the bailies and council in 1450, when Kirkcaldy was created a royal burgh. In the course of another century it had become an important commercial centre, the salt trade of the district being then the largest in Scotland. In 1644 it was made a free port, and six years later it was assessed as the sixth town in the kingdom. After the Union its shipping fell off, Jacobite troubles and the American War of Independence accelerating the decline. But its linen manufactures, begun early in the 18th century, restored prosperity. It is called the "lang toun," as since it absorbed Linktown and Abbotshall on the west, and Pathhead, Sinclairtown and Gallatown on the east, it has reached a length of nearly 4 m. The parish church was mainly rebuilt in 1809, but has a Norman tower, and there is a large United Free Church. The high school (1894) stands on the site of the ancient burgh school (1582). To the west lies Beveridge park of 110 acres, including a large sheet of water, which was presented to the town in 1892. The harbour has an inner and outer division, with wet dock and wharves. Extensions, which include the lengthening of the east pier and the construction of a south pier, a tidal harbour and a dock, were opened in 1909 Besides the manufacture of sheeting, towelling, ticks, dowlas and sail-cloth, the principal industries include flax tow and jute spinning, net and rope making, bleaching, dyeing, brass and iron founding, and there are potteries, machine works, fisheries, and factories for the making of oil-cloth and linoleum. In 1847 Michael Nairn invented the method of making oil-cloth. Kirkcaldy has kept the predominance in its manufacture to which Nairn's enterprise entitled it, and is the centre of the oil-cloth and linoleum manufacture of the kingdom. Kirkcaldy combines with Dysart, Buckhaven (with Methil and Innerleven), Kinghorn and Burntisland to return one member to parliament.

KIRKCALDY OF GRANGE, SIR WILLIAM (*c.* 1520–1573), Scottish politician, was the eldest son of Sir James Kirkcaldy of Grange (d. 1556). Sir James was lord high treasurer of Scotland from 1537 to 1543 and was a determined opponent of Cardinal Beaton, in whose murder (1546) he was assisted by William Kirkcaldy. In July 1547 he was captured by the French and sent as a prisoner to Normandy, whence he escaped in 1550. He was employed in France as a secret agent by Edward VI., being known as *Corax;* and later he served in the French army. The sentence passed on Kirkcaldy for his share in Beaton's murder was removed in 1556, and he returned to Scotland in 1557. He was one of the leaders of the lords of the congregation in their struggle with the regent, Mary of Lorraine He opposed Queen Mary's marriage with Darnley, and was forced to seek refuge in England (1566). Returning to Scotland, he was accessory to the murder of Rizzio, but he had no share in that of Darnley; and he was one of the lords who banded themselves together to rescue Mary after her marriage with Bothwell. After the fight at Carberry Hill the queen surrendered to Kirkcaldy, and he was mainly responsible for her defeat at Langside. After the murder of Murray Kirkcaldy ranged himself definitely among the friends of the imprisoned queen. Defying the regent Lennox, he began to strengthen the fortifications of Edinburgh castle, of which he was governor, and which he held for Mary, and early in 1573 he refused to come to an agreement with the regent Morton because the terms of peace did not include a section of his friends. After this some English troops arrived to help the Scots, and in May 1573 the castle surrendered. Strenuous efforts were made to save Kirkcaldy from the vengeance of his foes, but they were unavailing; he was hanged on Aug. 3, 1573.

See Sir James Melville, *Memoirs*, ed. T Thomson (Edinburgh, 1827); J. Grant, *Memoirs and Adventures of Sir W. Kirkcaldy* (Edinburgh, 1849); L. A Barbé, *Kirkcaldy of Grange* (1897); and A. Lang, *History of Scotland*, vol. ii. (1902).

KIRKCUDBRIGHT (Kur-kōō′brĭ), royal burgh, parish and county town, Kirkcudbrightshire, Scotland. Pop. (1921) 2,101. It is situated at the mouth of the Dee, crossed here by a bridge, 6 m. from the sea and 30 m. S.W. of Dumfries by the L.M.S. railway, being the terminus of a branch line. The old form of the name of the town was Kilcudbrit, from the Gaelic *Cil Cudbert*, "the chapel of Cuthbert," the saint's body having lain here for a short time during the seven years that lapsed between its exhumation at Lindisfarne and the re-interment at Chester-le-Street. The estuary of the Dee is divided at its head by the peninsula of St. Mary's isle, but though the harbour is good, the distance to which the tide retreats impairs its usefulness. The market cross stands in front of the old court-house, now a factory.

The ivy-clad ruins of Bomby castle, founded in 1582 by Sir Thomas Maclellan, ancestor of the barons of Kirkcudbright, stand at the end of the chief street. The town, which witnessed much of the international strife and Border lawlessness, was taken by Edward I. in 1300. It received its royal charter in 1455. After the battle of Towton, Henry VI. crossed the Solway and landed at Kirkcudbright to join Queen Margaret at Linlithgow. It withstood the English siege in 1547 under Sir Thomas Carleton, but after the country had been overrun was compelled to surrender.

Lord Maxwell, earl of Morton, as a Roman Catholic, mustered his tenants here to act in concert with the Armada; but on the approach of King James VI. to Dumfries he took ship at Kirkcudbright and was captured. On St. Mary's isle was situated the seat of the earl of Selkirk, at whose house Robert Burns gave the famous Selkirk grace.

Some ha'e meat, and canna eat,
And some wad eat that want it;
But we ha'e meat, and we can eat,
And sae the Lord be thankit.

DUNDRENNAN ABBEY, 4½ m. S.E., was the greatest achievement of Fergus, Lord of Galloway, a celebrated church builder of the 12th century. It was a Cistercian house, colonized from Rievaulx, and was built in 1140. There now remain only the transept and choir, a unique example of the Early Pointed style.

KIRKCUDBRIGHTSHIRE (also known as the STEWARTRY OF KIRKCUDBRIGHT and EAST GALLOWAY), county, Scotland, bounded north and north-west by Ayrshire, west and south-west by Wigtownshire, south and south-east by the Irish sea and Solway firth, and east and north-east by Dumfriesshire. It includes the small islands of Hestan and Little Ross, used as lighthouse stations. The north-western part of the shire is rugged and desolate. In this quarter the principal mountains are Merrick (2,764 ft.), the highest in the south of Scotland, and the group of the Rinns of Kells. Towards the south-west the chief hills are Lamachan, Larg and the bold mass of Cairnsmore of Fleet. In the south-east Criffel stands almost isolated. In the north rises the fine hill of Cairnsmuir of Carsphairn, and close to the Ayrshire border is the Windy Standard. Much of the highest ground consists of intrusive granite masses, but the rocks of widest extent are Silurian and Ordovician, folded in a direction north-east–south-west and consisting mainly of shales and grits. The south of the shire is mostly level or undulating, but picturesque: glacial deposits here cover much of the surface. Large stretches of sand are exposed in the Solway at low water.

The number of "burns" and "waters" is remarkable, but their length seldom exceeds 7 or 8 miles. Among the longer rivers are the Cree, which rises in Loch Moan and reaches the sea near Creetown after a course of about 30 m., during which it forms the boundary, at first of Ayrshire and then of Wigtownshire; the Dee or Black Water of Dee (so named from the peat by which it is coloured), which rises in Loch Dee and after a course mainly south-east and finally south, enters the sea at St. Mary's isle below Kirkcudbright, its length being nearly 36 m.; the Urr, rising in Loch Urr on the Dumfriesshire border, falls into the sea a few miles south of Dalbeattie 27 m. from its source; the Ken, rising on the confines of Ayrshire, flows mainly southerly and joins the Dee at the southern end of Loch Ken after a course of 24 m.; and the Deugh which, rising on the northern flank of the Windy Standard, pursues a winding course of 20 m. before reaching the Ken. The Nith, during the last few miles of its flow, forms the boundary with Dumfriesshire, to which county it almost wholly belongs. Lochs and mountain tarns are many; but except Loch Ken, which is about 6 m. long by ½ m. wide, none is large. There are several passes in the hill regions, but the only well-known glen is Glen Trool, not far from the district of Carrick in Ayrshire, and famous for its wild scenery and its associations with Robert Bruce.

Agriculture.—The major part of the land is either waste or poor pasture, but considerable tracts have recently been reclaimed. More than half the holdings consist of 50 ac. and over. Oats are the predominant grain crop, the acreage of barley and wheat being insignificant. Turnips and potatoes are grown. Sheep and cattle-breeding are followed with success; Ayrshires are gradually ousting the black Galloway breed. Horses are raised, the small Galloway horses having given place to larger breeds. Pig-rearing is important. The honey of the shire is in good repute.

Industries.—The granite quarries near Dalbeattie and Creetown occupy a large number of hands. Sandstone also is quarried. The manufactures, mostly of woollen goods, are unimportant; tanning, corn-milling and paper-making are carried on, and salmon are caught, Dee fish being notable.

The only railway communication is by the L.M.S. railway, running from Dumfries to Castle Douglas, from which there is a branch to Kirkcudbright, and the line beginning at Castle Douglas and leaving the county at Newton Stewart.

The population was 37,155 in 1921, when 103 persons spoke Gaelic and English. The chief towns are Castle Douglas (pop. in 1921, 2,801), Dalbeattie (2,998), Kirkcudbright (2,101), Maxwelltown (6,094). The shire returns one member to parliament.

KIRKE, PERCY (*c.* 1646–1691), English soldier, was the son of George Kirke, a court official to Charles I. and Charles II., entered the army in 1666, was with Monmouth at Maestricht (1673), and was present during two campaigns with Turenne on the Rhine. In 1680 he became lieutenant-colonel, and soon afterwards colonel of one of the Tangier regiments (afterwards the King's Own Royal Lancaster Regt.). In 1682 Kirke became governor of Tangier, and colonel of the old Tangier regiment. He was a successful governor, though he gave offence by the roughness of his manners and the wildness of his life. On the evacuation of Tangier "Kirke's Lambs" (so called from their badge) returned to England, and in 1685 their colonel served as a brigadier in Faversham's army. After Sedgemoor the rebels were treated with great severity. Brigadier Kirke took a notable part in the Revolution three years later. He commanded at the relief of Derry, and made his last campaign in Flanders in 1691. He died, a lieutenant-general, at Brussels in Oct. 1691.

KIRKINTILLOCH, police burgh and parish, Dumbartonshire, Scotland. Pop. (1921) 11,690 It is situated 8 m. N.E. of Glasgow by the L.N.E. railway. It lies on the Forth and Clyde canal, and the Kelvin—from which Lord Kelvin, the distinguished scientist, took the title of his barony—flows past the town, where it receives from the north the Glazert and from the south the Luggie, commemorated by David Gray. The Wall of Antoninus ran through the site of the town, the Gaelic name of which (*Caer,* a fort, not *Kirk,* a church) means "the fort at the end of the ridge." The town became a burgh of barony under the Comyns in 1170. The cruciform parish church (1644), with crow-stepped gables, is used as a childrens' church, a new parish church having been built; the Broomhill home for incurables is largely due to Miss Beatrice Clugston, to whom a memorial was erected in 1891 In 1898 the burgh acquired as a private park the Peel, containing traces of the Roman wall, a fort, and the foundation of Comyn's castle. The leading industries are chemical manufactures, iron-founding, muslin-weaving, coal and iron mining and nickel-works. Lenzie, a suburb, a mile to the south of the old town with a junction station, contains the towered building, in the Elizabethan style, of the Glasgow dental hospital, and the Glasgow convalescent home.

KIRK-KILISSE or **SARANDEKLISIE,** a town of European Turkey, in the vilayet of Adrianople, 35 m. E. of Adrianople. Pop. (1905), about 16,000, of whom about half were Greeks, and the remainder Bulgarians, Turks and Jews. The Greeks have now left. Kirk-Kilisse is built near the headwaters of several small tributaries of the river Ergene, and on the western slope of the Istranja Dagh. It owes its chief importance to its position at the southern outlet of the Fakhi defile over these mountains, through which passes the shortest road from Shumla to Constantinople. The name Kirk-Kilisse signifies "four churches," and the town possesses many mosques and Greek churches. It has an important trade with Constantinople in butter and cheese, and also exports wine, brandy, cereals and tobacco. The Turkish army was defeated here in 1912. From 1920 to 1922 the town was in Greek territory.

KIRKLAND LAKE, a thriving town of 4,000 inhabitants, in the district of Temiskaming in northern Ontario, Canada, 60 m. N. of Cobalt, on the Nipissing Central railway. It is the centre of the Kirkland Lake gold camp, one of the richest concentrations of gold values in the world, and the most important gold producing locality in Canada outside Porcupine. At present it includes six producing mines, viz., Kirkland Lake, Teck-Hughes, Lake Shore, Wright Hargreaves, Sylvanite, and Tough Oakes Burnside, and further search for new mines is being carried on constantly both to the west and east.

The first gold discovery in the vicinity was made in 1911, through the opening up of the country by the Temiskaming and Northern railway. Since then production has steadily increased. In 1926 gold was produced to the value of $7,173,065; in 1927 production was estimated at $9,500,000, and it is expected to increase greatly during the next few years. As a result of the gold discoveries in this district and in the Porcupine area, Canada now holds third place among the gold producing countries of the world.

KIRKSVILLE, a city of north-eastern Missouri, U.S.A., on the rolling prairie, at an altitude of 846ft.; the county seat of Adair county. It is on Federal highway 63, and is served by the Quincy, Omaha and Kansas City and the Wabash railways; also motor bus lines. The population was 7,213 in 1920 (95% native white). It is the commercial centre for a large agricultural and coal-mining region, and has shoe factories and other manufacturing industries It is the seat of the North-east Missouri State Teachers college, founded by Joseph Baldwin in 1867 and adopted by the State in 1870; and of the Andrew T. Still college of Osteopathy and Surgery (opened 1892), founded by and named for the originator of osteopathic treatment, who settled here in 1875. Kirksville was laid out in 1842, incorporated as a town in 1857, and chartered as a city in 1892 It was named after Jesse Kirk. In April, 1899, a cyclone caused serious damage.

KIRKUK, an important foothill town in eastern 'Iraq situated in 35° 30′ N., 45° 30′ E. The city was probably the capital of ancient Gutium, whose local god was Ramman, the thunder god. It does not appear to have been known during the period of Ur. It lies on the railroad from Baghdad to be extended to Mosul, and is one of the chief market centres of Kurdistan, in the centre of a corn and fruit district. There is also a considerable sheep industry. The population consists mostly of Kurds and is estimated as high as 20,000. The town exports agricultural products and wood. The first large producer of the Turkish Petroleum Co. was drilled near here in 1927, with a showing for 60,000–90,000 bbl. per day production of light oil.

KIRKWALL, a royal burgh, seaport and capital of the Orkney islands, county of Orkney, Scotland. Pop. (1921) 3,697. It is situated at the head of a bay of the same name on the east of the island of Pomona, or Mainland, 247 m. N. of Leith and 64 m. N. of Wick by steamer. Much of the town is old-fashioned, its main street (nearly 1 m. long) being in parts so narrow that two vehicles cannot pass each other. Kirkwall has very few manufactures, the linen, kelp and straw-plaiting industries being extinct, but distilling and boat-building are carried on. The town is important not only as regards its shipping and the deep-sea fishery, but also as a distributing centre for the islands and the seat of the superior law courts. The port has two piers. Kirkwall received its first charter from James III. in 1486, but as it was disregarded by the earls of Orkney and others, parliament passed an act in 1670 confirming the charter granted by Charles II. in 1661. The cathedral of St. Magnus, a stately cruciform red sandstone structure in severest Romanesque with touches of Gothic, was founded by Jarl Rognvald (Earl Ronald) in 1137 in memory of his uncle Jarl Magnus who was assassinated in the island of Egilshay in 1115, and afterwards canonized and adopted as the patron saint of the Orkneys. The remains of Rognvald and St. Magnus were found in the cathedral in 1926. The choir was lengthened and the beautiful eastern rose window added by Bishop Stewart in 1511, and the porch and the western end of the nave were finished in 1540 by Bishop Robert Reid. Saving that the upper half of the original spire was struck by lightning in 1671, and not rebuilt, the cathedral is complete, but it underwent extensive repairs in the 19th century. The disproportionate height and narrowness of the building lend it a certain distinction, but the sandstone has not resisted the effects of weather, and much of the external decorative work has perished. The choir is used as the parish church. The church of St. Olaf, from which the town took its name, was burned down by the English in 1502; and of the church erected on its site by Bishop Reid—the greatest building the Orkneys ever had—only a fragment survives. Nothing remains of the old castle, founded by Sir Henry Sinclair (d. 1400), earl and prince of Orkney and 1st earl of Caithness, and the earthwork to the east of the town thrown up by the Cromwellians has been converted into a battery of the Orkney Artillery Volunteers. Adjoining the cathedral are the ruins of the bishop's palace, in which King Haco died after his defeat at Largs in 1263. The round tower, added by Bishop Reid in 1550, contains a niche with an effigy believed to represent the founder, who also endowed the grammar school which is still in existence. To the east are the ruins of the earl's palace, built about 1600 for Patrick Stewart, 2nd earl of Orkney, and on his forfeiture given to the bishops for a residence. Tankerness house is a characteristic example of the old mansion of an Orkney laird There is daily communication with Stromness, and with Scrabster pier (Thurso), via Scapa pier, about 1½ m. to the S. of Kirkwall; and steamers sail regularly from the harbour to Lerwick, Aberdeen, Leith, and other islands in the Orkneys. Good roads place the capital in touch with most places in the island.

KIRKWOOD, a city of St. Louis county, Missouri, U.S.A., 14m. W. of the City Hall of St. Louis; served by the Frisco and the Missouri Pacific railways. It is a residential suburb, with a population in 1920 of 4,422.

KIRRIEMUIR, a burgh of barony and police burgh of Forfarshire, Scotland. Pop. (1921), 3,408. It is situated on a height above the glen through which the Gairie flows, 6¼ m N.W. of Forfar by a branch line of the L.M.S. railway of which it is the terminus. The staple industry is linen-weaving. Sir J. M. Barrie (b. 1860) was born here, and made the town famous under the name of "Thrums." The original Secession church—the kirk of the Auld Lichts—was founded in 1806 and rebuilt in 1893.

KIRSANOV, a town of the Russian S.F.S.R. in the province of Tambov, in 52° 39′ N., 42° 42′ E., on a small tributary of the Vorona river, and on the railway. Pop. (1926) 25,043. It has grown rapidly since 1900, and has smelting works and steam flour mills and a grain elevator. It was founded at the beginning of the 18th century as a result of the working of iron in the locality.

KIRSCH or **KIRSCHENWASSER,** a potable spirit distilled from cherries. Kirsch is manufactured chiefly in the Black forest in Germany, and in the Vosges and Jura districts in France. Generally the raw material consists of the wild cherry known as *Cerasus avium*. The cherries are subjected to natural fermentation and subsequent distillation Occasionally a certain quantity of sugar and water is added to the cherries after crushing, and the mass so obtained is filtered or pressed prior to fermentation. The spirit is usually "run" at a strength of about 50% of absolute alcohol. Compared with brandy or whisky the characteristic features of kirsch are (*a*) that it contains relatively large quantities of higher alcohols and compound ethers and (*b*) the presence in this spirit of small quantities of hydrocyanic acid, partly as such and partly in combination as benzaldehydecyanhydrine, to which the distinctive flavour of kirsch is largely due.

KIR-SHEHER, the chief town of a vilayet in Asia Minor, situated on a tributary of the Kizil Irmak (*Halys*), on the Angora-Kaisarieh road The town gives its name to the excellent carpets made in the vicinity. On the outskirts there is a hot chalybeate spring. Pop. (1927) 67,731. Kir-sheher represents the ancient *Mocissus*, a small town which became important in the Byzantine period: it was enlarged by the emperor Justinian, who re-named it *Justinianopolis*, and made it the capital of a large division of Cappadocia.

KIRWAN, RICHARD (1733–1812), Irish scientist, was born at Cloughballymore, Co. Galway, in 1733. In 1766 he was called to the Irish bar, but in 1768 abandoned practice in favour of scientific pursuits. During the next nineteen years he resided chiefly in London, enjoying the society of the scientific men living there. His experiments on the specific gravities and attractive powers of various saline substances formed a substantial contribution to the methods of analytical chemistry, and in 1782 gained him the Copley medal from the Royal Society, of which he was elected a fellow in 1780; and in 1784 he was engaged in

a controversy with Cavendish in regard to the latter's experiments on air. In 1787 he removed to Dublin, where four years later he became president of the Royal Irish Academy. He was one of the last supporters in England of the phlogistic hypothesis, for which he contended in his *Essay on Phlogiston and the Constitution of Acids* (1787), identifying phlogiston with hydrogen. This work, translated by Madame Lavoisier, was published in French with critical notes by Lavoisier and some of his associates; Kirwan attempted to refute their arguments, but they proved too strong for him, and he acknowledged himself a convert in 1791. His other books included *Elements of Mineralogy* (1784), which was the first systematic work on that subject in the English language, and which long remained standard; *An Estimate of the Temperature of Different Latitudes* (1787); *Essay of the Analysis of Mineral Waters* (1799), and *Geological Essays* (1799). He died in Dublin in June 1812.

KI-SEKI (rare or strange stones): *see* BON-SEKI.

KISFALUDY, KÁROLY [CHARLES] (1788–1830), Hungarian author, was born at Téte, near Raab, on Feb. 6, 1788. His birth cost his mother her life and himself his father's undying hatred. He entered the army as a cadet in 1804; saw active service in Italy, Serbia and Bavaria (1805–1809), distinguishing himself at the battle of Leoben (May 25, 1809). During the war he composed his first poems, *e.g.*, the tragedy *Gyilkos* ("The Murder," 1808), and numerous martial songs. He fell hopelessly in love with the beautiful Katalin Heppler, the daughter of a wealthy tobacco merchant. Kisfaludy, contrary to his father's wishes, now threw up his commission and went to live with a married sister at Vörröck. In 1812 he studied painting at Vienna, till the theatre attracted him. In 1812 he wrote the tragedy *Klára Zách*, and in 1815 went to Italy to study art more thoroughly. But he was back again within six months, and for the next three years lived a wandering life. The elder Kisfaludy refused any reconciliation. But the son became immediately famous with the production (1819) of his drama *Ilka*, written for the Fehérvár dramatic society. Subsequent plays, *The Voivode Stiber* and *The Petitioners* (the first original Magyar dramas), were equally successful. Kisfaludy may be said to have created the Hungarian drama. In May 1820 he wrote three new plays which still further increased his reputation. From 1820 onwards, under the influence of the critic Kazinczy, he learnt to polish and refine his style, while his friend and adviser György Gaal (who translated some of his dramas for the Vienna stage) introduced him to the works of Shakespeare and Goethe.

By this time Kisfaludy had evolved a literary theory of his own which inclined towards romanticism; and in collaboration with his elder brother Alexander (*see* below) he founded the periodical *Aurora* (1822), which attracted many young authors (including Vörösmarty, Bajza and Czuczor) and became the organ of romanticists. Kisfaludy contributed to *Aurora* ballads, epigrams, short epic pieces, and, best of all, his comic stories. His comic types amuse and delight to this day. When the folk-tale became popular in Europe, Kisfaludy set to work upon folk-tales also, and produced (1828) some of the masterpieces of that genre. He died on Nov. 21, 1830. Six years later the great literary society of Hungary, the *Kisfaludy Társaság*, was founded to commemorate his genius. Kisfaludy revived and nationalized the Magyar literature, giving it a range and scope undreamed of before his time.

The first edition of Kisfaludy's works, in 10 volumes, appeared at Buda in 1831, shortly after his death, but the 7th edition (Budapest, 1893) is the best and fullest. *See* Ferenc Toldy, *Lives of the Magyar Poets* (Hung.) (Budapest, 1870); Zsolt Beöthy, *The Father of Hungarian Comedy* (Budapest, 1882); Tamás Szana, *The Two Kisfaludys* (Hung.) (Budapest, 1876). Kisfaludy's struggles and adventures are also most vividly described in Jókai's novel, *Eppur si muove* (Hung.).

KISFALUDY SÁNDOR [ALEXANDER] (1772–1844), Hungarian poet, elder brother of the preceding, was born at Zala on the 27th of September 1772, educated at Raab, and graduated in philosophy and jurisprudence at Pressburg. He entered the Life Guards (1793) and plunged into the gay life of Vienna. In 1796 he was transferred to the army in Italy for being concerned with other officers in certain irregularities. When Milan was captured by Napoleon Kisfaludy was sent a prisoner of war to Vaucluse, where he studied Petrarch with enthusiasm and fell violently in love with Caroline D'Esclapon, a kindred spirit to whom he addressed his melancholy *Himfy Lays*. He left the army in September 1799, and married his old love Rózá Szegedy at the beginning of 1800. The first five happy years of their life were passed at Kám in Vás county, but in 1805 they removed to Sümeg where Kisfaludy gave himself up entirely to literature.

He had published a volume of erotic poetry which made him famous, and his reputation was still further increased by his *Regék* or Tales. In 1820 the Marczebánya Institute crowned his *Tales*. In 1822 he started the *Aurora* with his younger brother Károly (*see* above). He died on Oct. 28, 1844. Alexander Kisfaludy's art was self-taught, solitary and absolutely independent. If he imitated any one it was Petrarch; indeed his famous *Himfy szerelmei* ("The Loves of Himfy"), as his collected sonnets are called, have won for him the title of "The Hungarian Petrarch." Of his plays *Hunyádi János* (1816) need alone be mentioned.

The best critical edition of Sándor Kisfaludy's works is the fourth complete edition, by David Angyal, in eight volumes (Budapest, 1893). *See* Tamás Szana, *The Two Kisfaludys* (Hung.) (Budapest, 1876); Imre Sándor, *The Influence of the Italian on the Hungarian Literature* (Hung.) (Budapest, 1878); Kálmán Sümegi, *Kisfaludy and his Tales* (Hung.) (Budapest, 1877). (R. N. B.)

KISH, an island in the Persian gulf. (*See* QAIS.)

KISH (modern Tal al-Uhaimer), one of the most ancient and important cities of Sumer and Akkad, lies in a direct line about 8 miles from Babil, and 10 from Hillaa, in 32° 30′ N. 45° E. The site is a very extensive one and is in the course of excavation by a joint expedition of the University of Oxford (Weld) and the Field Museum of Chicago. The city lies on either side of the old bed of the Euphrates, and for descriptive purposes may be divided into eastern and western Kish, in relation to the river. There was also a great canal running through the eastern city. The ruins are extremely extensive The western flank of the city is guarded by two mounds, probably the fortress of the city, the later mound to the south being known to-day as Tal Khuzna, "the hill of treasure." The fortress consists of a large buttressed rampart, containing large chambers; some pottery of the Hammurabi period has been found here. The two hills stand up about forty feet above the plain, and from them (near the south-west corner of extensive city ruins) runs a massive wall and moat terminating in a low mound, no doubt a fort on the western bank of the old river channel. The city ruins which cover a wide area east of the twin western forts consist of a series of low mounds, which on their northern aspect extend as far as the ziggurat. These mounds have been extensively pillaged by illicit diggers and are probably the site from which many contracts have come. They terminate to the north-east in the great stage which rises 90 ft. above the plain and has received its modern name of Tal al-Uhaimer, the "little red mound," from the great mass of baked bricks of the period of Samsu-iluna which stands out very prominently across the plain and has protected the rest of the tower from erosion. East of the ziggurat is a series of low mounds, identified by Langdon as the ruins of Emete-ursag. These ruins cover a wide area and Langdon believes that they are the remains of one of the most extensive temples of Sumer and Akkad. South of the ziggurat and between it and the southern wall there is a wide space which seems originally to have been a city park. In addition to these extensive ruins in western Kish there are also chains of mounds which lead to the new bed of the Euphrates. These can with certainty be identified with the outer defences which Nebuchadrezzar claims to have made. Their great extent is probably responsible for the large dimensions attributed by Herodotus and other ancient authorities to the walls of Babylon (*see* BABYLON). Western Kish must therefore have formed in later times, long after the river changed its course, if not an important city, at least an important element in the outer defences of its successor, the town of Babylon.

Eastern Kish lying about a mile from the ziggurat is much

more extensive and impressive. It consists of two parts, divided by an old canal. Between this and the river bed there are first a series of three mounds, which were probably forts. The most southerly lies on the other side of the river from the fort which guards the end of the wall of western Kish. Between these forts and the canal there lies a mound about three quarters of a mile long and about 25 ft. high, which contained a large number of tablets and some late graves. The canal which lay east of this mound is marked to-day by a long series of narrow mounds, which stand out and are most impressive, especially when half concealed by the mists at dawn. The canal appears to have been reconstructed at various times, and may even have been in use as late as the Abbasid period. If this was so the water must have been brought, as is the case with the modern canal a little distance away, from the new bed of the river near Hillaa. Immediately east of the canal are a series of sites. To the north lies a large flat area, not a mound, covered with plano-convex bricks. It appears that this must have formed an important part of Kish in early Sumerian times, and included the palace of the kings. It was entirely abandoned about 3000 B.C. Further down the canal and south-east of this area lies the great horse shaped Tal Bandar, "the harbour mound," a very descriptive name. This mound which is about 60 ft. high and 280 ft. in its greatest dimension from east to west, probably dates from the first Babylonian dynasty. It does not seem to have been a temple, but at present its purpose is quite undetermined. Immediately south of the "harbour mound" is a further mound, about 40 ft. above the plain and about 2½ acres in extent. A short distance south of this, and immediately opposite the city ruins on the west bank of the canal, lie the most impressive ruins of eastern Kish. They consist of two great stage towers and a huge temple area, adjoining which there are extensive city ruins. The central mounds, known to-day as *Inghara,* a word of uncertain meaning, include two ziggurats joined together by a mass of ruins, and a mass of temple débris on the slopes of the mounds. The tower is 75 ft. high and the spur to the north is 3 ac. in extent and almost as high as the tower. All around is a large area covered with temples in ancient times. To the east of the old temple area there are extensive city ruins which are protected to the east by two forts. The residential quarter covers nearly ¼ sq.m. and is in most places about 30 ft. high. The upper strata at least are Neo-Babylonian.

It seems probable that the eastern forts mark the limits of the ancient city of Kish. Two miles, however, to the east, in a region of sand and desolation, lie the great mounds called by the Arabs Abu Sudaira, "the father of the Christ's Thorn," so-called from the single evidence of vegetation, a single shrub of *Ziziphus Spina Christi* which grows on the top. The mounds are irregular in shape and the lower summit is crowned with the remains of a Parthian tower. The whole surface is strewn with pottery of various dates, including some as late as Arab glazed pottery. There are Nebuchadrezzar bricks, and extensive traces of a cemetery, probably of no great antiquity. The mounds still await excavation. Farther east there is a further series of mounds; indeed the whole region between the Tigris and Kish contains abundant traces of intensive habitation. Some miles away, in 1925, Langdon excavated an early site at Jemdet-Nazr, "the hill of the Saviour." This mound, at present far from water, is probably on the site of some old stream bed, as the vegetation suggests traces of underground water. Langdon found here the remains of an ancient city whose pottery consisted entirely of painted ware. Its name and history are unknown. It certainly is of great antiquity from the pictographic tablet and the pottery, but nothing more is known. From the enormous numbers of pottery sickles lying on the surface it must once have been the centre of an agricultural district.

The history of Kish is especially interesting from its geographical aspect. In early Sumerian times, though the details have yet to be filled in, the whole region was the centre of a great wheat growing district. It was watered by the Euphrates and the water from the river was conducted in all probability across the present desert regions towards the Tigris, although this area has not as yet been fully explored archaeologically. This agricultural prosperity dates from as early in Sumerian times as it is possible at present to identify with any certainty. The city of Kish itself formed the dominating fortified city of the region, just as to-day so many walled cities in China dominate an agricultural area. Sargon, himself a native of Kish, abandoned the city after making war on it and during the dark period which followed little is known of the city, which may have been one of the very earliest sites of Sumerian civilization in Mesopotamia. In spite of attempts to do so, Kish never again regained her supremacy, which passed to Babylon (no doubt owing to the change in the bed of the Euphrates, although we have at present no information when this change took place). Towards the end of the third millennium B.C. Hammurabi and his successor did much work on the rebuilding of the temples, and Kish remained an important city as one of the most revered religious shrines of Akkad. In Neo-Babylonian times it again entered into a period of prosperity, forming almost an outer suburb of Babylon. The last actual reference to Kish occurs in the Nabonidos Chronicle, 539 B.C. A Greek tomb was found in the place in eastern Kish, but probably western Kish was abandoned in the Persian period. It is curious that in Kish itself apart from this one tomb nothing later than Nabonidos has been found, whereas all the mounds along the Shatt al Nil, to the east of Kish, are strewn with later pottery. Two different processes have been at work: one, political, that which led to the fall of Kish from its predominance, and the other the reduction of so much of the area to entire desolation.

A study of the canals shows that they gradually silted themselves up, but the more easterly, the Shatt al Nil, still remained as a possible supplier of water. Owing however to the lie of the land this canal runs to the east of Kish, and it is clear that the site has been progressively abandoned from the west, although it is probable that in early Sumerian times, when the river still ran past the city, eastern Kish was the earlier site. In spite of the possibility that the canal in the centre of the city was finally repaired in Abbasid times, it is more probable that the true site of Kish was entirely abandoned in ancient times and the city moved about two miles east, where there are abundant traces of later habitation, but where there was already a city at least as early as Nebuchadrezzar. Finally this site was abandoned also. Langdon is inclined to suggest that this final abandonment of the whole site was due to desiccation. The breaking down of the canal system under the Mongols would equally suffice to produce this result. The modern canal, based no doubt on water levels, runs east of Kish quite close to the sites of Abu Sudaira, and is playing an important part in rapidly converting that desolate region into irrigated land.

In conclusion, it may be said that the city of Kish depended on the river itself and that, except for ancient prestige and religious sanctity, it ceased to be important when the river deserted it. When the town was reduced to a supply of water from the new bed of the river, that canal was dug more to the east and so produced the Kish of Parthian, Persian and Arab times. When the canal system failed then those sites too melted into the desert. Meanwhile Babylon on the river usurped the place of Kish, and the site continued to be occupied, even though other later towns for various reasons succeeded to Babylon.

BIBLIOGRAPHY.—S. Langdon, *Excavations at Kish,* vol. i. (1924) and further publications of the University of Oxford (Weld) Field Museum (Chicago) Expedition to Mesopotamia (in the course of publication).

(L. H. D. B.)

KISHANGARH, an Indian state in the Rajputana agency. Area, 858 sq.m.; pop. (1921), 77,734. The state was founded in the reign of the emperor Akbar, by a younger son of the raja of Jodhpur. In 1818 Kishangarh first came into direct relations with the British government, by entering into a treaty, together with the other Rajput states, for the suppression of the Pindari marauders by whom the country was at that time overrun. The chief, whose title is maharaja, is a Rajput of the Rathor clan, and enjoys a salute of 15 guns. Irrigation from tanks and wells has been extended; factories for ginning and pressing cotton have been started; and the social reform movement, for discouraging

excessive expenditure on marriages, has been very successful. The town of KISHANGARH is 18 m. north-west of Ajmere by rail. Pop. (1921), 9,452. It is the residence of many Jain merchants.

KISHINEV (Rumanian, *Chisinau*), a town of Bessarabia, Rumania, capital of the department of Kishinev and formerly of the Russian Government of Bessarabia. Pop. (1924), 190,000, a mixture of Jews (nearly 50%), Rumanians, Russians, Tatars, Germans, Bulgarians and gypsies. Kishinev lies on the river Byk, on the railway between Odessa and Jassy; a direct line to south Bessarabia was under construction in 1928. Kishinev is seat of the bishop of Bessarabia, and contains a cathedral, an ecclesiastical seminary, a faculty of theology, a college, a museum, a public library, a botanic garden and a sanatorium with sulphur springs. The suburbs are remarkable for their gardens, which produce fruits (especially plums, which are dried and exported), mulberry leaves, tobacco and wine. There is a depot of the Government tobacco monopoly in the town, and a school of viticulture. Trade is active, and there are local industries. Kishinev was founded in 1436, but had only 7,000 inhabitants in 1812, when acquired by Russia from Moldavia. Since that date it has increased rapidly, and has been largely rebuilt. The old town is on the banks of the Byk, the new on high crags, 450 feet above the river. A notable pogrom was committed here in 1913.

KISHM, an island in the Persian gulf. (*See* QISHM.)

KISKUNFÉLEGYHÁZA, a Hungarian town, 80 m. S S.E. of Budapest. Lying at the edge of the drift-sand region it is surrounded by vineyards, orchards, tobacco and rye fields but is chiefly noted for its great cattle-market. Local finds point to a long history of settlement but the modern town dates from 1743 when the district was recolonized after the Turkish devastation of the 17th century. Pop. (1920), 36,797.

KISLOVODSK, a town and health-resort in the North Caucasian Area of the Russian S.F.S R. in lat. 43° 57′ N., long. 42° 45′ E., situated at an altitude of 2,690 ft., in a deep cauldron-shaped valley on the north side of the Caucasus. The town is the terminus of a branch line from Georgievsk through Piatigorsk. Pop. (about 4,000 in 1897) was 31,345 in 1926. There is a civic electricity and water supply. The limestone hills which surround the town rise by successive steps or terraces, and contain numerous caves. The mineral waters are strongly impregnated with carbonic acid gas and have a temperature of 51° F. The principal spring is known as Narsan, and its water is called by the Circassians the "drink of heroes."

KISMET, fate, destiny, a term used by Muslims to express all the incidents and details of man's lot in life. The word is the Turkish form of the Arabic *qismat,* from *qasama,* to divide.

KISS, the act of pressing or touching with the lips, the cheek, hand, or lips of another, as an expression of love, affection, reverence or greeting. Skeat (*Etym. Dict.,* 1898) connects the Teut. base *kussa* with Lat. *gustus,* taste.

For the liturgical *osculum pacis,* or "kiss of peace," *see* PAX. *See,* further, C. Nyrop, *The Kiss and its History,* trans. by W. F. Harvey (1902); J. J. Claudius, *Dissertatio de salutationibus veterum* (Utrecht, 1702); and "Baisers d'étiquette" (1689) in *Archives curieuses de l'histoire de France* (1834–90, series ii., tom. 12).

KISSAR or **GYTARAH BARBARYEH,** the ancient Nubian lyre, still in use in Egypt and Abyssinia, and having instead of the traditional tortoise-shell back a shallow, round bowl of wood, covered with a sound-board of sheepskin.

KISSI, a long-headed, dark-skinned, short-statured and slender-limbed patrilineal folk inhabiting a district lying on the frontiers of Sierra Leone and Liberia and extending into southern French Guinea between the upper Meli and Moa (Makona) rivers, who speak a language related to Bulom and Kim. They live in confederated villages under a paramount chief. Free choice of a wife is allowed. Inheritance passes to the surviving brother, whom failing, to the nephew. The people are engaged in cultivation, arboriculture and hunting, and are animists.

See Arcin, *La Guinée Française* (1907).

KISSINGEN, a town and watering-place of Germany, in the republic of Bavaria, situated on the Franconian Saale, 656 ft. above sea-level, 62 m. E. of Frankfort-on-Main, and 43 N.N.E. of Würzburg by rail. Pop. (1925) 6,517. The salt springs were known in the 9th century, and their medicinal properties were recognized in the 16th, but it was only during the 19th century that Kissingen became a popular resort. The town belonged to the counts of Henneberg until 1394, when it was sold to the bishop of Würzburg. With this bishopric it passed later to Bavaria. The three principal springs are the Rákóczy, the Pandur and the Maxbrunnen, of which the first two, strongly impregnated with iron and salt, have a temperature of 51·26° F; the last (50·72°) is like Selters or Seltzer water. At short distances from the town are the intermittent artesian spring Solensprudel, the Schönbornsprudel and the Theresienquelle; and in the same valley as Kissingen are the minor spas of Bocklet and Brückenau. They are all highly charged with salt, and productive government salt-works were at one time stationed near Kissingen.

KISTNA (or KRISHNA), a district of British India, in the N.E. of the Madras Presidency. Masulipatam is the district headquarters. Area, 5,907 sq m. The district is generally a flat country, but the interior is broken by a few low hills, the highest being 1,857 ft. above sea-level. The principal rivers are the Kistna, which cuts the district into two portions, and the Munyeru, Paleru and Naguleru (tributaries of the Gundlakamma and the Kistna). The Kolar lake, which covers an area of 21 by 14 m., and the Romparu swamp receive the drainage on the north and south sides of the Kistna respectively.

The population (2,133,314 in 1921) is increasing owing to the growing area of irrigated land. The Kistna delta system of irrigation canals, which are available also for navigation, connect with the Godavari system. The principal crops are rice, millets, pulse, oil-seeds, cotton, tobacco and a little sugar-cane. There are several factories for ginning and pressing cotton and a sugar factory; lace and embroidery are made, and a number of rice milling and cleaning works have recently been established. The manufacture of chintzes at Masulipatam has decayed, but cotton is woven for domestic use. Salt is evaporated, under government supervision, along the coast. Bezwada, at the head of the delta, is a place of growing importance, as the central junction of the East Coast railway system, which crosses the inland portion of the district in three directions. Some sea-borne trade, chiefly coasting, is carried on at the open roadsteads of Masulipatam and Nizampatam, both in the delta.

KISTNA or **KRISHNA,** a river of southern India. It rises near Mahabaleshwar in the Western Ghats, only about 40 m. from the Arabian sea, and flows across almost the entire peninsula from west to east for a distance of 800 m. before discharging into the Bay of Bengal. Its source is held sacred, and is frequented by pilgrims. From Mahabaleshwar the Kistna runs southward in a rapid course into the nizam's dominions, then turns to the east, and falls into the sea by two principal mouths, carrying with it the waters of the Bhima from the north and the Tungabadhra from the south-west. Along this part of the coast runs an extensive strip of land which has been entirely formed by the detritus washed down by the Kistna and Godavari. The river channel is throughout too rocky and the stream too rapid to allow navigation even by small native craft. In utility for irrigation the Kistna is also inferior to its two sister streams, the Godavari and Cauvery. By far the greatest of its irrigation works is the anicut at Bezwada, where the river bursts through the Eastern Ghats and spreads over the alluvial plain. The channel there is 1,300 yd. wide. During the dry season the depth of water is barely 6 ft., but sometimes it rises to as much as 36 ft. Of the two main canals connected with the dam, that on the left bank breaks into two branches, the one running 39 m. to Ellore, the other 49 m. to Masulipatam. The canal on the right bank proceeds nearly parallel to the river, and also sends off two principal branches, to Nizampatam and Comamur. The total length of the main channels is 349 m. and the total area irrigated in 1919–20 was 716,500 acres. A project for the building of a further dam was under consideration in 1928. The river is crossed by a fine railway bridge near Wadi junction.

KITASATO, SHIBASABURO (1856–), Japanese doctor of medicine, was born at Kumamoto and studied in Ger-

many under Koch from 1885 to 1891. In 1892 he became director of the Imperial Japanese Institute for Study of Infectious Diseases. He worked with Bering on the tetanus and diphtheria bacilli, and discovered (1894) the bubonic plague bacillus, and (1898) that of dysentery. In 1900 he discovered a second plague bacillus and prepared a new serum for that disease. At various times he investigated outbreaks of plague at Kobé, Osaka and in Manchuria and issued reports on his observations. He also studied the mode of infection in tuberculosis and read a paper on this subject at the International Congress of Medicine at Budapest in 1909. Kitasato was elected an Honorary Fellow of the Royal Society in 1908. In 1915 he resigned his directorship and founded a private institute where he was joined by his former colleagues. Kitasato was created a baron by the emperor of Japan in 1924 and in the following year obtained the Harben gold medal of the Royal Institute of Public Health.

KITCHEN, the room or place in a house set apart for cooking, in which the culinary and other domestic utensils are kept. Archaeologists have used the term "kitchen-midden," *i.e.*, kitchen rubbish heap, for the rubbish heaps of prehistoric man, containing bones, remains of edible shell-fish, implements, etc. (*see* SHELL-MOUNDS).

KITCHEN CABINET, a kitchen fitting in the shape of an enclosed dresser, fitted with doors, drawers and special containers, designed to economize space and to save labour by giving order and handiness to many materials and supplies. The kitchen is the workshop of the home, and any appliance which will make it more efficient is essential equipment. Although American in origin, the early American kitchen cabinet was an adaptation of the German kitchen cupboard, but included a kitchen table. The first American kitchen cabinets were brought out about the beginning of the twentieth century in the Middle West.

Most kitchen cabinets are made of wood, either oak, ash, birch or chestnut, but some of the higher priced cabinets are made of steel. Most kitchen cabinets have containers for flour, sugar, bread and cakes. The upper section is designed for food packets, groceries, crockery, etc. An extending porcelain top table is usually fitted, and in the lower sections are drawers for towels, cutlery, bread and cakes, and a cupboard for pots and pans. Kitchen cabinets are sometimes designed to incorporate additional units or sections, further to centralize the equipment of the kitchen. These units are placed on either side of the cabinets to hold such appliances as cooking pans, china and oven ware.

KITCHEN EQUIPMENT: *see* HOUSEHOLD APPLIANCES.

KITCHENER, HORATIO HERBERT KITCHENER, EARL (1850–1916), British field marshal and statesman, was the son of Lieut.-Colonel H. H. Kitchener and was born at Bally Longford, Co. Kerry, on June 24, 1850. He entered the Royal Military Academy, Woolwich, in 1868, and was commissioned second lieutenant, Royal Engineers, in 1871. In 1870 his parents were living at Dinan, and Kitchener volunteered for service in the army of the Loire. He was soon invalided out, but the love of France which impelled him remained. As a subaltern he was employed in survey work in Cyprus and Palestine, and on promotion to captain in 1883 was attached to the Egyptian army, then in course of re-organization under British officers. In the following year he served on the staff of the British expeditionary force on the Nile, and was promoted successively major and lieutenant-colonel by brevet for his services. From 1886 to 1888 he was governor-general of the Eastern Sudan, with headquarters at Suakin. In 1889 he commanded the cavalry in action against the dervishes at Gamaizieh and Toski. From 1889 to 1892 he served as adjutant-general of the army. He had become brevet-colonel in the British army in 1888, and he received the C.B. in 1889 after the action of Toski.

In 1892 Kitchener succeeded Francis Grenfell as sirdar of the Egyptian army, and three years later, when he had completed his predecessor's work of re-organizing the forces of the khedive, he began the formation of an expeditionary force on the vexed military frontier of Wady Halfa. The advance into the Sudan was prepared by thorough administrative work on his part which gained universal admiration. For the events of the River War *see* EGYPT, MILITARY OPERATIONS. Kitchener's work was crowned and the power of the Mahdists utterly destroyed by the victory of Omdurman (Sept. 2, 1898), for which he was raised to the peerage as Baron Kitchener of Khartum, received the G.C.B., the thanks of parliament and a grant of £30,000. Before Kitchener left the Sudan he went with an escort up the White Nile to Fashoda, and explained to Colonel Marchand that the French flag could not be hoisted in the Khedive's dominions. After Omdurman was taken by the Anglo-Egyptian forces under General Kitchener, the seat of government was again transferred to Khartum. It speedily arose from its ruins, being rebuilt on a much finer scale than the original city. In 1899 the railway from Wadi Halfa was completed to Khartum, and in 1906 through communication by rail was established with the Red Sea.

Little more than a year afterwards, while still sirdar of the Egyptian army, he was promoted lieutenant-general and appointed chief-of-staff to Roberts in the South African War. (*See* TRANSVAAL: *History.*) In this capacity he served in the campaign of Paardeberg, the advance on Bloemfontein and the subsequent northward advance to Pretoria, and on Roberts's return to England in November 1900 succeeded him as commander-in-chief, receiving at the same time the local rank of general. In June 1902 the long and harassing war came to its close, and Kitchener was made a viscount, received a grant of £50,000 and the Order of Merit. His method of wearing down the guerrilla resistance of the Boers was severely criticised then and afterwards. But when the Boers submitted Kitchener's influence was felt in the moderation of the peace terms.

Immediately after the peace he went to India as commander-in-chief in the East Indies, and in this position, which he held for seven years, he carried out not only many far-reaching administrative reforms but a complete re-organization and strategical redistribution of the British and native forces. In India he came into severe conflict with the viceroy, Lord Curzon, and he ultimately induced the secretary of state to give the commander-in-chief fuller powers over army expenditure. On leaving India in 1909 he was promoted field marshal, and succeeded the duke of Connaught as commander-in-chief and high commissioner in the Mediterranean. This post, not of great importance in itself, was regarded as a virtual command of the colonial as distinct from the home and the Indian forces, and on his appointment Kitchener (after a visit to Japan) undertook a tour of inspection of the forces of the empire, and went to Australia and New Zealand in order to assist in drawing up local schemes of defence. In this mission he was highly successful, and earned golden opinions. But soon after his return to England in April 1910 he declined to take up his Mediterranean appointment, owing to his dislike of its inadequate scope, and he was succeeded in June by Ian Hamilton. In the late summer of 1911 he became British agent and consul-general in Egypt.

Egypt.—On the day he landed at Alexandria, Italy was presenting an ultimatum to Turkey, and there is no doubt that Kitchener's presence and his prestige were mainly responsible for the safe passage of Egypt through the critical period of the Tripoli and Balkan wars, and that no one but himself would have been able to prevent collisions between the Greek and Italian colonists and the natives. His idea was to keep the country busy with the contemplation of its own affairs, and he initiated a policy of economic reform the effects of which were to be enduring. His programme comprised village savings banks, the five feddan law, the opening of cotton markets all over the country, cantonal courts, the promotion of the Department for Agriculture to a ministry, school buildings, sanitation and press supervision, and the heightening of the Aswan dam—all of absorbing interest to him, all receiving his assiduous care.

At the War Office.—Earl Kitchener (he had just received an earldom for his services in Egypt) came home on leave in June 1914, intending to return in September. But on July 31 all heads of missions were ordered to repair to their posts, and on Aug. 3 Kitchener was actually on board the Channel boat when a message arrived from the prime minister requiring him to stay in England. Three days later he took over the seals of the War

Office, and instantly laid his plans for an army of 70 divisions, coolly calculating that its maximum strength would be reached during the third year of the War, just when the enemy would be undergoing a sensible diminution of his resources in man-power. His scheme, of course, ran clean contrary to all accepted ideas: it had always been held that in time of war, though armies could be expanded, they could not be created, and to imagine otherwise seemed as surprising to our friends as to our enemies. In the early days of 1916 Kitchener could tell the Cabinet that 67 divisions were afoot and three in the mould; he was met by a representation that we must choose between a diminution of our forces and a reduction of our monetary advances to our Allies. He declined the dilemma. He did not think that England could present either of these conclusions to her Allies without proof positive that expenditure could not be reduced nor national income increased, that her administration was free from extravagance, that her taxable capacity was fully exploited and that all parts of the Empire were pulling their weight. The conflict of opinion was sharp and short, with the upshot that the 70 infantry divisions were assured of their existence, and the way was prepared for the Kitchener armies to take their part in the battle of the Somme which he knew was planned for the coming summer. "I have no fear," he said, "about winning the War; I fear very much we may not make a good peace." If he did not live to take his place at Versailles, at least as regards the creation and placing in the field of the great force which was to hold high England's honour he could review a finished work, for his last division to go overseas took ship the very day on which he himself set out on the journey from which he was not to return.

Kitchener's vision or intuition served him to protest, though vainly, against the concentration of the original B.E.F. so far forward as Maubeuge; his rapid and accurate grasp of a situation caused him to hurry to France after the retreat from Mons to insist, in the name of the Government, on the British Army remaining in the Allied line; and enabled him in 1915 to pronounce that the evacuation of the Gallipoli peninsula could be effected with infinitely less loss than had been gloomily predicted. Apart from these occasions he did little to interfere with the actual conduct of operations in the field. He knew and sympathised with the commanders, gave full consideration to their views, and gave them his entire trust and his unswerving support.

His recruiting work was wonderful. His stirring appeals to the nation received immediate answer. The first call was for 100,000 and was followed by analogous appeals at short intervals. He has been criticized for not making greater use of the existing Territorial Army organizations in the early days—the numbers at the Front might conceivably have, within narrow limits, been increased more rapidly had he done so. He had resolved to transform Great Britain into a great military Power while the struggle was actually in progress and success eventually crowned his efforts. If clothing and equipping the swarms of new armies presented obstacles at first, the skilfully tapped textile wealth of the country overcame them within a short space of time.

He had no easy task at the War Office, coming there as he did for the first time. There was no precedent for a great soldier occupying the position at a moment of great emergency. He was not familiar with the various ramifications of the existing military organizations. But, on the other hand his countrymen trusted him and were roused to enthusiasm by the magic of his name and his strength of character.

Of the great difficulties which beset the Secretary for War, perhaps the greatest and the most discussed was that of providing guns and ammunition for a constantly and rapidly increasing army. For the history of the provision of munitions for the army and the controversies arising out of it *see* MUNITIONS OF WAR. Before the end of the War, Kitchener's work was challenged in some quarters on this point; the answer furnished by the dossier of the master-general of ordnance presented a defence of the War Office, whence, as a matter of fact, came the first proposal of high explosive for use in France. To be precise, the Ministry of Munitions was set up during the first week of June 1915. It was not until the end of Oct. 1915 that a single component of ammunition worth speaking of was delivered from the Ministry of Munitions factories or orders, and not until April 1916 that the first complete round, made and filled under the orders and arrangements of the Ministry, was delivered to the army authorities. In other words, the army, for a period of more than 18 months, was furnished with continually increasing supplies under the former arrangements.

If Kitchener did not travel quite easily on political lines, his close personal touch with England's Allies was not the least of his contributions to the War, and his early and constant friendship with France gave him, so to speak, a flying start in gaining the best relationships with her public servants. Russia's rôle was to him a matter of vital importance if the War was to be brought even within his own three years' limit; but in the autumn of 1915 he said to Joffre at Chantilly, "You are calculating on Russia remaining till the end of the War; I am making my calculations on her being out within six months." He had not been afraid to commit himself to serious responsibilities as to arming and equipping the almost weaponless Russian hosts, but even so it is difficult to account for his great influence throughout Russia. He was thus able to criticise Russian methods with a freedom and to press his advice—more especially at the critical moment when Italy was hanging back—with an insistence that would have been tolerated at the hands of no other foreigner.

Proposed Visit to Russia.—Early in May 1916 the Tsar urged that Kitchener should visit Russia, promising that his counsel would be taken to the full even if that counsel included certain transfers of control into British hands. Kitchener was to start from Scapa Flow on June 5 for Archangel. He was asked to examine thoroughly the whole Russian situation: he was given a free hand to make arrangements and conditions which he thought advisable; he was to use all the influence which he had already acquired with the Tsar and the Russian military authorities to set the Russian military house in order, and he was asked to come back to England with all speed.

On the afternoon of the appointed day, Kitchener, having paid a visit to Lord Jellicoe on his flagship, embarked on the "Hampshire," which was directed to proceed on what, with the prevailing wind—as reported—would be the lee side of the Orkneys and Shetlands. The arrangements made for the voyage of the cruiser have been, and perhaps always will be, open to question. It is at least certain that an unswept channel was chosen for her passage and that, under stress of weather, the destroyers who formed her titular escort turned about, leaving the vessel, with her priceless freight, to steam to her doom. The "Hampshire" struck a mine, and went down with nearly all hands. The loss of Kitchener was felt to be a national calamity. The Queen-Mother at once placed herself at the head of a movement to secure a permanent and practical memorial, and in answer to her appeal there poured in from every point of the Empire—from men, women and children of all colours, classes and creeds—a stream of money, gathering in volume until it reached the astonishing sum of over £700,000. On Dec. 10, 1925 a memorial chapter in St. Paul's Cathedral was dedicated to Earl Kitchener and all who fell in 1914–8.

See Sir George Arthur, *Life of Lord Kitchener* (1920); also Churchill, *The River War* (1899), and the official records of the War in South Africa and the World War. An official narrative of the circumstances of his death, *The Loss of H.M.S. Hampshire* appeared in 1926.

KITCHENER, a city and port of Ontario, Canada, and the capital of Waterloo county, 58 m. W. of Toronto, on the Grand Trunk railway. It is the centre of a prosperous farming and manufacturing district, inhabited chiefly by German immigrants and their descendants, and was formerly called Berlin, the name being changed during the World War. The city contains a beet sugar refinery, automobile, leather, furniture, shirt and collar, felt, glove, button and rubber factories. Pop. (1921), 21,763.

KITCHENETTE, a small space, usually an alcove or closet, with a compact equipment for simple cooking for those who take most of their meals in restaurants. The specially designed miniature fittings may include an electric or gas stove, a cabinet for dishes and food, a sink with running water and a refrigerating

box. The kitchenette is now an integral part of the most luxurious suites in residential hotels and service apartments.

KITE, the name given to several birds of prey, including the common European species (*Milvus ictinus*), recognizable by its forked tail. Formerly extremely common in Britain, where it acted as a scavenger even in London, the kite is now restricted to a few localities in Wales and elsewhere, where it maintains a precarious foothold. On the European Continent, the kite is a summer visitor from Africa. Some 25–27in. long, the bird is pale reddish-brown, barred with black; the head is greyish-white. The nest is built of sticks, rags, etc., in the crotch of a large tree and contains three or four white eggs, spotted with brown and lilac.

INDIAN KITE

The smaller *M. ater* also inhabits Europe. *M. govinda* is the pariah kite of India, and other species of the genus occur in various parts of the Old World. The wide-ranging American swallow-tailed kite (*Elanoides forcatus*) is notable for the length of its wings and tail and its power of flight; the South European black-winged kite (*E. caeruleus*), a beautiful little bird, is its ally and others occur elsewhere. The Mississippi kite (*Ictinia mississippiensis*) belongs to an American genus. Other genera occur in South America.

KITE-FLYING, the art of sending up into the air, by means of the wind, light frames of varying shapes covered with paper or cloth (called kites, after the bird—in German *Drache,* dragon), which are attached to long cords or wires held in the hand or wound on a drum. When made in the common diamond form, or triangular with a semi-circular head, kites usually have a pendulous tail appended for balancing purposes. The tradition is that kites were invented by Archytas of Tarentum four centuries before the Christian era, but they have been in use among Asiatic peoples and savage tribes like the Maoris of New Zealand from time immemorial. Kite-flying has always been a national pastime of the Koreans, Chinese, Japanese, Tonkingese, Annamese, Malays and East Indians. It is less popular among the peoples of Europe. The origin of the sport, although obscure, is usually ascribed to religion. With the Maoris it still retains a distinctly religious character, and the ascent of the kite is accompanied by a chant called the kite-song. The Koreans attribute its origin to a general, who, hundreds of years ago, inspirited his troops by sending up a kite with a lantern attached, which was mistaken by his army for a new star and a token of divine succour. Another Korean general is said to have been the first to put the kite to mechanical uses by employing one to span a stream with a cord, which was then fastened to a cable and formed the nucleus of a bridge. In Korea, Japan and China, and indeed throughout Eastern Asia, even the tradespeople may be seen indulging in kite-flying while waiting for customers. Chinese and Japanese kites are of many shapes, such as birds, dragons, beasts and fishes. They vary in size, but are often as much as 7ft. in height or breadth, and are constructed of bamboo strips covered with rice paper or very thin silk. In China the 9th day of the 9th month is "Kites' Day," when men and boys of all classes betake themselves to neighbouring eminences and fly their kites. Kite-flying is a highly popular pastime in Eastern Asia. The cord near the kite is usually stiffened with a mixture of glue and crushed glass or porcelain. The kite-flyer manoeuvres to get his kite to windward of that of his adversary, then allows his cord to drift against his enemy's, and by a sudden jerk to cut it through and bring the kite to grief. The Malays possess a large variety of kites, mostly without tails. The Sultan of Johore sent to the Columbian Exposition at Chicago in 1893 a collection of 15 different kinds. Asiatic musical kites bear one or more perforated reeds or bamboos which emit a plaintive sound that can be heard for great distances. The ignorant, believing that these kites frighten away evil spirits, often keep them flying all night over their houses.

There are various metaphorical uses of the term "kite-flying," such as in commercial slang, when "flying a kite" means raising money on credit (*cf.* "raising the wind"), or in political slang for seeing "how the wind blows." And "flying-kites," in nautical language, are the topmost sails.

Kite-flying for scientific purposes began in the middle of the 18th century. In 1752 Benjamin Franklin made his memorable kite experiment, by which he attracted electricity from the air and demonstrated the electrical nature of lightning. A more systematic use of kites for scientific purposes may, however, be said to date from the experiments made in the last quarter of the 19th century. (E. Br.)

Meteorological Use.—Many European and American meteorological services employ kites regularly, and obtain information not only of the temperature, but also of the humidity and velocity of the air above. The kites used are mostly modifications of the so-called box-kites, invented by L. Hargrave. Roughly these kites may be said to resemble an ordinary box with the two ends removed, and also the middle part of each of the four sides. The original Hargrave kite, the form generally used, has a rectangular section; in Russia a semi-circular section with the curved part facing the wind is most in favour; in England the diamond-shaped section is preferred for meteorological purposes owing to its simplicity of construction. Stability depends on a multitude of small details of construction, and long practice and experience are required to make a really good kite. The sizes most in use have from 30 to 80sq ft. of sail area. There is no difficulty about raising a kite to a vertical height of one or even two miles on suitable days, but heights exceeding three miles are seldom reached. On Nov. 29, 1905, at Lindenberg, the Prussian Aeronautical Observatory, the upper one of a train of six kites attained an altitude of just 4 miles. The total lifting surface of these six kites was nearly 300sq ft., and the length of wire a little over 9 miles. The kites are invariably flown on a steel wire line, for the hindrance to obtaining great heights is not due so much to the weight of the line as to the wind pressure upon it, and thus it becomes of great importance to use a material that possesses the greatest possible strength, combined with the smallest possible size. Steel piano wire meets this requirement, for a wire of $\frac{1}{32}$ in. diameter will weigh about 16 lb. to the mile, and stand a strain of some 250–280 lb. before it breaks. Some stations prefer to use one long piece of wire of the same gauge throughout without a join, others prefer to start with a thin wire and join on thicker and thicker wire as more kites are added. The process of kite-flying is as follows: The first kite is started either with the self-recording instruments secured in it, or hanging from the wire a short distance below it. Wire is then paid out, whether quickly or slowly depends on the strength of the wind, but the usual rate is from two to three miles per hour. The quantity that one kite will take depends on the kite and on the wind, but roughly speaking it may be said that each 10sq ft. of lifting surface on the kite should carry 1000ft. of $\frac{1}{32}$ in. wire without difficulty. When as much wire as can be carried comfortably has run out another kite is attached to the line, and the paying out is continued; after a time a third is added, and so on. Each kite increases the strain upon the wire, and moreover adds to the height and makes it more uncertain what kind of wind the upper kites will encounter; it also adds to the time that is necessary to haul in the kites. In each way the risk of their breaking away is increased, for the wind is very uncertain and is liable to alter in strength. Since to attain an exceptional height the wire must be strained nearly to its breaking point, and under such conditions a small increase in the strength of the wind will break the wire, it follows that great heights can only be attained by those who are willing to risk the trouble and expense of frequently having their wire and train of kites break away. The weather is the essential factor in kite-flying. In the south-east of England in winter it is possible on about two days out of three, and in summer on about one day out of three. The usual cause of failure is want of wind, but there are a few days when the wind is too strong. (For meteorological results, etc., *see* Meteorology.) (W. H. D.)

Military Use.—A kite forms so extremely simple a method of lifting anything to a height in the air that it has naturally been suggested as being suitable for various military purposes, such as

signalling to a long distance, carrying up flags, or lamps, or semaphores. Kites have been used both in the army and in the navy for floating torpedoes on hostile postions. As much as two miles of line have been paid out. For purposes of photography a small kite carrying a camera to a considerable height may be caused to float over a fort or other place of which a bird's-eye view is required, the shutter being operated by electric wire, or slow match, or clockwork. Many successful photographs have been thus obtained in England and America.

The problem of lifting a man by means of kites instead of by a captive balloon is a still more important one. The chief military advantages to be gained are: (1) less transport is required; (2) they can be used in a strong wind; (3) they are not so liable to damage, either from the enemy's fire or from trees, etc., and are easier to mend; (4) they can be brought into use more quickly; (5) they are very much cheaper, both in construction and in maintenance, not requiring any costly gas.

Captain B. F. S. Baden-Powell, of the Scots Guards, in June 1894, constructed, at Pirbright Camp, a huge kite 36ft. high, with which he successfully lifted a man on different occasions. He afterwards improved the contrivance, using five or six smaller kites attached together in preference to one large one. With this arrangement he frequently ascended as high as 100ft. The kites were hexagonal, being 12ft. high and 12ft. across. The apparatus, which could be packed in a few minutes into a simple roll, weighed in all about 1 cwt. This appliance was proved to be capable of raising a man even during a dead calm, the retaining line being fixed to a wagon and towed along. Lieut. H. D. Wise made some trials in America in 1897 with some large kites of the Hargrave pattern (Hargrave having previously himself ascended in Australia), and succeeded in lifting a man 40ft. above the ground. In the Russian army a military kite apparatus has also been tried, and was in evidence at the manoeuvres in 1898. Experiments have also been carried out by most of the European powers. The German kite balloon invented by Parseval being very efficient.

(B. F. S. B.-P.)

KIT-FOX, a small fox (*Vulpes velox*) a native of north-western America, measuring less than a yard in length, inclusive of nearly a foot of tail. There is a good deal of variation in the colour of the fur, the prevailing tint being grey. The specific name was given on account of the swiftness of the animal.

KITING CHEQUES, a method of obtaining credit for funds at a bank, or of keeping up a fictitious balance by means of the deposit of a cheque backed by no funds or by insufficient funds. For example, A and B, having accounts in different banks, may exchange cheques to any amount, and each deposit the other's cheque in his own bank, trusting that neither will be presented for payment at the bank upon which it is drawn until the next day, or, if in distant cities, until several days have elapsed, before which time each person expects to make a deposit at his own bank to cover the cheque. The same thing is sometimes accomplished by a single person who, having accounts in two banks, deposits in one bank a cheque drawn against the other, in which there are not sufficient funds to cover the cheque, expecting to make good before the cheque is presented for collection. Many banks prevent this practice by declining to credit any cheque deposit until the collection has been made. (J. H. B.)

KITTANNING, a borough of western Pennsylvania, U.S.A., on the east bank of the Allegheny river, at 850ft. elevation, 50m. N.E. of Pittsburgh; the county seat of Armstrong county. It is on Federal highway 422, and is served by the Pennsylvania and the Pittsburgh and Shawmut railways. In 1910 the population was 4,311; in 1920, 7,153 (94% native white); and in 1928 it was estimated locally at over 10,000. River and wooded hills provide a beautiful setting. The region is rich in coal, gas, limestone, sandstone and clay, and an ample supply of electric power is available. The borough has important manufactures of pottery, brick, tile, oil and gas-well supplies and machinery. The assessed valuation of property in 1927 was $10,298,000. Kittanning took its name from the Kittanning Indian path across the State from east to west. A trading post was established here at an early date, and settlement began in 1795.

KITTIWAKE, the name on both sides of the Atlantic for the sea-gull *Rissa tridactyla,* in which the hind toe is reduced to a knob. It inhabits the north Atlantic. A subspecies *R. t. pollicaris* inhabits the N. Pacific south to Lower California. A second species, *R. brevirostris,* the red-legged kittiwake, is found in the Bering Sea. (*See* GULL.)

KITTO, JOHN (1804–1854), English biblical scholar, was the son of a mason at Plymouth, where he was born on Dec. 4, 1804. An accident brought on deafness, and in Nov. 1819 he was sent to the workhouse, where he was employed in making list shoes. He received assistance to obtain schooling, and was then employed by the Church Missionary Society. He spent some time as a missionary in Baghdad. After his return he published various popular works, of which the most important was the *Cyclopaedia of Biblical Literature* (2 vols., 1843–45) edited under his superintendence. In 1850 he received an annuity of £100 from the civil list. He died at Cannstatt on the Neckar, on Nov. 25, 1854.

See Kitto's own work, *The Lost Senses* (1845); J. E. Ryland, *Memoirs of Kitto* (1856); J. Eadie, *Life of Kitto* (1857).

KITZINGEN, a town of Germany, in the republic of Bavaria on the Main, 95 m. S.E. of Frankfort-on-Main on the railway to Regensburg. Pop. (1925) 10,272. Kitzingen possessed a Benedictine abbey in the 8th century, and later belonged to the bishopric of Würzburg. It is still surrounded by its old walls and towers, and has two old convents. Its chief industries are brewing, cask-making, the spinning of horsehair and the manufacture of cement and colours. Considerable trade in wine, fruit, grain and timber is carried on by boats on the Main.

KIUKIANG, a treaty port of China on the Yang-tze midway in its course between the Central (Hupeh) Basin and the Delta. Lying just above the debouchure into the Yang-tze of the Po-yang lake, which receives the drainage of Kiangsi, the port gathers up much but not all of the Yang-tze trade of the province. It is also linked by rail directly with Nanchang, its commercial focus and capital. Behind the port there rise the ranges of the Kiu-kung-shan, the chief tea-growing district of Kiangsi, for whose teas Kiukiang is the collecting centre. These are green teas and are gathered up by Hankow for export to Russia. While tea is the main item in the port's export trade, porcelain, paper and grass-cloth, the more important manufactured products of Kiangsi, also pass through Kiukiang. Kiukiang itself has a couple of factories of modern type. In 1926 the total trade of the port was Hk. Tls. 56,034,253, making it the twelfth among Chinese ports. On the slopes of the ranges behind Kiukiang is the little mountain summer resort of Kuling, frequented by the European population of the Yang-tze Valley.

KIUSTENDIL: *see* KYUSTENDIL.

KIVU, a large lake of central Africa, lying in the western rift valley and mid-way between Lakes Edward and Tanganyika; it discharges into the latter by the river Russisi. It is 55 m. long and 30 m. wide at its widest point. It is about 4,830 ft. above sea-level and is roughly triangular in outline, the longest side lying to the west. The coast-line is much broken, especially on the south-east, where the indentations have a fjord-like character. The rift valley has dropped down Archaean gneisses and schists but both north and south of the lake are volcanic centres (the lavas are phonolites, etc.) some of which are still active. The lake, is deep, and the shores are everywhere high, rising in places in bold precipitous cliffs of volcanic rock. A large island, Kwijwi runs in the direction of the major axis of the lake, south-west of the centre, and there are many smaller islands. The lake has many fish, but no crocodiles or hippopotami. South of Kivu the rift valley is blocked by huge ridges, through which the Russisi now breaks its way to descend 2,000 ft. to the lacustrine plain at the head of Tanganyika. The lake fauna is fresh-water, presenting no affinities with the so-called marine fauna of Tanganyika, but is similar to that shown to have existed in the more northern parts of the rift valley. The former outlet or extension in this direction seems to have been blocked in recent geological times by the elevation of the volcanic peaks. This volcanic region is of great interest and has various names, that most used being Mfumbiro (*q.v.*). Kivu and Mfumbiro were first heard of by J. H. Speke

in 1861, and first visited by a European, Count von Götzen, in 1894. The lake now lies entirely in the Belgian Congo.

BIBLIOGRAPHY.—R. Kandt, *Caput Nili* (Berlin, 1904) and *Karte des Kivusees*, 1: 285,000, with text by A. v. Bockelmann (Berlin, 1902); E. S. Grogan and A. H. Sharpe, *From the Cape to Cairo* (London, 1900); J. E. S. Moore, *The Tanganyika Problem* (1903); A. St. H. Gibbons, *Africa from South to North*, ii. (London, 1904); Sir A. Sharpe, "The Kivu Country," *Geogr. Journ.* (1916); C. G. Stigand and A. Holmes, "Structure of the Tanganyika—Nile Rift Valley," *Geogr. Journ.* (1919).

KIWANIS, an international organization of business and professional men interested in "promoting the adoption and application of higher social, business, and professional standards," and in the development of "intelligent, aggressive and serviceable citizenship." Practically every city, town and village in the United States has a Kiwanis club; the activities of these clubs are recorded in the Kiwanis magazine.

KIWI, the name of the New Zealand flightless birds of the genus *Apteryx*, forming a group of the section *Ratitae* (*q.v.*). The wings are almost entirely aborted; the nostrils are at the tip of the maxilla; the feathers have no aftershaft; and a back toe is present. Three species are known, *A. mantelli* of the North Island, *A. australis* from the South Island, and *A. oweni*, occurring in both. They are brown birds, about the size of a domestic fowl, with a long beak, and feed largely on earthworms. They are nocturnal in habit and can run swiftly. When brought to bay, they use the sharp claws on the feet as weapons. They are now rare. The egg is, relative to the size of the bird, the largest laid by any living species.

THE KIWI, THE NOCTURNAL FLIGHTLESS BIRD OF NEW ZEALAND

KIZILBASHES, a nickname meaning "Redheads" given by the Orthodox Turks to the Shiitic Turkish immigrants from Persia, who are found chiefly in the plains from Kara-Hissar along Tokat and Amasia to Angora. There are also many Kizilbashes in Afghanistan. The name seems to have been first used in Persia for the Shiites in allusion to their red caps. Their immigration dates from 1737. They are an industrious honest folk

See Ernest Chantre, *Recherches anthropologiques dans l'Asie occidentale* (Lyons, 1895).

KIZIL IRMAK, *i.e.*, "Red River" (anc. *Halys*), the longest river in Asia Minor, rising in the Kizil Dagh at an altitude of 6,500 ft., and running south-west past Zara to Sivas and on to Kaisarie In this section of its course it follows roughly the old East to West drainage of the Anatolian plateau. From the neighbourhood of the Tuz Geul it turns north-north-eastwards to the Black Sea. This section of its course represents the newer drainage scheme of the plateau occasioned by the gradual subsidence of the southern section of the Black Sea. In the neighbourhood of Osmanjik and Vezir Keupri further sections of older lines of weakness are visible in its course. The Kizil Irmak discharges into the Black Sea between Sinope and Samsun, where it forms a large delta The only important tributaries are the Delije Irmak, showing a similar structural pattern in its course flowing in on the right, and the Geuk Irmak on the left bank. The total length of the Kizil Irmak is about 600 miles.

KIZIL-KUM, a desert in Asiatic Russia, in the Kazakstan A.S.S.R., stretching south-east of the Aral sea between the river Syr darya on the north-east and the river Amu-darya on the south-west. It measures some 370 by 220 m., and is in part covered with drift-sand or dunes, many of which are advancing slowly but steadily towards the south-west. In character they resemble those of the neighbouring desert of Kara-kum (*q.v.*). On the whole the Kizil-kum slopes south-west towards the Aral sea, where its altitude is only about 160 ft. as compared with 2,000 in the south-east. In the vicinity of that lake the surface is covered with Aralo-Caspian deposits; but in the south-east, as it ascends towards the foothills of the Tian-shan system, it is braided with deep accumulations of fertile loess.

KIZLYAR (Kisliar or Kizlar) is a town in the Daghestan A.S.S.R., in the low-lying delta of the Terek river, left of the main stream, between two of the larger secondary branches. The bed of the river is above the level of the town and floods are frequent. The town is 35 m. inland from the Caspian, in lat. 43° 51′ N. long. 46° 40′ E. The population (1926) 9,514 is mainly supported by gardens and vineyards irrigated by canals from the river. Kizlyar wine is famous and finds a ready market at Nizhni-Novgorod fair. A government vineyard and school of viticulture are situated 3½ m. from the town. The town proper, which spreads out round the citadel, has Tatar, Georgian and Armenian quarters. The public buildings include the Greek cathedral, dating from 1786; a Greek nunnery, founded by the Georgian chief Daniel in 1736; the Armenian church of SS. Peter and Paul, remarkable for its size and wealth. Kizlyar is mentioned as early as 1616, but the most notable accession of inhabitants (Armenians, Georgians and Persians) took place in 1715. Its importance as a fortress dates from 1736, but the fortress is no longer kept in repair. The district between the Terek and the Kuma is known as the Kizlyar steppe; in the north it provides grazing specially suitable for sheep, while in the south, where there is a good irrigation system, maize, wheat, fruits and vine are grown. It is planned to settle 10,000 hill people from the poverty stricken regions of southern Daghestan in the Kizlyar steppe within the next five years (1928–33); some have already been settled there.

KJERULF, THEODOR (1825–1888), Norwegian geologist, was born at Oslo on March 30, 1825, and died there on Oct. 25, 1888. He worked under Bunsen at Heidelberg, and in 1858 became professor of geology at Oslo. The results of his study of Norwegian geology, especially in southern Norway, are embodied in his *Udsigt over det sydlige Norges Geologi* (1879).

KLABUND, pseudonym of ALFRED HENSCHKE (1891–1928), German poet, who was born at Krossen (Oder) on Nov. 4, 1891, and died on Aug. 14, 1928, at Davos, of tuberculosis. In his short life he made a great name in contemporary German literature His works include volumes of verse, *Morgenrot* (1913), *Klabunds Karussel* (1914), *Die Himmelsleiter* (1916), and others, from which a selection, *Gedichte*, appeared in 1926.

Klabund also wrote novels, mainly on historical subjects, ranging from *Mohammed* (1917) to *Pjotr* (Peter the Great, 1923). Among his plays may be mentioned especially the *Kirschblütenfest*, the Japanese play produced originally at Hamburg with an exquisite setting, and the Chinese play *Kreidekreis*, produced at Meissen in 1924. Among his latest dramas was *Cromwell* (1926).

KLACZKO, JULIAN (1825–1906), was born at Wilno in 1825. He studied at Heidelberg university, and early proved his literary and linguistic ability by articles written in German, mainly on the Russo-Polish question, and by his brochure *Die Deutschen Hegemonen* (1849). In 1849 he went to Paris, where he made his fame by his brilliant contributions on literature, politics and art to the Polish and French press, notably to the *Revue des Deux Mondes* in which most of his subsequently published books first appeared. His article "La Poésie Polonaise au Dix-Neuvième Siècle et le Poète Anonyme" (*Revue des Deux Mondes*, Jan. 1, 1862) remains one of the finest existing criticisms on the poet Krasinski. From that date Klaczko wrote almost exclusively in French. At the same time he took an active part in the national and literary life of the Polish exiles in Paris, frequently employing his pen in behalf of the Polish cause, especially during the Rising of 1863. His national sympathies led him to a close study of contemporary politics, the chief fruits of which were: *Études de Diplomatie Contemporaine* (Paris, 1866), an exposure of Bismarck's policy which created a considerable impression at the time, and *Deux Chanceliers* (1876). From 1869 to 1870 he was attached to the Austrian foreign ministry. After the Austro-Prussian and Franco-Prussian wars, Klaczko, despairing of support for Poland from either France or Austria, abandoned his political studies, and devoted himself to Italian literature and art. He wrote two very popular books on these subjects: *Causeries Florentines* (1880), crowned by the Académie Française, and

Rome et la Renaissance (1898). He died in Cracow in 1906. His works are characterized by their piercing insight and mordant wit, and by the fascination of his style.

KLADNO, mining town of Bohemia, Czechoslovakia, 18 m. W.N.W. of Prague, is of recent growth due to the coal deposits of the Kladno-Rakovnik field. Prior to 1842 it was a village of no importance. It has now large iron and steel foundries. Pop. (1923) 19,111.

KLAFSKY, KATHARINA (1855–1896), Hungarian operatic vocalist, was born at Szt János, Wieselburg, of humble parents, and began life as a nurserymaid, but became none the less one of the first Wagnerian singers of her generation. In 1892 she appeared in London, and had great success as Brünnhilde and Isolde. She sang in America in 1895 as a member of Damrosch's company and took New York by storm.

A *Life,* by L. Ordemann, was published in 1903 (Leipzig).

KLAGENFURT, the capital of the province of Carinthia, Austria, in a fertile basin and on the right bank of the Glan. It is a well-planned town with broad, regular streets and large squares and as the centre of a rich agricultural and mining region is important both for its market and its manufactures. The latter include iron and machine foundries, and white lead factories. Communication with the Wörther-see is maintained by the Lend canal, 2½ m. long, railway and tramway. Much of the modern aspect of this old town is due to the rebuilding necessitated through destructive fires in 1535, 1636, 1723 and 1796, but it has preserved some of its early buildings, notably the 14th century *Landhaus* or house of assembly, which contains a museum of natural history and antiquities and an art gallery. There are, too, a number of churches, the oldest being the parish church of St. Aegidius (1709) with a fine tower 298 ft. in height. Amongst the most beautiful of its open spaces is the Botanical gardens. During the Middle Ages Klagenfurt became the property of the crown, but by a patent of Maximilian I. of April 24, 1518, it was conceded to the Carinthian estates. Pop. (1923) 27,423.

KLAJ (Latinized CLAJUS), **JOHANN** (1616–1656), German poet, was born at Meissen, Saxony, studied at Wittenberg, and went to Nuremberg as a "candidate for holy orders." There, in conjunction with Georg Philipp Harsdörffer, he founded in 1644 the literary society known as the Pegnitz order. In 1647 he received an appointment as master in the Sebaldus school in Nuremberg, and in 1650 became preacher at Kitzingen, where he died in 1656. Klaj's poems consist of mystery plays among which are *Höllen- und Himmelfahrt Christi* (Nuremberg, 1644), and *Herodes, der Kindermörder* (Nuremberg, 1645); and a poem, written jointly with Harsdörffer, *Pegnesische Schäfergedicht* (1644), which gives in allegorical form the story of his settlement in Nuremberg

See J. Tittmann, *Die Nürnberger Dichterschule* (Göttingen, 1847).

KLAMATH FALLS, a city of Oregon, U.S.A., 20 m. from the southern boundary of the State; county seat of Klamath county. It is on Federal highway 97 and is served by the Southern Pacific and the Great Northern railways. The population was 447 in 1900; 4,801 in 1920 (90% native white); and was estimated locally at over 13,000 in 1928. It is beautifully situated, 4,100 ft. above sea-level, on the Upper Klamath lake (37 m. long and 4–5 m. wide). Mt. Shasta is visible in the distance. It is the distributing point for the agricultural and lumbering industries of the county, which have 140,000 ac. under irrigation and a stand of pine timber estimated at 30,000,000,000 ft. The city has large saw-mills and manufactures great quantities of box boards. Crater lake is 62 m. N.; the Klamath Indian reservation, 40 m. N.; and the Modoc lava beds, in California, to the south-east. The city was founded about 1878.

KLAPKA, GEORG (1820–1892), Hungarian soldier, was born at Temişoara (Temesvár) on April 7, 1820, and entered the Austrian army in 1838. Immediately on the formation of the National Hungarian army in 1848, he offered his services, and was at first employed on staff duties; then early in 1849, given command of a corps, he took a conspicuous share in the victories of Kapólna, Isaszeg, Waitzen, Nagy Sarlo and Komárom. Later, after a short period as minister of war, Klapka took command at Komárom, from which fortress he conducted many successful expeditions until the capitulation of Világos in August put an end to the war in the open field. He then brilliantly defended Komárom for two months, and finally surrendered on honourable terms. Klapka left the country at once, and lived thenceforward for many years in exile, at first in England and afterwards chiefly in Switzerland. He continued to work for Hungarian independence, especially at moments of European war, such as 1854, 1859 and 1866, when an appeal to arms seemed possible. After the war of 1866 (in which as a Prussian major-general he organized a Hungarian corps in Silesia) Klapka was permitted to return to Hungary, and in 1867 was elected to the Hungarian Chamber of Deputies, as a supporter of Deák. In 1877 he attempted to reorganize the Turkish army in view of the war with Russia. He died at Budapest, May 17, 1892.

He wrote *Memoiren* (Leipzig, 1850); *Der Nationalkrieg in Ungarn,* etc. (Leipzig, 1851); a history of the Crimean War, *Der Krieg im Orient . . . bis Ende Juli 1855* (Geneva, 1855); and *Aus meinen Erinnerungen* (translated from the Hungarian, Zürich, 1887).

KLAPPENHORN, a horn resembling a bugle, that is, fitted with keys to govern the length of tube used, and thus make the different notes sounded. (*See* BUGLE.)

KLAPROTH, HEINRICH JULIUS (1783–1835), German Orientalist and traveller, was born in Berlin on Oct. 11, 1783, the son of the chemist Martin Heinrich Klaproth (*q.v.*). He received an appointment in the St. Petersburg Academy, and in 1805 accompanied Count Golovkin on an embassy to China. On his return he was despatched by the academy to the Caucasus on an ethnographical and linguistic exploration (1807–1808), and was afterwards employed for several years in connection with the academy's Oriental publications. In 1812 he moved to Berlin; but in 1815 he settled in Paris, and in 1816 Humboldt procured him from the king of Prussia the title and salary of professor of Asiatic languages and literature, with permission to remain in Paris as long as was requisite for the publication of his works. He died in that city on the 28th of August 1835

Klaproth's great work *Asia polyglotta* (Paris, 1823 and 1831, with *Sprachatlas*), though now superseded, was a *résumé* of all that was known on the subject, and formed a new departure for the classification of the Eastern languages, more especially those of the Russian Empire.

Klaproth's other works include: *Reise in den Kaukasus und Georgien in den Jahren 1807 und 1808* (Halle, 1812–14; French translation, Paris, 1823); *Geographisch-historische Beschreibung des östlichen Kaukasus* (Weimar, 1814); *Tableaux historiques de l'Asie* (Paris, 1826); *Mémoires relatifs à l'Asie* (Paris, 1824–28); *Tableau historique, geographique, ethnographique et politique de Caucase* (Paris, 1827); and *Vocabulaire et grammaire de la langue géorgienne* (Paris, 1827). The *Itinerary of a Chinese Traveller* (1821) is spurious.

KLAPROTH, MARTIN HEINRICH (1743–1817), German chemist, was born at Wernigerode on Dec. 1, 1743. During a large portion of his life he followed the profession of an apothecary, and from 1782 he was pharmaceutical assessor of the Ober-Collegium Medicum in Berlin. In 1787 he was appointed lecturer in chemistry to the Royal Artillery, and when the university was founded in 1810 he was selected to be the professor of chemistry. He died in Berlin on Jan. 1, 1817. Klaproth was the leading chemist of his time in Germany. He was an exact and conscientious worker and did much to improve and systematize the processes of analytical chemistry and mineralogy; his appreciation of the value of quantitative methods led him to become one of the earliest adherents of the Lavoisierian doctrines outside France. He was the first to discover uranium, zirconium, cerium and titanium, and to characterize them as distinct elements, though he did not obtain any of them in the pure metallic state. He elucidated the composition of numerous substances till then imperfectly known, including compounds of the then newly recognized elements: tellurium, strontium, beryllium and chromium.

His papers, over 200 in number, were collected by himself in *Beiträge zur chemischen Kenntniss der Mineralkörper* (1795–1810) and *Chemische Abhandlungen gemischten Inhalts* (1815). He also published a *Chemisches Wörterbuch* (1807–1810), and edited a revised edition of F. A. C. Gren's *Handbuch der Chemie* (1806).

KLAUSTHAL, a town of Germany, in the Prussian province of Hanover, lying on a bleak plateau, 1,860 ft. above sea-level, W.S.W. of Halberstadt. Pop. (1925) 12,370. Klausthal was founded in the 12th century around a Benedictine monastery (closed in 1431), remains of which still exist in Zellerfeld. At the beginning of the 16th century the dukes of Brunswick made a new settlement here, and under their directions the mining, which had been begun by the monks, was carried on more energetically. The first church was built in 1570. In 1864 the control of the mines passed into the hands of the state. Klausthal is the chief mining town of the Upper Harz Mountains, and practically forms one town with Zellerfeld, which is separated from it by a small stream, the Zellbach. It has a mining college and a disused mint. Its chief mines are silver and lead, but it also smelts other ores.

KLÉBER, JEAN BAPTISTE (1753–1800), French general, the son of a builder, was born on March 9, 1753, at Strasbourg. He was trained as an architect, but obtained a nomination to the military school of Munich. Thence he obtained a commission in the Austrian army, but resigned it in 1783. Returning to France he was appointed inspector of public buildings at Belfort, where he studied military science. In 1792 he enlisted in the Haut-Rhin volunteers, and soon became lieutenant-colonel. At the defence of Mainz he so distinguished himself that though imprisoned with the rest of the garrison, he was promptly reinstated, and in Aug. 1793 promoted general of brigade. He was made general of division for his services in La Vendée, where his intimacy with Marceau began, but was later recalled for advocating lenient measures towards the Vendéans. In 1794 he was reinstated and sent to the army of the Sambre-et-Meuse, distinguishing himself particularly at Fleurus and in the siege of Mainz (1794–95). In the offensive campaign of 1796 he was Jourdan's most active and successful lieutenant. After the retreat to the Rhine (*see* FRENCH REVOLUTIONARY WARS) Kléber declined the chief command and retired early in 1798. He accepted a division in the expedition to Egypt under Bonaparte, but, owing to a head wound which he received at Alexandria, was afterwards appointed governor of Alexandria, as he was unable to take any further part in the campaign.

In the Syrian campaign of 1799 he won the great victory of Mount Tabor on April 15, 1799. When Napoleon returned to France towards the end of 1799 he left Kléber in command of the French forces, when he was forced to make the convention of El-Arish. But when Lord Keith, the British admiral, refused to ratify the terms, he defeated the Turks at Heliopolis, with but 10,000 men against 60,000, on March 20, 1800. He then retook Cairo, which had revolted from the French. He was assassinated at Cairo by a fanatic on June 14, 1800. Kléber was undoubtedly one of the greatest generals of the French revolutionary epoch, though he distrusted his powers and declined the responsibility of supreme command. His conduct of affairs in Egypt at a time when the treasury was empty and the troops were discontented for want of pay, shows that his powers as an administrator were little —if at all—inferior to those he possessed as a general.

Ernouf, the grandson of Jourdan's chief of staff, published in 1867 a valuable biography of Kléber. *See* also Reynaud, *Life of Merlin de Thionville;* Ney, *Memoirs;* Dumas, *Souvenirs;* Las Casas, *Memorial de Ste Hélène;* J. Charavaray, *Les Généraux morts pour la patrie;* General Pajol, *Kléber;* lives of Marceau and Desaix; M. F. Rousseau, *Kléber et Menou en Egypte* (1900).

KLEBS, EDWIN (1834–1913), German physician, was born at Königsberg on Feb. 6, 1834. He became assistant to Virchow at the Pathological institute, Berlin (1861–66), and subsequently professor of pathological anatomy at Berne (1866), Würzburg (1871), Prague (1873) and Zurich (1882). He died at Berne on Oct. 23, 1913. Garrison (*Hist. of Med.*) calls him "with Pasteur perhaps the most important precursor in the bacterial theory of infection." Klebs discovered with Löffler the diphtheria bacillus, investigated traumatic infections, malarial fever and the bacteriology of gunshot wounds, and was the first to produce tuberculous lesions in animals.

His chief works are two text-books on pathology (1869 and 1887).

KLEIN, FELIX (1849–1925), German mathematician, was born at Dusseldorf on April 25, 1849, and after studying at the universities of Bonn, Göttingen and Berlin was appointed professor of mathematics at the University of Erlangen (1872–75). He later took up similar professorships at the Munich technical college (1875–80), and at the universities of Leipzig (1880–86) and Göttingen (1886–1913), and finally became Professor Emeritus at the latter university. He died at Göttingen on June 22, 1925.

Klein wanted to specialize in the application of mathematics and mechanics to physics, but was obliged to modify his plans owing to the breakdown of his health on two occasions. He limited himself to lectures and to the large number of books which he published. Most of these books were notes of lectures taken by Klein's students, revised and supervised by him. To further his idea of linking up mathematics with physics he founded the *Encyklopädie* for mathematics in 1895, he formed a committee from the German academies to accept responsibility for it and obtained contributors from many countries. Klein was the editor of the *Mathematische Annalen* from 1872. Klein's researches in mathematics were chiefly on geometry and the theory of functions, he supervised the collection and publication of his papers in three volumes (1921–23) and added an account of his mathematical development with many personal references. His well-known treatise on the teaching of mathematics in Germany appeared in 1909. Klein was a member of many learned societies and was awarded the Copley Medal of the Royal Society in 1912. He travelled a good deal and lectured both in England and in America.

Among Klein's other works should be mentioned *Vorlesungen über das Ikosaeder und die Auflösungen der Gleichungen vom funften Grad* (1884), *Vortäge über ausgewählte Fragen der Elementargeometrie* (1895), *Theorie der elliptischen Modulfunctionen* with Fricke (2 vols. 1890 and 1892); *Vorlesungen uber die Theorie der automorphen Functionen* with Fricke (2 vols. 1897 and 1902), *Erlangen Programm* (1872) and a monumental treatise on the theory of the top, with Sommerfeld (1897–1910), His *Vorlesungen uber die Entwicklung der Mathematik in 19 Jahrhundert* was published posthumously (2 vols., 1926 and 1927).

KLEIST, BERND HEINRICH WILHELM VON (1777–1811), German poet, dramatist and novelist, was born at Frankfort-on-Oder on Oct. 18, 1777. After a scanty education, he entered the Prussian army in 1792, served in the Rhine campaign of 1796, and retired from the service in 1799 with the rank of lieutenant. He next studied law and philosophy in his native city, and in 1800 entered the Ministry of Finance at Berlin. Next year his roving, restless spirit got the better of him, and taking leave of absence he visited Paris and other places with his sister, and then settled in Switzerland, on Lake Thun, with the intention of developing his talent in quiet communion with nature. The decision cost him the love of Wilhelmina von Zenge, to whom he had been betrothed. In Switzerland he found friends in Heinrich Zschokke (*q.v.*), and August Wieland (1777–1819), son of the poet; and to them he read the draft of his first drama, a gloomy tragedy of the *Sturm und Drang* type, in which his genius was already apparent, *Die Familie Schrofenstein* (1803), originally entitled *Die Familie Ghonorez.*

In the autumn of 1802 Kleist returned to Germany; he visited Goethe, Schiller and Wieland in Weimar. At Weimar he began to work on his play *Robert Guiscard,* but was so discouraged that he began to doubt his own powers. He then wandered to Leipzig, Dresden and Paris. In Paris in an attack of nerves bordering on madness he burnt the MS. of his play, of which only the first act was saved. On returning to Berlin in 1804 he was transferred to the *Domänenkammer* (department for the administration of crown lands) at Königsberg. There he found Wilhelmina von Zenge married to Professor Krug. At Königsberg he wrote the comedy *Der zerbrochene Krug,* a classic in German comedy. On a journey to Dresden in 1807 Kleist was arrested by the French as a spy, and being sent to France was kept for six months a close prisoner at Châlons-sur-Marne. He was released in July, and in August returned to Dresden, where, with Heinrich Müller (1779–1829), he published in 1808 the journal *Phöbus,* in which many of his poems and the tragedy *Penthesilea* appeared.

In 1809 he went to Prague, and ultimately settled in Berlin, where he edited (1810–11) the *Berliner Abendblätter*, which combatted the policy of Hardenberg. Meanwhile he had written the romantic drama *Das Käthchen von Heilbronn* (1808), and some admirable short tales, among them *Michael Kohlhaas*, a story of the days of Luther, which is a landmark in German fiction. The great works of his Berlin period only appeared (*Kleists hinterlassene schriften*, ed. Tieck, 1821) after his death; they were the patriotic drama *Die Hermannschlacht* (1809), in which Varus and the Romans are but names for Napoleon and the French, and *Prinz Friedrich von Homburg*, the scene of which is laid in the time of the great elector. The full history of the tragic close of Kleist's life is not clear. He was embittered by the cool reception given to some of his work, and the closing down of the *Abendblätter* reduced him to poverty. He had a fatal passion for Henriette Vogel, and shot first the lady and then himself on the shore of the Wannsee near Potsdam, on Nov. 21, 1811.

His *Gesammelte Schriften* were published by Ludwig Tieck (3 vols., 1826) and in many other editions, including a critical edition by E. Schmidt (5 vols., 1904–05). His *Ausgewählte Dramen* were published by K. Siegen (Leipzig, 1877); and his letters by E. von Bülow, *Heinrich von Kleists Leben und Briefe* (1848).

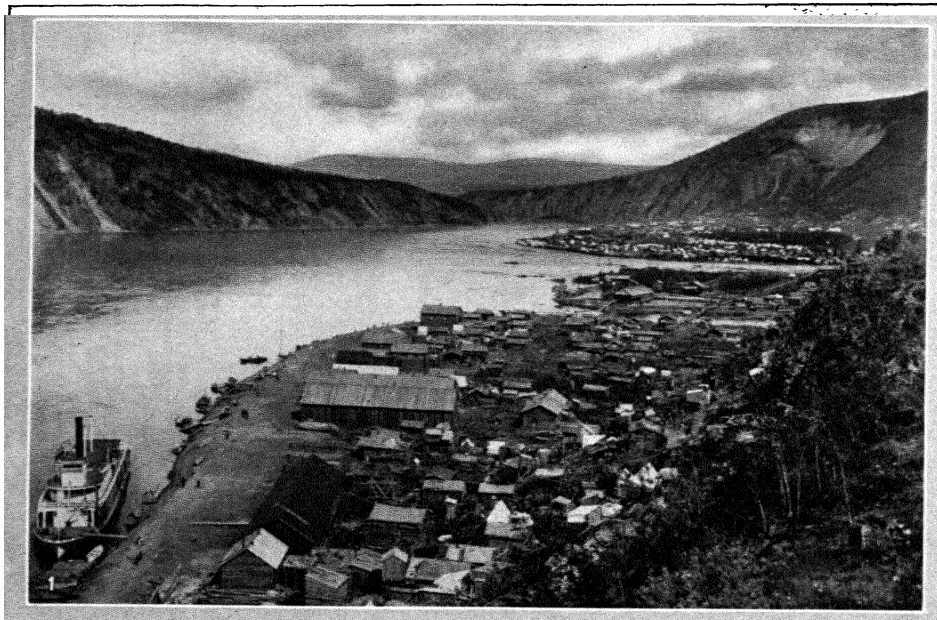
KLEIST, EWALD CHRISTIAN VON (1715–1759), German poet, was born at Zeblin, near Köslin in Pomerania, on March 7, 1715. After attending the Jesuit school in Deutschkrona and the gymnasium in Danzig, he proceeded in 1731 to the university of Königsberg, where he studied law and mathematics. On the completion of his studies, he entered the Danish army, in which he became an officer in 1736. He served in the Prussian army from 1740 onwards. In the course of his garrison duties he met J. W. L. Gleim (*q.v.*) at Potsdam and Lessing at Leipzig. He was mortally wounded at Kunersdorf (Aug. 12, 1759), and died at Frankfort-on-Oder on the 24th. Kleist's chief work is a poem in hexameters, *Der Frühling* (1749), for which Thomson's *Seasons* largely supplied ideas. In his description of the beauties of nature Kleist shows real poetical genius, an almost modern sentiment and fine taste. He also wrote some charming odes, idylls and elegies, and a small epic poem *Cissides und Paches* (1759), the subject being two Thessalian friends who die an heroic death for their country in a battle against the Athenians.

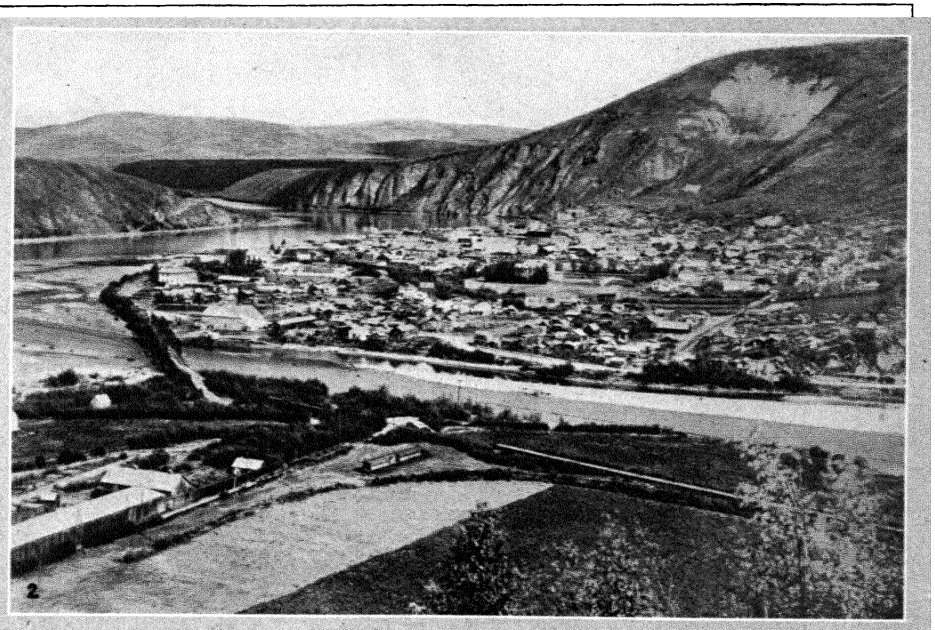
Kleist published in 1756 the first collection of his *Gedichte*, which was followed by a second in 1758. After his death his friend K. W. Ramler published an edition of *Kleists sämtliche Werke* in 2 vols. (1760). A critical edition, which includes his correspondence, was published by A. Sauer, in 3 vols. (1880–1882). *Cf.* further, A. Chuquet, *De Ewaldi Kleistii vita et scriptis* (Paris, 1887), and H. Pröhle, *Friedrich der Grosse und die deutsche Literatur* (1872).

KLEMANTANS. The word Klemantan is the name by which no tribe or set of tribes is called, but is a convenient generic term devised, at the suggestion of the writer, by the Cambridge university expedition of 1898 to comprise a large group possessing certain common characteristics. It is derived from the term Pulo Klemantan (Mango island) the name given to Borneo by the Malays. Klemantans number, perhaps, as many as 1,500,000, or more than a third of the pagan population of the island, most of them being found in Dutch Borneo, but both there and elsewhere chiefly on the lower reaches of the rivers. Their numbers and variations have made anything more than a general classification impossible, their chief characteristic being (as might be expected in so large a group), mediocrity, or an absence of any specially typical features.

Generally speaking, the Klemantan gives the impression of belonging to a highly civilized community; he is, usually, of medium stature, well proportioned, and graceful, with well-shaped and well-balanced features, a good mouth, eyes, and skin, and a pleasing expression. In manner he is somewhat gentle and quiet, seldom boisterous or pushing, and rarely emphatic in speech, for he commonly thinks before he speaks or acts. He is careful, intelligent, and sociable, and the keynote of his character is imitativeness and receptiveness. For this reason any culture that he has, has been acquired. He very often becomes, by conversion to Islam, a Malay, and in some cases adopts the customs of Mohammedans before actually becoming one; having embraced Islam, he easily settles down as a respectable citizen. His affinities lie most with the Kenyahs, a Kenyah-Klemantan mixture being common in the northern part of the island.



The Klemantan is usually a poor farmer, not depending altogether upon his own crops for his needs. In the minor arts, such as carving, bead-work, and the plaiting and lashing of rattans for various purposes, he excels. As a maker of swords, spears, and boats he is inferior to both the Kayan and the Kenyah. He may be said to have adopted, with modifications, a number of the arts, crafts, and various activities of the other tribes, without improving upon them; being indolent by nature, he looks for labour-saving devices rather than efficiency or excellence; and what he lacks in energy and thoroughness, he makes up for in versatility. *See* BORNEO; also C. Hose and W. McDougall, *The Pagan Tribes of Borneo* (1912). (C. H.)



KLERK, M. DE (1884–1923), Dutch artist, leader of a group of architects working in Amsterdam and interested mainly in building apartment houses. Disregarding Cuipers's watchword—rational building—he desired only to give form to his poetic vision. His work is the expression of feeling, intuitively controlled, and imitation of it, always tempting, has been the more dangerous for this absence of intellectualism. He collaborated with Kramer and van der Mey in the Shipping house in Amsterdam in 1913; since then his greatest works have been numerous housing-blocks in that city, completed respectively in 1913, 1914, 1917, 1920 and 1922, of which that of 1917 is perhaps the most individual and that of 1920 the most acceptable. De Klerk went very far in construction, and it is important to consider the swing and rhythm of his buildings as a whole without allowing the sometimes excrescent detail to become a distraction. It has been said by Micras that de Klerk and W. M. Dudok, municipal architect of Hilversum, where he has erected some notable public buildings, represent the two extremes of the contemporary Dutch movement. But Dudok, who works in unbroken masses of concrete with a masterly use of variation in the height of the grouped masses, however different his means of expression, undoubtedly resembles de Klerk in working from poetic inspiration. The colder and more intellectual work of the Rotterdam architects is in greater essential contrast. Among the Amsterdam group somewhat influenced by de Klerk's manner are P. L. Kramer (*q.v.*); C. J. Rutgers (housing-block 1921); J. F. Staal (housing-block 1922) and H. Th. Wydeveld (housing-block 1924).

KLERKSDORP, a town of S. Africa, 117 m. by rail S.W. of Johannesburg; alt. 4,347 ft. White population (1926), 3,391; in 1921 the population included 3,121 whites, 2,062 natives, 201 Asiatics and 302 mixed and other races; total 5,686. The town, built on the banks of the Schoonspruit, 10 m. above its junction with the Vaal, has several fine public buildings. The old village on the right bank was founded in 1838, and was the first Boer settlement in the Transvaal. The modern town, on the opposite bank, dates from 1888. Gold and diamonds occur in the vicinity.

KLESL, MELCHIOR (1552–1630), Austrian statesman and ecclesiastic, was the son of a Protestant baker. He became bishop of Vienna in 1598. Klesl was the chief and most trusted adviser of the archduke Matthias, whose election to the imperial throne he helped to procure in 1612. His advice that the question of the imperial succession should be postponed until agreement with the Protestant princes could be reached, caused the archduke Ferdinand (afterwards Emperor Ferdinand) to believe that Klesl was hostile to his candidature. In June 1618, a few months before the death of Matthias, he was seized by order of the archdukes and imprisoned at Ambras in Tirol. In 1622 Klesl, who had been

KLING or **TLING,** a term used in the Malay peninsula for people of Indian origin, derived from the term Kalinga or Telinga (*see* ASIA, FURTHER ASIA), of which Telugu is probably another form. The Telingas are a people of Dravidian race, speaking a highly developed agglutinative language. They amalgamate readily with the Malay, and the hybrids (called *Jawi Pĕkan*) form a large, clever and industrious community. Muslims of the Madras coast trading to the Malay straits are known as "Kling Islam."

See Winstedt, *Malaya* (1923). (J. H. H.)

KLINGER, FRIEDRICH MAXIMILIAN VON (1752–1831), German dramatist and novelist, was born of humble parentage at Frankfurt-on-Main, on Feb. 17, 1752, and had a hard childhood, as he was early left an orphan. He was befriended by Goethe who knew him from childhood. In 1775 Klinger gained with his tragedy *Die Zwillinge* a prize offered by the Hamburg theatre, and in 1776 was appointed *Theaterdichter* to the "Seylersche Schauspiel-Gesellschaft." In 1778 he entered the Austrian military service and took part in the Bavarian war of succession. In 1780 he went to St. Petersburg, and became an officer in the Russian army. He married a natural daughter of the empress Catherine, and was made praeses of the Academy of Knights in 1799. From 1803 to 1817 he was curator of the university of Dorpat. He then gradually gave up his official posts. He died at Dorpat on Feb. 25, 1831.

The bitter experiences and deprivations of Klinger's youth are largely reflected in his dramas It was one of his earliest works, *Sturm und Drang* (1776), which gave its name to this literary epoch. In addition to this tragedy and *Die Zwillinge* (1776), the chief plays of his early period of passionate fervour and restless "storm and stress" are *Die neue Arria* (1776), *Simsone Grisaldo* (1776) and *Stilpo und seine Kinder* (1780). To a later period belongs the fine double tragedy of *Medea in Korinth* and *Medea auf dem Kaukasos* (1791). In Russia he devoted himself mainly to the writing of philosophical romances, of which the best known are *Fausts Leben, Taten und Höllenfahrt* (1791), *Geschichte Giafars des Barmeciden* (1792), *Geschichte Raphaels de Aquillas* (1793), and *Der Weltmann und der Dichter* (1798), the finest of them all. In 1803 he summed up his human and literary experiences in *Betrachtungen und Gedanken über verschiedene Gegenstände der Welt und der Literatur.* In this work Klinger gives calm and dignified expression to the leading ideas which the period of *Sturm und Drang* had bequeathed to German classical literature.

Klinger's works were published in twelve volumes (1809–15). A selection will be found in A. Sauer, *Stürmer und Dränger,* vol. i. (1883). *See* E. Schmidt, *Lenz und Klinger* (1878); M. Rieger, *Klinger in der Sturm- und Drangperiode* (1880); and *Klinger in seiner Reife* (1896).

KLINGER, MAX (1857–1920), German painter, etcher and sculptor, was born at Leipzig on Feb. 18, 1857. He attended the classes at the Carlsruhe art school in 1874, and went in the following year to Berlin, where in 1878 he created a sensation at the Academy exhibition with two series of pen-and-ink drawings—the "Series upon the Theme of Christ" and "Fantasies upon the Finding of a Glove." The daring originality of these imaginative and eccentric works caused an outburst of indignation, and the artist was voted insane; nevertheless the "Glove" series was bought by the Berlin National Gallery. From 1883 to 1886 he studied in Paris and then visited Italy. In 1893 he settled at Leipzig. His painting of "The Judgment of Paris" caused another storm of indignant protest in 1887, owing to its rejection of all conventional attributes and the naïve directness of the conception. His vivid and somewhat morbid imagination, with its leaning towards the gruesome and disagreeable, and the Goyaesque turn of his mind, found their best expression in his "cycles" of etchings: "Deliverances of Sacrificial Victims told in Ovid," "A Brahms Phantasy," "Eve and the Future," "A Life," and "Of Death"; but in his use of the needle he does not aim at the technical excellence of the great masters; it supplies him merely with means of expressing his ideas. After 1886 Klinger devoted himself more exclusively to painting and sculpture. In his painting he aims neither at classic beauty nor modern truth, but at grim impressiveness not without a touch of mysticism. His "Pietà" at the Dresden gallery, the frescoes at the Leipzig university, and the "Christ in Olympus," at the Modern gallery in Vienna, are characteristic examples of his art. The Leipzig museum contains his sculptured "Salome" and "Cassandra." In sculpture he favours the use of varicoloured materials in the manner of the Greek chryselephantine sculpture. His "Beethoven" (1902) is a notable instance of his work in this direction His last enterprise was a colossal monument to Richard Wagner, which remained unfinished at his death at Leipzig on July 5, 1920. The Leipzig museum has a representative collection of his work which is exhibited in a hall designed by the artist himself.

See Max Schmid and Vogel, *Max Klinger* (Bielefeld and Leipzig 1926).

KLINT, KAARE (1888–), a Danish architect, who was born at Copenhagen on the 15th of December, 1888. Like the main body of Danish architects, Klint is not yet taking part in the international movement towards industrialized building which, it has been argued, began in Denmark in the 19th century with Bindesvölt and Herholdt, but meeting with little favour, never developed; he believes nevertheless that we must acknowledge the present and not falsely endeavour to re-create the past. His work, however, owes something to Danish Gothic and is more traditional than might at first sight be suspected. In common with Danish colleagues Klint believes that the first requirement of a building is to take its place with graceful suitability in the surrounding countryside, and that the style adopted by him best fulfils that condition of architectural beauty in Denmark. He completed a church and a Y.M.C.A. building at Odense in 1921 and 1923 respectively, while the magnificent Grundtvig Memorial church in Copenhagen was completed in 1926.

See Kay Fisker and F. R. Yerbury, *Modern Danish Architecture* (1927).

KLIPSPRINGER, a small African mountain-antelope (*Oreotragus saltator*), ranging from the Cape through East Africa to Somaliland and Abyssinia, characterized by its rounded hoofs, thick hair and gold-spangled colouring. It represents a genus by itself. The activity of these antelopes is marvellous.

KLONDIKE, a district in Yukon Territory, north-western Canada, approximately in 64° N. and 140° W. The limits are rather indefinite, but the district includes the country to the south of the Klondike river, which comes into the Yukon from the east and has several tributaries, as well as Indian river, a second branch of the Yukon, flowing into it some distance above the Klondike. The richer gold-bearing gravels are found along the creeks tributary to these two rivers within an area of about 800 sq.m. Rich gravel was discovered on Bonanza Creek in 1896, and a wild rush to this almost inaccessible region followed, a population of 30,000 coming in within the next three or four years with a rapidly increasing output of gold, reaching in 1900 the climax of $22,000,000. Since then the production has steadily declined, until in 1906 it fell to $5,600,000, and in 1925 to $988,465. The richest gravels were worked out before 1910, and most of the population had left the Klondike for Alaska and other regions; so that Dawson, which for a time was a bustling city of more than 10,000, dwindled to about 2,000 inhabitants. As the ground was almost all frozen, the mines were worked by a thawing process, first by setting fires, afterwards by using steam, new methods being introduced to meet the unusual conditions. Later dredges and hydraulic mining were resorted to with success. In recent years the silver-lead ores of Veno and Galena hills, in the Mayo district, have assumed some importance.

KLOPSTOCK, GOTTLIEB FRIEDRICH (1724–1803), German poet, was born at Quedlinburg, on July 2, 1724, the eldest son of a lawyer, a man of sterling character and of a deeply

religious mind. Both in his birthplace and on the estate of Friedeberg on the Saale, which his father later rented, young Klopstock passed a happy childhood; and more attention having been given to his physical than to his mental development he grew up a strong healthy boy and was an excellent horseman and skater. In his thirteenth year Klopstock returned to Quedlinburg where he attended the gymnasium, and in 1739 proceeded to the famous classical school of Schulpforta. Here he soon became an adept in Greek and Latin versification, and wrote some meritorious idylls and odes in German. His original intention of making the emperor Henry I. ("The Fowler") the hero of an epic, was, under the influence of Milton's *Paradise Lost,* with which he became acquainted through Bodmer's translation, abandoned in favour of the religious epic. While yet at school, he had already drafted the plan of *Der Messias.* On Sept. 21, 1745, he delivered on quitting school a remarkable "leaving oration" on epic poetry—*Abschiedsrede über die epische Poesie, kultur- und literargeschichtlich erläutert*—and next proceeded to Jena as a student of theology, where he elaborated the first three cantos of the *Messias* in prose.

Klopstock removed in 1746 to Leipzig, and here joined the circle of young contributors to the *Bremer Beiträge.* In this periodical the first three cantos of the *Messias* in hexameters were anonymously published in 1748. In Leipzig he also wrote a number of odes, the best known of which is *An meine Freunde* (1747), afterwards recast as *Wingolf* (1767). He left the university in 1748 and became a private tutor in the family of a relative at Langensalza. Here unrequited love for a cousin (the "Fanny" of his odes) disturbed his peace of mind. He accepted in 1750 an invitation from Jakob Bodmer (*q.v.*), the translator of *Paradise Lost,* to visit him in Zurich. Here Klopstock was at first treated with every kindness and respect and rapidly recovered his spirits. Bodmer, however, was disappointed to find in the young poet of the *Messias* a man of strong worldly interests, and a coolness sprang up between the two friends.

At this juncture Klopstock was invited by Frederick V. of Denmark, on the recommendation of his minister Bernstorff, to settle at Copenhagen, with an annuity of 400 talers, with a view to the completion of the *Messias.* On his way to the Danish capital Klopstock met at Hamburg Margareta (Meta) Moller, (the "Cidli" of his odes), an enthusiastic admirer of his poetry, who became his wife in 1754. His happiness was short; she died in 1758, leaving him almost broken-hearted. His grief at her loss finds pathetic expression in the 15th canto of the *Messias.* The poet subsequently published his wife's writings, *Hinterlassene Werke von Margareta Klopstock* (1759), which give evidence of a tender, sensitive and deeply religious spirit. Klopstock now relapsed into melancholy; new ideas failed him, and his poetry became more and more vague and unintelligible. He turned his attention to northern mythology, which he conceived should replace classical subjects in a new school of German poetry. In 1770, on the dismissal of Bernstorff from office, he retired with him to Hamburg, but retained his pension together with the rank of councillor of legation. Here, in 1773, he issued the last five cantos of the *Messias.* In the following year he published his scheme for the regeneration of German letters, *Die Gelehrtenrepublik* (1774).

In 1775 Klopstock travelled south, and making the acquaintance of Goethe on the way, spent a year at the court of the margrave of Baden at Karlsruhe. Thence, in 1776, with the title of *Hofrat* and a pension from the margrave, which he retained together with that from the king of Denmark, he returned to Hamburg where he spent the remainder of his life. His latter years he passed in retirement. The French Republic sent him the diploma of honorary citizenship; but, horrified at the terrible scenes the Revolution had enacted in the place of liberty, he returned it. When 67 years of age he contracted a second marriage with Johanna Elisabeth von Winthem, a widow and a niece of his late wife, who for many years had been one of his most intimate friends. He died at Hamburg on March 14, 1803, mourned by all Germany, and was buried by the side of his first wife in the churchyard of the village of Ottensen.

Klopstock's nature was best attuned to lyrical poetry, and in it his deep, noble character found its truest expression. He was less suited for epic and dramatic representation; for, wrapt up in himself, a stranger to the outer world, without historical culture, and without even any interest in the events of his time, he was lacking in the art of plastic representation such as a great epic requires. Thus the *Messias,* despite the magnificent passages which especially the earlier cantos contain, cannot satisfy the demands such a theme must necessarily make. The poem was translated into seventeen languages and led to numerous imitations. In his odes Klopstock had more scope for his peculiar talent. Among the best are *An Fanny; Der Zürchersee; Die tote Klorissa; An Cidli; Die beiden Musen; Der Rheinwein; Die frühen Gräber; Mein Vaterland.* His religious odes mostly take the form of hymns, of which the most beautiful is *Die Frühlingsfeier.* His dramas, in some of which, notably *Hermanns Schlacht* (1769) and *Hermann und die Fürsten* (1784), he celebrated the deeds of the ancient German hero Arminius, and in others, *Der Tod Adams* (1757) and *Salomo* (1764), took his materials from the Old Testament, are essentially lyrical in character and deficient in action. In addition to *Die Gelehrtenrepublik,* he was also the author of *Fragmente über Sprache und Dichtkunst* (1779) and *Grammatische Gespräche* (1794), works in which he made important contributions to philology and to the history of German poetry.

Klopstock's *Werke* first appeared in seven quarto volumes (1798–1809). At the same time a more complete edition in twelve octavo volumes was published (1798–1817), to which six additional volumes were added in 1830. More recent editions were published in 1844–45, 1854–55, 1879 (ed. by R. Roxberger, 1884 ed. by R. Hamel) and 1893 (a selection edited by F. Muncker). A critical edition of the *Odes* was published by F. Muncker and J. Pawel in 1889; a commentary on these by H. Düntzer (1860; 2nd ed., 1878). For Klopstock's correspondence *see* K. Schmidt, *Klopstock und seine Freunde* (1810); C. A. H. Clodius, *Klopstocks Nachlass* (1821); J. M. Lappenberg, *Briefe von und an Klopstock* (1867). *Cf.* further K. F. Cramer, *Klopstock, er und über ihn* (1780–92); J. G. Gruber, *Klopstocks Leben* (1832); R. Hamel, *Klopstock-Studien* (1879–80); F. Muncker, *F. G. Klopstock,* the most authoritative biography (1888); F. G. Klopstock, *Klopstock, 2. Juli, 1724. Zur Feier seines zweihundertjährigen Geburtstages* (Berlin, 1926); E. Bailly, *Étude sur la vie et les oeuvres de Klopstock* (Paris, 1888).

KLOSTERNEUBURG, a town in Lower Austria, on the right bank of the Danube at the foot of a spur of the Wiener Wald. Pop. (1923) 14,100. The chief occupation of its inhabitants is the preparation of wine from the many vineyards that line the slopes behind the town, which reflects its dominant activity in its possession of a school and experimental station of wine and fruit cultivation; there is also a large cement factory near the town. Klosterneuburg is famous for the magnificent buildings of the Augustine canonry, founded in 1106 by Margrave Leopold the Holy. This foundation, one of the oldest and richest in Austria, has numerous interesting features, notably the 12th century altar of Verdun, the 14th century chapel containing Leopold's tomb, the picture gallery, the treasury and the library containing 30,000 volumes and many MSS.

KLUCK, ALEXANDER VON (1846–), Prussian general, was born May 20, 1846 at Münster, Westphalia. He took part in the Austro-Prussian War of 1866 and the Franco-Prussian War of 1870, and was twice wounded at the battle of Colombey-Neuilly. In 1906 he was promoted to the rank of general of infantry, and at the outbreak of the World War was inspector-general of the VIII. Army Inspection. He was placed in chief command of I. Army of the West, which he led in the battles of Maubeuge and St. Quentin and the advance upon the Marne. (*See* FRONTIERS, BATTLES OF THE.) At the battle of the Marne, the faulty disposition of the German forces in the line of battle and the success of the Allied offensive compelled Von Kluck to withdraw his army to the Aisne positions. (*See* MARNE, FIRST BATTLE OF THE.) In March 1915 he was wounded while visiting the front trenches, and was placed on the retired list in Oct. 1916. He gave his account of the earlier operations in *Der Marsch auf Paris und die Marne-Schlacht* (1920).

KNARESBOROUGH, an urban district of the West Riding of Yorkshire, England, 16½ m. W. by N. of York by the L.N.E.

railway and 3½ m. N.E. of Harrogate. Pop. (1921), 5,518. Its situation is most picturesque, on the steep left bank of the river Nidd, which here follows a well-wooded valley, hemmed in by limestone cliffs.

Knaresborough (*Canardesburg, Cnarreburc, Cknareburg*), Crown property before the Conquest, formed part of William the Conqueror's grant to his follower, Serlo de Burgh, who probably founded Knaresborough castle. In the reign of Stephen, Knaresborough was forfeited by Eustace Fitzjohn, grandson of de Burgh, and was granted to Robert de Stuteville. From his descendants it passed, through marriage, to Hugh de Morville, one of the murderers of Thomas à Becket, who, with his accomplices, is said to have remained in hiding in the castle for a whole year. During the 13th and 14th centuries, the castle and lordship changed hands very frequently; they were granted successively to Hubert de Burgh, whose son forfeited them, after the battle of Evesham, to Richard, earl of Cornwall, whose son Edmund died without issue; to Piers Gaveston; and finally to John of Gaunt, duke of Lancaster, and so to the Crown as parcel of the duchy of Lancaster. In 1317, John de Lilleburn, who was holding the castle for Thomas, duke of Lancaster, against the king, surrendered, under conditions, to William de Ros of Hamelak, but, before leaving the castle, managed to destroy all the records of the liberties and privileges of the town, which were kept in the castle. An inquisition was taken, in 1368, to ascertain these privileges, and the jurors found that the burgesses held "all the soil of their borough yielding 7s. 4d. yearly and doing suit at the king's court." In the reign of Henry VIII. Knaresborough is said by Leland to be "no great thing and meanely builded but the market there is quik." The castle was probably founded in 1070, but its remains, which include a massive keep rising finely from a cliff above the Nidd, are mainly of the 14th century. During the Civil Wars the Royalists were obliged to surrender it to Fairfax after Marston Moor, and it was dismantled in 1646. A charter granted by Charles II., confirming earlier charters, allows a market on Wednesday, which is held in the open market square, and a fortnightly fair on the same day from the Feast of St. Mark to that of St. Andrew.

The Knaresborough free grammar school was founded in 1616. The church of St. John the Baptist is Early English, but has numerous Decorated and Perpendicular additions; it is a cruciform building containing several interesting monuments. Linen and leather are manufactured, and the limestone quarries employ a number of people, but the population is largely agricultural. Lead ore was found and worked on Knaresborough common in the 16th century.

From 1555 to 1867 the town returned two members to parliament, but in the latter year the number was reduced to one, and in 1885 the representation was merged in that of a district constituency.

KNAUS, LUDWIG (1829–1910), noted German genre painter, was born at Wiesbaden on Oct. 5, 1829, the son of an optician. From 1845–48 he studied at the Düsseldorf academy, forming his style on the great masters of the Dutch school (Ostade, Brouwer). He was one of the founders of the famous artists' club, *Malkasten,* at Düsseldorf. But his realistic rendering of nature was not understood by the classicist, W. Schadow, who was then director of the Academy. In 1852 Knaus went to Paris, where his picture, "Morning after Kirmes," exhibited at the Salon of 1853, was awarded the gold medal. "A Walk in the Tuileries Gardens" was acquired for the Luxembourg gallery and is now in the Louvre. After a period of travel, he settled at Berlin in 1874; he there taught at the Academy till 1882. His art had a great vogue in Germany; and his success was mainly due to the choice of his subjects—his rustic scenes telling an anecdote. In this work he was helped by his sympathetic and keen observation of the psychology in human situations. Moreover, his feeling for colour, his harmonious gold tone, and his broad and loose technique had a salutary influence on the development of German art. He is represented in most German and United States galleries. Among his best pictures are "The Children's Treat," "His Highness upon his Travels," "The Card Players," and "The Golden Wedding." He also painted portraits of distinguished men, including Mommsen and Helmholtz. His drawings are very able and sympathetic studies of character.

See L. Pietsch, *Knaus* (Bielefeld and Leipzig, 1896).

KNAVE, originally a male child, a boy (*cf.* Ger. *Knabe,* boy); early used as a name for any lad employed as a servant, and so of male servants in general. The current meaning, a rogue, was, however, an early usage. In playing-cards the lowest court card of each suit, representing a mediaeval servant, is called the "knave." *See* also VALET.

KNEBEL, KARL LUDWIG VON (1744–1834), German poet and translator, was born at the castle of Wallerstein in Franconia on Nov. 30, 1744. After serving for ten years in the Prussian army he became tutor to one of the Weimar princes, and introduced Goethe to the hereditary prince, Charles Augustus. This was the beginning of Goethe's intimate connection with the Weimar court. In 1798 he married the singer Luise von Rudorf, and retired to Ilmenau; but in 1805 he removed to Jena, where he lived until his death on Feb. 23, 1834. Knebel's *Sammlung kleiner Gedichte* (1815), issued anonymously, and *Distichen* (1827) contain many graceful sonnets, but it is as a translator that he is best known. His translations of the elegies of Propertius, *Elegien des Properz* (1798), and of Lucretius' *De rerum natura* (2 vols., 1831) are deservedly praised.

Knebel's *Literarischer Nachlass und Briefwechsel* was edited by K. A. Varnhagen von Ense and T. Mundt in 3 vols. (1835; 2nd ed., 1840). *See* Hugo von Knebel-Döberitz, *Karl Ludwig von Knebel* (1890).

KNEE, in human anatomy, the articulation of the upper and lower parts of the leg, the joint between the femur and the tibia. (*See* JOINTS.) The word is also used of articulation resembling the knee-joint in shape or position in other animals; it thus is applied to the carpal articulation of the foreleg of a horse, answering to the ankle in man, or to the tarsal articulation or heel of a bird's foot.

KNEISEL, FRANZ (1865–1926), violinist and founder of the Kneisel quartet, was born at Bucharest on Jan. 26, 1865. At the age of 14 he went to the Vienna conservatoire to study under Grün and Hellmesberger, and was only 16 when he became Konzertmeister of the Hofburg theatre, Vienna, a position which was followed in 1884 by a similar appointment in connection with the Bilse orchestra, Berlin. In 1885, through the good offices of Col. Henry L. Higginson, patron of the Boston symphony orchestra, he settled in the United States, as leader of that orchestra and in the same year established in Boston the famous quartet with which his name is associated. It soon took rank with the leading bodies of its kind, and in virtue of the superior quality of its performance set a standard for chamber-music playing in America which had never been approached before. The other original members of the quartet were E. Fiedler (2nd violin), Louis Svencenski (viola), and Fritz Giese ('cello), and it remained in existence, with various changes of personnel, no fewer than 32 years, giving its last concert on April 3, 1917. Subsequently, Kneisel devoted himself mainly to his work as chief violin professor at the Institute of Musical Art, New York. He died in New York on March 26, 1926.

KNELLER, SIR GODFREY (1648–1723), English portrait painter of German extraction, was born in Lubeck of an ancient family, on Aug. 8, 1648. He studied in the school of Rembrandt, and under Ferdinand Bol in Amsterdam. In 1672 he removed to Italy. In Rome, and more especially in Venice, Kneller earned considerable reputation by historical paintings as well as portraits. In 1674 he came to England at the invitation of the duke of Monmouth and was introduced to Charles II., of whom he made many portraits. Charles sent him to Paris, to take the portrait of Louis XIV., and appointed him court painter; and he continued to hold the same post into the days of George I. Under William III. (1692) he was made a knight, under George I. (1715) a baronet, and by order of the emperor Leopold I. a knight of the Roman Empire. His studio had at first been in Covent Garden, but in his closing years he lived in Kneller Hall, Twickenham. He died on Nov. 7, 1723. He was buried in Twickenham church, and has a monument in Westminster Abbey.

An elder brother, John Zachary Kneller, an ornamental painter, had accompanied Godfrey to England, and had died in 1702. The style of Sir Godfrey Kneller as a portrait painter represented the decline of that art as practised by Vandyck. His works have much freedom, and are well drawn and coloured; but they are mostly slight in manner, and to a great extent monotonous. The colouring may be called brilliant rather than true. Among Kneller's principal paintings are the "Forty-three Celebrities of the Kit-Cat Club," and the "Ten Beauties of the Court of William III.," now at Hampton Court. He executed altogether the likenesses of ten sovereigns, and a number of his works appear in the National Portrait Gallery, London.

KNICKERBOCKER, HARMEN JANSEN (*c.* 1650–*c.* 1716), Dutch colonist of New Amsterdam (New York) and founder of the Knickerbocker family in America, came from Holland about 1674 and in 1682 purchased land near Albany, N.Y. There he lived until 1704, when he bought land near Red Hook in Dutchess county and moved down the Hudson river to his new seat. The oldest son, Johannes Harmenson, remained in Albany county and settled for the remainder of his life at Schaghticoke on land which remained for over 200 years in the Knickerbocker name. His son Johannes (1723–1803), a colonel in the revolutionary army, and his grandson Harmen (1779–1855), a Federalist representative in Congress 1809–11, were well known to Washington Irving, who borrowed their name for use in his *Knickerbocker's History of New York* (1809). Largely owing to this book the name "Knickerbockers" has passed into current use as a designation of the early Dutch settlers in New York and their descendants.

KNIFE, a small cutting instrument, with the blade either fixed to the handle or fastened with a hinge so as to clasp into the handle (*see* CUTLERY). For the knives chipped from flint by prehistoric man *see* ARCHAEOLOGY and FLINTS.

KNIGGE, ADOLF FRANZ FRIEDRICH, FREIHERR VON (1752–1796), German author, was born on the family estate of Bredenbeck near Hanover on Oct. 16, 1752. He was attached successively to the courts of Hesse-Cassel and Weimar until 1777, and had no official appointment until 1791 when he became *Oberhauptmann* in Bremen, where he died on May 6, 1796. Knigge, under the name "Philo," was one of the most active members of the *Illuminati,* a society founded by Adam Weishaupt, and later affiliated to the Freemasons. After the *Illuminati* had been suppressed in Bavaria they were dispersed throughout Germany. Knigge denounced the institutions of royalty and nobility with revolutionary fervour. Knigge wrote several novels, but his most famous work was *Über den Umgang mit Menschen* (1788), in which he lays down rules to be observed for a happy life.

Knigge's *Schriften* were published in 12 volumes (1804–96). *See* K. Goedeke, *Adolf, Freiherr von Knigge* (1844); and H. Klencke, *Aus einer alten Kiste (Briefe, Handschriften und Dokumente aus dem Nachlasse Knigges)* (1853).

KNIGHT, CHARLES (1791–1873), English publisher and author, the son of a bookseller and printer at Windsor, was born on March 15, 1791. He published (1820–21) *The Etonian,* and (1823–24) *Knight's Quarterly Magazine,* to which W. M. Praed, Derwent Coleridge and Macaulay contributed. In 1827 Knight became the superintendent of the publications of the Society for the Diffusion of Useful Knowledge, for which he projected and edited *The British Almanack and Companion,* begun in 1828. In 1829 he resumed business on his own account with the publication of *The Library of Entertaining Knowledge,* writing several volumes of the series himself. In 1832 and 1833 he started *The Penny Magazine* and *The Penny Cyclopaedia* (completed, 1844) both of which had a large circulation. Besides many illustrated editions of standard works, including in 1842 *The Pictorial Shakespeare,* which had appeared in parts (1838–41), Knight published many popular illustrated works, including his *Popular History of England* (8 vols., 1856–62). In 1864 he retired from business, but he continued to write nearly to the close of his long life, publishing *The Shadows of the Old Booksellers* (1865) and an autobiography under the title *Passages of a Working Life during Half a Century* (3 vols., 1864–65). He died at Addlestone, Surrey, Mar. 9, 1873.

See A. A. Clowes, *Knight, a Sketch* (1892).

KNIGHT, DANIEL RIDGWAY (1845–1924), American artist, was born at Philadelphia (Pa.), in 1845. He was a pupil at the École des Beaux-Arts, Paris, under Gleyre, and later worked in the private studio of Meissonier. After 1872 he lived in France, having a house and studio at Poissy on the Seine. He painted peasant women out of doors with great popular success. He was awarded the silver medal and cross of the Legion of Honour, Exposition Universelle, Paris, 1889, and was made a knight of the Royal Order of St. Michael of Bavaria, Munich, 1893, receiving the gold medal of honour from the Pennsylvania Academy of Fine Arts, Philadelphia, 1893. His "Hailing the Ferry" is in the Pennsylvania Academy, Philadelphia, and "The Shepherdess" in the Brooklyn Institute Museum. He died in Paris on March 9, 1924.

KNIGHTHOOD and **CHIVALRY.** These two words, nearly but not quite synonymous, designate a single subject of inquiry, which presents itself under three aspects. It may be regarded in the first place as a mode of feudal tenure, in the second place as a personal attribute or dignity, and in the third place as a scheme of manners. The first aspect is discussed under the headings FEUDALISM and KNIGHT SERVICE: we are concerned here only with the second and third. For the more important religious orders of knighthood the reader is referred to the headings ST. JOHN OF JERUSALEM, KNIGHTS OF; TEUTONIC KNIGHTS; and TEMPLARS.

"The growth of knighthood" (writes Stubbs) "is a subject on which the greatest obscurity prevails": and, though J. H. Round has done much to explain the introduction of the system into England, its origin in Europe is still obscure in many details.

The words *knight* and *knighthood* are the modern forms of the Old English *cniht* and *cnihthád.* Of these the primary signification of the first was a boy or youth, and of the second the period of life between childhood and manhood. But before the middle of the 12th century they had the meaning of the French *chevalier* and *chevalerie.* In a secondary sense *cniht* meant a servant answering to the German *Knecht,* and in the Anglo-Saxon Gospels a disciple is a *leorning cniht.* In a tertiary sense the word was occasionally employed as equivalent to the Latin *miles*—usually translated by *thegn*—which in the earlier middle ages was used for the domestic as well as the martial officers or retainers of princes or great personages. Thegn itself, used as the description of an attendant of the king, appears to have meant more especially a military attendant. Besides the king, the ealdormen, bishops and king's thegns themselves had their thegns, and to these it is more than probable that the name of *cniht* was applied.

Around the Anglo-Saxon magnates were a crowd of retainers among whom were some called *cnihtas* who were not always the humblest of their number. In the reign of Edward the Confessor was a large class of landholders who had commended themselves to some lord; their condition in many respects similar to that of a vast number of unquestionably feudal tenants who appear after the Norman Conquest. If consequently the former were called *cnihtas,* it seems probable that the appellation should have been continued to the latter, practically their successors And if the designation of knights was first applied to the military tenants of the earls, bishops and barons—who although they held their lands of mesne lords owed their services to the king—its extension to the whole body of military tenants need not have been a very violent or prolonged process. Assuming, however, that *knight* was originally used for the military tenant of a noble person, as *cniht* had sometimes been used to describe the thegn of a noble person, it would, to begin with, have defined rather his social status than the nature of his services. But those whom the English called *knights* the Normans called *chevaliers,* by which term the nature of their services was defined, while their social status was left out of consideration. And at first *chevalier* in its general and honorary signification seems to have been rendered not by *knight* but by *rider,* as may be inferred from the Anglo-Saxon Chronicle, wherein it is recorded under the year 1085 that William the Conqueror "dubbade his sunu Henric to ridere." But, as E. A. Freeman says, "no such title is heard of in the earlier

days of England. The thegn, the ealdorman, the king himself, fought on foot; the horse might bear him to the field, but when the fighting itself came he stood on his native earth to receive the onslaught of her enemies." In this perhaps we may behold one of the most ancient of British insular prejudices, for on the Continent the importance of cavalry was already understood. From the word *caballarius,* which occurs in the reign of Charlemagne, came the words for knight in all the Romance languages. In Germany the chevalier was called *Ritter,* but neither *rider* nor *chevalier* prevailed against *knight* in England. And it was long after *knighthood* had acquired its present meaning with us that *chivalry* was incorporated into our language. It may be remarked too that in official Latin, in England and in all Europe, the word *miles* held its own against both *eques* and *caballarius.*

Origin of Mediaeval Knighthood.—Concerning the origin of knighthood or chivalry as it existed in the middle ages—implying as it did a formal assumption of and initiation into the profession of arms—nothing beyond conjecture is possible. But some of the rudiments of chivalry may be detected in early Teutonic customs, and they may have made some advance among the Franks of Gaul. We know from Tacitus that the German tribes in his day were wont to admit the young man into the ranks of their warriors with much ceremony. The people of his district were called together; his qualifications were inquired into; and, if he were deemed worthy, his chief, his father, or one of his near kinsmen presented him with a shield and a lance. Again, among the Franks we find Charlemagne girding his son Louis the Pious, and Louis the Pious girding his son Charles the Bald with the sword, when they arrived at manhood It seems certain here that some ceremony was observed which was a thing of recognized importance. It does not follow that a similar ceremony extended to personages less exalted than the sons of kings and emperors. But if it did we must suppose that it applied first to the mounted warriors of the Franks. It was among the Franks indeed that cavalry first acquired the place which it long maintained in Europe. In early society, where the army is the armed nation, the cavalry must consist of the noble and wealthy, and cavalry and chivalry, as Freeman observes, will be the same. Since then we discover in the *Capitularies* of Charlemagne mention of "caballarii" as a class of warriors; it may be concluded that formal investiture with arms applied to the "caballarii" if it was a usage extending beyond the sovereign and his heir-apparent.

In spite of the silence of our records, Stubbs thinks that such kings as Ethelred, Canute and Edward the Confessor could hardly have failed to introduce into England the institution of chivalry then springing up in every country of Europe; it is nowhere mentioned as a Norman innovation. Yet the fact that Harold received knighthood from William of Normandy makes it clear either that Harold was not yet a knight, which in the case of so tried a warrior would imply that "dubbing to knighthood" was not yet known in England, or, as Freeman thinks, that in the middle of the 11th century the custom had grown in Normandy into "something of a more special meaning" than it bore in England.

As a military organization, the feudal system of tenures was better adapted to the purposes of defensive than of offensive warfare. When kings and kingdoms were in conflict, and distant and prolonged expeditions became necessary, it was discovered that the resources of feudalism were inadequate. Then there grew up all over Europe a system of fining the knights who failed to respond to the sovereign's call or to stay their full time in the field; and in England this fine developed, from the reign of Henry II. to that of Edward II., into a war-tax called *escuage* or *scutage* (*q.v.*). In this way funds for war were at the disposal of sovereigns, and the conditions under which feudatories served were altogether changed. Their military service was now far more the result of special agreement. In the reign of Edward I., whose warlike enterprises after he was king were within the four seas, this alteration does not seem to have gone very far. But the armies of Edward III., Henry V. and Henry VI. during the century of warfare between England and France were recruited and sustained to a very great extent on the principle of contract. On the Continent the employment of mercenaries was both an early and a common practice.

Besides the convenience of sovereigns and their feudatories, there were other causes which contributed towards bringing about those changes in the military system of Europe which were finally accomplished in the 13th and 14th centuries. During the crusades vast armies were set on foot in which feudal rights had no place. It was thus established that pay, the love of enterprise and the prospect of plunder were as useful for enlisting troops and keeping them together as the tenure of land and the solemnities of homage and fealty. Moreover, the crusaders who survived an expedition to Palestine were seasoned and experienced although frequently impoverished and landless soldiers, ready to hire themselves to the highest bidder, and well worth their wages.

Knighthood Independent of Feudalism.—To distinguished soldiers of the cross the honours and benefits of knighthood could hardly be refused on the ground that they did not possess a sufficient property qualification—of which perhaps they had denuded themselves in order to get equipment for the Holy War. And thus the conception of knighthood as of something distinct from feudalism arose and gained ground. It was then that the analogy was first detected between the order of knighthood and the order of priesthood, and that a union of monachism and chivalry was effected in the religious orders of which the Knights Templars and the Knights Hospitallers were the most eminent examples. Somewhat later is marked the existence of a large and noble class who either from the subdivision of fiefs or from the effects of the custom of primogeniture were very insufficiently provided for. To them only two callings were generally open, that of the churchman and that of the soldier, and the latter as a rule offered greater attractions. Hence men of birth, although not of fortune, would attach themselves to some prince or magnate in whose military service they were sure of maintenance, and might hope for reward in the shape of booty or of ransom. It is probably to this period and these circumstances that we must look for, at all events, the rudimentary beginnings of the military as well as the religious orders of chivalry. It seems likely enough therefore that there should grow up bodies of knights banded together by engagements of fidelity, although free from monastic obligations; wearing a uniform or livery, and naming themselves after some special symbol or some patron saint of their adoption. And such bodies placed under the command of a sovereign or grand master, regulated by statutes and enriched by endowments would have been precisely what in after times such orders as the Garter in England, the Golden Fleece in Burgundy, the Annunziata in Savoy and the St. Michael and Holy Ghost in France actually were.

Grades of Knighthood.—During the 14th and 15th centuries, as well as somewhat earlier and later, the arrangements of a European army were always and everywhere pretty much the same. Under the sovereign the constable and the marshal or marshals held the chief commands, their authority being partly joint and partly several Attendant on them were the heralds, who were the officers of their military court wherein offences committed in the camp and field were tried and adjudged, and among whose duties it was to carry orders and messages, to deliver challenges and call truces, and to identify and number the wounded and the slain. The main divisions of the army were distributed under the royal and other principal standards, smaller divisions under the banners of some of the greater nobility or of knights banneret, and smaller divisions still under the pennons of knights or, as in distinction from knights banneret they came to be called, knights bachelors. All knights whether bachelors or bannerets were escorted by their squires. But the banner of the banneret always implied a more or less extensive command, while every knight was entitled to bear a pennon and every squire a pencel. All three flags were of such a size as to be conveniently attached to and carried on a lance, and were emblazoned with the arms or some portion of the bearings of their owners. But while the banner was square the pennon was either pointed or forked at its extremity, and the pencel had a single tail or streamer.

If indeed we look at the scale of chivalric subordination from

another point of view, it seems to be more properly divisible into four than into three stages, of which two may be called provisional and two final. The bachelor and the banneret were both equally knights, only the one was of greater distinction and authority than the other. In like manner the squire and the page were both in training for knighthood, but the first had advanced farther than the second. It is true that the squire was a combatant while the page was not, and that many squires voluntarily served as squires all their lives owing to the insufficiency of their fortunes to support the costs of knighthood But in the ordinary course of a chivalrous education the conditions of page and squire were passed through in boyhood and youth, and the condition of knighthood was reached in early manhood. Every feudal court and castle was a school of chivalry, and although princes and great personages were rarely actually pages or squires, the discipline through which they passed was not different from that to which less exalted candidates for knighthood were subjected. In many castles, and perhaps in most, the discipline followed simply a natural and unwritten code of "fagging" and seniority, as in public schools or on board men-of-war some 100 years or so ago.

Modes of Conferring Knighthood.—Two modes of conferring knighthood appear to have prevailed from a very early period. In the one the accolade constituted the whole or nearly the whole of the ceremony, in the other it was surrounded with many additional observances. The former and simpler of these modes was naturally that used in war: the candidate knelt before "the chief of the army or some valiant knight," who struck him thrice with the flat of a sword, pronouncing a brief formula of creation and of exhortation which varied at the creator's will.

In this form a number of knights were made before and after almost every battle between the 11th and the 16th centuries, and its advantages gradually led to its general adoption both in time of peace and time of war. On extraordinary occasions indeed the more elaborate ritual continued to be observed. But in England about the beginning of the 15th century it came to be appropriated to a special taking of knighthood. When Segar, garter king of arms, wrote in the reign of Queen Elizabeth, he does not even mention that there were two ways of creating knights bachelors. "He that is to be made a knight," he says, "is stricken by the prince with a sword drawn upon his back or shoulder, the prince saying, 'Soys Chevalier,' and in times past was added 'Saint George.' And when the knight rises the prince sayeth 'Avencez.'" In our days when a knight is personally made he kneels before the sovereign, who lays a sword drawn, ordinarily the sword of State, on either of his shoulders and says, "Rise," calling him by his Christian name with the addition of "Sir" before it.

Very different were the solemnities which attended the creation of a knight when the complete procedure was observed. "The ceremonies and circumstances at the giving this dignity," says Selden, "in the elder time were of two kinds especially, which we may call courtly and sacred. The courtly were the feasts held at the creation, giving of robes, arms, spurs and the like. The sacred were the holy devotions and what else was used in the church at or before the receiving of the dignity."

But the full solemnities for conferring knighthood seem to have been so largely and so early superseded by the practice of dubbing or giving the accolade alone that in England it became at last restricted to such knights as were made at coronations and some other occasions of State. And to them the particular name of Knights of the Bath was assigned. It is usually supposed that the first creation of Knights of the Bath under that designation was at the coronation of Henry IV.; and before the order of the Bath as a companionship or capitular body was instituted the last creation was at the coronation of Charles II. But all knights were also knights of the spur or "equites aurati," because their spurs were golden or gilt—the spurs of squires being of silver or white metal; the spurs together with the sword were always employed as the leading ensigns of knighthood.

With regard to knights banneret, various opinions have been entertained as to both the nature of their dignity and the qualifications they were required to possess for receiving it at different periods and in different countries. Du Cange divides the mediaeval nobility of France and Spain into three classes: first, barons or ricos hombres; secondly, chevaliers or caballeros; and thirdly, écuyers or infanzons; and to the first, the greater nobility of either country, he limits the designation of banneret and the right of leading their followers to war under a banner or square flag. At any rate to commence with, it seems probable that bannerets were in every country merely the more important class of feudatories, the "ricos hombres" in contrast to the knights bachelors, who in France in the time of St. Louis were known as "pauvres hommes." In England all the barons or greater nobility were entitled to bear banners, but it is clear that from a comparatively early period bannerets whose claims were founded on personal distinction rather than on feudal tenure gradually came to the front, and much the same process of substitution appears to have gone on in their case as that which we have marked in the case of simple knights.

The knight bachelor whose services and landed possessions entitled him to promotion would apply formally to the commander in the field for the title of banneret. If this were granted, the heralds were called to cut publicly the tails from his pennon: or the commander, as a special honour, might cut them off with his own hands.

What the exact contingent was which bannerets were expected to supply to the royal host is doubtful. But in the reign of Edward III. and afterwards bannerets appear as the commanders of a military force raised by themselves and marshalled under their banners: their status and their relations both to the Crown and to their followers were mainly the consequences of voluntary contract not of feudal tenure. It is from the reigns of Edward III. and Richard II. also that the two best descriptions we possess of the actual creation of a banneret have been transmitted to us. Sir Thomas Smith, writing towards the end of the 16th century, says, after noticing the conditions to be observed in the creation of bannerets, "but this order is almost grown out of use in England"; and, during the controversy which arose between the new order of baronets and the Crown early in the 17th century respecting their precedence, it was alleged without contradiction before the privy council that "there are not bannerets now in being, peradventure never shall be." Sir Ralph Fane, Sir Francis Bryan and Sir Ralph Sadler were created bannerets by the Lord Protector Somerset after the battle of Pinkie in 1547, and the better opinion is that this was the last occasion on which the dignity was conferred.

Existing Orders of Knighthood.—On the continent of Europe the degree of knight bachelor disappeared with the military system which had given rise to it. It is now therefore peculiar to the British empire, where, although very frequently conferred by letters patent, it is yet the only dignity which is still even occasionally created—as every dignity was formerly created—by means of a ceremony in which the sovereign and the subject personally take part. Everywhere else dubbing or the accolade seems to have become obsolete, and no other species of knighthood, if knighthood it can be called, is known except that which is dependent on admission to some particular order. It is a common error to suppose that baronets are hereditary knights. Baronets are not knights unless they are knighted like anybody else; and, so far from being knights because they are baronets, one of the privileges granted to them shortly after the institution of their dignity was that they, not being knights, and their successors and their eldest sons and heirs-apparent should, when they attained their majority, be entitled if they desired to receive knighthood. It is a maxim of the law indeed that, as Coke says, "the knight is by creation and not by descent," and, although we hear of such designations as the "knight of Kerry" or the "knight of Glin," they are no more than traditional nicknames, and do not by any means imply that the persons to whom they are applied are knights in a legitimate sense. Notwithstanding, however, that simple knighthood has gone out of use abroad, there are innumerable grand crosses, commanders and companions of a formidable assortment of orders in almost every part of the world. (*See* the section on "Orders of Knighthood" on p. 434.)

Great Britain has nine orders of knighthood—the Garter, the Thistle, St. Patrick, the Bath, the Star of India, St. Michael and St. George, the Indian Empire, the Royal Victorian Order and the Order of the British Empire; and, while the first is undoubtedly the oldest as well as the most illustrious anywhere existing, a fictitious antiquity has been claimed for the second and fourth.

Order of the Garter.—It is, however, certain that the "most noble" Order of the Garter at least was instituted in the middle of the 14th century, although in what particular year this event occurred is and has been the subject of much difference of opinion, since the original records of the order until after 1416 have perished. The dates which have been selected vary from 1344 (given by Froissart, but almost certainly mistaken) to 1351. It is indisputable that in the wardrobe account from Sept. 1347 to Jan. 1349, the issue of certain habits with garters and the motto embroidered on them is marked for St. George's day; that the letters patent relating to the preparation of the royal chapel of Windsor are dated in Aug. 1348; and that in the treasury accounts of the prince of Wales there is an entry in Nov. 1348 of the gift by him of "24 garters to the knights of the Society of the Garter." But the order was not in existence before the summer of 1346. Nobody who was not a knight could under its statutes have been admitted to it, and neither the prince of Wales nor several others of the original companions were knighted until the middle of that year.

Sir Harris Nicolas contends that the order had no loftier immediate origin than a joust or tournament. It consisted of the king and the Black Prince, and 24 knights divided into two bands of 12 like the tilters in a hastilude—at the head of the one being the first, and of the other the second; and to the companions belonging to each, when the order had superseded the Round Table and had become a permanent institution, were assigned stalls either on the sovereign's or the prince's side of St. George's chapel. No change was made in the numbers until 1786, when the sons of George III. and his successors were made eligible notwithstanding that the chapter might be complete. In 1805 another alteration was effected by the provision that the lineal descendants of George II. should be eligible in the same manner, except the Prince of Wales for the time being, who was declared to be "a constituent part of the original institution"; and again in 1831 it was further ordained that the privilege accorded to the descendants of George II. should extend to those of George I. The records during the 14th and 15th centuries show that ladies were received into the order leaves no doubt that they were regularly received into it. The queen consort, the wives and daughters of knights, and some other women of exalted position, were designated "Dames de la Fraternité de St. George," and entries of the delivery of robes and garters to them are found at intervals in the Wardrobe Accounts from 1376 to 1495. The effigies of Margaret Byron, wife of Sir Robert Harcourt, K.G., at Stanton Harcourt, and of Alice Chaucer, wife of William de la Pole, duke of Suffolk, K.G., at Ewelme, which date from the reigns of Henry VI. and Edward IV., have garters on their left arms.

Persons Empowered to Confer Knighthood.—It has been the general opinion, as expressed by Sainte Palaye and Mills, that formerly all knights were qualified to confer knighthood. But it may be questioned whether the privilege was thus indiscriminately enjoyed even in the earlier days of chivalry; the sounder conclusion appears to be that the right was always restricted to sovereign princes, to those acting under their authority or sanction, and to a few other personages of exalted rank and station. In several of the writs for distraint of knighthood from Henry III. to Edward III. a distinction is drawn between those who are to be knighted by the king himself or by the sheriffs of counties respectively, and bishops and abbots could make knights in the 11th and 12th centuries. At all periods the commanders of the royal armies had the power of conferring knighthood; under James I. an ordinance of 1622, confirmed by a proclamation of 1623, for the registration of knights in the college of arms, is rendered applicable to all who should receive knighthood from either the king or any of his lieutenants. But when in 1543 Henry VIII. appointed Sir John Wallop to be captain of Guisnes, it was considered necessary that he should be authorized in express terms to confer knighthood, which was also done by Edward VI. in his own case when he received knighthood from the duke of Somerset. In the middle ages it was a common practice for sovereigns and princes to dub each other knights much as they were afterwards, and are now, in the habit of exchanging the stars and ribbons of their orders. Long after the military importance of knighthood had practically disappeared, a knight's title was recognized in all European countries, and not only in that country in which he had received it. In modern times, however, by certain regulations, made in 1823, and repeated and enlarged in 1855, not only is it provided that the sovereign's permission by royal warrant shall be necessary for the reception by a British subject of any foreign order of knighthood, but further that such permission shall not authorize "the assumption of any style, appellation, rank, precedence, or privilege appertaining to a knight bachelor of the United Kingdom."

Degradation.—The cases in which a knight has been formally degraded in England are exceedingly few; Dallaway says that only three were on record in the College of Arms when he wrote in 1793. The last case was that of Sir Francis Michell in 1621, whose spurs were hacked from his heels, his sword-belt cut, and his sword broken over his head by the heralds in Westminster Hall.

Roughly speaking, the age of chivalry properly so called may be said to have extended from the beginning of the crusades to the battle of Bosworth. Even in the way of pageantry and martial exercise it did not long survive the middle ages. In England tilts and tourneys were even occasionally held until after the death of Henry, prince of Wales. But on the Continent they were discredited by the fatal accident which befell Henry II. of France in 1599. The golden age of chivalry has been variously located. Most writers would place it in the early 13th century, but Gautier would remove it two or three generations further back. It may be true that, in the comparative scarcity of historical evidence, 12th-century romancers present a more favourable picture of chivalry at that earlier time; but even such historical evidence as we possess, when carefully scrutinized, is enough to dispel the illusion that there was any period of the middle ages in which the unselfish championship of "God and the ladies" was anything but a rare exception.

The Spirit of Chivalry.—It is difficult to describe the true spirit and moral influence of knighthood, if only because the ages in which it flourished differed so widely from our own. At its very best, it was always hampered by the limitations of mediaeval society. Moreover, many of the noblest precepts of the knightly code were a legacy from earlier ages, and have survived the decay of knighthood just as they will survive all transitory human institutions, forming part of the eternal heritage of the race. Indeed, the most important of these precepts did not even attain to their highest development in the middle ages. As a conscious effort to bring religion into daily life, chivalry was less successful than later puritanism; while the educated classes of our own day far surpass the average mediaeval knight in discipline, self-control and outward or inward refinement. In its own age, chivalry rested practically, like the highest civilization of ancient Greece and Rome, on slave labour; and if many of its most brilliant outward attractions have now faded for ever, this is only because modern civilization tends so strongly to remove social barriers. The knightly ages will always enjoy the glory of having formulated a code of honour which aimed at rendering the upper classes worthy of their exceptional privileges; yet we must judge chivalry not only by its formal code but also by its practical fruits.

Abuses in Practice.—Far too much has been made of the extent to which the knightly code, and the reverence paid to the Virgin Mary, raised the position of women. As Gautier himself admits, the feudal system made it difficult to separate the woman's person from her fief: lands and women were handed over together, as a business bargain, by parents or guardians. In theory, the knight was the defender of widows and orphans; but in practice wardships and marriages were bought and sold as a matter of everyday routine like stocks and shares in the modern market.

Thomas, lord of Berkeley (1245–1321), counted on this as a regular and considerable source of income. Late in the 15th century, in spite of the somewhat greater liberty of that age, we find Stephen Scrope writing nakedly to a familiar correspondent "for very need [of poverty], I was fain to sell a little daughter I have for much less than I should have done by possibility," *i.e.*, than the fair market price. Startling as such words are, it is perhaps still more startling to find how frequently and naturally, in the highest society, ladies were degraded by personal violence. The proofs of this from the *Chansons de Geste* might be multiplied indefinitely. The Knight of La Tour-Landry (1372) relates, by way of warning to his daughters, a tale of a lady who so irritated her husband by scolding him in company, that he struck her to the earth with his fist and kicked her in the face, breaking her nose. Upon this the good knight moralizes: "And this she had for her euelle and gret langage, that she was wont to saie to her husbonde." This was a natural consequence not only of the want of self-control which we see everywhere in the middle ages, but also of the custom of contracting child-marriages for unsentimental considerations. Between 1288 and 1500 five marriages are recorded in the direct line of the Berkeley family in which the ten contracting parties averaged less than 11 years of age: the marriage contract of another Lord Berkeley was drawn up before he was six years old. Moreover, the same business considerations which dictated those early marriages clashed equally with the strict theory of knighthood. In the same Berkeley family, the lord Maurice IV. was knighted in 1338 at the age of seven to avoid the possible evils of wardship, and Thomas V. for the same reason in 1476 at the age of five. Smyth's record of this great family shows that, from the middle of the 13th century onwards, the lords were not only statesmen and warriors, but gentlemen-farmers on a great scale, even selling fruit from the castle gardens, while their ladies would go round on tours of inspection from dairy to dairy. Indeed, economic causes contributed much to the decay of romantic chivalry. It is not surprising, therefore, to find that at least as early as the middle of the 13th century the commercial side of knighthood became very prominent. Although by the code of chivalry no candidate could be knighted before the age of 21, we have seen how great nobles like the Berkeleys obtained that honour for their infant heirs in order to avoid possible pecuniary loss; and French writers of the 14th century complained of this knighting of infants as a common abuse. Moreover, after the knight's liability to personal service in war had been modified by the scutage system, it became necessary in the first quarter of the 13th century to compel landowners to take up the knighthood which in theory they should have coveted as an honour—a compulsion which was soon systematically enforced (*Distraint of Knighthood*, 1278), and became a recognized source of royal income. An indirect effect of this system was to break down another rule of the chivalrous code—that none could be dubbed who was not of gentle birth. This rule, however, had often been broken before; even the romances of chivalry speak not infrequently of the knighting of serfs or *jongleurs*. While knighthood was avoided by poor nobles, it was coveted by rich citizens. It is recorded in 1298 as "an immemorial custom" in Provence that rich burghers enjoyed the honour of knighthood; and less than a century later we find Sacchetti complaining that the dignity is open to any rich upstart, however disreputable his antecedents. Similar causes contributed to the decay of knightly ideas in warfare. Even in the 12th century, when war was still rather the pastime of kings and knights than a national effort, the strict code of chivalry was more honoured in the breach than in the observance. Already about 1160 Peter of Blois had written, "The so-called order of knighthood is nowadays mere disorder"; half a century earlier still, Guibert of Nogent gives an equally unflattering picture of contemporary chivalry in his *De vita sua*. But when the Hundred Years' War brought a real national conflict between England and France, when archery became of supreme importance, and a large proportion even of the cavalry were mercenary soldiers, then the exigencies of serious warfare swept away much of that outward display and those class-conventions on which chivalry had always rested. Several of the best English commanders (*e.g.*, Sir Robert Knolles and Sir Thomas Dagworth) were of obscure birth, while on the French side even Du Guesclin had to wait long for his knighthood because he belonged only to the lesser nobility. The tournament again, which for two centuries had been under the ban of the church, was often almost as definitely discouraged by Edward III. as it was encouraged by John of France; and while John's father opened the Crécy campaign by sending Edward a challenge in due form of chivalry, Edward took advantage of this formal delay to amuse the French king with negotiations while he withdrew his army by a rapid march from an almost hopeless position. A quotation from Froissart will illustrate the extent to which war had now become a mere business. At the battle of Aljubarrota, as also at Agincourt, the handful of victors were obliged by a sudden panic to slay their prisoners. "Lo, behold the great evil adventure that fell that Saturday. For they slew as many good prisoners as would well have been worth, one with another, 400,000 franks."

BIBLIOGRAPHY.—Froissart is perhaps the source from which we may gather most of chivalry in its double aspect, good and bad. The brilliant side comes out most clearly in Joinville, the *Chronique de Du Guesclin*, and the *Histoire de Bayart;* the darker side appears in the earlier chronicles of the crusades, and is especially emphasized by preachers and moralists like Jacques de Vitry, Etienne de Bourbon, Nicole Bozon and John Gower. John Smyth's *Lives of the Berkeleys* (Bristol and Gloucs. Archaeol. Soc., 2 vols.) and the *Book of the Knight of La Tour-Landry* (ed. A de Montaiglon, or in the old English trans published by the Early English Text Soc.) throw a very vivid light on the inner life of noble families. Of modern books, *see* A. Schultz, *Hofisches Leben z. Zeit der Minnesänger* (Leipzig, 1879); S. Luce, *Hist. de Du Guesclin et de son Epoque* (2nd ed., 1882); Léon Gautier, *La Chevalerie* (1883); F. W. Cornish, *Chivalry* (1901).

ORDERS OF KNIGHTHOOD

When orders ceased to be fraternities and became more and more marks of favour and a means of recognizing meritorious services to the Crown and country, the term "orders," became loosely applied to the insignia and decorations themselves. Thus "orders," irrespective of the title or other specific designation they confer, fall in Great Britain generally into three main categories, according as the recipients are made "knights grand cross," "knights commander" or "companions" In some orders the classes are more numerous, as in the Royal Victorian, for instance, which has five, numerous foreign orders a like number, some six, while the Chinese "Dragon" boasted no less than 11 degrees. Generally speaking, the insignia of the "knights grand cross" consist of a star worn on the left breast and a badge, usually some form of the cross-paty, worn suspended from a ribbon over the shoulder or, in certain cases, on days of high ceremonial from a collar. The "commanders" wear the badge from a ribbon round the neck, and the star on the breast; the "companions" have no star and wear the badge from a narrow ribbon at the button-hole.

Orders may, again, be grouped according as they are (1) PRIME ORDERS OF CHRISTENDOM, conferred upon an exclusive class only. Here belong, or belonged, the well-known orders of the *Garter* (England), *Golden Fleece* (Austria and Spain), *Annunziata* (Italy), *Black Eagle* (Prussia), *St. Andrew* (Russia), *Elephant* (Denmark) and *Seraphim* (Sweden). Of these the first three only, which are usually held to rank *inter se* in the order given, are historically identified with chivalry. (2) FAMILY ORDERS, bestowed upon members of the royal or princely class, or upon humbler individuals according to classes, in respect of "personal" services rendered to the family. In this category are such orders as the Royal Victorian and the Hohenzollern (Prussia). (3) ORDERS OF MERIT, whether military, civil or joint orders. Such have, as a rule, at least three, oftener five classes, and here belong such as the *Order of the Bath* (British) and the *Legion of Honour* (France). There are also certain orders, such as the recently instituted *Order of Merit* (British), which have but one class.

Of the great military and religious orders were the Teutonic Order and the Knights of St. John of Jerusalem (*Johanniter Orden, Malteser Orden*), for the history of which and the present state *see* TEUTONIC ORDER and ST. JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF.

Great Britain.—The history and constitution of the "most

noble" *Order of the Garter* has been treated above. The officers of the order are five—the prelate, chancellor, registrar, king of arms and usher—the first, third and fifth having been attached to it from the commencement, while the fourth was added by Henry V. and the second by Edward IV. The prelate has always been the bishop of Winchester; the chancellor was formerly the bishop of Salisbury, but is now the bishop of Oxford; the registrarship and the deanery of Windsor have been united since the reign of Charles I.; the king of arms, whose duties were in the beginning discharged by Windsor herald, is Garter Principal King of Arms; and the usher is the gentleman usher of the Black Rod. The chapel of the order is St. George's chapel, Windsor.

The "most ancient" *Order of the Thistle* was founded by James II. in 1687, and dedicated to St. Andrew. It consisted of the sovereign and eight knights companions, and fell into abeyance at the Revolution of 1688. In 1703 it was revived by Queen Anne, when it was ordained to consist of the sovereign and 12 knights companions, the number being increased to 16 by statute in 1827. The officers of the order are the dean, the secretary, Lyon King of Arms and the gentleman usher of the Green Rod. The chapel, in St. Giles's, Edinburgh, was begun in 1909. The collar is formed of thistles, alternating with sprigs of rue, and the motto is *Nemo me impune lacessit.*

The "most illustrious" *Order of St. Patrick* was instituted by George III. in 1788, to consist of the sovereign, the lord lieutenant of Ireland as grand master and 15 knights companions, enlarged to 22 in 1833. The king of arms is Ulster King of Arms; Black Rod the usher. The chapel is in St. Patrick's cathedral, Dublin. The collar is formed of alternate roses with red and white leaves, and gold harps linked by gold knots; the badge is suspended from a harp surmounted by an imperial jewelled crown. The motto is *Quis separabit?*

The "most honourable" *Order of the Bath* was established by George I. in 1725, to consist of the sovereign, a grand master and 36 knights companions. This was a pretended revival of an order supposed to have been created by Henry IV. at his coronation in 1399. But, as has been shown in the preceding section, no such order existed. Knights of the Bath, although they were allowed precedence before knights bachelors, were merely knights bachelors who were knighted with more elaborate ceremonies than others and on certain great occasions. In 1815 the order was instituted, in three classes, "to commemorate the auspicious termination of the long and arduous contest in which the empire has been engaged"; and in 1847 the civil knights commanders and companions were added. Exclusive of the sovereign, royal princes and distinguished foreigners, the order is limited to 55 military and 27 civil knights grand cross, 145 military and 108 civil knights commanders, and 705 military and 298 civil companions. The officers of the order are the dean (the dean of Westminster), Bath King of Arms, the registrar and the usher of the Scarlet Rod.

The "most distinguished" *Order of St. Michael and St. George* was founded by the prince regent, afterwards George IV., in 1818, in commemoration of the British protectorate of the Ionian islands, "for natives of the Ionian islands and of the island of Malta and its dependencies, and for such other subjects of his majesty as may hold high and confidential situations in the Mediterranean." By statute of 1832 the lord high commissioner of the Ionian islands was to be the grand master. After the repudiation of the British protectorate of the Ionian islands, the order was placed on a new basis, and by letters patent of 1868 and 1877 it was extended and provided for such of "the natural born subjects of the Crown of the United Kingdom as may have held or shall hold high and confidential offices within her majesty's colonial possessions, and in reward for services rendered to the crown in relation to the foreign affairs of the empire." The chapel of the order, in St. Paul's cathedral, was dedicated in 1906. The star of the knights grand cross is a seven-rayed star of silver with a small ray of gold between each, in the centre is a red St. George's cross bearing a medallion of St. Michael encountering Satan, surrounded by a blue fillet with the motto *Auspicium melioris aevi.*

The *Order of St. Michael and St. George ranks* between the "most exalted" *Order of the Star of India* and the "most eminent" *Order of the Indian Empire,* of both of which the viceroy of India for the time being is *ex officio* grand master. Of these the first was instituted in 1861 and enlarged in 1876, 1897 and 1903, in three classes, knights grand commanders, knights commanders and companions, and the second was established (for "companions" only) in 1878 and enlarged in 1887, 1892, 1897 and 1903, also in the same three classes, in commemoration of Queen Victoria's assumption of the style and title of empress of India. The collar of the *Star of India* is composed of alternate links of the lotus flower, red and white roses and palm branches enamelled on gold, with an imperial crown in the centre; that of the *Indian Empire* is composed of elephants, peacocks and Indian roses.

The *Royal Victorian Order* was instituted by Queen Victoria on April 25, 1896, for personal services rendered to her majesty and her successors. It consists of the sovereign, chancellor, secretary and five classes—knights grand commanders, knights commanders, commanders and members of the fourth and fifth classes.

To the class of orders without the titular appellation "knight" belongs the *Order of Merit,* founded by King Edward VII. on the occasion of his coronation. The order includes those who have gained distinction in the military and naval services of the empire, and such as have made themselves a great name in the fields of science, art and literature. The number of British members has been fixed at 24, with the addition of such foreign persons as the sovereign shall appoint. A lady, Miss Florence Nightingale, received the order in 1907. The badge is a cross of red and blue enamel surmounted by an imperial crown; the central blue medallion bears the inscription "For Merit" in gold, and is surrounded by a wreath of laurel. The badge of the military and naval members bears two crossed swords in the angles of the cross. The ribbon is garter blue and crimson and is worn round the neck.

The *Distinguished Service Order,* an order of military merit, was founded on Sept. 6, 1886, by Queen Victoria, to recognize the special services of officers in the army and navy. It consists of one class only, who take precedence immediately after the 4th class of the Royal Victorian Order. The badge is a white and gold cross with a red centre bearing the imperial crown surrounded by a laurel wreath. The ribbon is red, edged with blue. The *Imperial Service Order* was likewise instituted on June 26, 1902, and finally revised in 1908, as a recognition of services rendered to the British Crown by the members of the civil service in the empire, to consist of companions only. In precedence the order ranks after the Distinguished Service Order.

In addition to the above, there are two British orders confined to ladies. The *Royal Order of Victoria and Albert,* instituted in 1862, is a purely court distinction. The *Imperial Order of the Crown of India* is conferred for like purposes as the Order of the Indian Empire. Its object is to recognize the services of ladies connected with the court of India.

As was inevitable, the huge number of people engaged in the World War made it necessary that appointments to all the British Orders should be made on a greatly increased scale, while two additional Orders were instituted. A change in the method of wearing the badge of the Third Class (Companion) of some British Orders was made. Where it used to be worn medal-fashion on the left breast, it is now hung round the neck.

The *Order of the British Empire* was instituted in June 1917, to reward War services in all capacities, military and civil. In 1918 a Military Division of the Order was created. The essential features of the latest statute of the Order, published on Dec. 29, 1922, are as follows:—

There are five classes of the Order, which (like the Order of the Bath) is divided into military and civil divisions. Each class can be conferred upon men and women equally.

Highest Class—Knights Grand Cross and Dames Grand Cross (G.B E.).

Second Class—Knights Commander and Dames Commander (K.B.E. and D.B.E.).

Third Class—Commanders (C.B.E.).

Fourth Class—Officers (O.B E.).

Fifth Class—Members (M.B.E.).

The two highest classes of the Order wear a star, which is of

silver, of two designs. In the centre is a golden medallion showing a representation of Britannia seated, surrounded by a circlet of crimson enamel bearing the motto of the Order, "For God and the Empire."

The members of the first class wear the larger star on the left breast, and the badge of the Order (*see* below) is also worn on the sash, which, in the case of men, is 3¾ in. wide, in the case of women, 2¼ in. wide, and crosses the breast from the right shoulder to the left hip, the badge resting on the hip. A collar has been instituted for this class.

The members of the second class wear the smaller star on the left breast, with the badge suspended, in the case of men, by a ribbon 1¾ in. wide passing round the neck, and in the case of women, from a bow of ribbon of the same width, placed on the left side, above the star. The third class wear the badge, in the case of men, from a ribbon of the same width as the second class round the neck, and, in the case of women, from a bow on the left side. The fourth and fifth classes wear the badge on the left breast, from a ribbon 1½ in. wide, medal-fashion in the case of men, from a bow in the case of women.

The badge is a cross paty, bearing in the centre the medallion and circlet as in the star. An imperial crown in gold surmounts the cross. For the first three classes the cross is enamelled in pearl grey, bordered with gold, while the circlet is of red enamel with the motto in gold. The commander's badge is smaller than that for the other two classes. The badge of the fourth class is entirely silver gilt, while that of the lowest class is entirely silver. The ribbon of the Order is purple for the civil division, and purple with a narrow red central stripe for the military division.

There are also two medals belonging to the Order: The gallantry medal, which is rare, and is only awarded for conspicuous bravery, where the recipient knew, when he performed the deed of gallantry, that his life was in danger, and the meritorious service medal, given for meritorious service.

The order of *Companions of Honour* was instituted in June 1917, at the same time as the Order of the British Empire. It may be conferred upon either men or women who have rendered conspicuous national service; it confers no title or precedence.

It consists of the Sovereign and 50 members, and there is only one class. This order ranks next after the first class of the Order of the British Empire.

The sovereign's permission by royal warrant is necessary before a British subject can receive a foreign order of knighthood. For other decorations, *see* under MEDALS.

The Golden Fleece (La Toison d'Or) ranks historically and in distinction as one of the great knightly orders of Europe. It became divided into two branches, Austria and Spain. It was founded on Jan. 10, 1429–30, by Philip the Good, duke of Burgundy, on the day of his marriage with Isabella of Portugal at Bruges, in her honour and dedicated to the Virgin and St. Andrew. No certain origin can be given for the name. It seems to have been in dispute even in the early history of the order. At its constitution the number of the knights was limited to 24, exclusive of the grand master, the sovereign. The sovereign undertook to consult the knights before embarking on a war, all disputes between the knights were to be settled by the order, at each chapter the deeds of each knights were held in review, and punishments and admonitions were dealt out to offenders; to this the sovereign was expressly subject. Thus we find that the emperor Charles V. accepted humbly the criticism of the knights of the Fleece on his over-centralization of the government and the wasteful personal attention to details. The knights could claim as of right to be tried by their fellows on charges of rebellion, heresy and treason, and Charles V. conferred on the order exclusive jurisdiction over all crimes committed by the knights. It was in defiance of this right that Alva refused the claim of Counts Egmont and Horn to be tried by the knights of the Fleece in 1568. By the marriage of Mary, only daughter of Charles the Bold of Burgundy to Maximilian, archduke of Austria, 1477, the grand mastership of the order came to the house of Habsburg and, with the Netherlands provinces, to Spain in 1504 on the accession of Philip, Maximilian's son, to Castile. On the extinction of the Habsburg dynasty in Spain by the death of Charles II. in 1700 the grand-mastership, which had been filled by the kings of Spain after the loss of the Netherlands, was claimed by the emperor Charles VI., and he instituted the order in Vienna in 1713. Protests were made at various times by Philip V., but the question was never decided by treaty, and the Austrian and Spanish branches continued as independent orders as the principal order of knighthood in the respective States. While the Austrian branch excludes any other than Roman Catholics from the order, the Spanish Fleece may be granted to Protestants. The badges of the two branches vary slightly in detail, more particularly in the attachment of firestones and steels by which the fleece is attached to the ribbon of the collar. The collar is composed of alternate links of furisons and double steels interlaced to form the letter B for Burgundy.

Austria-Hungary.—The following were the principal orders other than that of the Golden Fleece. The *Order of . t. Stephen of Hungary,* the royal Hungarian order, founded in 1764 by the empress Maria Theresa. The *Order of Leopold,* for civil and military service, was founded in 1808 by the emperor Francis I. in memory of his father Leopold II. The *Order of the Iron Crown, i.e.,* of Lombardy, was founded by Napoleon as king of Italy in 1809, and refounded as an Austrian order of civil and military merit in 1816 by the emperor Francis I. The *Order of Francis Joseph,* for personal merit of every kind, was founded in 1849 by the emperor Francis Joseph I. The *Order of Maria Theresa* was founded by the empress Maria Theresa in 1757. A purely military order, it was given to officers for personal distinguished conduct in the field. The *Order of Elizabeth Theresa,* also a military order for officers, was founded in 1750 by the will of Elizabeth Christina, widow of the emperor Charles VI. It was renovated in 1771 by her daughter, the empress Maria Theresa. The *Order of the Starry Cross,* for high-born ladies of the Roman Catholic faith who devoted themselves to good works, was founded in 1668 by the empress Eleanor, mother of Leopold I., to commemorate the recovery of a relic of the true cross from a fire in the palace at Vienna. The relic was supposed to have been peculiarly treasured by the emperor Maximilian I. and the emperor Frederick III. The *Order of Elizabeth,* also for ladies, was founded in 1898.

Belgium.—The *Order of Leopold,* for civil and military merit, was founded in 1832 by Leopold I., with four classes, a fifth being added in 1838. The badge is a white enamelled cross, with gold borders and balls, suspended from a royal crown and resting on a green laurel and oak wreath. In the centre a medallion, surrounded by a red fillet with the motto of the order, *L'union fait la force,* bears a golden Belgian lion on a black field. The ribbon is watered red. The *Order of the Iron Cross,* the badge of which is a black cross with gold borders, with a gold centre bearing a lion, was instituted by Leopold II. in 1867 as an order of civil merit. The military cross was instituted in 1885. There are also the following orders instituted by Leopold II. for service in the Congo State: the *Order of the African Star* (1888), the *Royal Order of the Lion* (1891) and the *Congo Star* (1889).

Bulgaria.—The *Order of SS. Cyril and Methodius* was instituted in 1909 by King Ferdinand to commemorate the elevation of the principality to the position of an independent kingdom. It now takes precedence of the *Order of St. Alexander,* which was founded by Prince Alexander in 1881, and reconstituted by Prince Ferdinand in 1888.

Denmark.—The *Order of the Elephant,* one of the chief European orders of knighthood, was, it is said, founded by Christian I. in 1462; a still earlier origin has been assigned to it, but its regular institution was that of Christian V. in 1693. The order, exclusive of the sovereign and his sons, is limited to 30 knights, who must be of the Protestant religion. The ribbon is light watered blue, the collar of alternate gold elephants with blue housings and towers, the star of silver with a purple medallion bearing a silver or brilliant cross surrounded by a silver laurel wreath. The motto is *Magnanime pretium.* The *Order of the Dannebrog* is, according to Danish tradition, of miraculous origin, and was founded by Valdemar II. in 1219 as a memorial of a victory over the Esthonians, won by the appearance in the sky

of a red banner bearing a white cross. Historically the order dates from the foundation in 1671 by Christian V. at the birth of his son Frederick. The badge of the order is, with variations for the different classes, a white enamelled Danish cross with red and gold borders, bearing in the centre the letter W (V) and on the four arms the inscription *Gud og Kongen* (For God and King). The ribbon is white with red edging.

Egypt.—Since the war, the king of Egypt has founded six new Orders. The chief of them is the *Order of Mohammed Ali* (1915), with three classes: the ribbon is of watered green silk with a white line near to each edge. In 1922 was founded the *Order of Ismail*, the second Egyptian Order; the ribbon dark blue with a stripe of red towards the edges. The *Order of the Nile* (1915) has a ribbon of watered blue silk with a golden-yellow stripe at each edge. For ladies is the *Order of Al Kamal* (1915). The other orders are those of *Agriculture* (1915) and of the *Military Star of King Fuad* (1919).

France.—*The Legion of Honour*, the only order of France, and one which in its higher grades ranks in estimation with the highest European orders, was instituted by Napoleon Bonaparte on May 19, 1802 (29 Floreal of the year X.), as a general military and civil order of merit. All soldiers on whom "swords of honour" had been already conferred were declared legionaries *ipso facto*, and all citizens after 25 years' service were declared eligible, whatever their birth, rank or religion. On admission all were to swear to co-operate so far as in them lay for the assertion of the principles of liberty and equality. The organization as laid down by Napoleon in 1804 was as follows: Napoleon was grand master; a grand council of seven grand officers administered the order; the order was divided into 15 "cohorts" of seven grand officers, 20 commanders, 30 officers and 350 legionaries, and at the headquarters of the cohorts, for which the territory of France was separated into 15 divisions, were maintained hospitals for the support of the sick and infirm legionaries. Salaries varying in each rank were attached to the order. In 1805 the rank of "Grand Eagle" (now Grand Cross or *Grand Cordon*) was instituted, taking precedence of the grand officers. At the Restoration many changes were made, the old military and religious orders were restored, and the *Legion of Honour*, now *Ordre Royale de la Légion d'Honneur*, took the lowest rank. The revolution of July 1830 restored the order to its unique place The constitution of the order now rests on the decrees of March 16 and Nov. 24, 1852, the law of July 25, 1873, the decree of Dec. 29, 1892, and the laws of April 16, 1895, and Jan. 28, 1897, and a decree of June 26, 1900. The president of the republic is the grand master of the order; the administration is in the hands of a grand chancellor, who has a council of the order nominated by the grand master. The chancellery is housed in the *Palais de la Légion d'Honneur*, which, burnt during the Commune, was rebuilt in 1878. The order consists of the five classes of grand cross (limited to 80), grand officer (200), commander (1,000), officers (4,000), and chevalier or knight, in which the number is unlimited. These limitations in number do not affect the foreign recipients of the order. Salaries are attached to the military and naval recipients of the order when on the active list. The numbers of the recipients of the order *sans traitement* are limited through all classes. In ordinary circumstances 20 years of military, naval or civil service must have been performed before a candidate can be eligible for the rank of chevalier, and promotions can only be made after definite service in the lower rank. Extraordinary service in time of war and extraordinary services in civil life admit to any rank. Women have been decorated, notably Rosa Bonheur, Madame Curie and Madame Bartet. In the present order of the French republic the symbolical head of the republic appears in the centre, and a laurel wreath replaces the imperial crown; the inscription round the medallion is *République française*.

Among the orders swept away at the French Revolution, restored in part at the Restoration, and finally abolished at the revolution of July 1830 were the following: The *Order of St. Michael* was founded by Louis XI. in 1469 for a limited number of knights of noble birth. Later the numbers were so much increased under Charles IX. that it became known as *Le Collier à toutes bêtes*. In 1816 the order was granted for services in art and science. In view of the low esteem into which the *Order of St. Michael* had fallen, Henry III. founded in 1578 the *Order of the Holy Ghost* (*St. Esprit*). The badge of the order was a white Maltese cross decorated in gold, with the gold lilies of France at the angles, in the centre a white dove with wings outstretched, the ribbon was sky blue (*cordon bleu*). The *Order of St. Louis* was founded by Louis XIV. in 1693 for military merit, and the *Order of Military Merit* by Louis XV. in 1759, originally for Protestant officers.

Germany.—Officially, the old orders of the German empire have now ceased to exist, although the decorations are often worn.

i. *Anhalt.*—The *Order of Albert the Bear*, a family order or *Hausorden*, was founded in 1836 by the dukes Henry of Anhalt-Köthen, Leopold Frederick of Anhalt-Dessau and Alexander Charles of Anhalt-Bernburg.

ii. *Baden.*—The *Order of Fidelity or Loyalty* (*Hausorden der Treue*) was instituted by William, margrave of Baden-Durlach in 1715, and reconstituted in 1803 by the elector Charles Frederick. There was, in the end, only one class, for princes of the reigning house, foreign sovereigns and eminent men of the State. The military *Order of Charles Frederick* was founded in 1807. The order was conferred for long and meritorious military service. The *Order of the Zähringen Lion* was founded in 1812 in commemoration of the descent of the reigning house of Baden from the dukes of Zähringen. After 1896 the *Order of Berthold I.* was a distinct order; it was founded in 1877 as a higher class of the *Zähringen Lion*.

iii. *Bavaria.*—The *Order of St. Hubert*, one of the oldest and most distinguished knightly orders, was founded in 1444 by Duke Gerhard V. of Jülich-Berg in honour of a victory over Count Arnold of Egmont at Ravensberg on St. Hubert's day. The knights wore a collar of golden hunting horns, whence the order was also known as the *Order of the Horn;* the order fell into abeyance at the extinction of the dynasty in 1609. It was revived in 1708, and its constitution was altered at various times, its final form being given in 1808. The *Order of St. George*, said to have been founded in the 12th century as a crusading order and revived by the emperor Maximilian I. in 1494, dated historically from its institution in 1729 by the elector Charles Albert, afterwards the emperor Charles VII. It was confirmed by the elector Charles Theodore in 1778 and by the elector Maximilian Joseph IV. as the second Bavarian order. Besides the above Bavaria possessed the *Military Order of Maximilian Joseph*, 1806, and the *Civil Orders of Merit of St. Michael*, 1693, and of the *Bavarian Crown*, 1808. There were also the two illustrious orders for ladies, the *Order of Elizabeth*, founded in 1766, and the *Order of Theresa*, in 1827.

iv. *Brunswick.*—The *Order of Henry the Lion*, for military and civil merit, was founded by Duke William in 1834.

v. *Hanover.*—The *Order of St. George* was instituted by King Ernest Augustus I. in 1839 as the family order of the house of Hanover; the *Royal Guelphic Order* by George, prince regent, afterwards George IV. of Great Britain, in 1815; and the *Order of Ernest Augustus* by George V. of Hanover in 1865. These orders have not been conferred since 1866, when Hanover ceased to be a kingdom, and the *Royal Guelphic Order*, which from its institution was more British than Hanoverian, not since the death of William IV. in 1837. The last British grand cross was the late duke of Cambridge.

vi. *Hesse.*—Of the various orders founded by the houses of Hesse-Cassel and Hesse-Darmstadt the following survived in the grand duchy of Hesse. The *Order of Louis*, founded by the grand duke Louis I. of Hesse-Darmstadt in 1807; the *Order of Philip the Magnanimous*, founded by the grand duke Louis II in 1840. The *Order of the Golden Lion* was founded in 1770 by the landgrave Frederick II. of Hesse-Cassel.

vii. *Mecklenburg.*—The grand duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz possessed jointly the *Order of the Wendish Crown*, founded in 1864 by the grand dukes Frederick Francis II. of Schwerin and Frederick William of Strelitz. The *Order of the Griffin*, founded in 1884 by Frederick Francis III.

of Schwerin, was made common to the duchies in 1904.

viii. *Oldenberg.*—The *Order of Duke Peter Frederick Louis,* a family order and order of merit, was founded by the grand duke Paul Frederick Augustus in 1838.

ix. *Prussia.*—The *Order of the Black Eagle* was founded in 1701 by the elector of Brandenburg, Frederick I., in memory of his coronation as king of Prussia. The order consisted of one class only and the original statutes limited the number, exclusive of the princes of the royal house and foreign members, to 30, but the number has been exceeded. It was only conferred on those of royal lineage and upon high officers of State. Only those who had received the *Order of the Red Eagle* were eligible. The *Order of the Red Eagle,* the second of the Prussian orders, was founded originally as the *Order of Sincerity* in 1705 by George William, hereditary prince of Brandenburg-Bayreuth. The original constitution and insignia were afterwards changed, with the exception of the red eagle which formed the centre of the cross of the badge. The order had almost fallen into oblivion when it was revived in 1734 by the margrave George Frederick Charles as the *Order of the Brandenburg Red Eagle.* On the cession of the principality to Prussia in 1791 the order was transferred and King Frederick William raised it to its high place in Prussian orders.

The *Order for Merit* (*Ordre pour le Mérite*), one of the most highly prized of European orders of merit, had two divisions, military and for science and art. It was originally founded by the electoral prince Frederick, afterwards Frederick I. of Prussia, in 1667 as the *Order of Generosity;* it was given its later name and granted for civil and military distinction by Frederick the Great, 1740. In 1810 the order was made one for military merit against the enemy in the field exclusively. In 1840 the class for distinction for science and art, or peace class, was founded by Frederick William IV. The number was limited to 30 German and 30 foreign members. The *Academy of Sciences and Arts* on a vacancy nominated three candidates, from which one was selected by the king. It is interesting to note that this was the only distinction which Thomas Carlyle would accept. The *Order of the Crown,* founded by William I. in 1861, ranked with the Red Eagle. Other Prussian orders were the *Order of William,* instituted by William II. in 1896; a Prussian branch of the knights of St. John of Jerusalem, *Johanniter Orden,* in its later form dating from 1893; and the family *Order of the House of Hohenzollern,* founded in 1851 by Frederick William IV. There was also for ladies the *Order of Service,* founded in 1814 by Frederick William III., in one class, but enlarged in 1850 and in 1865. The decoration of merit for ladies (*Verdienst-kreuz*) founded in 1870, was raised to an order in 1907. For the famous military decoration, the *Iron Cross, see* MEDALS.

x. *Saxony.*—The *Order of the Crown of Rue* was founded as a family order by Frederick Augustus I. in 1807. It was of one class only, and the sons and nephews of the sovereign were born knights of the order. It was granted to foreign ruling princes and subjects of high rank. Other Saxon orders were the military *Order of St. Henry;* the *Order of Albert,* for civil and military merit; the *Order of Civil Merit,* 1815. For ladies there were the *Order of Sidonia,* 1870, in memory of the wife of Albert the Bold, the mother of the Albertine line; and the *Maria Anna Order,* 1906.

xi. The duchies of *Saxe Altenburg, Saxe Coburg Gotha* and *Saxe Meiningen* had in common the family *Order of Ernest,* founded in 1833 in memory of Duke Ernest the Pious of Saxe Gotha and as a revival of the *Order of German Integrity* founded in 1690. Saxe Coburg Gotha and Saxe Meiningen had also separate crosses of merit in science and art.

xii. *Saxe Weimar.*—The *Order of the White Falcon* or *of Vigilance* was founded in 1732 and renewed in 1815.

xiii. *Württemberg.*—The *Order of the Crown of Württemberg* was founded in 1818, uniting the former *Order of the Golden Eagle* and an order of civil merit. Besides the military *Order of Merit* founded in 1759, and the silver cross of merit, 1900, Württemberg had also the *Order of Frederick,* 1830, and the *Order of Olga,* 1871, which was granted to ladies as well as men.

Greece.—The *Order of the Redeemer* was founded as such in 1833 by King Otto, being a conversion of a decoration of honour instituted in 1829 by the National Assembly at Argos. There were five classes, the numbers being regulated for each. In 1912 was instituted the *Order of George I.*

Holland.—The *Order of William,* for military merit, was founded in 1815 by William I.; there are four classes; the badge is a white cross resting on a green laurel Burgundian cross, in the centre the Burgundian flint-steel, as in the order of the Golden Fleece. The motto *Voer Moed, Belied, Trouw* (for Valour, Devotion, Loyalty), appears on the arms of the cross. The cross is surmounted by a jewelled crown; the ribbon is orange with dark blue edging. The *Order of the Netherlands Lion,* for civil merit, was founded in 1818. The family *Order of the Golden Lion of Nassau* passed in 1890 to the grand duchy of Luxembourg (*see* under *Luxemburg*). In 1892 Queen Wilhelmina instituted the *Order of Orange-Nassau.* The *Teutonic Order* (*q.v.*), surviving in the Ballarde (Bailiwick) of Utrecht, was officially established in the Netherlands by the States General in 1580. It was abolished by Napoleon in 1811 and was restored in 1815.

Italy.—The *Order of the Annunziata,* the highest order of knighthood of the Italian kingdom, was instituted in 1362 by Amadeus VI., count of Savoy, as the Order of the Collare or Collar, from the silver collar made up of love-knots and roses, which was its badge, in honour of the 15 joys of the Virgin; hence the number of the knights was restricted to 15, the 15 chaplains recited 15 masses each day, and the clauses of the original statute of the order were 15 (Amadeus VIII added five others in 1434). Charles III. decreed that the order should be called the Annunziata, and made some other alterations in 1518. His son and successor, Emmanuel Philibert, made further modifications in the statute and the costume. The knights of the Annunziata have the title of "cousins of the king," and enjoy precedence over all the other officials of the State The costume of the order is of white satin embroidered in silk, with a purple velvet cloak adorned with roses and gold embroidery, but it is now never worn; in the collar the motto *Fert* is inserted, on the meaning of which there is great uncertainty, and from it hangs a pendant enclosing a medallion representing the Annunciation. The motto has been taken as the Latin word meaning "he bears" or as representing the initials of the legend *Fortitudo Ejus Rhodum Tenuit,* with an allusion to a defence of the island of Rhodes by an ancient count of Savoy.

The *Order of St. Maurice and St. Lazarus* (SS. Maurizio e Lazzaro), is a combination of two ancient orders The Order of St. Maurice was originally founded by Amadeus VIII., duke of Savoy, in 1434, when he retired to the hermitage of Ripaille, and consisted of a group of half-a-dozen councillors who were to advise him on such affairs of State as he continued to control. When he became pope as Felix V. the order practically ceased to exist. It was re-established at the instance of Emmanuel Philibert by Pope Pius V. in 1572 as a military and religious order, and the following year it was united to that of St. Lazarus by Gregory XIII. The latter order had been founded as a military and religious community at the time of the Latin kingdom of Jerusalem with the object of assisting lepers, many of whom were among its members. Popes, princes and nobles endowed it with estates and privileges, including that of administering and succeeding to the property of lepers, which eventually led to grave abuses. With the advance of the Saracens the knights of St. Lazarus, when driven from the Holy Land and Egypt, migrated to France (1291) and Naples (1311), where they founded leper hospitals. The order in Naples, which alone was afterwards recognized as the legitimate descendant of the Jerusalem community, was empowered to seize and confine anyone suspected of leprosy, a permission which led to the establishment of a regular inquisitorial system of blackmail. In the 15th and 16th centuries the order declined in credit and wealth, until finally the grand master resigned his position in favour of Emmanuel Philibert, duke of Savoy, in 1571. Two years later the orders of St. Lazarus and St. Maurice were incorporated into one community, the members of which were to devote themselves to the defence of the Holy See and to fight its enemies as well as to continue assisting lepers. The galleys of the order subsequently took part in

various expeditions against the Turks and the Barbary pirates. Leprosy, which had almost disappeared in the 17th century, broke out once more in the 18th, and in 1773 a hospital was established by the order at Aosta. The knighthood of St. Maurice and St. Lazarus is now a dignity conferred by the king of Italy (the grand master) on persons distinguished in the public service, science, art and letters, trade, and above all in charitable works, to which its income is devoted.

The military *Order of Savoy* was founded in 1815 by Victor Emmanuel of Sardinia; badge modified 1855 and 1857. The *Civil Order of Savoy,* founded in 1831 by Charles Albert of Sardinia, is of one class, and is limited to 60 members. The *Order of the Crown of Italy* was founded in 1868 by Victor Emmanuel II. in commemoration of the union of Italy into a kingdom.

Luxemburg.—The *Order of the Golden Lion* was founded as a family order of the house of Nassau by William III. of the Netherlands and Adolphus of Nassau jointly. On the death of William in 1890 it passed to the grand duke of Luxemburg. The *Order of Adolphus of Nassau,* for civil and military merit, was founded in 1858, and the *Order of the Oak Crown* as a general order of merit in 1841, modified 1858.

Monaco.—The *Order of St. Charles* was founded in 1858 by Prince Charles III. and remodelled in 1863. It is a general order of merit.

Montenegro.—The *Order of St. Peter,* founded in 1852, was a family order, in one class, and only given to members of the princely family; the *Order of Danilo,* or of the *Independence of Montenegro,* was a general order of merit also founded in 1852.

Norway.—The *Order of St Olaf* was founded in 1847 by Oscar I. in honour of St. Olaf, the founder of Christianity in Norway, as a general order of merit, military and civil. The *Order of the Norwegian Lion,* founded in 1904 by Oscar II., has only one class; foreigners on whom the order is conferred must be sóvereigns or heads of States or members of reigning houses.

Papal.—The arrangement and constitution of the papal orders was remodelled by a brief of Pius X. in 1905. The *Order of Christ,* the supreme pontifical order, is of one class only; for the history of this ancient order see *Portugal* (*infra*). The *Order of Pius* was founded in 1847 by Pius IX. The *Order of St. Gregory the Great,* founded in 1831, is in two divisions, civil and military. The *Order of St. Sylvester* was originally founded as the *Order of the Golden Spur* by Paul IV. in 1559 as a military body, though tradition assigns it to Constantine the Great and Pope Sylvester. It was reorganized as an order of merit by Gregory XVI. in 1841. In 1905 the order was divided into three classes, and a separate order, that of the *Golden Spur* or *Golden Legion* (*Militia Aurata*) was established, in one class, with the numbers limited to 100. The cross *Pro Ecclesia et Pontifice* instituted by Leo XIII. in 1888 is a decoration, not an order. There remains the venerable *Order of the Holy Sepulchre,* of which tradition assigns the foundation to Godfrey de Bouillon. It was, however, probably founded as a military order for the protection of the Holy Sepulchre by Alexander VI. in 1496. The right to nominate to the order was shared with the pope as grand master by the guardian of the *Patres Minores* in Jerusalem, later by the Franciscans, and then by the Latin patriarch in Jerusalem. In 1905 the latter was nominated grand master, but the pope reserves the joint right of nomination. The badge of the order is a red Jerusalem cross with red Latin crosses in the angles.

Poland.—Since the restoration of Polish freedom, the old *Order of the White Eagle* has been set up again. It is given only for exceptional service: the ribbon is light blue. The origin of the *Order of Polonia Restituta* needs no explanation. There are five classes; the badge is a white cross with the eagle of Poland on it; the ribbon consisting of the Polish national colours; red with white edges.

Portugal.—The *Order of Christ* was founded on the abolition of the Templars by Diniz of Portugal in 1318 in conjunction with Pope John XXII., both having the right to nominate to the order. The papal branch survives as a distinct order. In 1522 it was formed as a distinct Portuguese order and the grand mastership vested in the crown of Portugal. In 1789 its original religious aspect was abandoned, and with the exception that its members had to be of the Roman Catholic faith, it was entirely secularized. The *Order of the Tower and Sword* was founded in 1808 in Brazil by the regent, afterwards King John VI. of Portugal, as a revival of the old *Order of the Sword,* said to have been founded by Alfonso V. in 1459. It was remodelled in 1832 under its later name as a general order of military and civil merit. The *Order of St. Benedict of Aviz* (earlier of *Evora*), founded in 1162 as a religious military order, was secularized in 1789 as an order of military merit. The *Order of St. James of the Sword,* or James of Compostella, was a branch of the Spanish order of that name (*see* below under Spain). It also was secularized in 1789, and in 1862 was constituted an order of merit for science, literature and art. In 1789 these three orders were granted a common badge uniting the three separate crosses in a gold medallion; to the separate crosses was added a red sacred heart and small white cross. There were also the *Order of Our Lady of Villa Viçosa* (1819), for both sexes, and the *Order of St. Isabella,* 1801, for ladies.

Rumania.—The *Order of the Star of Rumania* was founded in 1877, and the *Order of the Crown of Rumania* in 1881, for civil and military merit; the ribbon of the first is red with blue borders, of the second light blue with two silver stripes.

Russia.—The *Order of St. Andrew* was founded in 1698 by Peter the Great. It was the chief order of the empire, and admission carried with it according to the statutes of 1720 the orders of *St. Anne, Alexander Nevsky,* and the *White Eagle;* there was only one class. The *Order of St. Catherine,* for ladies, ranked next to the St. Andrew. It was founded under the name of the *Order of Rescue* by Peter the Great in 1714 in honour of the empress Catherine and the part she had taken in rescuing him at the battle of the Pruth in 1711. The *Order of St. Alexander Nevsky* was founded in 1725 by the empress Catherine I. The *Order of the White Eagle* was founded in 1713 by Augustus II. of Poland and was adopted as a Russian order in 1831. The *Order of St. Anne* was founded by Charles Frederick, duke of Holstein-Gottorp in 1735 in honour of his wife, Anna Petrovna, daughter of Peter the Great. It was adopted as a Russian order in 1797 by their grandson, the emperor Paul. Other orders were those of *St. Vladimir,* founded by Catherine II., 1782, and of *St. Stanislaus,* founded originally as a Polish order by Stanislaus Augustus Poniatowski in 1765, and adopted as a Russian order in 1831. The military *Order of St. George* was founded by the empress Catherine II. in 1769 for military service on land and sea, with four classes; a fifth class for non-commissioned officers and men, the *St. George's Cross,* was added in 1807. [These orders were naturally ended by the Soviet revolution which has given rise to the *Order of the Red Flag,* for service to the international revolution, an order which perhaps does not come under this heading.]

Spain.—The branch of the *Order of the Golden Fleece* has been dealt with above. The three most ancient orders of Spain—of *St. James of Compostella,* or *St. James of the Sword,* of *Alcantara* and of *Calatrava*—still exist as orders of merit, the last two as orders of military merit. They were all originally founded as military religious orders, like the crusading Templars, and the Hospitallers, but to fight for the true faith against the Moors in Spain. The present badges of the orders represent the crosses that the knights wore on their mantles. That of St. James of Compostella is the red lily-hilted sword of St. James; the ribbon is also red. The other two orders wear the cross *fleury*—*Alcantara* red, *Calatrava* green, with corresponding ribbons. A short history of these orders may be here given. Tradition gives the foundation of the *Order of Knights of St. James of Compostella* to Ramiro II., king of Leon, in the 10th century, to commemorate a victory over the Moors, but, historically the order dates from the confirmation in 1175 by Pope Alexander III. It gained great reputation in the wars against the Moors and became very wealthy. In 1493 the grand-mastership was annexed by Ferdinand the Catholic, and was vested permanently in the crown of Spain by Pope Adrian VI. in 1522.

The *Order of Knights of Alcantara,* instituted about 1156 by

the brothers Don Suarez and Don Gomez de Barrientos for protection against the Moors. In 1177 they were confirmed as a religious order of knighthood under Benedictine rule by Pope Alexander III. Until about 1213 they were known as the Knights of San Julian del Pereyro; but when the defence of Alcantara, newly wrested from the Moors by Alphonso IX. of Castile, was entrusted to them they took their name from that city. For a considerable time they were in some degree subject to the grand master of the kindred order of Calatrava. Ultimately, however, they asserted their independence by electing a grand master of their own. During the rule of 37 successive grand masters, similarly chosen, the influence and wealth of the order gradually increased until the Knights of Alcantara were almost as powerful as the sovereign. In 1494–95 Juan de Zuñiga was prevailed upon to resign the grand-mastership to Ferdinand, who thereupon vested it in his own person as king; and this arrangement was ratified by a bull of Pope Alexander VI., and was declared permanent by Pope Adrian VI. in 1523. In 1540 Pope Paul III. released the knights from the strictness of Benedictine rule by giving them permission to marry, though second marriage was forbidden. The three vows were henceforth *obedientia, castitas conjugalis* and *conversio morum*. In modern times the history of the order has been somewhat chequered. When Joseph Bonaparte became king of Spain in 1808, he deprived the knights of their revenues, which were only partially recovered on the restoration of Ferdinand VII. in 1814. The order ceased to exist as a spiritual body in 1835.

The *Order of Knights of Calatrava* was founded in 1158 by Don Sancho III. of Castile, who presented the town of Calatrava, newly wrested from the Moors, to them to guard. In 1164 Pope Alexander III. granted confirmation as a religious military order under Cistercian rule. In 1197 Calatrava fell into the hands of the Moors and the order removed to the castle of Salvatierra, but recovered their town in 1212. In 1489 Ferdinand seized the grand-mastership, and it was finally vested in the crown of Spain in 1523. The order became a military order of merit in 1808 and was reorganized in 1874. The *Royal and Illustrious Order of Charles III.* was founded in 1771 by Charles III.; it was abolished by Joseph Bonaparte in 1809, together with all the Spanish orders except the Golden Fleece, and the *Royal Order of the Knights of Spain* was established. In 1814 Ferdinand VII. revived the order. The *Order of Isabella the Catholic* was founded in 1815 under the patronage of St. Isabella, wife of Diniz of Portugal; originally instituted to reward loyalty in defence of the Spanish possessions in America, it is now a general order of merit. Other Spanish orders are the *Maria Louisa*, 1792, for noble ladies; the military and naval orders of merit of *St. Ferdinand*, founded by the Cortes in 1811; of *St. Ermenegild* (*Hermenegildo*), 1814; of *Military Merit* and *Naval Merit*, 1866, and of *Maria Christina*, 1890; the *Order of Beneficencia* for civil merit, 1856; that of *Alfonso XII.* for merit in science, literature and art, 1902, and the *Civil Order of Alfonso XII.*, 1902.

Sweden.—The *Order of the Seraphim* (the "Blue Ribbon"). Tradition attributes the foundation of this most illustrious order of knighthood to Magnus I. in 1280; more certainty attaches to the fact that the order was in existence in 1336. In its modern form the order dates from its reconstitution in 1748 by Frederick I. Exclusive of the sovereign and the princes of the blood, the order is limited to 23 Swedish and eight foreign members. The native members must be already members of the *Order of the Sword* or the *Pole Star*. There is a prelate of the order which is administered by a chapter; the chapel of the knights is in the Riddar Holmskyrka at Stockholm. The collar is formed of alternate gold seraphim and blue enamelled patriarchal crosses. The motto is *Iesus Hominum Salvator*. The *Order of the Sword* (the "Yellow Ribbon"), the principal Swedish military order, was founded, it is said, by Gustavus I. Vasa in 1522, and was re-established by Frederick I., with the *Seraphim* and the *Pole Star* in 1748. The *Order of the Pole Star* (*Polar Star, North Star*, the "Black Ribbon"), was founded in 1748 for civil merit. The *Order of Vasa* (the "Green Ribbon"), was founded by Gustavus III. in 1772 as an order of merit for services rendered to the national industries and manufactures. The *Order of Charles XIII.*, founded in 1811, is granted to Freemasons of high degree. It is thus quite unique.

Turkey.—The *Nischan-i-Imtiaz*, or *Order of Privilege*, was founded by Abdul Hamid II. in 1879 as a general order of merit in one class; the *Nischan-el-Iftikhar*, or *Order of Glory*, also one class, founded 1831 by Mahmoud II.; the *Nischan-i-Mejidi*, the *Mejidieh*, was founded as a civil and military order of merit in 1851 by Abdul Medjid. The *Nischan-i-Osmanie*, the *Osmanieh*, for civil and military merit, was founded by Abdul Aziz in 1862. The *Nischan-i-Schefakat of Compassion or Benevolence*, was instituted for ladies in 1878 by the sultan in honour of the work done for the non-combatant victims of the Russo-Turkish war of 1877. There was also the family order, for Turkish princes, the *Hanédani-Ali-Osman*, founded in 1893, and the *Ertogroul*, in 1903.

Yugoslavia.—The *Order of the White Eagle*, the principal order, was founded by Milan I. in 1882; the ribbon is blue and red; the *Order of St. Sava*, founded 1883, is an order of merit for science and art; the *Order of the Star of Karageorgevitch*, was founded by Peter I. in 1904. The orders of *Milosch the Great*, founded by Alexander I. in 1898 and of *Takovo*, founded originally by Michael Obrenovitch in 1863, reconstituted in 1883, are since the dynastic revolution of 1903 no longer bestowed. The *Order of St. Lazarus* is not a general order, the cross and collar being only worn by the king.

Estonia has established the *Liberty Cross; Finland* the *White Rose of Finland; Latvia* the *Order of the Three Stars*.

Non-European Orders.—Of the various States of Central and South America, Nicaragua has the *American Order of San Juan* or *Grey Town*, founded in 1857; and Venezuela that of the *Bust of Bolivar*, 1854. Mexico has abolished its former orders, the *Mexican Eagle*, 1865, and *Our Lady of Guadalupe*, 1853; as has Brazil those of the *Southern Cross*, 1822, *Dom Pedro I.*, 1826, *the Rose*, 1829, and the Brazilian branches of the Portuguese orders of *Christ, St. Benedict of Aviz* and *St. James*. The republican *Order of Columbus*, founded in 1890, was abolished in 1891.

China.—There were no orders for natives, and such distinctions as were conferred by the different coloured buttons of the mandarins, the grades indicated by the number of peacock's feathers, the gift of the yellow jacket and the like, were rather insignia of rank or personal marks of honour than orders in the European sense. For foreigners, however, the emperor in 1882 established the sole order, that of the *Imperial Double Dragon*. The recipients eligible for the various classes were graded, from the first grade of the first class for reigning sovereigns down to the fifth class for merchants and manufacturers.

Japan.—The Japanese orders were all instituted by the emperor Mutsu Hito. In design and workmanship the insignia of the orders are beautiful examples of the art of the native enamellers. The *Order of the Chrysanthemum* (*Kikkwa Daijasho*), founded in 1877, has only one class. It is but rarely conferred on others than members of the royal house or foreign rulers or princes. The *Order of the Paulownia Sun* (*Tokwa Daijasho*), founded in 1888, in one class, may be in a sense regarded as the highest class of the *Rising Sun* (*Kiokujitsasho*) founded in eight classes, in 1875. The badge of both orders is essentially the same, viz., the red sun with white and gold rays; in the former the lilac flowers of the Paulownia tree, the flower of the Tycoon's arms, take a prominent part. The last two classes of the *Rising Sun* wear a decoration formed of the Paulownia flower and leaves. The *Order of the Mirror* or *Happy Sacred Treasure* (*Zaihosho*) was founded in 1888. There is also an order for ladies, that of the *Crown*, founded in 1888. The military order of Japan is the *Order of the Golden Kite*, founded in 1890.

Persia.—The *Order of the Sun and Lion*, founded by Fath 'Ali Shāh in 1808, had five classes. It is understood that the creation by the present Shah of a new set of orders and decorations, is imminent.

Siam.—The *Sacred Order*, or the *Nine Precious Stones*, was founded in 1869, in one class only, for the Buddhist princes of the royal house. The *Order of the White Elephant*, founded in 1861, is the principal general order. The badge is a striking exam-

ple of oriental design adapted to a European conventional form. The circular plaque is formed of a triple circle of lotus leaves in gold, red and green, within a blue circlet with pearls a richly caparisoned white elephant on a gold ground, the whole surmounted by the jewelled gold pagoda crown of Siam; the collar is formed of alternate white elephants, red, blue and white royal monograms and gold pagoda crowns. Other orders are the *Siamese Crown* (*Mongkut Siam*), founded 1869; the family *Order of Chulah-Chon-Clao,* 1873; and the *Maha Charkrkri,* 1884, only for princes and princesses of the reigning family. (C. We.)

KNIGHT-SERVICE, the dominant and distinctive tenure of land under the feudal system. Its origin may be traced to the mailed horseman, armed with lance and sword, who became the most important factor in battle. This novel system was introduced after the Conquest by the Normans, who relied essentially on their mounted knights, while the English fought on foot. They were already familiar with the principle of knight-service, the knight's fee, as it came to be termed in England, being represented in Normandy by the *fief du haubert,* so termed from the hauberk or coat of mail (*lorica*) which was worn by the knight. The coronation charter of Henry I. (1100) speaks of those holding by knight-service as *milites qui per loricam terras suas deserviunt.*

The Conqueror divided the lay lands of England among his followers, to be held by the service of a fixed number of knights in his host, and imposed the same service on most of the great ecclesiastical bodies. No record evidence exists of this action on his part, and the quota of knight-service exacted was not determined by the area or value of the lands granted, but was based upon the *unit* of the feudal host, the *constabularia* of ten knights. Of the tenants-in-chief or barons (*i.e.,* those who held directly of the Crown), the chief ones were called on to find one or more of such units, while of the lesser ones some were called on for five knights, *i.e.,* half a *constabularia.* The same system was adopted in Ireland when that country was conquered under Henry II. The baron who had been enfeoffed by his sovereign on these terms could provide the knights required either by hiring them for pay or, more conveniently when wealth was mainly represented by land, by a process of subenfeoffment, analogous to that by which he himself had been enfeoffed.

The primary obligation incumbent on every knight was service in the field, when called upon, for 40 days a year, with specified armour and arms. There was, however, a standing dispute as to whether he could be called upon to perform this service outside the realm, nor was the question of his expenses free from difficulty. In addition to this primary duty he had, in numerous cases at least, to perform that of "castle ward" at his lord's chief castle for a fixed number of days in the year. On certain baronies also was incumbent the duty of providing knights for the guard of royal castles, such as Windsor, Rockingham and Dover. Under the feudal system the tenant by knight-service had also the same pecuniary obligations to his lord as had his lord to the king. These consisted of (1) "relief," which he paid on succeeding to his lands; (2) "wardship," *i.e.,* the profits from his lands during a minority; (3) "marriage," *i.e.,* the right of giving in marriage, unless bought off, his heiress, his heir (if a minor) and his widow; and also of the three "aids" (*q.v.*). The chief sources of information for the extent and development of knight-service are the returns (*cartae*) of the barons (*i.e.,* the tenants-in-chief) in 1166, informing the king, at his request, of the names of their tenants by knight-service with the number of fees they held, supplemented by the payments for "scutage" (*q.v.*) recorded on the pipe-rolls, by the later returns printed in the *Testa de Nevill,* and by the still later ones collected in *Feudal Aids.* In the returns made in 1166 some of the barons appear as having enfeoffed more and some less than the number of knights they had to find. In the latter case they described the balance as being chargeable on their "demesne," *i.e.,* on the portion of their fief which remained in their own hands. These returns further prove that lands had already been granted for the service of a fraction of a knight, such service being in practice already commuted for a proportionate money payment; and they show that the total number of knights with which land held by military service was charged was not, as was formerly supposed, 60,000, but probably somewhere between 5,000 and 6,000. Similar returns were made for Normandy, and are valuable for the light they throw on its system of knight-service.

The principle of commuting for money the obligation of military service struck at the root of the whole system, and so complete was the change of conception that "tenure by knight-service of a mesne lord becomes, first in fact and then in law, tenure by escuage (*i.e.,* scutage)." By the time of Henry III., as Bracton states, the test of tenure was scutage; liability, however small, to scutage payment made the tenure military.

The disintegration of the system was carried farther in the latter half of the 13th century as a consequence of changes in warfare, which were increasing the importance of foot soldiers and making the service of a knight for 40 days of less value to the king. The barons, instead of paying scutage, compounded for their service by the payment of lump sums, and, by a process which is still obscure, the nominal quotas of knight-service due from each had, by the time of Edward I., been largely reduced. The knight's fee, however, remained a knight's fee, and the pecuniary incidents of military tenure, especially wardship, marriage and fines on alienation, long continued to be a source of revenue to the Crown. But at the Restoration tenure by knight-service was abolished by 12 Car. II. *c.* 24, and these vexatious exactions disappeared.

Bibliography.—For the returns of 1166 *see* the *Liber Niger,* ed. by Hearne, and the *Liber Rubeus* or *Red Book of the Exchequer,* ed. by Hall. The later returns are in *Testa de Nevill* (Record Commission, 1807) and in the Record Office volumes of *Feudal Aids,* arranged under counties. For the financial side *see* the early pipe-rolls of the Record Commission and the Pipe Roll Society, and abstracts of later ones in *The Red Book of the Exchequer;* but the editor's view must be received with caution and checked by J. H. Round's *Studies on the Red Book of the Exchequer* (for private circulation). The *Baronia Anglica* of Madox may also be consulted. The existing theory on knight-service was enunciated by Mr. Round in *English Historical Review,* vi., vii., and reissued by him in his *Feudal England* (1895). It is accepted by Pollock and Maitland (*Hist. Eng. Law*), who discuss the question at length; by J. F. Baldwin in his *Scutage and Knight-service in England* (Univ. of Chicago Press, 1897), a valuable monograph with bibl.; and by Petit-Dutaillis, in his *Studies supplementary to Stubbs' Constitutional History* (Manchester Univ. Series, 1908). (J. H. R.)

KNIGHTS OF COLUMBUS, THE, the leading Catholic laymen's organization in the world, was founded by the Rev. M. J. McGivney in 1882 in New Haven, Conn. From an original membership of 11 it grew from city to city in Connecticut and then from State to State and beyond national boundaries, until its membership in 1928 was more than 700,000. It operates in the United States and its possessions, in Canada, Newfoundland, Mexico and Cuba. The primary object of the Knights of Columbus is to associate Catholic men for religious and civic usefulness. There are four degrees of membership, none having any secret or oath-bound stipulation. The Knights have maintained, since their inception, an insurance feature for members. Non-insurance members are associates. Previous to their emergence into general public notice as an agency of war welfare work the Knights had done educational and social work. In launching a new movement for boys in 1928, the Columbian Squires, the Knights undertook the task of organizing Catholic youth in the seven countries in which the order operates, where a demand for such organization was felt to justify it.

KNIGHTS OF THE GOLDEN CIRCLE, a semi-military secret society in the United States, in the Middle West, 1861–64, the purpose of which was to bring the Civil War to a close and restore the "Union as it was." After the outbreak of the Civil War many of the Democrats of the Middle West, who were opposed to the war policy of the Republicans, organized the Knights of the Golden Circle, pledging themselves to exert their influence to bring about peace. In 1863, owing to the disclosure of some of its secrets, the organization took the name of Order of American Knights, and in 1864 this became the Sons of Liberty. The total membership of this order probably reached 250,000 to 300,000, principally in Ohio, Indiana, Illinois, Iowa, Wisconsin, Kentucky and south-western Pennsylvania. Fernando Wood of New York seems to have been the chief officer and in 1864 Clement L. Vallandigham of Ohio was second in command. The

great importance of the Knights of the Golden Circle and its successors was due to their opposition to the war policy of the Republican administration. The plan was to overthrow the Lincoln government in the elections and give to the Democrats the control of the state and Federal governments, which would then make peace and invite the Southern States to come back into the Union on the old footing. The most effective work done by the order was in encouraging desertion from the Federal armies, preventing enlistments and resisting the draft. Wholesale arrests of leaders and numerous seizures of arms by the United States authorities resulted in a general collapse of the order late in 1864. Three of the leaders were sentenced to death by military commissions, but sentence was suspended until 1866, when they were released under a decision of the United States Supreme Court.

P. Morton* (2 vols., 1899); *Treason History of Sons of Liberty*, F. G. Stundy (Chicago, 1903); J. F. Rhodes, *History of the United States from the Compromise of 1850*, vol. v. (1905).

KNIPPERDOLLINCK or **KNIPPERDOLLING, BERNT** (BEREND or BERNHARDT) (*c.* 1490–1536), German divine, was a prosperous cloth-merchant at Münster when in 1524 he joined Melchior Rinck and Melchior Hofmann in a business journey to Stockholm, which developed into an abortive religious errand. Knipperdollinck, a man of fine presence and glib tongue, noted from his youth for eccentricity, had the ear of the Münster populace when in 1527 he helped to break the prison of Tonies Kruse, in the teeth of the bishop and the civic authorities. For this he made his peace with the latter; but, venturing on another business journey, he was arrested, imprisoned for a year, and released on payment of a high fine—in regard of which treatment he began an action before the Imperial Chamber. Though his aims were political rather than religious, he attached himself to the reforming movement of Bernhardt Rothmann, once (1529) chaplain of St. Mauritz, outside Münster, now (1532) pastor of the city church of St. Lamberti. A new bishop directed a mandate (April 17, 1532) against Rothmann, which had the effect of alienating the moderates in Münster from the democrats.

Knipperdollinck was a leader of the democrats in the surprise (Dec. 26, 1532) which made prisoners of the negotiating nobles at Telgte, in the territory of Münster. In the end, Münster was by charter from Philip of Hesse (Feb. 14, 1533) constituted an evangelical city. Knipperdollinck was made a burgomaster in Feb. 1534. Anabaptism had already (Sept. 8, 1533) been proclaimed at Münster by a journeyman smith; and, before this, Heinrich Roll, a refugee, had brought Rothmann (May 1533) to a rejection of infant baptism. From Jan. 1, 1534, Roll preached Anabaptist doctrines in a city pulpit; a few days later, two Dutch emissaries of Jan Matthysz, or Matthyssen, the master-baker and Anabaptist prophet of Haarlem, came on a mission to Münster. They were followed (Jan. 13) by Jan Beukelsz (or Bockelszoon, or Buchholdt), better known as John of Leyden. It was his second visit to Münster; he came now as an apostle of Matthysz. He was 25, with a winning personality, great gifts as an organizer, and plenty of ambition. Knipperdollinck, whose daughter Clara was ultimately enrolled among the wives of John of Leyden, came under his influence. Matthysz himself came to Münster (1534) and lived in Knipperdollinck's house, which became the centre of the new movement to substitute Münster for Strasbourg (Melchior Hofmann's choice) as the New Jerusalem. On the death of Matthysz, in a foolish raid (April 5, 1534), John became supreme.

Knipperdollinck, with one attempt at revolt, when he claimed the kingship for himself, was his subservient henchman, wheedling the Münster democracy into subjection to the fantastic rule of the "king of the earth." He was made second in command, and executioner of the refractory. He fell in with the polygamy innovation, the protest of his wife being visited with a penance. In the military measures for resisting the siege of Münster he took no leading part. On the fall of the city (June 25, 1535) he hid in a dwelling in the city wall, but was betrayed by his landlady. After six months' incarceration, his trial, along with his comrades, took place on Jan. 19, and his execution, with fearful tortures, on Jan. 22, 1536. Knipperdollinck attempted to strangle himself, but was forced to endure the worst. His body, like those of the others, was hung in a cage on the tower of St. Lamberti, where the cages are still to be seen. An alleged portrait, from an engraving of 1607, is reproduced in the appendix to A. Ross's *Pansebeia* (1655).

See L. Keller, *Geschichte der Wiedertäufer und ihres Reichs zu Munster* (1880); C. A. Cornelius, *Historische Arbeiten* (1899); E. Belfort Bax, *Rise and Fall of the Anabaptists* (1903). (A. GO.)

KNITTING, the art of forming a single thread or strand of yarn into a texture or fabric of a loop structure, by employing needles or wires. Crochet work is an analogous art in its simplest form. It consists of forming a single thread into a single chain of loops. All warp knit fabrics are built on this structure. Knitting may be said to be divided into two principles, viz., (1) hand knitting and (2) frame-work knitting. (*See* HOSIERY.) In hand knitting the wires, pins or needles used are of different lengths or gauges, according to the class of work wanted to be produced. They are made of steel, bone, wood or ivory. Some are headed to prevent the loops from slipping over the ends. Flat or selvedged work can only be produced on them. Others are pointed at both ends, and by employing three or more a circular or circular-shaped fabric can be made. In hand knitting each loop is formed and thrown off individually and in rotation and is left hanging on the new loop formed. The cotton, wool and silk fibres are the principal materials from which knitting yarns are manufactured—wool being the most important and most largely used. "Lamb's-wool," "wheeling," "fingering" and worsted yarns are all produced from the wool fibre, but may differ in size or fineness and quality. Those yarns are largely used in the production of knitted underwear. Hand knitting is to-day principally practised as a domestic art, but in some of the remote parts of Scotland and Ireland it is pursued as an industry to some extent. In the Shetland Islands the wool of the native sheep is spun and used in its natural colour, being manufactured into shawls, scarves, ladies' jackets, etc. The principal trade of other districts is hose and half-hose, made from the wool of the sheep native to the district. The formation of the stitches in knitting may be varied in a great many ways, by "purling" (knitting or throwing loops to back and front in rib form), "slipping" loops, taking up and casting off and working in various coloured yarns to form stripes, patterns, etc. The articles may be shaped according to the manner in which the wires and yarns are manipulated.

KNOBKERRIE, a strong, short stick with a rounded knob or head used by the natives of South Africa in warfare and the chase (from the Taal or South African Dutch, *knopkirie,* derived from Du. *knop,* a knob or button, and *kerrie,* a Bushman or Hottentot word for stick). It is employed at close quarters, or as a missile, and in time of peace serves as a walking-stick. The name has been extended to similar weapons used by the natives of Australia, the Pacific islands, and other places.

KNOLLES, RICHARD (*c.* 1545–1610), English historian, a native of Northamptonshire, was educated at Lincoln college, Oxford. He became a fellow of his college, and was master of a school at Sandwich, Kent, where he died in 1610. In 1603 Knolles published his *Generall Historie of the Turkes,* of which several editions subsequently appeared, among them a good one edited by Sir Paul Rycaut (1700), who brought the history down to 1699. It was dedicated to King James I., and Knolles availed himself largely of Jean Jacques Boissard's *Vitae et Icones Sultanorum Turcicorum* (Frankfort, 1596).

See the *Athenaeum,* Aug. 6, 1881.

KNOLLES (or KNOLLYS), SIR ROBERT (*c.* 1325–1407), English soldier, belonged to a Cheshire family. In 1346 he served in Brittany, and he was one of the English survivors who were taken prisoners by the French after the famous "combat of the thirty" in March 1351. He was soon released and took advantage of the civil war in Brittany to win fame and wealth. In 1356 he transferred his operations to Normandy, when he served under the allied standards of England and of Charles II. of Navarre. He led the "great company" in their work of devastation along the valley of the Loire, winning a terrible reputation by his

ravages. After the treaty of Brétigny in 1360 Knolles returned to Brittany, and took part in the struggle for the possession of the duchy between John of Montfort (Duke John IV.) and Charles of Blois, gaining great fame by his conduct in the fight at Auray (September 1364). In 1367 he fought in Spain with the Black Prince and in 1369 in Aquitaine. In 1370 he headed an expedition which invaded France and marched on Paris, but a mutiny broke up the army, and he was forced to take refuge in his Breton castle of Derval. In 1363 Knolles again assisted John of Montfort in Brittany, where he acted as John's representative; later he led a force into Aquitaine, and was one of the leaders of the fleet sent against the Spaniards in 1377. In 1380 he served in France under Thomas of Woodstock, afterwards duke of Gloucester, distinguishing himself at the siege of Nantes; and in 1381 he went with Richard II. to meet Wat Tyler at Smithfield. He died at Sculthorpe in Norfolk on Aug. 15, 1407. Sir Robert built a college and an almshouse at Pontefract; he restored the churches of Sculthorpe and Harpley; and he helped to found an English hospital in Rome. Knolles won an immense reputation by his skill and valour in the field, and ranks as one of the foremost captains of his age. French writers call him Canolles, or Canole.

KNOLLYS (nōlz), name of an English family descended from Sir Thomas Knollys (d. 1435), lord mayor of London. The first distinguished member of the family was Sir Francis Knollys (*c.* 1514–96), English statesman, son of Robert Knollys, or Knolles (d. 1521), a courtier in the service and favour of Henry VII. and Henry VIII. Robert had also a younger son, Henry, who took part in public life during the reign of Elizabeth and who died in 1583.

Sir Francis Knollys.—Francis Knollys, who entered the service of Henry VIII. before 1540, became M.P. in 1542 and was knighted in 1547 while serving with the English army in Scotland. A strong supporter of the reformed doctrines, he retired to Germany after Mary's accession, returning to England to become a privy councillor, vice-chamberlain of the royal household and a member of parliament under Queen Elizabeth, whose cousin Catherine (d. 1569), daughter of William Carey and niece of Anne Boleyn, was his wife. Knollys was sent in 1566 to Ireland, his mission being to obtain for the queen confidential reports on the lord-deputy Sir Henry Sidney, of whose conduct of affairs he gave a good report. In 1568 he was sent to Carlisle to take charge of Mary Queen of Scots; he was afterwards in charge of the queen at Bolton castle and then at Tutbury castle. He gave up the position of guardian just after his wife's death in January 1569. He was treasurer of the royal household from 1572 until his death on July 19, 1596 His monument may still be seen in the church of Rotherfield Grays, Oxfordshire. Knollys was Elizabeth's commissioner on such important occasions as the trials of Mary Queen of Scots, of Philip Howard earl of Arundel, and of Anthony Babington.

Sir Francis's eldest son Henry (d. 1583), and his sons Edward (d. *c.* 1580), Robert (d. 1625), Richard (d. 1596), Francis (d. *c.* 1648), and Thomas, were all courtiers and served the queen in parliament or in the field. His daughter Lettice (1540–1634) married Walter Devereux, earl of Essex, and then Robert Dudley, earl of Leicester; she was the mother of Elizabeth's favourite, the 2nd earl of Essex.

Some of Knollys's letters are in T. Wright's *Queen Elizabeth and her Times* (1838) and the *Burghley Papers*, ed. S. Haynes (1740); and a few of his manuscripts are still in existence. A speech which Knollys delivered in parliament against some claims made by the bishops was printed in 1608 and again in W. Stoughton's *Assertion for True and Christian Church Policie* (London, 1642).

Sir William Knollys.—Sir Francis Knollys's second son William (*c.* 1547–1632) served as a member of parliament and a soldier during the reign of Queen Elizabeth, being knighted in 1586. William became in 1596 a privy councillor and comptroller of the royal household; in 1602 he was made treasurer of the household. James I. created him Baron Knollys in 1603 and Viscount Wallingford in 1616. Through his second wife Elizabeth (1586–1658), daughter of Thomas Howard, earl of Suffolk, Knollys was related to Frances, countess of Somerset, and when this lady was tried for the murder of Sir Thomas Overbury her relatives were regarded with suspicion. Wallingford had to resign his appointments, but he regained the royal favour, and was created earl of Banbury in 1626. He died in London on May 25, 1632.

For the controversy over the Banbury peerage in the 17th and 18th centuries *see* Sir H. N. Nicolas, *Treatise in the Law of Adulterine Bastardy* (1833).

Sir W. T. Knollys.—His descendant, Sir William Thomas Knollys (1797–1883), entered the army and served with the Guards during the Peninsular War. Remaining in the army after the conclusion of the peace of 1815 he rose high in his profession. From 1855 to 1860 he was in charge of the military camp at Aldershot, then in its infancy, and in 1861 he was made president of the council of military education. From 1862 to 1877 he was comptroller of the household of the prince of Wales, afterwards King Edward VII. From 1877 until his death on June 23, 1883, he was gentleman usher of the black rod; he was also a privy councillor and colonel of the Scots Guards.

Viscount Knollys.—His son Francis (1837–1924), private secretary to Edward VII. and George V., was created Baron Knollys in 1902 and received a viscounty in 1911.

Another son, Sir Henry Knollys (b. 1840), was private secretary to King Edward's daughter Maud, queen of Norway until 1919.

KNORR, LUDWIG (1859–1921), German chemist, was born on Dec. 2, 1859, at Munich. He studied at Munich, Heidelberg and Erlangen He held the following posts: assistant in the chemical laboratories of the University of Munich (1880–82), at the University of Erlangen (1882–85), director of the analytical department of the chemical laboratories at the University of Würzburg (1885–88), "professor extraordinarius" of chemistry at Wurzburg (1888–89), and finally professor at the University of Jena. He died at Jena on June 4, 1921. Knorr's researches were in organic chemistry; he isolated and synthesized a number of organic compounds, and did experimental and theoretical work on tautomerism. He isolated, synthesized and gave a proof of the structure of pyrazole; he also isolated the di-keto, keto-enol and di-enol forms of dibenzoylsuccinic esters and of diacetylsuccinic esters. He synthesized pyrazolone, antipyrine and quinoline. Knorr also did some work on the alkaloids, particularly the morphine alkaloids. He plotted the solubility and melting point curves of a number of tautomeric compounds and worked on the tautomerism of methylpyrazole, of benzene and of diacylsuccinic esters.

KNOSSOS: *see* CRETE.

KNOT, a Limicoline bird, very abundant at certain seasons on the shores of Britain and of many northern countries. There are few of the Limicolae that present greater changes of plumage according to age or season. The knot (*Calidris canutus*) is rather larger than a snipe, but with a shorter bill and legs. In winter the plumage is ashy-grey above (save the rump, which is white) and white beneath. In summer the feathers of the back are black, broadly margined with light orange-red, mixed with white, those of the rump white, more or less tinged with red, and the lower parts are of a nearly uniform deep chestnut. The birds which winter in temperate climates seldom attain the brilliancy of colour exhibited by those that arrive from the south. Young birds are ashy-grey above, each feather banded with dull black and ochreous, while the breast is tinged with warm buff. There are four protectively coloured eggs The bird has been found breeding in the islands north of Siberia and elsewhere, probably having a circumpolar range. In winter its wanderings are extensive, as it is recorded from Surinam, Brazil, South Africa, China, Queensland and New Zealand. Formerly this species was netted in England, and the birds fattened for the table.

KNOT-GRASS, KNOT-WEED or BISTORT, the common names for various plants of the genus *Polygonum* (family Polygonaceae). All members of the genus, which contains about 275 species, mostly in temperate regions, are herbaceous. The flowers, mostly with a five-leaved perianth and about eight stamens, are usually brightly coloured, and consequently visited by insects. In some species, however (e.g., *P. aviculare*), cleistogamous flowers are produced, while in *P. viviparum* many of the lower

flowers are replaced by bulbils. About 12 species, inclusive of the foregoing, occur in the British Isles. In North America upwards of 75 species are found, among which are several which have been introduced from the Old World.

The name knot-grass is sometimes used in the southern United States to denote the joint-grass, *Paspalum distichum,* which is a true grass (Gramineae) and a good fodder-plant.

KNOTS, an interlacement of the parts of one or more ropes, cords, threads, etc ; commonly used as a device for binding together various objects. The word is from the O E. *cnotta,* from a Teutonic stem *knott; cf.* "knit" and Ger. *knoten.* A description of the more familiar knots is given below. The word is also applied to any hard mass resembling a knot drawn tight as, for example, to the one formed in the trunk of a tree at the intersection of a branch. "Knot" or "knob" is an architectural term for a bunch of flowers, leaves or other ornamentation carved on a corbel or on a boss. In heraldry, a "knot" is an ornamental figure formed by intertwining the parts of one or more cords. The word is used on shipboard to denote the distance marks on a log line, and hence as the equivalent of a nautical mile. It is applied figuratively to any intricate problem, hard to disentangle, a use stereotyped in the proverbial expression "cutting the Gordian knot." (*See* GORDIUM.)

KNOTS, BENDS, HITCHES, SPLICES AND SEIZINGS

These are all ways of fastening together the parts of one or more ropes, cords, etc., or of attaching a rope to some such object as a ring or spar. In the narrow sense, a "knot" is a knob on a rope, usually formed by untwisting the strands at an end and weaving them together (*cf.* "wall knot," fig. 32), though sometimes by turning the rope on itself through a loop (*cf.* "overhand knot," fig. 1). A "bend" and a "hitch" are ways of fastening ropes to one another or to spars, etc. A "splice" is made by untwisting two rope ends and weaving them together. A "seizing" is made by fastening together two spars, two ropes, or two parts of the same rope by means of another rope. The use of the various terms is, however, often arbitrary. Generally speaking, the knot and seizing are meant to be permanent and must be unwoven in order to be unfastened, while the bend and hitch can be undone, at once, by pulling the ropes in the reverse direction from that in which they are meant to hold. The governing principle in the design of these last is that the strain which pulls against them shall draw them together.

Many forms of fastening are employed on shipboard and in industry. Some of the more important ones are here described and pictured; for further details, the reader is referred to any book on seamanship. In the figures, the knots are in general drawn very slack and open, so that their structure may be more plainly exhibited.

Knots for Fastening.—*Overhand Knot* (fig. 1-A). Used to make a knob on a rope, or as the commencement of another knot.

Figure-of-Eight Knot (fig. 1-B). Turned in the end of a rope to prevent unreeving. It will not jam as an overhand does.

Square, or *Reef Knot* (fig. 1-C). Two overhand knots turned in opposite ways. Should be carefully distinguished from the *Granny* (fig. 1-D) which jams when it does not slip. A square knot is unsatisfactory for uniting ropes of different sizes, as the parts will slip unless stopped down. For fastenings of a temporary nature the second knot is sometimes turned over a bight in the end *a* of one of the ropes (fig. 1-E). By a pull on *a,* the knot can be slipped loose. A *Thief Knot* (fig. 1-F), though similar in appearance to a square knot, will slip under a strain applied to the two standing parts *b* and *b'*. To make a *Surgeon's Knot* (fig. 1-G), take an additional twist after turning the first overhand, and draw the partially completed knot taut. The parts will be held in place by the friction of the cord while the second overhand is being tied. Used in tying a ligature around a cut artery.

Half-Hitch (fig. 1-H). Pass the end of the rope round the standing part *b* and through the bight. *Half-Hitch over a Pin* (fig. 1-I). Should be made so as to continue the lay of the rope about the pin. *Midshipman's Hitch* (fig. 1-J).

Slippery-Hitch (fig. 1-K). Pass the end *a* under a belaying pin or cleat and tuck a bight under the standing part *b*. Can be slipped loose by a pull on *a*.

Bowline (fig. 1-L). Forms a loop that cannot slip. A very common and useful knot. Lay the end *a* over the standing part *b*; form with *b* a bight *c* over *a*; take *a* round behind *b* and through the bight *c*. *Running Bowline* (fig. 1-M) is a convenient temporary running noose. Formed by making a bowline over its own standing part. *Bowline on a Bight* (fig. 1-N) is a more comfortable sling for a man than a simple bowline. Double the rope on itself; start as if to make a bowline in the doubled rope, but finish by passing the loop *c* around the loop *b*.

Sheepshank (fig. 1-O). Used for temporarily shortening a rope. A half hitch is taken with the standing parts *a* round the bights *b*.

Blackwall Hitch (fig. 1-P). Form a bight at the end of the rope and put the hook of the tackle through the bight so that the end of the rope may be jammed between the standing part and the hook. This and the next two are used for hooking tackle on to the end of a rope.

Double Blackwall, or *Stunner Hitch* (fig. 1-Q). Pass the end *a* twice round the hook under the standing part *b* at the last cross.

Cat's Paw (fig. 1-R). Twist up two parts of a lanyard in opposite directions and hook the tackle through the two eyes thus formed.

Sheet or *Becket Bend,* also called a *Weaver's Knot* (fig. 1-S). Suitable for uniting ropes of different sizes. Pass the end of one rope through a bight of the other, around both parts of the other, and under its own standing part. An ordinary net is a series of sheet bends Similar in principle is the *Double Sheet Bend* (fig. 1-T).

Carrick Bend (fig. 1-U). Lay the end of one rope over its own part so as to form a bight. Pass the end of the other rope through the bight, etc., as shown in the figure. *Double Carrick Bend* (fig. 1-V). Commonly used for bending hawsers together. If the two parts are of different sizes each part should be seized back on itself. May be tied in either of two ways shown

Reeving Line Bend (fig. 1-W). Particularly useful when the lines are to be veered through a small pipe.

English or *Fisherman's Knot.* Used for fastening gut ends, etc. The ends are laid alongside pointing in opposite directions and an overhand is made in each around the end of the other.

Two ropes are sometimes united by means of a square knot (fig. 1-C) or by means of two interlinking bowlines, one on each rope.

Clove Hitch or *Builder's Knot* (fig. 1-X). Pass the end *a* round a spar and cross it over *b*. Pass it round the spar again and put the end *a* through the second bight. *Two Half Hitches:* the half hitch repeated; or a *Round Turn and Two Half Hitches* (fig. 1-Y).

Fisherman's Bend. Take two turns round a spar, then a half hitch round the standing part and between the spar and turns. An added half hitch round the standing part gives an *Anchor Bend* (fig. 2-A), used to bend a cable to an anchor; or if in place of the last half hitch the end *a* is tucked under one of the round turns we obtain a *Studding Sail Halyard Bend* (fig. 2-B). A *Magnus Hitch* has two round turns, then a third on the other side of the standing part, with the end through the bight. *Studding Sail Tack Bend* (fig. 2-C). Will not come adrift by the flapping of the sail.

Timber Hitch (fig. 2-D). Take the end of a rope round a spar, then round the standing part, then several times around its own part against the lay of the rope. *Timber and Half Hitch* (fig. 2-E). Used for towing or dragging a spar.

Rolling Hitch (fig. 2-F). Very handy when one rope is to be fastened to the standing part of another or to a spar, as the rope can be put on and taken off very rapidly. For hauling a spar, two round turns are taken round the spar in the direction in which it is to be hauled and a half hitch on the other side of the hauling part.

Knots Worked in the End of a Rope.—*Wall Knot* (fig. 2-G). Unlay the end of a rope and with the strand *a* form a bight; take the next strand *b* round the end of *a*; take the last strand *c* round the end of *b* and through the bight made by *a*. Haul the ends taut.

Wall and Crown (fig. 2-H). Form a wall knot and lay one of the ends *a* over the knot. Lay *b* over *a* and *c* over *b* and through

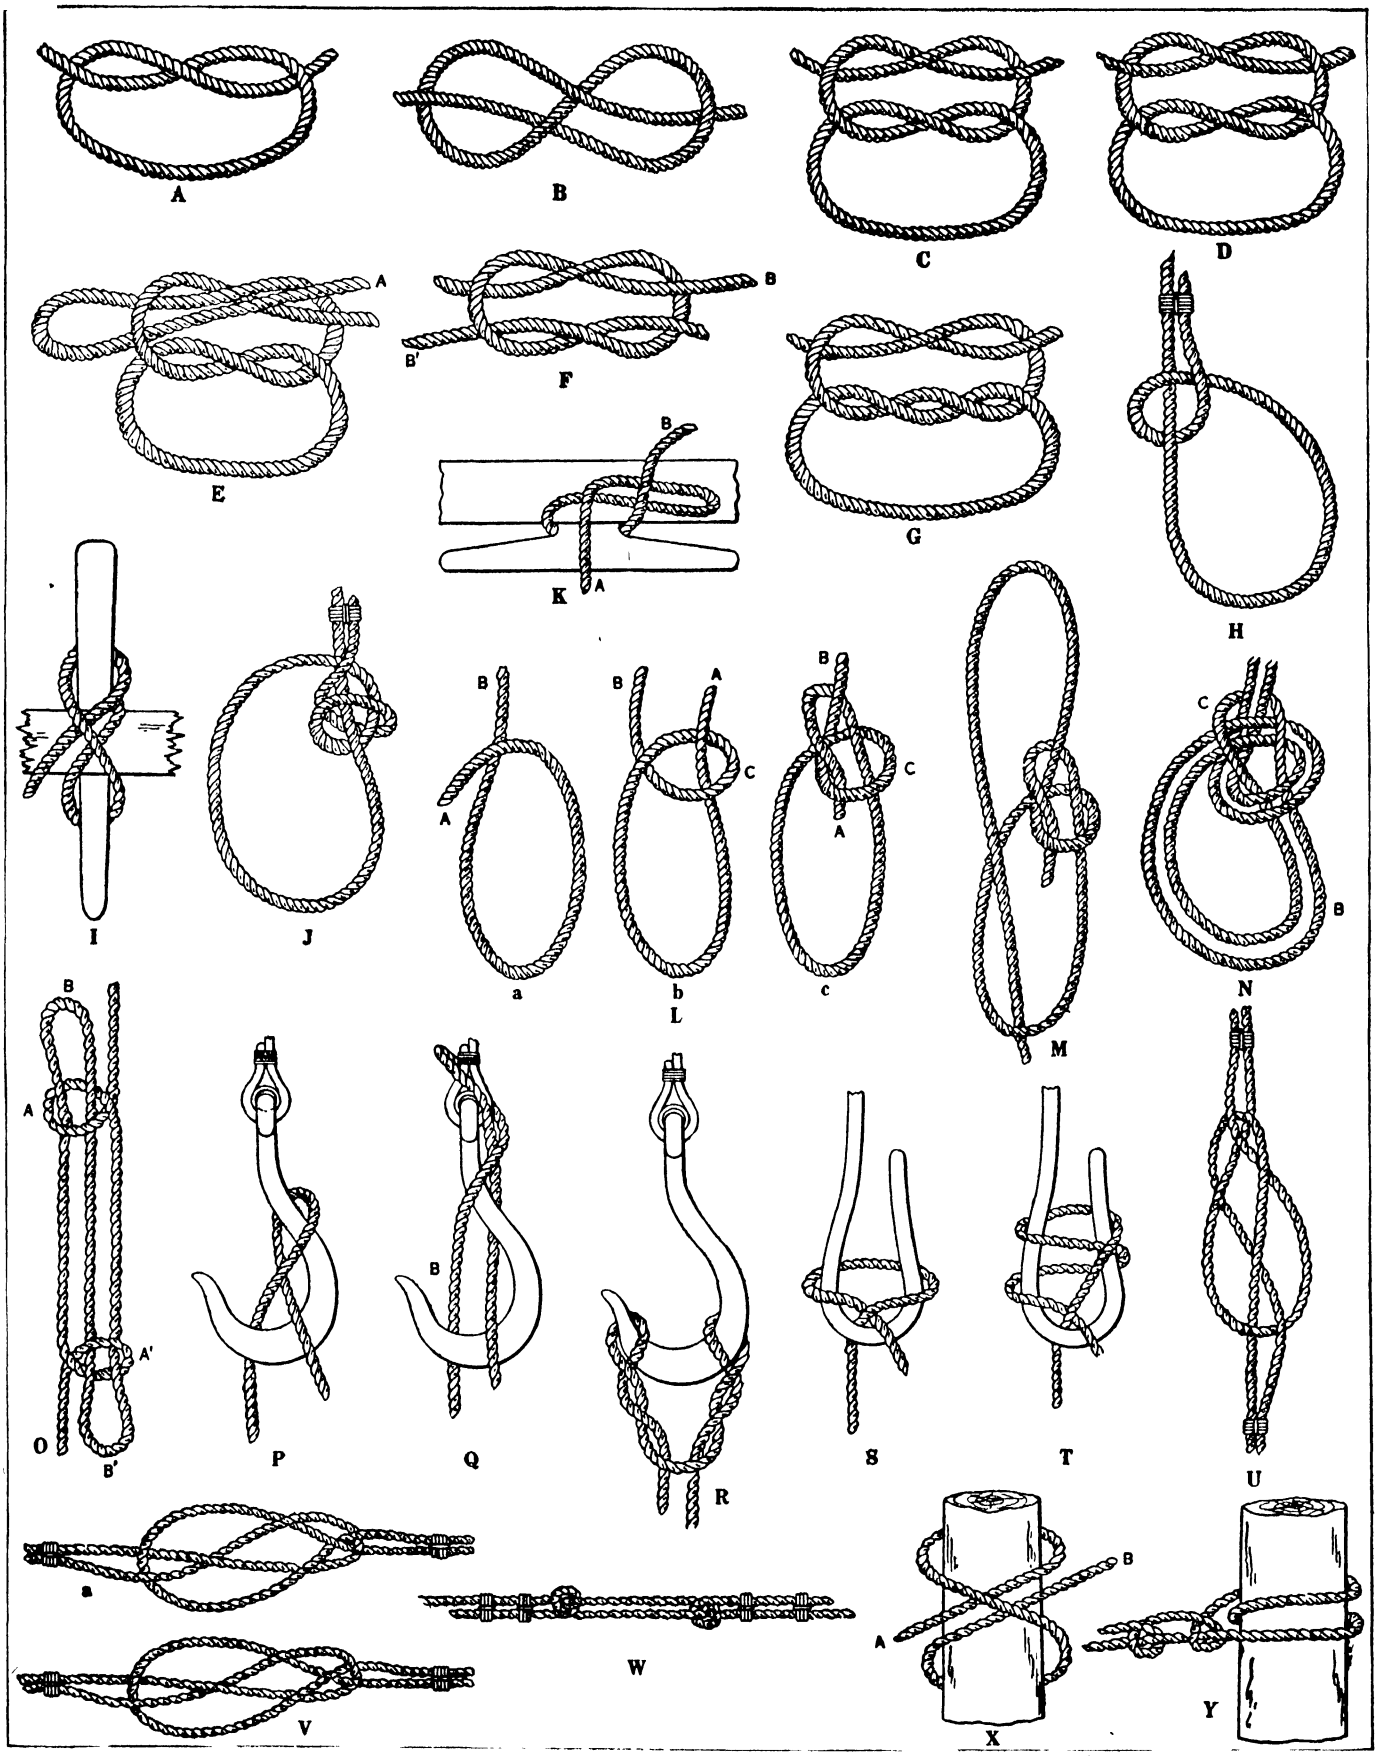

FIG. 1.—KNOTS: (A) OVERHAND, (B) FIGURE-OF-EIGHT, (C) SQUARE, OR REEF, (D) GRANNY, (E) TEMPORARY SQUARE, (F) THIEF, (G) SURGEONS, (H) HALF-HITCH, (I) HALF-HITCH OVER PIN, (J) MIDSHIPMAN'S HITCH, (K) SLIPPERY-HITCH, (L) BOWLINE, (M) RUNNING BOWLINE, (N) BOWLINE ON A BIGHT, (O) SHEEPSHANK (P) BLACKWALL HITCH, (Q) DOUBLE BLACKWALL OR STUNNER HITCH, (R) CATS PAWS, (S) SHEET OR BECKET BEND, (T) DOUBLE SHEET BEND, (U) CARRICK BEND, (V) DOUBLE CARRICK BEND, (W) REEVING LINE BEND, (X) CLOVE HITCH OR BUILDER'S HITCH, (Y) ROUND TURN AND TWO HALF-HITCHES

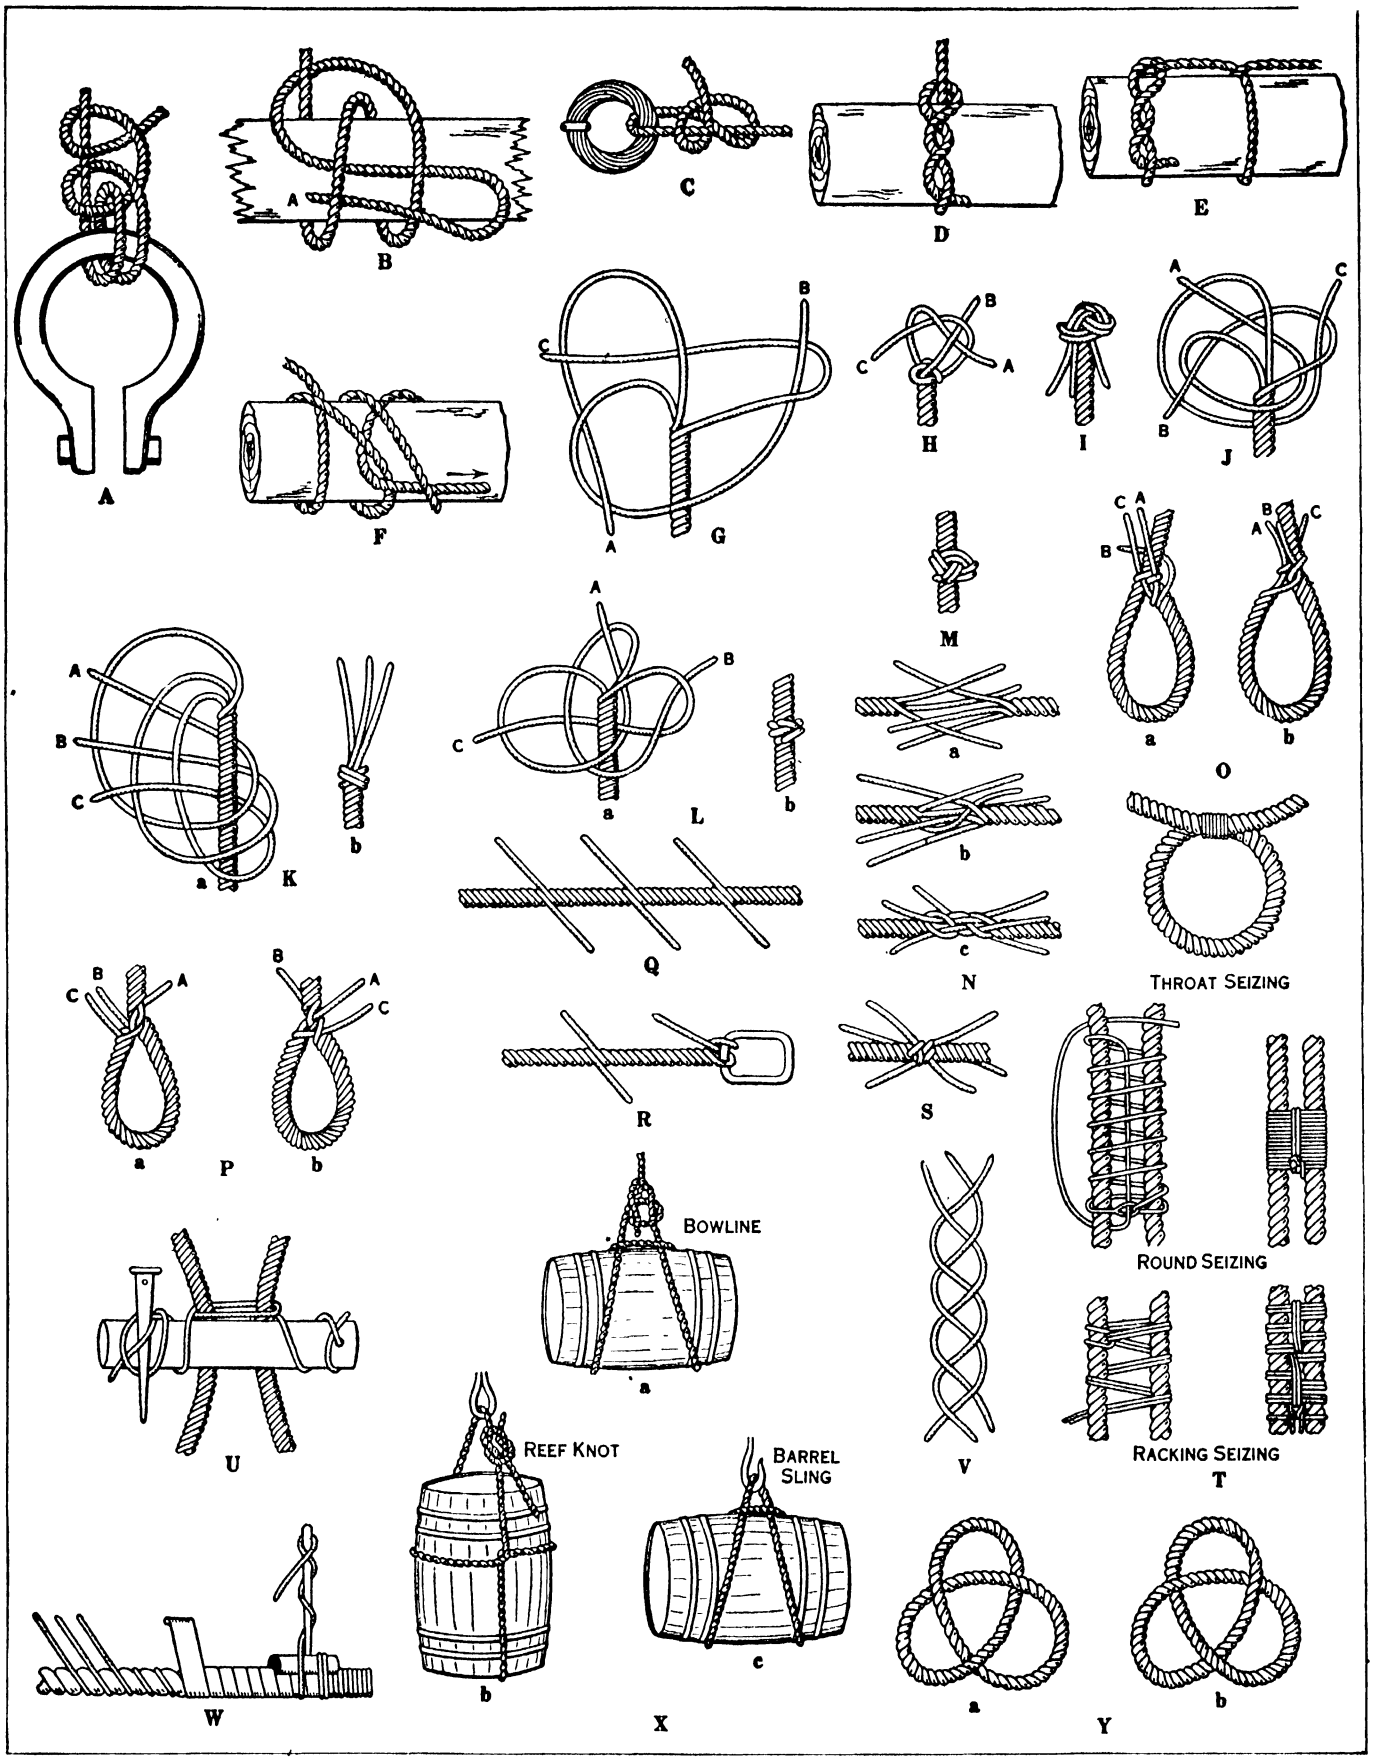

FIG. 2.—KNOTS: (A) ANCHOR BEND, (B) STUDDING SAIL HALYARD BEND, (C) STUDDING SAIL TACK BEND, (D) TIMBER HITCH, (E) TIMBER AND HALF-HITCH, (F) ROLLING HITCH, (G) WALL, (H) WALL AND CROWN, (I) CROWN OR MAN ROPE, (J) SINGLE MATTHEW WALKER, (K) DOUBLE MATTHEW WALKER, (L) SINGLE DIAMOND, (M) DIAMOND, (N) SHORT SPLICE, (O) EYE SPLICE, (P) SAILMAKER'S EYE SPLICE, (Q) LONG SPLICE, (R) CHAIN SPLICE, (S) SHROUD KNOT, (T) SEIZINGS, (U) SPANISH WINDLASS, (V) SENNIT, (W) WORMING A ROPE, (X) METHODS OF FASTENING TACKLE TO BARRELS, (Y) TREFOIL KNOTS

the bight of *a*. Haul the ends taut. *Double Wall and Double Crown,* or *Man Rope Knot* (fig. 2-I). Form a wall and crown and let the ends follow their own parts round until all the parts appear double. Put the ends down through the knot.

Single Matthew Walker (fig. 2-J). Unlay the end of a rope and with the strand *a* form a bight; take the next strand *b* round the end of *a* and through the bight made by *a*; take the last strand *c* round the ends of *a* and *b* and through the bight made by *b*. Haul the ends taut. *Double Matthew Walker* (fig. 2-K). Unlay the ends of a rope. Take the first strand round the rope and through its own bight; the second round the rope, through the bight of the first and through its own bight; the third through all three bights. Haul the ends taut.

Single Diamond Knot (fig. 2-L). Unlay the ends of a rope and with the strands form three bights down the sides. Pass strand *a* over *b* and through the bight of *c*; pass strand *b* over *c* and through the bight of *a*; pass strand *c* over *a* and through the bight of *b*. Haul the ends taut, and lay the rope up again. *Double Diamond Knot* (fig. 2-M). First make a single diamond. Make strands *a* and *b* follow the lead of the single knot through two single bights, so that they come up on top of the knot; make strand *c* pass through two double bights. Haul the ends taut and lay the rope up again

Splices.—*Short Splice* (fig. 2-N). The strands at the end of each rope are unlaid, married and tucked through the lay of the other rope, over one strand and under the next, two or three times each way. To render the splice neater the strands should be trimmed down to two-thirds their original size before being tucked under for the second time, and to one-third their original size before the last tuck.

Eye Splice (fig. 2-O). The strands at the end of a rope are brought back on the body of the rope at such a distance as to give an eye of the size wanted. The unlaid strands are then tucked through the strands of the rope (which are opened out by a spike), in the manner shown in the figure. They are then trimmed and tucked again, trimmed and tucked a third time, passing over one strand and under the next, as in the case of a short splice. *Sailmaker's Eye Splice* (fig. 2-P). Used in the roping of sails Continues the original lay of the rope around the eye.

Cut Splice and *Horseshoe Splice*. Similar to an eye splice but made out of two pieces of rope; therefore with two splices In a horseshoe splice the part of one rope between the two splices is much shorter than the corresponding part of the other.

Long Splice (fig. 2-Q). The ropes are unlaid for a considerable distance and their ends brought together with strands interlacing One strand of each rope is then unlaid for a further distance and the vacant space filled by the adjacent part of the other rope. The splice is thus practically divided into three parts; at each the two strands are halved, knotted and turned in twice. *Chain Splice* (fig 2-R). For splicing a rope to a chain.

Shroud Knot (fig. 2-S). Used when shrouds or stays are broken A stop is passed at such distance from each end of the broken shroud as to afford strands of sufficient length. The strands are then unlaid, the parts married as if to make a short splice, and a wall knot formed in each, as shown in the figure. After the knot has been well stretched the ends are tapered, laid smoothly between the strands of the shroud, and firmly served over.

Seizings.—These are used to lash together spars, ropes or parts of the same rope. Various types of seizings are illustrated in fig. 2-T. With heavy ropes, where power is necessary to heave the parts together, some such device as a *Spanish Windlass* (fig. 2-U), may be employed. The marlinspike, which may act as a lever is attached to the rope of the windlass by a *Marlinspike Hitch,* as shown in the figure.

Miscellaneous.—There are various ways of securing blocks to ropes. One simple method is to splice an eye of suitable size at one end of the rope. The eye is passed over the end of the block and held in position by a round seizing clapped on close under the block. A *single strap* is made by joining the ends of a rope by a short splice. The strap is passed over the end of the block and secured by a seizing, as in the previous case. An iron thimble with a hook is frequently strapped to a block. When this is done the strap is reeved through the eye of the hook and over the groove of the thimble. A seizing is clapped on between the thimble and the block.

Grommet Strap. Made from a single strand of somewhat more than three times the length of the circumference of the strap. Lay one end of the strand over the standing part to form a ring, then with the long end follow the lay of the rope until the ring becomes three-stranded. Split the ends, knot two of the halves together so that the knot will fall in the lay of the rope, cut off the remaining halves, and tuck the knotted halves under the lay of the rope, as in finishing a long splice.

Selvagee Strap. This is a pliable strap used for clapping a tackle on gear, etc. It is made by winding rope yarns around two or more pegs placed at suitable distances from one another, until a strap of the desired stoutness has been obtained. The yarns are then secured together by half hitching with marline.

Sennit (fig. 2-V). Made by plaiting together three rope yarns. It makes a flat lashing, or gasket.

Worming a rope consists in winding spun yarn between the strands, following the lay of the rope (fig. 2-W) This helps to keep out the moisture and renders the surface of the rope smooth for parcelling. *Parcelling* consists in winding a strip of tarred canvas spirally around the rope, as a further protection from the wet. *Serving* consists in wrapping small stuff snugly over the parcelling. Ordinarily a serving mallet is used for hauling each turn taut. Various methods for fastening tackle to barrels, casks, etc., are illustrated in fig. 2-X.

THE MATHEMATICAL THEORY OF KNOTS

In the sense of analysis situs (*q.v.*), a knot is any simple, closed curve in three dimensional space, a curve which never passes more than once through the same point of space and which may be thought of as starting at a point *P* and ultimately returning to *P*. Two knots are said to be of the same *class* if there exists a continuous deformation of space carrying one knot into the position initially occupied by the other. If a knot is of the same class as a circle it is said to be unknotted, for it is convenient to treat an unknotted curve as a special case of a knot, just as it is convenient to treat a straight line as a special case of a curve. No general method has, as yet, been found for telling when two arbitrarily given knots are of the same class, or even for telling whether or not a curve is unknotted.

The structure of a perfectly general mathematical curve can be so complicated that, in most discussions on knots, attention is confined to curves of a reasonable degree of regularity. These last may be thought of, without serious error, as physical threads, arbitrarily twisted and tangled, and closed by having their two ends sealed together. From this physical point of view, the problem of classifying knots reduces to the problem of telling under what conditions it is possible, by a process of bending, stretching and shrinking, to deform one of two arbitrarily given threads into a thread of the same shape as the other.

The knot problem seems to have been originally proposed and studied by J. B Listing in one of the earliest works ever published on the subject of analysis situs. It was again attacked, independently, by P. G. Tait at a time when attempts were being made to interpret material atoms as vortex lines in the ether and to account for the differences in the various chemical elements by ascribing to the atoms of each a characteristic type of knottedness.

When we fix our eyes on a knotted thread we notice a certain number of *apparent crossing points* where, from our point of observation, one branch of the thread is seen to pass in front of another. This number of apparent crossing points may be varied either by deforming the knot or by shifting our point of observation, but if we start with any particular knot there is a certain minimal number *k* of crossing points which may be attained by suitably deforming the knot, but below which it is impossible to pass. The number *k* is a knot invariant, called the number of irreducible crossings of the knot. The simplest possible knot is one of zero crossings: that is to say, one which is unknotted. Next in order of simplicity come the two *trefoil knots*

(fig. 2-Y) with three crossings each. These knots are not of the same class. The problem of effectively determining the number of irreducible crossings of an arbitrarily given knot is still unsolved.

A classification of the more elementary knots according to the number of their irreducible crossings was begun by Tait and later extended by Kirkman, Little and others, so that tables now exist which exhibit all possible kinds of knots of 11 or less crossings. These tables are not altogether satisfactory, however, for they were arrived at by essentially empirical methods. It has never actually been proved, for instance, that no two knots listed in the tables as of distinct classes can be transformed into one another.

The first effectively calculable knot invariants were discovered by J. W. Alexander and, later, independently by K. Reidemeister. With the aid of these invariants, Alexander and Briggs have shown that all knots of eight or less crossings listed as distinct by Tait actually do belong to different classes. However, the new invariants appear to be insufficient to solve the knot problem completely, for they fail to distinguish between certain knots of nine crossings which give every indication of belonging to different classes. It is even doubtful whether they are sufficient to determine whether or not an arbitrary thread is unknotted. A neat classification of braids has been made by Artin.

KNOT SIGNS. One of the commonest devices to recall to mind something to be done is to tie a knot in a handkerchief. It is probable that the untrained memory would fail to recall the meaning attached to more than a very limited number of knots (*see* QUIPUS).

The simplest application of these knots is in keeping a record of a number of days, as is related by Herodotus (iv. 98) of Darius, who, on crossing the Ister in his Scythian expedition, left with the Greeks appointed to guard the bridge a thong with a number of knots equal to the number of days that their watch over the bridge was to be continued. One knot was to be undone each day, and if the king had not returned by the time that all the knots were undone, the Greeks were to break down the bridge and go away.

KNOUT, the whip used in Russia for flogging criminals and political offenders. It is said to have been introduced under Ivan III. (1462–1505). The knout had different forms. One was a lash of raw hide 16in. long, attached to a wooden handle, 9in. long. The lash ended in a metal ring, to which was attached a second lash as long, ending also in a ring, to which in turn was attached a few inches of hard leather ending in a beak-like hook. Another kind consisted of many thongs of skin plaited and interwoven with wire, ending in loose wired ends, like the cat-o'-nine-tails. The victim was tied to a post or on a triangle of wood and stripped, receiving the specified number of strokes on the back. A sentence of 100 or 120 lashes was equivalent to a death sentence, but few lived to receive so many. Peter the Great is traditionally accused of knouting his son Alexis to death. The emperor Nicholas I. abolished the earlier forms of knout and substituted the *pleti*, a three-thonged lash. (*See* PUNISHMENT.)

KNOWLEDGE, THEORY OF, that branch of philosophy which has for its province the investigation of the nature and structure of knowledge as such, with a view to determine the conditions of its possibility, and the significance, worth or validity of its contents as representing the nature and relations of the real.

1. THE CHARACTER AND SCOPE OF THE INVESTIGATION

It is only within a comparatively recent period that epistemology has come to be recognised as a distinct department of philosophical inquiry. Since the days of Kant, German thinkers have been in the habit of grouping under the head of *Erkenntnistheorie* a number of problems which belong together,—problems which have always, from the time of Plato, been included within the domain of philosophy. The term epistemology would appear to have been used for the first time in Ferrier's *Institutes of Metaphysics*, published in 1854. Philosophy according to Ferrier, consisted of two main divisions—epistemology, the doctrine or theory of knowing, and ontology, the science of that which truly is. Of these, the latter, he maintained, naturally comes *to us* first,—in the order of time, the proximate question of philosophy has been that of the nature of real or ultimate being. But in the logical order the former comes first; we cannot even get a footing in ontology unless we have at least attempted to *know* what is. And we are not in a position to know what is, until we have found an answer to the questions—What is the meaning of *to know?*

No sooner is the effort made to treat knowledge as itself the subject-matter of investigation than there comes to the front an antithesis that would seem to be of fundamental importance. There would seem, namely, to be implied in the very notion of knowledge a distinction and a relation between the inner or mental process of knowing and the outer world of fact, to which the act of knowing or cognising refers. To the former there has been assigned the technical name, the subjective, and to the latter the technical name, the objective. In all knowledge these two distinguishable aspects seem to be brought together into a certain unity. And we call the result which may be attained the acquisition of truth—a term again involving in another way the antithesis of subjective and objective. Thus, three great fields of human research are at once indicated,—(*a*) the structure of the subjective process called knowing; (*b*) the specific character of the objects of the external world; and (*c*) the nature of truth, as discriminated alike from the mind that recognises it and from the facts which it is "about." The first belongs to psychology, the second forms the domain of the natural sciences and the third constitutes the subject-matter of the theory of knowledge and logic.

Epistemology and Psychology.—The exact nature of the fundamental problem with which epistemology is concerned may be made manifest by considering the ways in which knowledge is dealt with by psychology and epistemology respectively.

The psychologist proposes to scrutinize the subjective aspect of knowledge,—the activity of knowing, as a condition of the individual mind, as so much matter of fact that can be inspected and analysed in the manner in which every other matter of fact can be, and with respect to which there may be discovered uniformities of structure and of succession, uniformities which may be designated natural laws. These "states of consciousness" are, for him, so many events which happen at a definite time and in a definite set of connections with other psychical states. Take, for example, such a psychical event as the perception of a sense-quality. The business of the psychologist is to determine its nature as a transient phase in the history of an individual mental life. If he deems it to be simple and irreducible, he needs to inquire how it stands related to those concomitant events which serve as occasions for calling forth its exercise. If he deems it to be complex, he needs to disengage the components of which it consists, and to find out how these are combined into the unity of the apparently simple act.

And in this investigation no special weight will be laid upon the question whether the sense-quality apprehended is a characteristic belonging to physical things or merely a way in which physical things appear to us to be characterised. Or, take what is called a belief. The aim of the psychologist will be to exhibit the antecedent mental conditions that led to its being entertained, how it is related to the emotional and volitional sides of the mental life in question, with what states of the bodily organism it is connected, and so on. But obviously there remains a characteristic set of problems which this psychological treatment of cognition leaves entirely untouched. The act of perception purports to give what is called knowledge of the external world. In

entertaining a belief, the conscious subject is persuaded of its truth, that is to say, that it corresponds to something that is real and independent of the act of believing.

This contrast between the existence in an individual mind of a state or act of knowing and the significance of what is contained therein—the contrast between knowing as a psychical occurrence and knowledge as representative of relations in the material known—presses upon us whatever portion of cognitive activity be selected, whether perceiving or imagining or thinking. How is it possible that in and through means of a subjective act there should be awareness of what is, *ex hypothesi*, distinct both from the act and from the mind of which the act is a transitory phase? Again, from the nature of a cognitive act, as the psychologist describes it, it is evidently possible that it may fail to accomplish its natural end, the attainment of truth; its content may not correspond to fact. We are, therefore, driven to ask, under what conditions and in what forms is such a correspondence to be obtained, when and where can we be reasonably assured that our representation of the real is true? Such questions are manifestly of a different order from those which have been designated psychological, and, without going to the extent of saying that in the attempt to answer them psychological considerations are altogether irrelevant, it may safely be asserted that they are insufficient. The worth or significance of knowledge can never be determined by tracing the stages of its history.

LOCKE AND KANT

The difference between the two points of view was indicated by Locke. In the Introduction to the *Essay*, Locke gives a preliminary statement of the subjects with which he proposes to deal in the second and fourth Books. "First," he writes, "I shall inquire into the original of those ideas, notions, or whatever else you please to call them, which a man observes, and is conscious to himself he has in his mind; and the ways whereby the understanding comes to be furnished with them." This is a psychological inquiry. He proposes to try to find out what the cognitive states of the individual mind are, which of them are complex and which simple, and to analyse the former into their constituents. Furthermore, he proposes to trace the genesis and development of cognition, and the way in which it gradually comes to be what we find it to be in ourselves. But he proceeds: "Secondly, I shall endeavour to show what knowledge the understanding hath by those ideas, and the certainty, evidence and extent of it." This is, in brief, the subject-matter of epistemology. He proposes here to try to find out how by means of our mental states we obtain information about the world in which we are, how far that information is reliable, and the degree to which we are justified in placing credence in it.

Unfortunately, however, although he had thus shown himself to be aware that these two lines of inquiry are different, Locke, in his subsequent procedure, is constantly confusing what he had carefully distinguished, and drawing upon considerations which properly belong to one of these sets of problems in dealing with the other. It was in Kant's *Critique of Pure Reason* that the methods and aims of epistemology were first definitely formulated, and in which it was exhibited as the mode of approach to the other problems of philosophy. More than once Kant lays emphasis upon the consideration that the first part of the *Critique* would be misconstrued if regarded as a treatise on the psychology of cognition. The question with respect to knowledge which it was concerned to answer was the question *quid juris* and not the question *quid facti*, the question as to the validity of knowledge and not the question as to the natural conditions under which knowledge grows up in the individual mind. Taking for granted that knowledge *is* possible, Kant seeks to show *how* it is possible, to inspect it in its character as apprehensive of fact and to determine the conditions implied in its nature. Empirical psychology seemed to him to stand related to this "critical" inquiry in much the same way as the natural sciences stood related to it. It involved in its methods of research presuppositions which it was the business of a theory of knowledge to examine, and it employed notions which it was the business of a theory of knowledge to criticise. Psychology begins by assuming that the world of experience can be broadly divided into two realms of facts,—those which it is customary to call outer and inner, objective and subjective,—and all its explanations are based upon the mutual interconnection of these.

But from the point of view of a critical theory of knowledge, the division between outer and inner, between objective and subjective, itself demanded investigation and defence. The meaning of such a distinction for the conscious subject within whose experience it presents itself called for consideration, and the conditions under which it is recognised by him required to be shown. Or, in other words, knowledge exhibits the two characteristic features—reference to a self that knows and reference to a reality other than self; and the former is no less a problem than the latter. It has to be confessed that Kant was not always successful in keeping his own treatment within the limits he had prescribed; but it was he who first fully realised the import of the problems that fall to a theory of knowledge.

2. TREATMENT OF KNOWLEDGE IN THE HISTORICAL SYSTEMS OF PHILOSOPHY

A. **In Greek Philosophy.**—The problems which are now grouped under epistemology are many of them nearly as old as philosophy itself. It is true that human reflection always looks outward before it looks inward; and that, consequently, cosmological inquiries into the nature of the physical world precede in the order of time inquiries into the way in which knowledge of the physical world is acquired. In Greek thought, these cosmological inquiries centred round the attempt to discover a "material principle" or "cause" of things. From the time of Thales (born about 625 B.C.) to that of Protagoras (born about 480 B.C.) there can be traced a tolerably well demarcated line of speculation the aim of which was to come upon some known permanent substratum of natural fact and to exhibit the ways in which that substratum is connected with the particular phenomena of concrete experience. Only by degrees did problems of knowledge come into prominence, and therefore, only gradually did there evince itself a deliberate trend of human reflection towards their solution. Probably Socrates (born about 470 B.C.) first set the current of Greek thought definitely in this direction. The view that Socrates was a mere moralist is ill-founded.

That Socrates did select practical conduct as matter worthy above all of rational consideration can scarcely be disputed. And to do this was in effect to accentuate the intimate relation of objective fact to human thought. It was as introducing this subjective element into Greek speculation that Socrates brought to the front issues of an epistemological character. Doubtless he was crystallizing much of the current opinion of his time—particularly that which prevailed among the Sophists and their followers,—but no sooner had the step been taken than we find Greek philosophy occupied with special and well-marked problems of the kind we should now call epistemological.

In the *Theaetetus* (completed about 368 B.C.), three theories of the nature of knowledge (ἐπιστήμη) are submitted to examination. In this dialogue Plato's aim is to show that these three theories break down under the weight of criticism that may be brought to bear upon them.

More than half the dialogue is occupied with a theory which was not only that propounded by certain well-known philosophic inquirers but an answer to the question likely to be given by anyone who has pondered over the matter,—namely, that knowledge is identical with sense-apprehension (αἴσθησις). This view is immediately connected with the doctrine of Protagoras that "man is the measure of all things," and interpreted as implying the relativist position that things *are* for me as they appear to me, and for you as they appear to you. A thing *is* to each man as it appears to him, and to say that it appears to him is equivalent to saying that he perceives it. Sensation, then, is of something that is, and is exempt from error; it is *certain* knowledge. As Taylor has pointed out, it is not a doctrine of "subjectivism" that is here attributed to Protagoras; it is not suggested that he meant to assert of "what appears" that it is a mental state of the percipient.

Rather the point is that, according to Protagoras, we are not entitled to assume a *common* real world apprehensible by any number of percipients; each individual percipient lives in a private world known only to himself, and, since no two of these private worlds have anything in common, each percipient can be said to be infallible in regard to what he perceives. Socrates is represented as attempting to work out the theory more elaborately before proceeding to judge its merits. It virtually depends, he argues, upon an ontological position, such as that which had been advocated by Heracleitus, that every thing real is in a condition of ceaseless flux, that what is called "being" is but change. So regarded the entities we speak of as "existents" are streams of events and movement is the ultimate reality.
